

Combination of searches for Higgs boson pair production in pp collisions at $\sqrt{s} = 13$ TeV with the ATLAS detector

The ATLAS Collaboration

This Letter presents results from a combination of searches for Higgs boson pair production using $126\text{--}140\text{ fb}^{-1}$ of proton–proton collision data at $\sqrt{s} = 13$ TeV recorded with the ATLAS detector. At 95% confidence level (CL), the upper limit on the production rate is 2.9 times the Standard Model (SM) prediction, with an expected limit of 2.4 assuming no Higgs boson pair production. Constraints on the Higgs boson self-coupling modifier $\kappa_\lambda = \lambda_{HHH}/\lambda_{HHH}^{\text{SM}}$, and the quartic $HHVV$ coupling modifier $\kappa_{2V} = g_{HHVV}/g_{HHVV}^{\text{SM}}$, are derived individually, fixing the other parameter to its SM value. The observed 95% CL intervals are $-1.2 < \kappa_\lambda < 7.2$ and $0.6 < \kappa_{2V} < 1.5$, while the expected intervals are $-1.6 < \kappa_\lambda < 7.2$ and $0.4 < \kappa_{2V} < 1.6$ in the SM case. Constraints obtained for several interactions within Higgs effective field theory are the strongest to date, offering insights into potential deviations from SM predictions.

Since the discovery of the Higgs boson (H) by the ATLAS and CMS collaborations at the Large Hadron Collider (LHC) in 2012 [1, 2], understanding its intrinsic properties and interactions has been a priority. The Higgs self-coupling is directly related to the shape of the Higgs scalar field potential, which is important for understanding the mechanism of electroweak symmetry breaking and serves as an essential test of the electroweak theory. After the symmetry breaking, the Higgs potential predicted in the Standard Model (SM) can be expanded in the Higgs boson field, H , near its minimum: $V(H) = \frac{1}{2}m_H^2 H^2 + \lambda_{HHH}vH^3 + O(H^4)$, where m_H is the Higgs boson mass and $v \approx 246$ GeV is the field’s vacuum expectation value. The Higgs boson’s trilinear self-coupling $\lambda_{HHH}^{\text{SM}}$ is equal to $m_H^2/2v^2$, its coupling g_{HVV}^{SM} to vector bosons ($V = W, Z$) is equal to $2m_V^2/v$, and its coupling $g_{Hf\bar{f}}^{\text{SM}}$ to fermions is equal to m_f/v . The quartic coupling between two Higgs bosons and two vector bosons, g_{HHVV}^{SM} , is equal to g_{HVV}^{SM}/v [3]. The production of Higgs boson pairs (HH) via gluon–gluon fusion (ggF) and vector-boson fusion (VBF) provides a direct probe of λ_{HHH} and g_{HHVV} , which affects the pair-production differential cross-section at tree level. Observed (expected) 95% confidence level (CL) upper limits on the HH production cross-section have been set at 2.4 (2.9) and 3.4 (2.5) times the SM prediction by previous ATLAS [4] and CMS [5] search combinations, respectively.

Deviations from the SM can be expressed in terms of coupling modifiers κ_i [6, 7] or Wilson coefficients c_i in the Higgs effective field theory (HEFT) [8, 9], as illustrated in Figure 1. In the κ framework the coupling modifiers κ_λ , κ_t , κ_V and κ_{2V} are each defined as the ratio of the Higgs boson coupling to its SM value, e.g. $\kappa_\lambda = \lambda_{HHH}/\lambda_{HHH}^{\text{SM}}$. In the HEFT framework, new physics in the electroweak sector is described through anomalous couplings of the Higgs boson. The organization of the HEFT Lagrangian is guided by chiral perturbation theory, with the low-energy dynamics of electroweak symmetry breaking described using a nonlinear realization of the gauge symmetry group $SU(2)_L \times U(1)_Y$. One advantage of the HEFT framework is that the anomalous single-Higgs-boson and HH couplings are defined separately, allowing simplified HH interpretations. In the HEFT Lagrangian, ggF HH production is described at leading order by five relevant operators, and their associated Wilson coefficients are c_{tth} , c_{ggh} , c_{hhh} , c_{gggh} and c_{tthh} . In this formalism, c_{tth} and c_{hhh} are equivalent to κ_t and κ_λ . In this analysis, κ_V , κ_t (c_{tth}) and c_{ggh} are set equal to the SM predictions because those parameters are constrained by precise measurements of single Higgs boson production [5, 10].

