

Optimizing Psychological Counseling with Instruction-Tuned Large Language Models

Wenjie Li, Tianyu Sun, Kun Qian, Wenhong Wang

Shangqiu University

1606081059@stu.sqxy.edu.cn

Abstract

The advent of large language models (LLMs) has significantly advanced various fields, including natural language processing and automated dialogue systems. This paper explores the application of LLMs in psychological counseling, addressing the increasing demand for mental health services. We present a method for instruction tuning LLMs with specialized prompts to enhance their performance in providing empathetic, relevant, and supportive responses. Our approach involves developing a comprehensive dataset of counseling-specific prompts, refining them through feedback from professional counselors, and conducting rigorous evaluations using both automatic metrics and human assessments. The results demonstrate that our instruction-tuned model outperforms several baseline LLMs, highlighting its potential as a scalable and accessible tool for mental health support.

1 Introduction

The advent of large language models (LLMs [OpenAI, 2023]) has brought significant advancements in various domains, including natural language processing, automated content generation, and interactive dialogue systems [Zhou et al., 2024a,b]. One of the promising applications of LLMs is in the field of psychological counseling, where these models can potentially provide support and guidance to individuals in need. The significance of Psychological Counseling LLMs lies in their ability to address the increasing demand for mental health services, especially in regions with a shortage of trained professionals and in situations where immediate help is required. By leveraging LLMs, we aim to create scalable and accessible solutions that can offer preliminary counseling and emotional support, thereby bridging the gap in mental health care services [Huang et al., 2023, Li et al., 2024].

However, deploying LLMs in psychological counseling presents several challenges. The primary challenge is ensuring that the responses generated by these models are contextually appropriate, empathetic, and therapeutically valuable. Unlike general conversational AI, psychological counseling requires a nuanced understanding of emotional cues and the ability to provide responses that are not only relevant but also supportive and non-judgmental. Existing models often fall short in this regard due to their general-purpose training data, which lacks the specificity needed for mental health contexts [Tan et al., 2024, Chen et al., 2023]. This motivates the need for a specialized approach that can fine-tune LLMs for psychological counseling through carefully crafted prompts and instruction tuning.

Our research focuses on enhancing the performance of LLMs in psychological counseling by developing a comprehensive dataset of instruction-tuned prompts. These prompts are designed to guide the models in generating responses that adhere to established counseling techniques such as active listening, empathy expression, cognitive restructuring, and crisis intervention. For instance, prompts might include questions like "How does that make you feel?" to encourage emotional exploration or statements like "It's understandable to feel that way given your situation" to validate the user's feelings. This tailored approach aims to improve the models' ability to provide meaningful and supportive interactions [Huang et al., 2023, Chen et al., 2023].

To achieve this, we will use an iterative process that involves collecting feedback from real-world counseling sessions and refining the prompts accordingly. This feedback loop will ensure that the

prompts remain aligned with professional therapeutic standards and are effective in various counseling scenarios. Additionally, we will conduct instruction tuning on the data generated from these prompts to further enhance the model’s understanding and performance. Our experiments will involve collecting a new set of evaluation data, specifically designed to test the model’s capabilities in providing psychological support. We will use GPT-4 to assess the quality of the responses, ensuring that the evaluation is thorough and objective [Tan et al., 2024, Chen et al., 2023].

- We propose a novel dataset of instruction-tuned prompts specifically designed for psychological counseling, enhancing the LLM’s ability to generate contextually appropriate and empathetic responses.
- Our iterative feedback loop from real-world counseling sessions ensures that the prompts are continuously refined and aligned with professional therapeutic standards.
- We conduct rigorous experiments with new evaluation data and use GPT-4 for objective assessment, demonstrating the effectiveness of our approach in improving LLM performance in psychological counseling.

