# $(u, v)$ -ABSORBING (PRIME) HYPERIDEALS IN COMMUTATIVE MULTIPLICATIVE HYPERRINGS

MAHDI ANBARLOEI

ABSTRACT. In this paper, we will introduce the notion of  $(u, v)$ -absorbing hyperideals in multiplicative hyperrings and we will show some properties of them. Then we extend this concept to the notion of  $(u, v)$ -absorbing prime hyperideals and then we will give some results about them.

## 1. Introduction

In 1934 [\[25\]](#page-13-0), the French mathematician F. Marty presented the notion of hyperstructures or multioperations in which an operation yields a set of values rather than a single value. Many authors have contributed to the advancement of this novel area of modern algebra [\[12,](#page-13-1) [13,](#page-13-2) [14,](#page-13-3) [15,](#page-13-4) [16,](#page-13-5) [26,](#page-13-6) [30,](#page-13-7) [36\]](#page-14-0). An importan class of the algebraic hyperstructures called the multiplicative hyperring was defined by Rota in 1982 [\[32\]](#page-13-8). In this hyperstructure, the multiplication is a hyperoperation however the addition is an operation. Multiplicative hyperrings are deeply demonstrated and characterized in [\[3,](#page-13-9) [4,](#page-13-10) [5,](#page-13-11) [22,](#page-13-12) [28,](#page-13-13) [29,](#page-13-14) [31,](#page-13-15) [35\]](#page-14-1). Dasgupta studied the prime and primary hyperideals in multiplicative hyperrings in [\[17\]](#page-13-16). The notions of 1-absorbing and v-absorbing hyperideals as generalizations of the prime hyperideals were studied in [\[29\]](#page-13-14) and [\[5\]](#page-13-11). The idea of  $(u, v)$ -closed hyperideals in a multiplicative hyperring was proposed in [\[6\]](#page-13-17). Our purpose of this research work is to introduce and study the notion of  $(u, v)$ -absorbing hyperideals as an extension of the *n*-absorbing hyperideals in a commutative multiplicative hyperring. Several specific properties are given to illustrate the structures of the new notion. Furthermore, we extend this concept to  $(u, v)$ -absorbing prime hyperideals.

## 2. multiplicative hyperrings

In this section, we recall some background materials. A hyperoperation " $\circ$ " on non-empty set X is a mapping from  $X \times X$  into  $P^*(X)$  such that  $P^*(X)$  is the family of all non-empty subsets of X. In this case,  $(X, \circ)$  is called hypergroupoid. Let  $X_1, X_2$  be two subsets of X and  $x \in X$ , then  $X_1 \circ X_2 = \cup_{x_1 \in X_1, x_2 \in X_2} x_1 \circ x_2$ , and  $X_1 \circ x = X_1 \circ \{x\}$ . This means that the hyperoperation " $\circ$ " on X can be extended to subsets of X. A hypergroupoid  $(X, \circ)$  is called a semihypergroup if  $\bigcup_{a\in y\circ z}x\circ a = \bigcup_{b\in x\circ y}b\circ z$  for all  $x, y, z \in X$  which means  $\circ$  is associative. A semihypergroup X is called a hypergroup if  $x \circ X = X = X \circ x$  for each  $x \in X$ . A non-empty subset Y of a semihypergroup  $(X, \circ)$  refers to a subhypergroup if  $x \circ Y = Y = Y \circ x$  for each  $x \in Y$  [\[19\]](#page-13-18).

<sup>2010</sup> Mathematics Subject Classification. Primary 20N20; Secondary 16Y99.

Key words and phrases.  $(u, v)$ -absorbing hyperideal,  $AB-(u, v)$ -absorbing hyperideal,  $(u, v)$ absorbing prime hyperideal.

**Definition 2.1.** [\[19\]](#page-13-18) An algebraic structure  $(A, +, \circ)$  refers to a commutative multiplicative hyperring if

- (1)  $(A,+)$  is a commutative group;
- (2)  $(A, \circ)$  is a semihypergroup;
- (3)  $x \circ (y + z) \subseteq x \circ y + x \circ z$  and  $(y + z) \circ x \subseteq y \circ x + z \circ x$  for every  $x, y, z \in A$ ;
- (4)  $x \circ (-y) = (-x) \circ y = -(x \circ y)$  for every  $x, y \in A$ ;
- (5)  $x \circ y = y \circ x$  for every  $x, y \in A$ .

If in  $(3)$ , the equality holds then the multiplicative hyperring A is called strongly distributive.

Conseder the ring of integers  $(\mathbb{Z}, +, \cdot)$ . For each subset  $T \in P^{\star}(\mathbb{Z})$  with  $|T| \geq$ 2, there exists a multiplicative hyperring  $(\mathbb{Z}_T, +, \circ)$  where  $\mathbb{Z}_T = \mathbb{Z}$  and  $a \circ b =$  ${a.x.b \mid x \in T}$  for all  $a, b \in \mathbb{Z}_T$  [\[17\]](#page-13-16).

**Definition 2.2.** [\[1\]](#page-12-0) An element  $e \in A$  is considered as an identity element if  $a \in a \circ e$ for all  $a \in A$ .

Throughout this paper, A denotes a commutative multiplicative hyperring with identity 1.

**Definition 2.3.** [\[1\]](#page-12-0) An element  $x \in A$  is called unit, if there exists  $y \in A$  such that  $1 \in x \circ y$ . Denote the set of all unit elements in A by  $U(A)$ .

Moreover, a hyperring  $A$  refers to a hyperfield if each non-zero element of  $A$  is unit.

**Definition 2.4.** [\[19\]](#page-13-18) A non-empty subset  $B$  of  $A$  is a hyperideal if

(i)  $x - y \in B$  for all  $x, y \in B$ ;

(ii)  $r \circ x \subseteq B$  for all  $x \in B$  and  $r \in A$ .

**Definition 2.5.** [\[17\]](#page-13-16) A proper hyperideal B in A refers to a prime hyperideal if  $x \circ y \subseteq B$  for  $x, y \in A$ , then  $x \in B$  or  $y \in B$ .

The intersection of all prime hyperideals of  $A$  containing a hyperideal  $B$  is said to be the prime radical of B, denoted by  $rad(B)$ . If the multiplicative hyperring A has no prime hyperideal containing B, we define  $rad(B) = A$ . Assume that C is the class of all finite products of elements of A that is  $\mathcal{C} = \{a_1 \circ a_2 \circ \cdots \circ a_n \mid a_i \in A, n \in \mathcal{C}\}$  $\mathbb{N}\}\subseteq P^*(A)$  and B is a hyperideal of A. B refers to a C-hyperideal of A if for each  $C \in \mathcal{C}$  and  $B \cap C \neq \emptyset$  imply  $C \subseteq B$ . Notice that  $\{a \in A \mid a^n \subseteq B \text{ for some } n \in \mathcal{C}\}$  $\mathbb{N}\}\subseteq rad(A)$ . The equality holds if B is a C-hyperideal of A (see Proposition 3.2) in [\[17\]](#page-13-16)). Moreover, a hyperideal B of A refers to a strong C-hyperideal if for each  $D \in \mathfrak{U}$  and  $D \cap B \neq \emptyset$  imply  $D \subseteq B$  such that  $\mathfrak{U} = \{ \sum_{i=1}^n C_i \mid C_i \in \mathcal{C}, n \in \mathbb{N} \}$  and  $C = \{a_1 \circ a_2 \circ ... \circ a_n \mid a_i \in A, n \in \mathbb{N}\}\$  (for more details see [\[18\]](#page-13-19)).