In the SM, destructive interference between the ggF HH production diagrams in Figures 1(a) and 1(b) makes softer Higgs bosons more sensitive for constraining κ_λ . For $m_H = 125$ GeV and $\sqrt{s} = 13$ TeV proton–proton collisions, the predicted cross-section is $\sigma_{\text{ggF}}^{\text{SM}}(HH) = 31.1_{-7.1}^{+1.9}$ (scale + m_{top}) ± 0.9 (PDF + α_s) fb [11–18] at next-to-next-to-leading order in α_s and including an approximation of finite- m_{top} effects. The “PDF + α_s ” uncertainty accounts for uncertainties in the parton distribution functions and strong coupling constant, the “scale” uncertainty is due to the finite order of quantum chromodynamics (QCD) calculations, and the “ m_{top} ” uncertainty is related to the top-quark mass scheme. For SM VBF HH production, divergences in the diagrams shown in Figures 1(d) and 1(e) cancel out due to perturbative unitarity. If κ_{2V} deviates from the SM prediction, this cancellation no longer occurs, leading to a linear dependence of the cross-section on the effective center-of-mass energy of the incoming vector bosons [19]. Consequently, the Higgs bosons are expected to be more energetic in non-SM scenarios. The cross-section for VBF HH production is $\sigma_{\text{VBF}}^{\text{SM}}(HH) = 1.73 \pm 0.04$ fb at next-to-next-to-next-to-leading order in QCD [20–24].

This Letter presents a combination of results from the $b\bar{b}b\bar{b}$ [25, 26], $b\bar{b}\tau^+\tau^-$ [27], $b\bar{b}\gamma\gamma$ [28], multilepton [29] and $b\bar{b}\ell\ell + E_{\text{T}}^{\text{miss}}$ [30] decay channels, probing more than half of the HH decays. The first three analyses have been improved since the previous combination [4], and the other two are newly included. The $HH \rightarrow b\bar{b}b\bar{b}$ decay mode has the advantage of having the largest SM HH decay branching fraction (33.9%) but it also has the largest SM background, due to the abundance of QCD multijet events. Given its capability to probe relatively high-energy Higgs bosons, both the resolved [25] and boosted topologies [26]

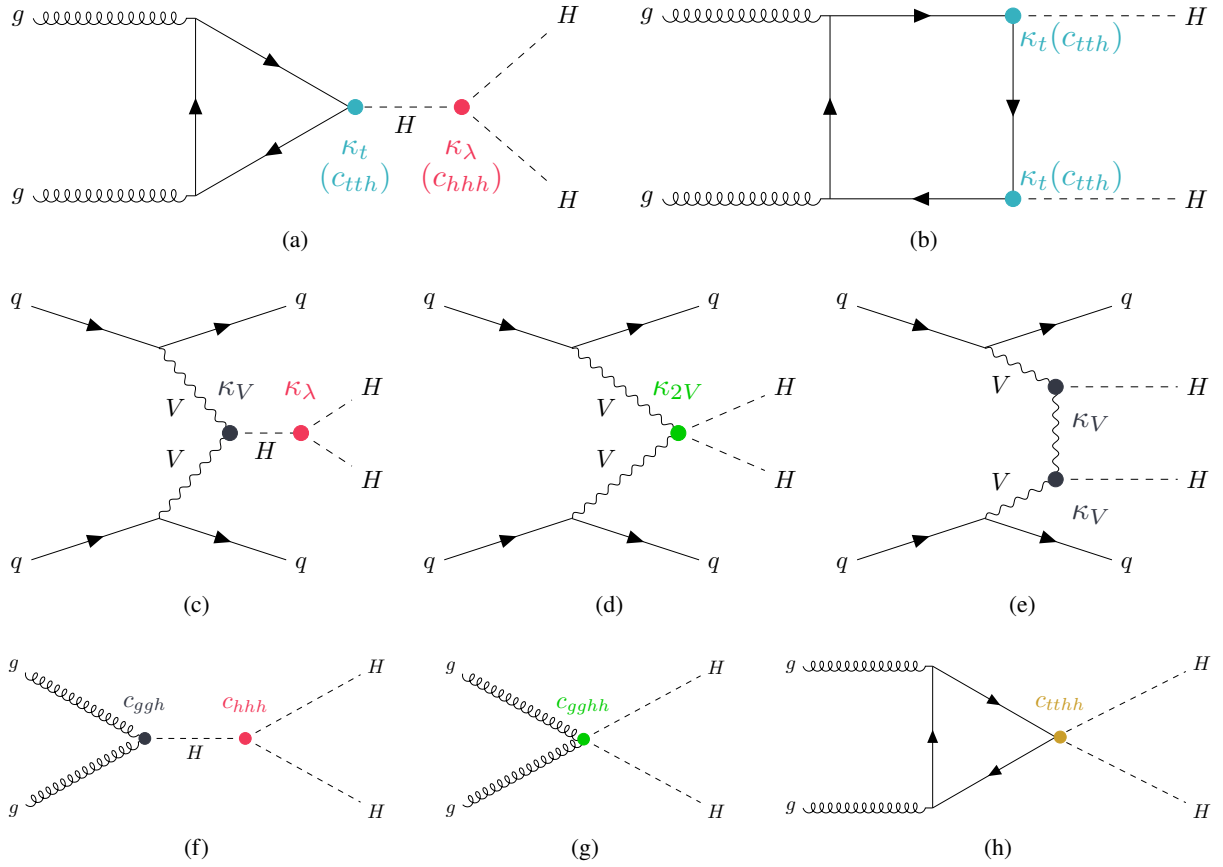

Figure 1: Leading-order Feynman diagrams showing the production of Higgs boson pairs via the ggF (a), (b), (f)–(h) and VBF (c)–(e) processes. Each diagram is sensitive to specific coupling factors, denoted by κ_i in the κ framework or c_i in the HEFT. Diagrams (a)–(e) occur in the SM predictions, while diagrams (f)–(h) manifest only when deviations from the SM predictions are present in the coefficients c_{ggh} , c_{gghh} or c_{tthh} .