2 Related Work

2.1 Large Language Models

With the rapid development of deep learning in computer vision [Wang et al., 2024a,b] and natural language processing [Zhou et al., 2021a, 2022a], large language models are receiving increasing attention. Large Language Models (LLMs [OpenAI, 2023]) have become a cornerstone of modern natural language processing, showcasing impressive capabilities across a wide range of tasks [Wei et al., 2021, Sanh et al., 2021, Ouyang et al., 2022, Zhou et al., 2022b,c]. Early models like GPT-2 and BERT laid the groundwork by demonstrating the power of transformer architectures in language understanding and generation. Subsequent advancements, such as GPT-3 and LLaMA, significantly increased model sizes and training data, resulting in models capable of performing complex tasks with minimal fine-tuning. These models have been utilized in various applications, from text generation and summarization to translation and question-answering, showing that scaling up model parameters and training data leads to improved performance and generalization [Brown et al., 2020, Touvron et al., 2023, Zhou et al., 2021b].

Research has also explored the limitations and emergent properties of LLMs. Studies have shown that increasing the size of LLMs can lead to the development of unexpected abilities, such as few-shot learning and the capacity to generate more coherent and contextually relevant responses [Wei et al., 2022, Henighan et al., 2020]. However, challenges such as interpretability, ethical considerations, and the substantial computational resources required for training and deploying these models remain significant [Bubeck et al., 2023, Bommasani et al., 2021]. Recent surveys provide comprehensive overviews of these advancements and ongoing research efforts aimed at addressing these challenges [Rajeshwaran et al., 2023, Min et al., 2023].

2.2 Instruction Tuning

Instruction tuning is a technique used to enhance the performance of LLMs by fine-tuning them on a diverse set of instruction-following tasks. This process involves training models on datasets where tasks are explicitly described, allowing the models to better understand and execute instructions. Notable efforts in this area include the development of datasets like FLAN, which compiles a wide range of instructional tasks to improve model generalization [Wei et al., 2021].

Instruction tuning has shown that models can perform well on unseen tasks by learning from a variety of instruction types, making them effective zero-shot learners [Sanh et al., 2021, Ouyang et al., 2022]. This approach has also been applied to multimodal models, integrating visual and textual data to create more robust and versatile systems [Dai et al., 2023]. Furthermore, research has highlighted the benefits of using synthetic data generated by models like GPT-4 to create large-scale instruction-following datasets, which can significantly boost model performance [OpenAI, 2023].

However, instruction tuning is not without its challenges. Issues such as the consistency of instruction formats and the need for high-quality, diverse datasets are critical for the success of this technique. Studies have examined the impact of format consistency on model performance, suggesting that both task diversity and format standardization are essential for effective instruction tuning [Iyer et al., 2022]. Additionally, the scalability of instruction tuning and its application to different domains, including multilingual contexts, are ongoing areas of research [Wang et al., 2022].

3 Dataset Collection

The effectiveness of instruction-tuned large language models (LLMs) in psychological counseling largely depends on the quality and relevance of the data used for training and evaluation. In this section, we describe our approach to dataset collection for both instruction tuning and model evaluation. The dataset comprises two main components: a set of instruction-tuned prompts specifically designed for psychological counseling and a newly curated evaluation dataset.

3.1 Instruction Tuning Dataset

To create a robust instruction-tuning dataset, we first conducted an extensive review of existing psychological counseling literature and professional guidelines. This review helped us identify key counseling techniques and common conversational patterns that are effective in therapeutic settings. Based on these insights, we developed a comprehensive set of prompts designed to guide the LLMs in generating responses that exhibit empathy, active listening, cognitive restructuring, and crisis intervention.

The prompts were structured to cover a wide range of counseling scenarios, including but not limited to, anxiety, depression, relationship issues, and crisis situations. Each prompt was designed to encourage the model to produce responses that are supportive, validating, and relevant to the user’s emotional state. For example, prompts like “Can you tell me more about what you’re feeling right now?” and “It’s okay to feel overwhelmed; let’s explore some ways to manage this together” were used to elicit detailed and empathetic responses from the model.

To ensure the prompts were effective, we iteratively refined them using feedback from professional counselors and real-world counseling sessions. This iterative process involved multiple rounds of testing and adjustment, where counselors provided insights on the appropriateness and therapeutic value of the model’s responses. The final dataset includes a diverse collection of high-quality prompts that are tailored for psychological counseling.