**Definition 2.6.** [\[1\]](#page-12-0) A proper hyperideal B of A is maximal in A if for each hyperideal M of A with  $B \subset M \subseteq A$ , then  $M = A$ .

The intersection of all maximal hyperideals of A is denoted by  $J(A)$ . Also, A refers to a local multiplicative hyperring if it has just one maximal hyperideal.

**Definition 2.7.** [\[1\]](#page-12-0) Assume that  $B_1$  and  $B_2$  are hyperideals of H. We define  $(B_2 : B_1) = \{x \in A \mid x \circ B_1 \subseteq B_2\}.$ 

## 3.  $(u, v)$ -ABSORBING HYPERIDEALS

A proper hyperideal Q in A refers to a v-absorbing hyperideal for  $v \in \mathbb{N}$  if whenever  $x_1 \circ \cdots \circ x_{v+1} \subseteq Q$  for  $x_1, \cdots, x_{v+1} \in A$ , then there exist v of the  $x_i$ s whose product is a subset of  $Q$ . In this section, we aim to introduce the class of the  $(u, v)$ -absorbing hyperideals as an extension of the v-absorbing hyperideals and present some of their properties.

**Definition 3.1.** Let  $u, v \in \mathbb{N}$  with  $u > v$ . A proper hyperideal Q of A is called a  $(u, v)$ -absorbing hyperideal if whenever  $x_1 \circ \cdots \circ x_u \subseteq Q$  for  $x_1, \cdots, x_u \in A \setminus U(A)$ , then there are  $v$  of the  $x_i$ 's whose product is a subset of  $Q$ .

<span id="page-2-3"></span>**Example 3.2.** Consider the multiplicative hyperring  $(\mathbb{Z}_T, +, \circ)$  where  $T = \{2, 4\}.$ Then  $Q = \langle 150 \rangle$  is a (4,3)-absorbing hyperideal of the multiplicative hyperring  $(\mathbb{Z}_T, +, \circ)$ . However, it is not  $(3, 2)$ -absorbing as the fact that  $3 \circ 5^2 = \{300, 600, 1200\} \subseteq$ Q but  $3 \circ 5 = \{30, 60\} \not\subseteq Q$  and  $5^2 = \{50, 100\} \not\subseteq Q$ .

<span id="page-2-0"></span>*Remark* 3.3. Assume that Q is a proper hyperideal of A and  $k, r, u, v \in \mathbb{N}$ .

- (i) Let  $Q$  be a  $(u, v)$ -absorbing hyperideal of  $A$ . Then:
	- (1) Q is a  $(k, r)$ -absorbing hyperideal for every  $k \geq u$  and  $r \geq v$ . (2)  $Q$  is a  $(u - 1)$ -absorbing hyperideal of A.
- (ii) Q is a  $(u, v)$ -absorbing hyperideal of A if and only if  $x_1 \circ \cdots \circ x_k \subseteq Q$  for  $x_1, \dots, x_k \in A \backslash U(A)$  and  $k \geq u$  imply that there are v of the  $x_i$ 's whose product is a subset of Q.

<span id="page-2-2"></span>**Proposition 3.4.** Let  $Q_i$  be a proper hyperideal of A and  $u_i, v_i \in \mathbb{N}$  for every  $i \in \{1, \dots, k\}$ . If  $Q_i$  is a  $(u_i, v_i)$ -absorbing hyperideal of A for every  $i \in \{1, \dots, k\}$ , then  $Q = \bigcap_{i=1}^k Q_i$  is a  $(u, v)$ -absorbing hyperideal of A where  $v = v_1 + \cdots + v_k$  and  $u = \max\{u_1, \dots, u_k, v + 1\}.$ 

*Proof.* Assume that  $Q_i$  is a  $(u_i, v_i)$ -absorbing hyperideal of A for every  $i \in \{1, \dots, k\}$ . By Remark [3.3](#page-2-0) (i), we conclude that  $Q_i$  is a  $(u, v_i)$ -absorbing hyperideal of A where  $v = v_1 + \cdots + v_k$  and  $u = \max\{u_1, \dots, u_k, v + 1\}$ . Let  $x_1 \circ \cdots \circ x_u \subseteq Q$  for  $x_1, \dots, x_u \in A \backslash U(A)$ . Since  $Q_i$  is a  $(u, v_i)$ -absorbing hyperideal of A for every  $i \in \{1, \dots, k\}$  and  $x_1 \circ \dots \circ x_u \subseteq Q_i$ , we get the result that  $\Pi_{\alpha \in I_i} x_\alpha \subseteq Q_i$  for each  $i \in \{1, \dots, k\}$  such that  $I_i \subseteq \{1, \dots, u\}$  and  $|I_i| = v_i$ . Put  $I = \bigcup_{i=1}^k I_i$ . Since  $\Pi_{\alpha \in I} x_{\alpha} \subseteq Q$  and  $|I| \leq v$ , we conclude that  $Q = \bigcap_{i=1}^{k} Q_i$  is a  $(u, v)$ -absorbing hyperideal of  $A$ .

<span id="page-2-1"></span>Let  $u, v \in \mathbb{N}$ . Then the smallest integer not less than  $\frac{u}{v}$  is denoted by  $\lceil \frac{u}{v} \rceil$ .

**Proposition 3.5.** Let Q be a  $(u, v)$ -absorbing C-hyperideal of A for  $u, v \in \mathbb{N}$  with  $u > v$ . Then:

(i)  $rad(Q) = \{x \in A \mid x^v \subseteq Q\}.$ 

(ii)  $rad(Q)$  is a  $(k, v)$ -absorbing hyperideal of A where  $k = \max\{\lceil \frac{u}{v} \rceil, v + 1\}.$ 

*Proof.* (i) Assume that Q is a  $(u, v)$ -absorbing hyperideal of A. Take any  $x \in$ rad(Q). Then there exists a smallest element  $n \in \mathbb{N}$  such that  $x^n \subseteq Q$ . Let  $n > v$ . Remark [3.3\(](#page-2-0)i)(2) shows that Q is a  $(u - 1)$ -absorbing hyperideal of A. Then we conclude that  $n \leq u - 1$  by Theorem 3.6 in [\[5\]](#page-13-11). This means  $x^u \subseteq Q$  which means  $x^v \subseteq Q$  as Q is a  $(u, v)$ -absorbing hyperideal of A. This is contradicts the fact that *n* is a smallest positive integer such that  $x^n \subseteq Q$ . Therefore  $n \leq v$  and  $x^v \subseteq Q$ .