are now used to reconstruct the Higgs bosons. The $HH \rightarrow b\bar{b}\tau^+\tau^-$ decay mode has one of the larger branching fractions (7.3%) among the investigated HH decay channels and benefits from having only moderate background contamination. In this analysis [27], one of the τ -leptons is required to decay hadronically, ensuring orthogonality with the $b\bar{b}\ell\ell + E_T^{\text{miss}}$ search. Although the $HH \rightarrow b\bar{b}\gamma\gamma$ decay mode has a small branching fraction (0.26%), it has high trigger efficiency and a clean experimental signature. The $b\bar{b}\tau^+\tau^-$ [27] and $b\bar{b}\gamma\gamma$ [28] analyses have been improved through optimized classification of selected events to enhance the sensitivity to the Higgs boson couplings. Furthermore, the $b\bar{b}\tau^+\tau^-$ analysis now benefits from more accurate background modeling and larger samples of simulated events. The multilepton analysis is designed to select HH events in $b\bar{b}ZZ^*$, VV^*VV^* ($V = W$ or Z), $VV^*\tau^+\tau^-$, $\tau^+\tau^-\tau^+\tau^-$, $\gamma\gamma VV^*$ and $\gamma\gamma\tau^+\tau^-$ decay channels with leptons in the final states; the total branching fraction is around 6.5%. The $b\bar{b}\ell\ell + E_T^{\text{miss}}$ search targets final states arising from HH decay channels where one of the Higgs bosons decays to a b -quark pair and the other to either a boson pair (ZZ^* , WW^*) or a τ -lepton pair, which then decays to a pair of opposite-sign leptons ($\ell = e, \mu$) and neutrinos, for a total branching fraction of 2.9%. Depending on the analysis, the final discriminating variable can be the HH invariant mass, the diphoton invariant mass, or the multivariate classifiers used to separate signal from background.

The analyses under consideration use the full sample of $\sqrt{s} = 13$ TeV proton–proton (pp) collision data

recorded with the ATLAS detector during Run 2 of the LHC. The integrated luminosity ranges from 126 to 140 fb⁻¹ depending on the trigger selection [31]. The ATLAS experiment is a multipurpose particle detector with a forward–backward symmetric cylindrical geometry and nearly 4π coverage in solid angle [32–34]. A software suite [35] is used in data simulation, in the reconstruction and analysis of real and simulated data, in detector operations, and in the trigger and data acquisition systems of the experiment. The searches use a common set of event generators to describe ggF and VBF *HH* production in the *pp* collisions. Reweighting methods are used to estimate the total and differential signal yields at a given value of κ_i from samples simulated for different values of κ_λ and κ_{2V} [4], or to estimate the particle-level m_{HH} distributions for alternative values of the Wilson coefficients using parameters from Ref. [36].

The results are derived from a likelihood function, $L(\vec{\alpha}, \vec{\theta})$, where $\vec{\alpha}$ denotes the vector of parameters of interest (POIs) in the statistical model, and $\vec{\theta}$ is a set of nuisance parameters (NPs), including systematic uncertainty contributions and background parameters. This global likelihood function is the product of individual search likelihoods. The profile-likelihood-ratio test statistic, $-2 \ln \Lambda(\vec{\alpha}, \vec{\theta})$, is used to determine the 68% and 95% CL intervals and local significance in the asymptotic approximation [37]. The CL_s method [38] is utilized to derive upper limits on the *HH* production cross-section. To evaluate the expected limits, Asimov datasets [37] are generated, setting all NPs to their best-fit values in data and fixing the POIs to those posited in the hypothesis under test. The event samples from the combined searches are scrutinized for overlaps; they are found to be less than 1% in the signal regions, and thus considered negligible.

Complete discussions of the systematic uncertainties considered in the individual searches are provided in Refs. [25–30]. Correlations of these uncertainties between different searches are investigated. Uncertainties related to the data-taking conditions, such as those associated with the integrated luminosity and the mismodeling of the multiple *pp* interactions per bunch crossing, are assumed to be correlated across the searches. An exception is the integrated luminosity uncertainty in the resolved $b\bar{b}b\bar{b}$ analysis [25], which employs a different calibration version. Where applicable, uncertainties associated with physics objects common to two or more searches are considered correlated. Correlations are also assumed for theoretical uncertainties affecting simulated signal and background processes, such as uncertainties in the QCD scale, proton parton distribution functions, and Higgs boson decay branching fractions. Systematic uncertainties that significantly influence the individual searches but are strongly constrained or pulled in the data fitting are treated as uncorrelated to prevent undue influence on the other searches. However, the impact of treating them as correlated or uncorrelated in the combination was checked and found to be negligible.