3.2 Evaluation Dataset

In addition to the instruction-tuning dataset, we developed a new evaluation dataset to rigorously assess the performance of our LLMs in psychological counseling tasks. This dataset was designed to test the model’s ability to handle a variety of counseling scenarios and to provide meaningful and supportive interactions. Unlike traditional evaluation metrics, which often focus on general language proficiency, our evaluation criteria emphasize therapeutic effectiveness and empathy.

The evaluation dataset comprises a series of hypothetical counseling sessions, each featuring a unique scenario that the model must navigate. These scenarios were created based on common issues encountered in psychological counseling and include detailed context descriptions to provide the model with sufficient background information. The model’s responses were then evaluated on several key dimensions:

- **Empathy and Validation:** The degree to which the model’s responses demonstrate understanding and validation of the user’s feelings.
- **Relevance and Specificity:** The appropriateness and specificity of the responses in relation to the given scenario.
- **Supportiveness and Encouragement:** The extent to which the model offers constructive support and encouragement.

- **Active Listening:** The model’s ability to reflect, paraphrase, and build on the user’s statements.
- **Crisis Handling:** The effectiveness of the model’s responses in high-stakes situations, such as when the user expresses suicidal thoughts or severe distress.

3.3 GPT-4 as Judge

To ensure an objective and thorough evaluation of the model’s performance, we employed GPT-4 as an evaluation tool. GPT-4 was used to assess the quality of the model’s responses based on the aforementioned criteria. This approach involved using specific prompts to guide GPT-4 in evaluating each response. For example, GPT-4 was prompted to analyze the empathy and validation shown in the responses by considering phrases like ”Does the response acknowledge the user’s emotions?” and ”Is the response supportive and non-judgmental?”

By leveraging GPT-4’s advanced language understanding capabilities, we were able to obtain detailed and consistent evaluations of the model’s performance across various scenarios. This method provides a novel and comprehensive way to assess the effectiveness of LLMs in psychological counseling, going beyond traditional metrics to focus on therapeutic outcomes and user satisfaction [OpenAI, 2023].

- We collected and iteratively refined a comprehensive set of instruction-tuned prompts for psychological counseling, ensuring high-quality guidance for LLMs.
- A new evaluation dataset was created, focusing on real-world counseling scenarios and emphasizing therapeutic effectiveness and empathy in model responses.
- GPT-4 was employed as an evaluation tool, providing detailed and consistent assessments of the model’s performance based on specific therapeutic criteria.

4 Method

Our approach focuses on enhancing large language models (LLMs) for psychological counseling through a well-defined process of instruction tuning, guided by specialized prompts. This section details the specific prompt design, the motivation behind these prompts, the instruction tuning process, and the overall significance and benefits of our method.

4.1 Prompt Design and Motivation

The design of prompts is a critical aspect of our method, as it directly influences the quality of the model’s responses. The prompts are crafted to encapsulate various counseling techniques and scenarios, ensuring that the model can generate responses that are empathetic, relevant, and therapeutically valuable. For example, a prompt designed to address anxiety might look like:

Prompt: ”A user expresses feeling overwhelmed and anxious about their upcoming exams. Respond with empathy, validate their feelings, and suggest practical coping strategies.”

The motivation behind this specific prompt is to guide the model in recognizing and addressing the user’s emotional state, while also providing constructive advice. By focusing on common therapeutic practices such as empathy and validation, we ensure that the model’s responses are not only accurate but also emotionally supportive.

4.2 Instruction Tuning Process

Once the prompts are designed, the next step involves using these prompts for instruction tuning. Instruction tuning is a method where the model is fine-tuned on a dataset of prompts and corresponding high-quality responses. This process helps the model to better understand and generate context-specific outputs. The instruction tuning process can be broken down into the following steps:

- **Dataset Preparation:** We prepare a dataset of diverse prompts covering various psychological counseling scenarios. Each prompt is paired with an ideal response crafted by professional counselors.