(ii) Suppose that  $x_1 \circ \cdots \circ x_k \subseteq rad(Q)$  such that  $k = \max\{\lceil \frac{u}{v} \rceil, v+1\}$  and  $x_1, \dots, x_k \in A \setminus U(A)$ . Then for any  $a \in x_1 \circ \dots \circ x_k$ ,  $a^v \subseteq Q$ . Again,  $a^v \subseteq$ 

 $(x_1 \circ \cdots \circ x_k)^v \subseteq x_1^v \circ \cdots \circ x_k^v \subseteq Q$ . So,  $(x_1^v \circ \cdots \circ x_k^v) \cap Q \neq \emptyset$  and then  $x_1^v \circ \cdots \circ x_k^v \subseteq Q$  as  $Q$  is a  $C$ -hyperideal. The hyperideal  $Q$  is a  $(kv, v)$ -absorbing hyperideal of A because  $k \geq \lceil \frac{u}{v} \rceil$ . Then we conclude that  $x_{i_1}^{r_1} \circ \cdots \circ x_{i_v}^{r_v} \subseteq Q$  for some  $\{i_1, \cdots, i_v\} \subseteq \{1, \cdots, k\}$ such that  $0 \leq i_1, \dots, i_v \leq v$  and  $r_1 + \dots + r_v = v$ . This implies that  $x_{i_1}^v \circ \dots \circ x_{i_v}^v \subseteq Q$ which means  $x_{i_1} \circ \cdots \circ x_{i_v} \subseteq rad(Q)$ . Consequently,  $rad(Q)$  is a  $(k, v)$ -absorbing hyperideal of A.

**Theorem 3.6.** Assume that Q is a hyperideal of A and  $u, v \in \mathbb{N}$  with  $u > v$ . Then *there exists a* (u, v)*-absorbing hyperideal of* A *which is minimal in the set of all* (u, v)*-absorbing hyperideals of* A *containing* Q*.*

*Proof.* Suppose that  $\Gamma = \{P \mid P \text{ is a } (u, v)\text{-absorbing hyperideal of } A \text{ and } Q \subseteq P\}.$ Let M be a maximal hyperideal of A containing Q. Then M is a  $(u, v)$ -absorbing hyperideal for all  $u, v \in \mathbb{N}$  with  $u > v$  and so  $M \in \Gamma$  which means  $\Gamma \neq \emptyset$ . Order  $\Gamma$  by  $\leq$  such that  $P_1 \leq P_2$  if and only if  $P_1 \supseteq P_2$  for every  $P_1, P_2 \in \Gamma$ . Let  $\{P_i\}_{i\in\Delta}$  be a non-empty chain of hyperideals in  $\Gamma$ . Put  $I = \bigcap_{i\in\Delta} P_i$ . Assume that  $x_1 \circ \cdots \circ x_u \subseteq I$  for  $x_1, \cdots, x_u \in A \setminus U(A)$  such that none of the product of the terms v of  $x_i$ 's is a subset of I. Then that there exists  $P_j$  in the chain such that none of the product of the terms v of  $x_i$ 's is a subset of  $P_j$  which is impossible. Hence there are v of the  $x_i$ 's whose product is a subset of I. Now, by Zorn's lemma, we conclude that  $(\Gamma, \leq)$  has a maximal element which means  $\Gamma$  has a minimal  $(u, v)$ -absorbing hyperideal of A containing Q.

As an immediate consequence of the previous theorem, we have the following result.

<span id="page-3-0"></span>**Corollary 3.7.** Suppose that Q is a hyperideal of A and  $v \in \mathbb{N}$ . Then there exists a minimal v-absorbing hyperideal P of A such that  $Q \subseteq P$ .

**Theorem 3.8.** *Assume that*  $Q$  *is a*  $(u, v)$ *-absorbing hyperideal of*  $A$  *and*  $k, r \in \mathbb{N}$ *with*  $2 \leq k \leq r \leq u-1$ *. If* Q *has* r *minimal prime hyperideals, then there are at* least  $\frac{r!}{(r-k)!k!}$  k-absorbing hyperideals of A that are minimal over Q.

*Proof.* Suppose that Q has r minimal prime hyperideals and  $k = 2$ . Then there exist the distinct prime hyperideals  $Q_1, \dots, Q_r$  of A that are minimal over Q. Hence  $Q_i \cap Q_j$  is a 2-absorbing hyperideal of A for each  $i, j \in \{1, \dots, r\}$  and  $i \neq j$ by Theorem 3.4 in [\[5\]](#page-13-11). Hence we have  $Q \subseteq Q_{ij} \subseteq Q_i \cap Q_j$  for some minmal 2absorbing hyperideal  $Q_{ij}$  of A by Corollary [3.7.](#page-3-0) Therefore we conclude that  $Q_i$  and  $Q_j$  are only minimal prime hyperideals over  $Q_{ij}$  by Theorem 3.8 in [\[5\]](#page-13-11). Assume that  $Q_{ij}$ 's are not distinct such that  $Q_{ij} = Q_{st}$  for some  $i, j, s, t \in \{1, \dots, r\}$  and  $\{i, j\} \neq \{s, t\}.$  Then we conclude that  $Q_i, Q_j, Q_s$  and  $Q_t$  are distinct minimal prime hyperideals over  $Q_{ij}$  which contradicts the fact that there are at most two prime hyperideals of A that are minimal over the 2-absorbing hyperideal  $Q_{ij}$ . Hence the  $Q_{ij}$ 's are distinct. Thus we get the result that Q has at least  $\frac{r!}{(r-k)!k!}$ minimal 2-absorbing hyperideals. If  $k > 2$ , one can easily complete the proof by using a similar argument.

<span id="page-3-1"></span>**Lemma 3.9.** Let Q be a  $(u, v)$ -absorbing hyperideals of  $A, Q_1, \dots, Q_v$  be incomparable prime C-hyperideals of A such that  $Q \subseteq \bigcap_{i=1}^{v} Q_i$  and  $k_1, \dots, k_v \in \mathbb{N}$ . If  $x_1^{k_1} \circ \cdots \circ x_v^{k_v} \subseteq Q$  for  $x_i \in Q_i \setminus (\cup_{j \neq i} Q_j)$ , then  $x_1 \circ \cdots \circ x_v \subseteq Q$ .

*Proof.* Suppose that  $k_1, \dots, k_v \in \mathbb{N}$ . Put  $k = k_1 + \dots + k_v$ . Let  $k \geq u$ . So Q. is a  $(k, v)$ -absorbing hyperideal of A by Remark [3.3\(](#page-2-0)i). Then there exist integers

 $r_1, \dots, r_v$  such that  $x_1^{r_1} \circ \dots \circ x_v^{r_v} \subseteq Q$ ,  $0 \le r_i \le k_i$  and  $r_1 + \dots + r_v = v$ . Assume that 1 one of the r , i s is zero. Then we have x r1 1 ◦· · · x ri−<sup>1</sup> i−1 ◦x ri+1 <sup>i</sup>+1 ◦· · · ◦x rv <sup>v</sup> ⊆ Q ⊆ Q<sup>i</sup> . Then there exists  $j \in \{1, \dots, i-1, i+1, \dots, v\}$  such that  $x_j \in Q_i$  which is impossible. Hence  $x_1 \circ \cdots \circ x_v \subseteq Q$ .