The signal strength μ_{HH} is defined as the ratio of the measured inclusive ggF and VBF *HH* production cross-section to the SM prediction $\sigma_{\text{ggF+VBF}}^{\text{SM}}(HH) = 32.8_{-7.2}^{+2.1}$ fb. This μ_{HH} measure assumes that the relative ggF and VBF production cross-sections, Higgs boson decay branching fractions, and relative kinematic distributions correspond to the SM predictions. The fit to data indicates a value of $\mu_{HH} = 0.5_{-1.0}^{+1.2} = 0.5_{-0.8}^{+0.9}(\text{stat.})_{-0.6}^{+0.7}(\text{syst.})$, where “stat.” and “syst.” denote the statistical and systematic uncertainties, respectively. The result is compatible with the SM prediction, with a *p*-value of 0.64. Assuming $\sigma_{\text{ggF+VBF}}(HH) = \sigma_{\text{ggF+VBF}}^{\text{SM}}(HH)$, the expected value is $\mu_{HH} = 1.0_{-1.0}^{+1.2} = 1.0_{-0.9}^{+1.0}(\text{stat.})_{-0.5}^{+0.7}(\text{syst.})$. The primary systematic uncertainty arises from an estimated uncertainty of 100% in modeling the radiation of additional heavy-flavor jets in the ggF single-Higgs-boson production process [39–43], affecting μ_{HH} by 25%. The observed (expected) significance of μ_{HH} is 0.4 (1.0) standard deviations, with respect to the hypothesis of no *HH* production. No significant *HH* signal is observed above the expected background, and a 95% CL upper limit of 2.9 is placed on μ_{HH} . If *HH* production is absent, the expected 95% CL upper limit is 2.4, and in the SM case ($\mu_{HH} = 1$) the expected upper limit is 3.4. The expected upper limit is 17% lower than in the previous combination [4]: 13% from improvements in the $b\bar{b}\tau^+\tau^-$, $b\bar{b}\gamma\gamma$ and $b\bar{b}b\bar{b}$ analyses, and an additional 4% from the inclusion of the multilepton and $b\bar{b}\ell\ell + E_{\text{T}}^{\text{miss}}$ channels. This

Figure 2: Observed and expected 95% CL upper limits on the signal strength for inclusive ggF HH and VBF HH production from the $b\bar{b}\ell\ell + E_T^{\text{miss}}$, $b\bar{b}\gamma\gamma$, $b\bar{b}b\bar{b}$, multilepton and $b\bar{b}\ell\ell + E_T^{\text{miss}}$ decay channels, and their statistical combination. The predicted SM cross-section assumes $m_H = 125$ GeV. The expected limit, along with its associated $\pm 1\sigma$ and $\pm 2\sigma$ bands, is calculated for the assumption of no HH production and with all NPs profiled to the observed data.

combination provides the best expected sensitivity to the HH production cross-section to date. Figure 2 displays the limits from the individual searches and their combination,¹ highlighting the $b\bar{b}\tau^+\tau^-$ channel as the one expected to constrain μ_{HH} the most. The p -value for compatibility between the μ_{HH} value measured in the combination and those measured in the individual searches is 0.16. The observed and expected 95% CL upper limits on $\sigma_{\text{ggF}+\text{VBF}}(HH)$ from the combination are 86 fb and 71 fb, respectively, derived excluding theoretical uncertainties in the HH production cross-section.

The self-coupling modifier κ_λ is explored in the ggF and VBF HH production processes. Assuming that other Higgs boson couplings conform to the SM predictions, a fit to data yields $\kappa_\lambda = 3.8_{-3.6}^{+2.1}$, which is compatible with the SM prediction, with a p -value of 0.53. The expected value of κ_λ is $1.0_{-1.5}^{+4.7}$ when assuming SM HH production. The observed (expected) 95% CL interval is $-1.2 < \kappa_\lambda < 7.2$ ($-1.6 < \kappa_\lambda < 7.2$), representing the best expected sensitivity to the Higgs boson self-coupling to date. The values of the test statistic as a function of κ_λ are shown in Figure 3(a) for both the individual searches and their combination, highlighting the $b\bar{b}\gamma\gamma$ channel as the most sensitive. Similarly, κ_{2V} is explored in the VBF HH production process. Assuming the SM predictions for other Higgs boson couplings, the observed (expected) value is $\kappa_{2V} = 1.02_{-0.23}^{+0.22}$ ($\kappa_{2V} = 1.00_{-0.36}^{+0.40}$). The observed (expected) 95% CL interval is $0.6 < \kappa_{2V} < 1.5$ ($0.4 < \kappa_{2V} < 1.6$). The values of the test statistic as a function of κ_{2V} are shown in Figure 3(b), highlighting the $b\bar{b}b\bar{b}$ analysis as the most sensitive, mainly due to the boosted channel [26]. A deficit of data events in this channel results in stronger constraints on κ_{2V} than expected. To reduce model dependence, two-dimensional contours of $-2 \ln \Lambda$ in the κ_{2V} - κ_λ plane are presented in Figure 3(c). The p -value for compatibility of the combined measurement and the SM prediction is 0.78.