- **Model Fine-Tuning:** The model is fine-tuned on this dataset, using the prompts to guide the generation of appropriate responses. During this phase, the model learns to produce outputs that align with the therapeutic goals outlined in the prompts.
- **Iterative Refinement:** Based on feedback from professional counselors and further testing, the prompts and responses are iteratively refined to improve the model’s performance.

4.3 Significance and Benefits

The significance of our method lies in its ability to produce LLMs that are better suited for psychological counseling tasks. By using carefully crafted prompts and instruction tuning, we can enhance the model’s ability to generate responses that are not only accurate but also emotionally supportive and therapeutically valuable.

The key benefits of our approach include:

- **Improved Empathy and Support:** Our prompts are designed to encourage the model to produce responses that show understanding and validation of the user’s feelings, which are crucial components of effective psychological counseling.
- **Contextual Relevance:** Instruction tuning with specific prompts ensures that the model’s responses are relevant to the context of the user’s issues, providing more meaningful and practical support.
- **Enhanced Therapeutic Value:** By aligning the model’s responses with professional counseling techniques, we enhance the overall therapeutic value of the interactions, making the model a more effective tool for mental health support.

In summary, our method leverages the power of large language models combined with targeted instruction tuning to create a robust tool for psychological counseling. By focusing on empathy, relevance, and therapeutic value, we aim to bridge the gap in mental health services and provide scalable, accessible support to individuals in need.

5 Experiments

To evaluate the effectiveness of our proposed method for enhancing large language models (LLMs) in psychological counseling, we conducted a series of comparative experiments. We compared our instruction-tuned model against several baseline models, including LLaMA 7B, LLaMA-2 7B, and Qwen 7B. The experiments were designed to assess the models’ performance across various dimensions of psychological counseling, such as empathy, relevance, supportiveness, and crisis handling.

5.1 Experimental Setup

For our experiments, we used the following models:

- **LLaMA 7B:** A large language model known for its general-purpose capabilities.
- **LLaMA-2 7B:** An improved version of LLaMA with enhanced fine-tuning capabilities.
- **Qwen 7B:** Another state-of-the-art LLM with strong performance in various NLP tasks.
- **Our Model:** An instruction-tuned LLM specifically designed for psychological counseling using the method described in the previous sections.

We evaluated these models using a newly created evaluation dataset, which includes diverse counseling scenarios requiring the models to demonstrate empathy, provide relevant support, and handle crisis situations effectively. Each model was assessed based on its ability to generate contextually appropriate and supportive responses.

5.2 Evaluation Metrics

To comprehensively evaluate the models, we employed several key metrics:

- **Empathy and Validation:** Measures the extent to which the model’s responses demonstrate understanding and validation of the user’s feelings.
- **Relevance and Specificity:** Assesses how well the responses are tailored to the specific context and needs of the user.
- **Supportiveness:** Evaluates the model’s ability to provide helpful and encouraging feedback.
- **Crisis Handling:** Examines the effectiveness of the model in responding to high-stakes situations, such as when the user expresses severe distress or suicidal thoughts.

5.3 Dataset and Training

The dataset for instruction tuning consisted of a collection of prompts and responses curated from real-world counseling sessions. We created a diverse set of scenarios encompassing various psychological issues such as anxiety, depression, relationship problems, and crisis interventions. This dataset was used to fine-tune our model, ensuring it could generate appropriate and supportive responses.

The instruction tuning process involved:

- **Data Collection:** Gathering real-world counseling dialogues and extracting relevant prompts and responses.
- **Data Annotation:** Collaborating with professional counselors to annotate the data, ensuring that the responses were therapeutically valuable and contextually appropriate.
- **Model Training:** Fine-tuning the model using the annotated dataset with a focus on minimizing the auto-regressive loss.
- **Iterative Refinement:** Continuously refining the model based on feedback from counselors and performance on evaluation metrics.

5.4 Results

The experimental results are summarized in Table 1. Our model outperformed the baseline models across all evaluation metrics, demonstrating the effectiveness of instruction tuning with specialized prompts.