Theorem 3.10. *Assume that* Q *is a* (u, v)*-absorbing strong* C*-hyperideal of* A *for*  $u, v \in \mathbb{N}$  with  $2 \le v < u$  and  $Q_1, \dots, Q_v$  are the only minimal prime *C*-hyperideals *over*  $Q$ *. If*  $z_i \in Q_i \setminus (\cup_{j \neq i} Q_j)$ *, then*  $Q_j \circ \Pi_{i \neq j} z_i \subseteq Q$ *.* 

*Proof.* Assume that  $x \in P_j$ . If  $x \notin \bigcup_{j \neq i} Q_j$ , then we have  $x \circ \prod_{i \neq j} z_i \subseteq \bigcap_{i=1}^v Q_i =$  $rad(Q)$  as the  $Q_i$ 's are the only minimal prime hyperideals over  $Q$ . Therefore we conclude that  $x \circ \prod_{i \neq j} z_i \subseteq Q$  by Proposition [3.5](#page-2-1) and Lemma [3.9.](#page-3-1) Let  $x \in Q_j \cap Q$  $(\cup_{j\neq i}Q_j)$ . Then there exist  $y \in A$  and  $z \in Q_j \setminus (\cup_{j\neq i}Q_j)$  such that  $w + x \in$  $Q_j\setminus(\cup_{j\neq i}Q_j)$  for every  $w \in y \circ z$  by Corollary 3.12 in [\[5\]](#page-13-11). It follows that  $(w+x) \circ z$  $\Pi_{i\neq j}z_i\subseteq Q$  and so  $w\circ \Pi_{i\neq j}z_i+x\circ \Pi_{i\neq j}z_i\subseteq Q$  as  $Q$  is a strong  $\mathcal C$ -hyperideal of  $A$ . Since  $w \circ \Pi_{i \neq j} z_i \subseteq Q$ , we obtain  $x \circ \Pi_{i \neq j} z_i \subseteq Q$  which means  $Q_j \circ \Pi_{i \neq j} z_i \subseteq Q$ .  $\Box$ 

Let Q be a u-absorbing hyperideal of A for  $u \in \mathbb{N}$ . We define  $Abs(Q)$  $\min\{v \mid Q \text{ is a } v\text{-absorbing hyperideal of } A\},\text{ otherwise } Abs(Q) = \infty$  [\[5\]](#page-13-11). Moreover, we define  $abs(Q) = min\{v \mid Q \text{ is an } (Abs(Q) + 1, v)$ -absorbing hyperideal of A. It is clear that  $abs(Q) \leq Abs(Q)$ . Thus, in Proposition [3.4,](#page-2-2) we get  $abs(\bigcap_{i=1}^{k}) \leq$  $abs(Q_1) + \cdots + abs(Q_k)$  and  $Abs(\bigcap_{i=1}^k Q_i) \le \max\{Abs(Q_1), \cdots, Abs(Q_k), abs(Q_1) + \cdots$  $\cdots + abs(Q_k)$ . Also, in Proposition [3.5,](#page-2-1) we have  $abs(rad(Q)) \leq abs(Q)$  and  $Abs(rad(Q)) \leq \max\{\lceil \frac{Abs(Q)+1}{abs(Q)} \rceil - 1, abs(Q)\}.$  Recall from [\[1\]](#page-12-0) that the hyperideals I and J are coprime if  $I + J = A$ .

Theorem 3.11. *Assume that* Q *is a* (u, v)*-absorbing strong* C*-hyperideal of* A *for*  $u, v \in \mathbb{N}$  with  $2 \le v < u$  and  $Q_1, \dots, Q_v$  are the only minimal prime C-hyperideals *over* Q*. Then*

- (i)  $Q_1 \circ \cdots \circ Q_v \subseteq Q$  *and*  $abs(Q) = v$ .
- (ii) *If*  $Q_1, \cdots, Q_v$  *are pairwise coprime, then*  $Q_1 \circ \cdots \circ Q_v = Q$  *and*  $abs(Q) = v$ .

*Proof.* It can be easily seen that the claim is true in a similar manner to the proofs of Theorem 3.13 and Theorem 3.14 in [\[5\]](#page-13-11).  $\Box$ 

<span id="page-4-0"></span>Theorem 3.12. *Assume that* Q *is a radical* C*-hyperideal of* A*. Then* Q *is a* (u, v) *absorbing hyperideal of* A *if and only if* Q *is a* v*-absorbing hyperideal of* A*.*

*Proof.* ( $\implies$ ) Suppose that Q is a  $(u, v)$ -absorbing hyperideal of A and  $x_1 \circ \cdots \circ$  $x_{u-1} \subseteq Q$  for  $x_1, \dots, x_{u-1} \in A \setminus U(A)$ . Since  $x_1 \circ \dots \circ x_{k-1} \circ x_k^2 \circ x_{k+1} \circ \dots \circ x_{u-1} \subseteq Q$ , we conclude that either  $x_{i_1} \circ \cdots \circ x_{i_v} \subseteq Q$  for some  $i_j \in \{1, \cdots, k-1, k, k+1, \cdots, u-1\}$ 1} which implies Q is a  $(u-1, v)$ -absorbing hyperideal of A or  $x_k^2 \circ x_{i_1} \circ \cdots \circ x_{i_{v-2}} \subseteq Q$ for some  $i_j \in \{1, \dots, k-1, k+1, \dots, u-1\}$  which means  $x_k \circ x_{i_1} \circ \dots \circ x_{i_{v-2}} \subseteq rad(Q)$ . Since Q is a radical hyperideal, we get  $x_k \circ x_{i_1} \circ \cdots \circ x_{i_{v-2}} \subseteq Q$  which implies Q is a  $(u - 1, v)$ -absorbing hyperideal of A. By continuing this process, we conclude Q is a  $(v+1, v)$ -absorbing hyperideal and so it is a v-absorbing hyperideal of A by Remark [3.3\(](#page-2-0)i).

 $(\Leftarrow)$  Let Q is a v-absorbing hyperideal of A and  $x_1 \circ \cdots \circ x_u \subseteq Q$  for  $x_1, \cdots, x_{u-1} \in$  $A\setminus U(A)$ . Take any  $c \in (x_{i_1} \circ \cdots \circ x_{i_{u-v}}) \setminus Q$  such that  $i_j \in \{1, \cdots, u\}$ . Then a product of v of the  $x_i$ 's othere than the  $x_{i_j}$  with c is a subset of Q and so a product of v of the  $x_i$ s othere than the  $x_{i_j}$  is a subset of Q as Q is a v-absorbing hyperideal of A. Thus  $Q$  is a  $(u, v)$ -absorbing hyperideal of A.  $\square$ 

Let us give the following theorem without proof as a result of Theorem [3.12.](#page-4-0)

**Corollary 3.13.** Let  $Q$  be a  $(u, v)$ -absorbing radical C-hyperideal of A. Then  $abs(Q) = Abs(Q).$ 

Recall from [\[17\]](#page-13-16) that a proper hyperideal Q of A is primary if for any  $x, y \in A$ ,  $x \circ y \subseteq Q$  implies that  $x \in Q$  or  $y^t \subseteq Q$  for some  $t \in \mathbb{N}$ . Since the radical of a primary C-hyperideal  $Q$  is a prime hyperideal of  $A$ , say  $P$ ,  $Q$  is referred to as a P-primary C-hyperideal of A.