For the HEFT interpretation the three most sensitive HH decay channels, $b\bar{b}\tau^+\tau^-$, $b\bar{b}\gamma\gamma$ and $b\bar{b}b\bar{b}$, are

¹ The test statistic and statistical uncertainties of the signal MC samples are updated in the $b\bar{b}\ell\ell + E_T^{\text{miss}}$ result compared to Ref. [30].

combined. The VBF HH process is ignored since it is only sensitive to c_{hhh} (κ_λ). One-dimensional constraints are evaluated separately for the coefficients $c_{gg hh}$ and $c_{tt hh}$, with all other coefficients fixed to the SM predictions. At 95% CL, the observed interval on $c_{gg hh}$ is $-0.38 < c_{gg hh} < 0.49$; if the SM value $c_{gg hh} = 0$ is assumed, the expected 95% CL interval is $-0.36 < c_{gg hh} < 0.36$. Similarly, the observed (expected) 95% CL interval on $c_{tt hh}$ is $-0.19 < c_{tt hh} < 0.70$ ($-0.27 < c_{tt hh} < 0.66$). These represent the most stringent constraints to date on $c_{gg hh}$ and $c_{tt hh}$. The results are compatible with the SM predictions, with p -values of 0.087 and 0.16, respectively. Figure 4 displays the two-dimensional test-statistic contours in the coefficient spaces of $(c_{gg hh}, c_{hhh})$, $(c_{tt hh}, c_{hhh})$, and $(c_{gg hh}, c_{tt hh})$, with each plot fixing $c_{tt hh}$, $c_{gg hh}$ or c_{hhh} , respectively, to its SM value. Two minima are expected because of the quadratic dependence of the cross-section on the coefficients. The p -values for compatibility of the $c_{gg hh}$ – c_{hhh} , $c_{tt hh}$ – c_{hhh} and $c_{gg hh}$ – $c_{tt hh}$ measurements with the SM predictions are 0.044, 0.21 and 0.031, respectively. The relatively low p -values are primarily due to the $b\bar{b}b\bar{b}$ analysis [25], where the data-driven background modeling cannot perfectly describe the background distribution in data, making non-SM signals more favorable in the fit. Due to insufficient sensitivity, the combination does not allow simultaneous constraints to be placed on c_{hhh} , $c_{gg hh}$ and $c_{tt hh}$ in a more model-independent manner.²

In summary, this Letter presents a combination of the results of searches for HH production in the $b\bar{b}\tau^+\tau^-$, $b\bar{b}\gamma\gamma$, $b\bar{b}b\bar{b}$, multilepton and $b\bar{b}\ell\ell + E_T^{\text{miss}}$ decay channels, utilizing the complete LHC Run 2 dataset of 13 TeV proton–proton collisions recorded with the ATLAS detector. This new combination provides the best expected sensitivities to the HH production cross-section and the Higgs boson self-coupling. The results agree well with the SM predictions. When using Higgs effective field theory to interpret the measurements, unprecedented constraints are placed on the effective $ggHH$ and $t\bar{t}HH$ interactions.

² The results in both the κ and HEFT frameworks are affected by the issue concerning the ggF HH prediction for BSM scenarios in POWHEG reported in the erratum to Ref. [44]. The main effect is on the high- m_{HH} region and decreases the signal acceptance. The changes to resolve this issue described in Ref. [45] are not included, to be consistent with individual channels. It was estimated that the impact on the 95% CL limits would be smaller than 4% for κ_λ , negligible for $c_{gg hh}$, and at most 10% for $c_{tt hh}$.