Table 1: Performance Comparison of Different Models on Psychological Counseling Tasks

Model	Empathy and Validation	Relevance and Specificity	Supportiveness	Crisis Handling
LLaMA 7B	3.2	3.4	3.1	2.8
LLaMA-2 7B	3.5	3.7	3.4	3.0
Qwen 7B	3.8	3.9	3.6	3.2
Our Model	4.5	4.6	4.7	4.3

5.5 Analysis and Human Evaluation

To further validate the effectiveness of our method, we conducted an additional analysis using human evaluators. We asked professional counselors to rate the quality of the responses generated by each model based on the same criteria used in the automatic evaluation. The human evaluation results, presented in Table 2, corroborate our earlier findings, showing that our model consistently provides higher quality and more empathetic responses.

Table 2: Human Evaluation of Model Responses

Model	Empathy and Validation	Relevance and Specificity	Supportiveness	Crisis Handling
LLaMA 7B	3.1	3.3	3.0	2.9
LLaMA-2 7B	3.6	3.8	3.5	3.1
Qwen 7B	3.9	4.0	3.8	3.4
Our Model	4.7	4.8	4.9	4.6

5.6 Discussion

The results of both automatic and human evaluations clearly demonstrate the superiority of our instruction-tuned model in providing high-quality psychological counseling responses. The significant improvement in performance metrics highlights the importance of using specialized prompts and instruction tuning to enhance the therapeutic value of LLMs in mental health applications.

Our model’s ability to consistently outperform baseline models in empathy, relevance, supportiveness, and crisis handling underscores the effectiveness of our approach. The feedback from professional counselors further validates the quality and therapeutic value of the responses generated by our model.

5.7 Ablation Study

To understand the contribution of different components of our instruction tuning process, we conducted an ablation study. We systematically removed one component at a time, such as the empathy prompts or the crisis handling scenarios, and observed the impact on the model’s performance. The results, presented in Table 3, show that each component significantly contributes to the overall performance, with empathy prompts having the most substantial impact.

Table 3: Ablation Study Results

Component Removed	Empathy and Validation	Relevance and Specificity	Supportiveness	Crisis Handling
None	4.5	4.6	4.7	4.3
Empathy Prompts	3.8	4.1	4.0	3.9
Crisis Scenarios	4.2	4.5	4.5	3.5
Support Prompts	4.3	4.4	4.2	4.0

5.8 Limitations and Future Work

While our model shows significant improvements, there are limitations to our approach. The quality of responses depends heavily on the quality of the prompts and the data used for instruction tuning. Additionally, our model’s performance may vary across different cultural contexts and languages. Future work will focus on expanding the dataset to include a more diverse range of scenarios and incorporating multilingual capabilities.

In conclusion, our experiments confirm that instruction tuning with carefully designed prompts is an effective strategy for improving the performance of large language models in psychological counseling. Our model’s superior performance across various dimensions of counseling tasks underscores its potential as a valuable tool in providing scalable and accessible mental health support.

6 Conclusion

In this paper, we investigated the application of large language models (LLMs) in the domain of psychological counseling, a critical area with a growing demand for mental health services. Our approach focused on instruction tuning with carefully crafted prompts designed to enhance the model’s ability to provide contextually appropriate and empathetic responses. Through comprehensive experiments, we demonstrated that our instruction-tuned model significantly outperforms baseline models such as LLaMA 7B, LLaMA-2 7B, and Qwen 7B across multiple metrics, including empathy, relevance, supportiveness, and crisis handling.

Our iterative process of refining prompts based on real-world feedback and the subsequent instruction tuning proved to be effective, as evidenced by both automatic and human evaluations. The ablation

study further validated the importance of each component of our method. Despite the promising results, we acknowledge the limitations of our current approach, particularly the dependency on the quality of the prompts and the dataset’s cultural and linguistic diversity. Future work will aim to address these limitations by expanding the dataset and incorporating multilingual capabilities. Overall, our findings highlight the potential of instruction-tuned LLMs as a valuable tool for scalable and accessible mental health support.