**Theorem 3.14.** *Assume that*  $u, v \in \mathbb{N}$  *and*  $Q$  *is a* P-primary C-hyperideal of A where P is a prime hyperideal of A with  $P^v \subseteq Q$ . Then Q is a  $(u, v)$ -absorbing *hyperideal of* A *for any*  $u \ge v+1$ . Furthermore, if  $P^v$  is a P-primary C-hyperideal of A, then  $P^v$  is a  $(u, v)$ -absorbing hyperideal of A for any  $u \ge v+1$  and  $abs(P^v) = v$ .

*Proof.* The proof follows from Theorem 4.1 in [\[5\]](#page-13-11).  $\Box$ 

## 4.  $AB-(u, v)$ -ABSORBING HYPERIDEALS

This section is devoted to the study of a subclass of the  $(u, v)$ -absorbing hyperideals called  $AB-(u, v)$ -absorbing hyperideals.

**Definition 4.1.** Let  $u, v \in \mathbb{N}$  with  $u > v$ . A proper hyperideal Q of A is said to be an  $AB-(u, v)$ -absorbing hyperideal if whenever  $x_1 \circ \cdots \circ x_u \subseteq Q$  for  $x_1, \cdots, x_u \in A$ , then there are v of the  $x_i$ 's whose product is a subset of  $Q$ .

**Theorem 4.2.** Let Q be a proper strong C-hyperideal of A such that  $a + 1 \notin U(A)$ *for some*  $a \in Q$  *and*  $u, v \in \mathbb{N}$  *with*  $u > v$ *. Then*  $Q$  *is an AB*- $(u, v)$ -*absorbing hyperideal if and only if* Q *is a* (u, v)*-absorbing hyperideal.*

*Proof.*  $(\implies)$  It is obvious.

(←) Assume that  $x_1 \circ \cdots \circ x_u \subseteq Q$  for  $x_1, \cdots, x_u \in A$ . Let  $x_1, \cdots, x_{s-1}$  be nonunit elements in A and  $x_s, \dots, x_u$  be unit elements in A for some  $s \geq v+2$ . Since  $x_1 \circ \cdots \circ x_u \subseteq Q$  and  $x_s, \cdots, x_u$  are units in A, we get  $x_1 \circ \cdots, x_s \subseteq Q$ . Put  $y_i = 1+a$ for each  $i \in \{1, \dots, s\}$ . Then the  $y_i$ s are non-unit. Since Q is a  $(u, v)$ -absorbing hyperideal and  $x_1 \circ \cdots \circ x_{s-1} \circ y_s \circ \cdots \circ y_u \subseteq Q$ , we conclude that there exist v elements of the  $x_i$  and the  $y_i$ 's whose product is a subset of Q. Take any  $n \in \mathbb{N}$ . Assume that  $_i$  and the  $y_j$  $(a+1)^n \subseteq Q$ . This implies that  $(\sum_{k=0}^n \binom{n}{k}$ k  $a^{n-k} \circ 1^k$ )  $\cap Q \neq \emptyset$ . Since Q is a strong C-hyperideal of A, we have  $(\sum_{k=0}^n \binom{n}{k}$ k  $a^{n-k} \circ 1^k \subseteq Q$  and so  $1 \in Q$ , a contradiction. Then  $(a + 1)^n \nsubseteq Q$  for all  $n \geq 1$ . Thus  $x_{i_1} \circ \cdots \circ x_{i_n} \circ (a + 1)^{v-h} \subseteq Q$  for some  $h \in \{1, \dots, v\}$  and  $i_j \in \{1, \dots, s-1\}$ . Clearly,  $\Sigma_{k=0}^{v-h} \binom{v-h}{k}$ k  $\int a^{v-h-k} \circ 1^k = X+1$ where  $X \subseteq Q$ . Since  $x_{i_1} \circ \cdots \circ x_{i_h} \circ (X+1) \subseteq Q \cap (x_{i_1} \circ \cdots \circ x_{i_h} \circ X) + (x_{i_1} \circ \cdots \circ x_{i_h} \circ 1)$ , we obtain  $(x_{i_1} \circ \cdots \circ x_{i_h} \circ X) + (x_{i_1} \circ \cdots \circ x_{i_h} \circ 1) \subseteq Q$ . Hence we get the result that  $x_{i_1} \circ \cdots \circ x_{i_h} \subseteq Q$  which implies Q is an  $AB-(u, v)$ -absorbing hyperideal of A.  $\Box$ 

As a result of the previous theorems, we give the following result.

**Corollary 4.3.** Let Q be a proper strong C-hyperideal of A such that  $Q \nsubseteq J(A)$ and  $u, v \in \mathbb{N}$  with  $u > v$ . Then Q is an AB- $(u, v)$ -absorbing hyperideal if and only if  $Q$  is a  $(u, v)$ -absorbing hyperideal.

 $(u, v)$ -ABSORBING (PRIME) HYPERIDEALS IN COMMUTATIVE MULTIPLICATIVE HYPERRINGS7

Let X be a finite sum of finite products of elements of A. Consider the relation  $\gamma$  on a multiplicative hyperring A defined as  $x\gamma y$  if and only if  $\{x, y\} \subseteq X$ , namely,  $x \gamma y$  if and only if  $\{x, y\} \subseteq \sum_{j \in J} \prod_{i \in I_j} z_i$  for some  $z_1, ..., z_n \in A$  and  $I_j, J \subseteq \{1, ..., n\}$ .  $\gamma^*$  denotes the transitive closure of  $\gamma$ . The relation  $\gamma^*$  is the smallest equivalence relation on A such that the set of all equivalence classes, i.e., the quotient  $A/\gamma^*$ , is a fundamental ring. Assume that  $\Sigma$  is the set of all finite sums of products of elements of A. We can rewrite the definition of  $\gamma^*$  on A, namely,  $x\gamma^*y$ if and only if there exist  $z_1, ..., z_n \in A$  such that  $z_1 = x, z_{n+1} = y$  and  $u_1, ..., u_n \in \Sigma$ where  $\{z_i, z_{i+1}\} \subseteq u_i$  for  $1 \leq i \leq n$ . Suppose that  $\gamma^*(x)$  is the equivalence class containing  $x \in A$ . Define  $\gamma^*(x) \oplus \gamma^*(y) = \gamma^*(z)$  for every  $z \in \gamma^*(x) + \gamma^*(y)$  and  $\gamma^*(x) \odot \gamma^*(y) = \gamma^*(w)$  for every  $w \in \gamma^*(x) \circ \gamma^*(y)$ . Then  $(A/\gamma^*, \oplus, \odot)$  is a ring called a fundamental ring of A [\[37\]](#page-14-2).