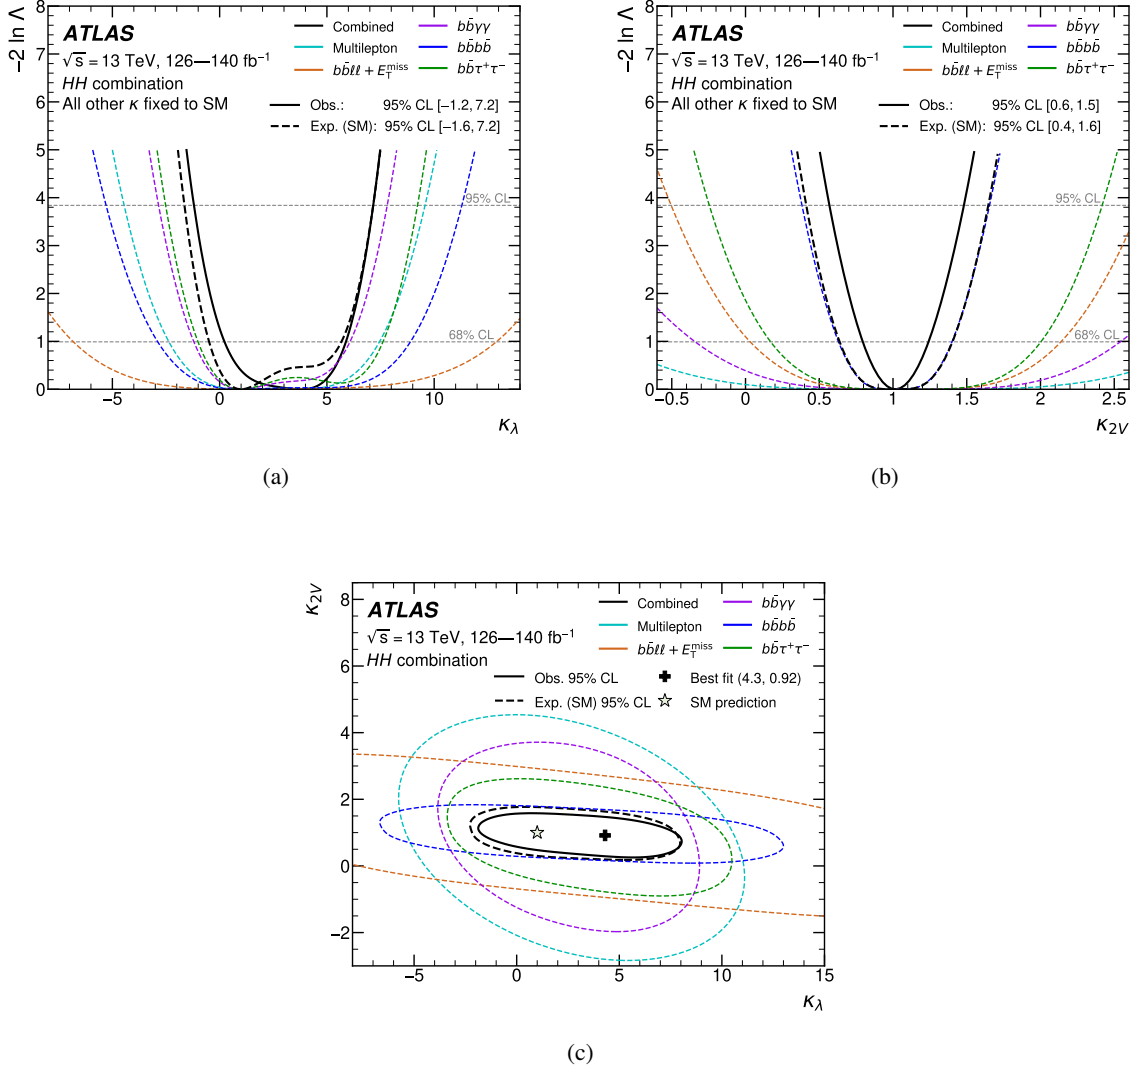

Figure 3: Expected values (dashed lines) of the test statistic ($-2 \ln \Lambda$) as functions of (a) κ_λ and (b) κ_{2V} . These results are shown for the decay channels $b\bar{b}\gamma\gamma$ (purple), $b\bar{b}\tau^+\tau^-$ (green), multilepton (cyan), $b\bar{b}b\bar{b}$ (blue) and $b\bar{b}l\bar{l} + E_T^{\text{miss}}$ (brown), as well as their combination (black). The observed values from the combined data are depicted by solid black lines. These results are computed with the assumption that all other Higgs boson couplings follow the SM predictions. (c) The expected 95% CL contours in the κ_{2V} – κ_λ plane, corresponding to the individual decay channels and their combination, are illustrated using dashed lines. The observed contour from the combined results is depicted by a solid black line. The SM prediction is marked by a star, and the combined best-fit value is indicated by a cross.

Figure 4: Two-dimensional test-statistic contours at 68% CL (solid line) and 95% CL (dashed line) in the (a) $C_{gg hh}-C_{hh h}$, (b) $C_{tt hh}-C_{hh h}$ and (c) $C_{tt hh}-C_{gg hh}$ HEFT parameter spaces, with $C_{tt hh}$, $C_{gg hh}$ and $C_{hh h}$ fixed to their SM values, respectively. The corresponding SM expected contours are shown by the inner and outer shaded regions. The SM prediction is indicated by the star, while the best-fit value is shown by the cross.

Acknowledgments

We thank CERN for the very successful operation of the LHC and its injectors, as well as the support staff at CERN and at our institutions worldwide without whom ATLAS could not be operated efficiently.

The crucial computing support from all WLCG partners is acknowledged gratefully, in particular from CERN, the ATLAS Tier-1 facilities at TRIUMF/SFU (Canada), NDGF (Denmark, Norway, Sweden), CC-IN2P3 (France), KIT/GridKA (Germany), INFN-CNAF (Italy), NL-T1 (Netherlands), PIC (Spain), RAL (UK) and BNL (USA), the Tier-2 facilities worldwide and large non-WLCG resource providers. Major contributors of computing resources are listed in Ref. [46].

We gratefully acknowledge the support of ANPCyT, Argentina; YerPhI, Armenia; ARC, Australia; BMWFW and FWF, Austria; ANAS, Azerbaijan; CNPq and FAPESP, Brazil; NSERC, NRC and CFI, Canada; CERN; ANID, Chile; CAS, MOST and NSFC, China; Minciencias, Colombia; MEYS CR, Czech Republic; DNRF and DNSRC, Denmark; IN2P3-CNRS and CEA-DRF/IRFU, France; SRNSFG, Georgia; BMBF, HGF and MPG, Germany; GSRI, Greece; RGC and Hong Kong SAR, China; ISF and Benozzi Center, Israel; INFN, Italy; MEXT and JSPS, Japan; CNRST, Morocco; NWO, Netherlands; RCN, Norway; MNiSW, Poland; FCT, Portugal; MNE/IFA, Romania; MESTD, Serbia; MSSR, Slovakia; ARRS and MIZŠ, Slovenia; DSI/NRF, South Africa; MICINN, Spain; SRC and Wallenberg Foundation, Sweden; SERI, SNSF and Cantons of Bern and Geneva, Switzerland; MOST, Taipei; TENMAK, Türkiye; STFC, United Kingdom; DOE and NSF, United States of America.

¹³⁴Institute of Physics of the Czech Academy of Sciences, Prague; Czech Republic.

¹³⁵Czech Technical University in Prague, Prague; Czech Republic.

¹³⁶Charles University, Faculty of Mathematics and Physics, Prague; Czech Republic.

¹³⁷Particle Physics Department, Rutherford Appleton Laboratory, Didcot; United Kingdom.

¹³⁸IRFU, CEA, Université Paris-Saclay, Gif-sur-Yvette; France.

¹³⁹Santa Cruz Institute for Particle Physics, University of California Santa Cruz, Santa Cruz CA; United States of America.

¹⁴⁰^(a)Departamento de Física, Pontificia Universidad Católica de Chile, Santiago;^(b)Millennium Institute for Subatomic physics at high energy frontier (SAPHIR), Santiago;^(c)Instituto de Investigación Multidisciplinario en Ciencia y Tecnología, y Departamento de Física, Universidad de La Serena;^(d)Universidad Andres Bello, Department of Physics, Santiago;^(e)Instituto de Alta Investigación, Universidad de Tarapacá, Arica;^(f)Departamento de Física, Universidad Técnica Federico Santa María, Valparaíso; Chile.

¹⁴¹Department of Physics, University of Washington, Seattle WA; United States of America.

¹⁴²Department of Physics and Astronomy, University of Sheffield, Sheffield; United Kingdom.

¹⁴³Department of Physics, Shinshu University, Nagano; Japan.

¹⁴⁴Department Physik, Universität Siegen, Siegen; Germany.

¹⁴⁵Department of Physics, Simon Fraser University, Burnaby BC; Canada.