**Theorem 4.4.** Let  $Q$  be a proper hyperideal of  $A$ . Then  $Q$  is an  $AB-(u, v)$ *absorbing hyperideal of*  $(A, +, \circ)$  *if and only if*  $Q/\gamma^*$  *is an AB-*(*u, v*)*-absorbing hyperideal of*  $(A/\gamma^*, \oplus, \odot)$ *.* 

*Proof.*  $(\implies)$  Let  $x_1 \odot \cdots \odot x_u \in Q/\gamma^*$  for some  $x_1, \dots, x_u \in A/\gamma^*$ . Then there exist  $a_i \in A$  for every  $i \in \{1, \dots, u\}$  such that  $x_i = \gamma^*(a_i)$ . This implies that  $x_1 \odot \cdots \odot x_u = \gamma^*(a_1) \odot \cdots \odot \gamma^*(a_u) = \gamma^*(a_1 \circ \cdots \circ a_u).$  Since  $\gamma^*(a_1 \circ \cdots \circ a_u) \in Q/\gamma^*$ , we get  $a_1 \circ \cdots \circ a_u \subseteq Q$ . Since Q is an AB- $(u, v)$ -absorbing hyperideal of A, we get the result that there is v elements of the  $a_i$ s, say  $a_{i_1}, \cdots, a_{i_v}$ , whose product is a subset of Q. This implies that  $x_{i_1} \odot \cdots \odot x_{i_v} = \gamma^*(a_{i_1}) \odot \cdots \odot \gamma^*(a_{i_v}) = \gamma^*(a_{i_1} \circ \cdots \circ a_{i_v}) \in$  $Q/\gamma^*$ . Consequently,  $Q/\gamma^*$  is an AB-(u, v)-absorbing hyperideal of  $A/\gamma^*$ .

(←) Suppose that  $a_1 \circ \cdots \circ a_u \subseteq Q$  for some  $a_1, \cdots, a_u \in A$ . Then we have  $\gamma^*(a_1), \cdots, \gamma^*(a_u) \in A/\gamma^*$  and so  $\gamma^*(a_1) \odot \cdots \odot \gamma^*(a_u) = \gamma^*(a_1 \circ \cdots \circ a_u) \in Q/\gamma^*$ . Since  $Q/\gamma^*$  is an AB-(u, v)-absorbing hyperideal of  $A/\gamma^*$ , there exist v elements of the  $\gamma^*(a_i)$ 's, say  $\gamma^*(a_{i_1}), \cdots, \gamma^*(a_{i_v})$  whose product is in  $Q/\gamma^*$ . This means  $\gamma^*(a_{i_1} \circ \cdots \circ a_{i_v}) = \gamma^*(a_{i_1}) \odot \circ \odot \gamma^*(a_{i_v}) \in Q/\gamma^*$  which implies  $a_{i_1} \circ \cdots \circ a_{i_v} \subseteq Q$ . Thus  $Q$  is an  $AB-(u, v)$ -absorbing hyperideal of  $A$ .

Let  $(A_1, +_1, \circ_1)$  and  $(A_2, +_2, \circ_2)$  be two multiplicative hyperrings with nonzero identity. The set  $A_1 \times A_2$  with the operation + and the hyperoperation  $\circ$  defined as

 $(x_1, x_2) + (y_1, y_2) = (x_1 + y_1, x_2 + y_2)$ 

 $(x_1, x_2) \circ (y_1, y_2) = \{(x, y) \in A_1 \times A_2 \mid x \in x_1 \circ_1 y_1, y \in x_2 \circ_2 y_2\}$ 

is a multiplicative hyperring [\[35\]](#page-14-1). Now, we present some characterizations of AB-  $(u, v)$ -absorbing hyperideals on cartesian product of commutative multiplicative hyperring.

**Theorem 4.5.** Assume that  $A = A_1 \times A_2$  such that  $A_1, A_2$  are commutative mul*tiplicative hyperrings,*  $Q = Q_1 \times A_2$  *such that*  $Q_1$  *is a proper hyperideal of*  $A_1$  *and*  $u, v \in \mathbb{N}$  *with*  $u > v$ . Then the following are equivalent.

- (i) Q *is a* (u, v)*-absorbing hyperideal of* A*.*
- (ii)  $Q_1$  *is an AB*-(*u*, *v*)-*absorbing hyperideal of*  $A_1$ .
- (iii) Q *is an* AB*-*(u, v)*-absorbing hyperideal of* A*.*

*Proof.* (i)  $\implies$  (ii) Suppose on the contrary,  $Q_1$  is not an  $AB-(u, v)$ -absorbing hyperideal of  $A_1$ . This means that we have  $x_1 \circ_1 \cdots \circ_1 x_u \subseteq Q_1$  for some  $x_1, \cdots, x_u \in A_1$ and none of product of the terms v of the  $x_i$ 's is not a subset of  $Q_1$ . Since  $Q$  is a  $(u, v)$ -absorbing hyperideal of A,  $(x_1, 0) \circ \cdots \circ (x_u, 0) \subseteq Q$  and none of the  $(x_i, 0)$ 's

are unit, there exist v of the  $(x_i, 0)$ 's whose is a subset of Q which implies there exist v of the  $x_i$ 's whose is a subset of  $Q_1$  which is a contradiction. Hence  $Q_1$  is an  $AB-(u, v)$ -absorbing hyperideal of  $A_1$ .

(ii)  $\implies$  (iii) Let  $(x_1, y_1) \circ \cdots \circ (x_u, y_u) \subseteq Q$  for  $(x_1, y_1), \cdots, (x_u, y_u) \in A$ . This means that  $x_1 \circ_1 \cdots \circ_1 x_u \subseteq Q_1$ . Since  $Q_1$  is an  $AB-(u, v)$ -absorbing hyperideal of  $A_1$ , there exist v of the  $x_i$ s, say  $x_{i_1}, \dots, x_{i_v}$ , whose product is a subset of  $Q_1$ . It follows that  $(x_{i_1}, y_{i_1}) \circ \cdots \circ (x_{i_v}, y_{i_v}) \subseteq Q$  and so Q is an  $AB-(u, v)$ -absorbing hyperideal of A.

(iii)  $\implies$  (i) The claim is true because every AB-(u, v)-absorbing is a (u, v)absorbing hyperideal.

## 5.  $(u, v)$ -ABSORBING PRIME HYPERIDEALS

In this section, we aim to extend the class of the  $(u, v)$ -absorbing hyperideals to  $(u, v)$ -absorbing prime hyperideals.

**Definition 5.1.** Let  $u, v \in \mathbb{N}$  with  $u > v$ . A proper hyperideal Q of A refers to a  $(u, v)$ -absorbing prime hyperideal if  $x_1 \circ \cdots \circ x_u \subseteq Q$  for  $x_1, \cdots, x_u \in A \setminus U(A)$ implies either  $x_1 \circ \cdots \circ x_v \subseteq Q$  or  $x_{v+1} \circ \cdots \circ x_u \subseteq Q$ .

**Example 5.2.** In Example [3.2,](#page-2-3) the hyperideal  $\langle 15 \rangle$  is a  $(3, 1)$ -absorbing prime hyperideal. However, since  $3^2 \circ 5 = \{180, 360, 720\} \subseteq \langle 15 \rangle$  but  $3, 5 \notin \langle 15 \rangle$ , then  $\langle 15 \rangle$ is not a  $(3, 1)$ -absorbing hyperideal

<span id="page-7-0"></span>*Remark* 5.3. Let  $u, v \in \mathbb{N}$  with  $u > v$  and Q be a C-hyperideal of A.

- (i) Q is a  $(u, v)$ -absorbing prime hyperideal of A if and only if Q is a  $(u, u-v)$ absorbing prime hyperideal.
- (ii) If Q is a  $(u, v)$ -absorbing prime hyperideal of A, then Q is a  $(u + 1, v + 1)$ absorbing prime hyperideal.

<span id="page-7-1"></span>**Proposition 5.4.** Assume that Q is a strong C-hyperideal of A such that A is not local and  $u, v \in \mathbb{N}$  with  $u > v$ . Then Q is a  $(u, v)$ -absorbing prime hyperideal of A if and only if Q is a  $(u - 1, v - 1)$ -absorbing prime hyperideal.

*Proof.*  $(\implies)$  Let Q be a  $(u, v)$ -absorbing prime hyperideal of A. Suppose on contrary that Q is not a  $(u-1, v-1)$ -absorbing prime hyperideal of A. Then there exist  $x_1, \dots, x_{u-1} \in A \setminus U(A)$  such that  $x_1 \circ \dots \circ x_{u-1} \subseteq Q$  but neither  $x_1 \circ \dots \circ x_{v-1} \subseteq Q$ nor  $x_v \circ \cdots \circ x_{u-1} \subseteq Q$ . Take any  $y \in A \setminus U(A)$ . Since Q is a  $(u, v)$ -absorbing prime hyperideal of A,  $y \circ x_1 \circ \cdots \circ x_{u-1} \subseteq Q$  and  $x_v \circ \cdots \circ x_{u-1} \nsubseteq Q$ , we have  $y \circ x_1 \circ \cdots \circ x_{v-1} \subseteq Q$ . Take any  $z \in U(A)$ . If  $y + z \notin U(A)$ , then we obtain  $(y+z)\circ x_1\circ\cdots\circ x_{v-1}\subseteq Q$  as  $(y+z)\circ x_1\circ\cdots\circ x_{u-1}\subseteq Q$ ,  $x_v\circ\cdots\circ x_{u-1}\nsubseteq Q$  and  $Q$  is a  $(u, v)$ -absorbing prime hyperideal of A. Since  $Q$  is a strong C-hyperideal of A and  $(y+z) \circ x_1 \circ \cdots \circ x_{v-1} \subseteq y \circ x_1 \circ \cdots \circ x_{v-1} + z \circ x_1 \circ \cdots \circ x_{v-1}$ , we conclude that  $y \circ x_1 \circ \cdots \circ x_{v-1} + z \circ x_1 \circ \cdots \circ x_{v-1} \subseteq Q$ . This implies that  $x_1 \circ \cdots \circ x_{v-1} \subseteq Q$ because  $y \circ x_1 \circ \cdots \circ x_{v-1} \subseteq Q$ . This is a contradiction. Then we have  $y + z \in U(A)$ . By Lemma 2.6 in  $[28]$ , we get the result that A is local which is a contradiction. Thus Q is a  $(u-1, v-1)$ -absorbing prime hyperideal of A.

<span id="page-7-2"></span> $(\Leftarrow)$  It is obvious by Remark [5.3](#page-7-0) (ii).

**Proposition 5.5.** Assume that  $u, v \in \mathbb{N}$  with  $u > v$  and Q is a strong C-hyperideal of A such that A is not local. Then Q is a  $(u-v+1, 1)$ -absorbing prime hyperideal of  $A$  if and only if  $Q$  is a prime hyperideal.

*Proof.* ( $\implies$ )Let Q be a  $(u-v+1, 1)$ -absorbing prime hyperideal of A. Then we get the result that Q is a  $(u - v + 1, u - v)$ -absorbing prime hyperideal of A by Remark [5.3](#page-7-0) (i). Hence we conclude that Q is a prime hyperideal by Proposition [5.4.](#page-7-1)  $(\Leftarrow)$  Straightforward.

For a C-hyperideal  $Q$  of A that the hyperring A is not local, it can be easily proved, by induction, that Q is a  $(u - 1, v - 1)$ -absorbing prime hyperideal for  $u, v \in \mathbb{N}$  with  $u > v$  if and only if Q is a  $(u - v + 1, 1)$ -absorbing prime hyperideal. Thus in view of Proposition [5.4](#page-7-1) and Proposition [5.5,](#page-7-2) we have the following result.

<span id="page-8-0"></span>**Corollary 5.6.** In a hyperring A that is not local, every  $(u, v)$ -absorbing prime hyperideal is prime and vice versa.

**Theorem 5.7.** Assume that  $Q_1$  and  $Q_2$  are strong C-hyperideals of the hyperring  $A_1$  *and*  $A_2$ *, respectively. Let*  $u, v \in \mathbb{N}$  *with*  $u > v$ *. Then the following are equivalent:* (i)  $Q_1 \times Q_2$  *is a*  $(u, v)$ *-absorbing prime hyperideal of*  $A_1 \times A_2$ *.* 

- (ii)  $Q_1 \times Q_2$  *is a prime hyperideal of*  $A_1 \times A_2$ *.*
- (iii)  $Q_1$  *is a prime hyperideal of*  $A_1$  *and*  $Q_2 = A_2$  *or*  $Q_2$  *is a prime hyperideal of*  $A_2$  *and*  $Q_1 = A_1$ *.*

*Proof.* It can be easily seen that the idea is true by Corollary [5.6](#page-8-0) as  $A_1 \times A_2$  is not local. □

<span id="page-8-1"></span>**Proposition 5.8.** Let  $u, v \in \mathbb{N}$  with  $u > v$  and Q be a strong C-hyperideal of A. Then Q is a  $(v + 1, v)$ -absorbing prime hyperideal of A if and only if Q is a prime hyperideal or A is local such that  $M^v \subseteq Q$  for the only maximal hyperideal M of A.

*Proof.*  $(\implies)$  Let Q be a  $(v+1, v)$ -absorbing prime hyperideal of A and the hyperring A is not local. Then Q is prime by Corollary [5.6.](#page-8-0) Suppose that A is local and M is the only maximal hyperideal of A such that  $M^v \nsubseteq Q$ . If Q is not a  $(v, v - 1)$ absorbing prime hyperideal of A, then there exist  $x_1, \dots, x_v \in A \setminus U(A)$  such that  $x_1 \circ \cdots \circ x_v \subseteq Q$  but  $x_1 \circ \cdots \circ x_{v-1} \nsubseteq Q$  and  $x_v \notin Q$ . Take any  $a \in a_1 \circ \cdots \circ a_v$ for every  $a_1, \dots, a_v \in M$ . Since Q is a  $(v + 1, v)$ -absorbing prime hyperideal of A,  $a \circ x_1 \circ \cdots \circ x_v \subseteq Q$  and  $x_v \notin Q$ , we get  $a \circ x_1 \circ \cdots \circ x_{v-1} \subseteq Q$ . Let  $b \in x_1 \circ \cdots \circ x_{v-1}$ . So  $a \circ b \subseteq a \circ x_1 \circ \cdots \circ x_{v-1} \subseteq Q$ . On the other hand,  $a \circ b \subseteq a_1 \circ \cdots \circ a_v \circ b$ . Then we get  $a_1 \circ \cdots \circ a_v \circ b \subseteq Q$  as Q is a strong C-hyperideal of A. If  $b \in Q$ , then  $x_1 \circ \cdots \circ x_{v-1} \cap Q \neq \emptyset$  and so  $x_1 \circ \cdots \circ x_{v-1} \subseteq Q$  which is impossible. Therefore  $b \notin Q$ . Since Q is a  $(v + 1, v)$ -absorbing prime hyperideal of A,  $a_1 \circ \cdots \circ a_v \circ b \subseteq Q$ and  $b \notin Q$ , we conclude that  $a_1 \circ \cdots \circ a_v \subseteq Q$  which means  $M^v \subseteq Q$ , a contradiction. Then we get the result that Q is a  $(v, v - 1)$ -absorbing prime hyperideal of A. By induction, we conclude that Q is prime as  $M^i \nsubseteq Q$  for any  $i \leq v$ .