- ¹⁴⁶SLAC National Accelerator Laboratory, Stanford CA; United States of America.
- ¹⁴⁷Department of Physics, Royal Institute of Technology, Stockholm; Sweden.
- ¹⁴⁸Departments of Physics and Astronomy, Stony Brook University, Stony Brook NY; United States of America.
- ¹⁴⁹Department of Physics and Astronomy, University of Sussex, Brighton; United Kingdom.
- ¹⁵⁰School of Physics, University of Sydney, Sydney; Australia.
- ¹⁵¹Institute of Physics, Academia Sinica, Taipei; Taiwan.
- ¹⁵²(^a) E. Andronikashvili Institute of Physics, Iv. Javakhishvili Tbilisi State University, Tbilisi; (^b) High Energy Physics Institute, Tbilisi State University, Tbilisi; (^c) University of Georgia, Tbilisi; Georgia.
- ¹⁵³Department of Physics, Technion, Israel Institute of Technology, Haifa; Israel.
- ¹⁵⁴Raymond and Beverly Sackler School of Physics and Astronomy, Tel Aviv University, Tel Aviv; Israel.
- ¹⁵⁵Department of Physics, Aristotle University of Thessaloniki, Thessaloniki; Greece.
- ¹⁵⁶International Center for Elementary Particle Physics and Department of Physics, University of Tokyo, Tokyo; Japan.
- ¹⁵⁷Department of Physics, Tokyo Institute of Technology, Tokyo; Japan.
- ¹⁵⁸Department of Physics, University of Toronto, Toronto ON; Canada.
- ¹⁵⁹(^a) TRIUMF, Vancouver BC; (^b) Department of Physics and Astronomy, York University, Toronto ON; Canada.
- ¹⁶⁰Division of Physics and Tomonaga Center for the History of the Universe, Faculty of Pure and Applied Sciences, University of Tsukuba, Tsukuba; Japan.
- ¹⁶¹Department of Physics and Astronomy, Tufts University, Medford MA; United States of America.
- ¹⁶²Department of Physics and Astronomy, University of California Irvine, Irvine CA; United States of America.
- ¹⁶³University of Sharjah, Sharjah; United Arab Emirates.
- ¹⁶⁴Department of Physics and Astronomy, University of Uppsala, Uppsala; Sweden.
- ¹⁶⁵Department of Physics, University of Illinois, Urbana IL; United States of America.
- ¹⁶⁶Instituto de Física Corpuscular (IFIC), Centro Mixto Universidad de Valencia - CSIC, Valencia; Spain.
- ¹⁶⁷Department of Physics, University of British Columbia, Vancouver BC; Canada.
- ¹⁶⁸Department of Physics and Astronomy, University of Victoria, Victoria BC; Canada.
- ¹⁶⁹Fakultät für Physik und Astronomie, Julius-Maximilians-Universität Würzburg, Würzburg; Germany.
- ¹⁷⁰Department of Physics, University of Warwick, Coventry; United Kingdom.
- ¹⁷¹Waseda University, Tokyo; Japan.
- ¹⁷²Department of Particle Physics and Astrophysics, Weizmann Institute of Science, Rehovot; Israel.
- ¹⁷³Department of Physics, University of Wisconsin, Madison WI; United States of America.
- ¹⁷⁴Fakultät für Mathematik und Naturwissenschaften, Fachgruppe Physik, Bergische Universität Wuppertal, Wuppertal; Germany.
- ¹⁷⁵Department of Physics, Yale University, New Haven CT; United States of America.
- ^a Also Affiliated with an institute covered by a cooperation agreement with CERN.
- ^b Also at An-Najah National University, Nablus; Palestine.
- ^c Also at Borough of Manhattan Community College, City University of New York, New York NY; United States of America.
- ^d Also at Center for Interdisciplinary Research and Innovation (CIRI-AUTH), Thessaloniki; Greece.
- ^e Also at CERN, Geneva; Switzerland.
- ^f Also at CMD-AC UNEC Research Center, Azerbaijan State University of Economics (UNEC); Azerbaijan.
- ^g Also at Département de Physique Nucléaire et Corpusculaire, Université de Genève, Genève; Switzerland.

- h* Also at Departament de Física de la Universitat Autònoma de Barcelona, Barcelona; Spain.
- i* Also at Department of Financial and Management Engineering, University of the Aegean, Chios; Greece.
- j* Also at Department of Physics, California State University, Sacramento; United States of America.
- k* Also at Department of Physics, King's College London, London; United Kingdom.
- l* Also at Department of Physics, Stanford University, Stanford CA; United States of America.
- m* Also at Department of Physics, Stellenbosch University; South Africa.
- n* Also at Department of Physics, University of Fribourg, Fribourg; Switzerland.
- o* Also at Department of Physics, University of Thessaly; Greece.
- p* Also at Department of Physics, Westmont College, Santa Barbara; United States of America.
- q* Also at Hellenic Open University, Patras; Greece.
- r* Also at Imam Mohammad Ibn Saud Islamic University; Saudi Arabia.
- s* Also at Institutio Catalana de Recerca i Estudis Avancats, ICREA, Barcelona; Spain.
- t* Also at Institut für Experimentalphysik, Universität Hamburg, Hamburg; Germany.
- u* Also at Institute for Nuclear Research and Nuclear Energy (INRNE) of the Bulgarian Academy of Sciences, Sofia; Bulgaria.
- v* Also at Institute of Applied Physics, Mohammed VI Polytechnic University, Ben Guerir; Morocco.
- w* Also at Institute of Particle Physics (IPP); Canada.
- x* Also at Institute of Physics, Azerbaijan Academy of Sciences, Baku; Azerbaijan.
- y* Also at Institute of Theoretical Physics, Ilia State University, Tbilisi; Georgia.
- z* Also at National Institute of Physics, University of the Philippines Diliman (Philippines); Philippines.
- aa* Also at Technical University of Munich, Munich; Germany.
- ab* Also at The Collaborative Innovation Center of Quantum Matter (CICQM), Beijing; China.
- ac* Also at TRIUMF, Vancouver BC; Canada.
- ad* Also at Università di Napoli Parthenope, Napoli; Italy.
- ae* Also at University of Colorado Boulder, Department of Physics, Colorado; United States of America.
- af* Also at Washington College, Chestertown, MD; United States of America.
- ag* Also at Yeditepe University, Physics Department, Istanbul; Türkiye.