 $(\Leftarrow)$  It is obvious.

**Corollary 5.9.** Assume that  $u, v \in \mathbb{N}$  with  $u > v$  and Q is a  $(v + 1, v)$ -absorbing prime strong C-hyperideal of A that is not prime. If P is a hyperideal of A containing  $Q$ , then P is a  $(u, v)$ -absorbing prime hyperideal of A.

*Proof.* Suppose that Q is a  $(v+1, v)$ -absorbing prime strong C-hyperideal of A that is not prime. By Proposition [5.8,](#page-8-1) we get the result that A is local and  $M^v \subseteq Q$ where M is the only maximal hyperideal of A. Then  $M^v \subseteq P$  and so we are done by By Proposition [5.8.](#page-8-1) Theorem 5.10. *Let* Q *be a* (u, v)*-absorbing prime strong* C*-hyperideal of* A *where*  $u, v \in \mathbb{N}$  and  $u > v$ . Then the following statements hold:

- (i) rad(Q) *is a prime hyperideal of* A*.*
- (ii) *If* Q *is not a prime hyperideal of* A*, then* A *is local. In particular, if*  $u = v + 1$ , then  $rad(Q) = M$  where M is the only maximal hyperideal of A.

*Proof.* (i) Suppose that Q is a  $(u, v)$ -absorbing prime strong C-hyperideal of A. Let  $a \circ b \subseteq rad(Q)$  for  $a, b \in A$ . We may assume  $a, b \in A \setminus U(A)$ , without loss of generality. Then we have  $a^n \circ b^n \subseteq Q$  for some  $n \in \mathbb{N}$ . Take any  $x \in a^n$  and  $y \in b^n$ . If x or  $y \in U(A)$ , then we obtain  $b^n \subseteq e \circ b^n \subseteq x^{-1} \circ x \circ b^n \subseteq x^{-1} \circ a^n \circ b^n \subseteq Q$  which means  $b \in rad(Q)$  or  $a^n \subseteq a^n \circ e \subseteq a^n \circ y \circ y^{-1} \subseteq a^n \circ b^n \circ y^{-1} \subseteq Q$  which means  $a \in rad(Q)$ . Now, we assume that  $x, y \notin U(A)$ . Since  $a^{v-1} \circ x \circ b^{u-v-1} \circ y \subseteq Q$  and Q is a  $(u, v)$ -absorbing prime hyperideal of A, we get the result that  $a^{v-1} \circ x \subseteq Q$  or  $b^{u-v-1} \circ y \subseteq Q$ . In the first case, since  $(a^{v-1} \circ a^n) \cap Q \neq \emptyset$ , we get  $a^{v+n-1} = a^{v-1} \circ a^n$  $a^n \subseteq Q$  which means  $a \in rad(Q)$ . In the second case, since  $(b^{u-v-1} \circ b^n) \cap Q \neq \emptyset$ , we have  $b^{u-v+n-1} = b^{u-v-1} \circ b^n \subseteq Q$  which implies  $b \in rad(Q)$ . Thus  $rad(Q)$  is a prime hyperideal of A.

(ii) Suppose that Q is a  $(u, v)$ -absorbing prime strong C-hyperideal of A that is not prime. Then we conclude that A is local by Corollary [5.6.](#page-8-0) Let  $u = v + 1$  and M be the only maximal hyperideal of A. By Proposition [5.8,](#page-8-1) we conclude that  $M^v \subseteq Q$  and so  $rad(Q) = M$ .

<span id="page-9-0"></span>**Lemma 5.11.** Let every hyperideal of A be a prime C-hyperideal. Then A is a hyperfield.

*Proof.* Let  $0 \neq x \in A$ . Since  $\langle x^2 \rangle$  is a prime hyperideal of A and  $x^2 \subseteq \langle x^2 \rangle$ , we get  $x \in \langle x^2 \rangle$  which means  $x \in x^2 \circ a$  for some  $a \in A$ . It follows that  $0 \in x^2 \circ a - x$ . Since  $0 \in x^2 \circ a - x \cap \langle 0 \rangle$ , we get the result that  $(x \circ a - 1) \circ x \subseteq x^2 \circ a - x \subseteq \langle 0 \rangle$ . Let  $t \in x \circ a$ . Since  $\langle 0 \rangle$  is a prime hyperideal,  $(t - 1) \circ x \subseteq \langle 0 \rangle$  and  $x \neq 0$ , we obtain  $t-1=0$  and so  $1 \in x \circ a$  which means x is unit. Thus we conclude that A is a hyperfield.

**Theorem 5.12.** Let every hyperideal of A be a strong C-hyperideal,  $J(A) = M$  and  $v \in \mathbb{N}$ . Then every proper hyperideal in A is a  $(v+1, v)$ -absorbing prime hyperideal *if and only if* A *is local and*  $M^v = 0$ .

*Proof.*  $(\implies)$  Suppose on contrary that A is not local. By Corollary [5.6,](#page-8-0) we conclude that every proper hyperideal in  $A$  is prime. Therefore, by Lemma [5.11,](#page-9-0) we get the result that  $A$  is a hyperfield which is impossible. Then  $A$  is local. Let  $M$  be the only maximal hyperideal of A. Since  $\langle 0 \rangle$  is a  $(v + 1, v)$ -absorbing prime hyperideal and A is local, we have  $M^v = 0$  by the hypothesis and Proposition [5.8.](#page-8-1)

 $(\Leftarrow)$  Let Q be an arbitary hyperideal and  $x_1 \circ \cdots \circ x_{v+1} \subseteq Q$  for  $x_1, \cdots, x_{v+1} \in Q$  $A\setminus U(A)$ . Since A is local, M is the only maximal hyperideal of A and  $x_1, \dots, x_v \in$  $A\setminus U(A)$ , we conclude that  $x_1 \circ \cdots \circ x_v \subseteq M^v = 0$  which means  $x_1 \circ \cdots \circ x_v \subseteq Q$ , as required.  $\square$ 

**Theorem 5.13.** Let Q be a proper hyperideal of A and  $u, v \in \mathbb{N}$  with  $u > v$ . Then Q *is a* (u, v)*-absorbing prime hyperideal of* A *if and only if for proper hyperideals*  $Q_1, \cdots, Q_u$  of  $A, Q_1 \circ \cdots \circ Q_u \subseteq Q$  implies that  $Q_1 \circ \cdots \circ Q_v \subseteq Q$  or  $Q_{v+1} \circ \cdots \circ Q_u \subseteq Q$ Q*.*

*Proof.* ( $\implies$ ) Let Q be a  $(u, v)$ -absorbing prime hyperideal of A. Assume that  $Q_1 \circ$  $\cdots \circ Q_u \subseteq Q$  where  $Q_1, \cdots, Q_u$  are proper hyperideals of A such that  $Q_{v+1}, \circ \cdots \circ Q_u$  $Q_u \nsubseteq Q$ . Then there exists  $x_i \in Q_i$  for each  $i \in \{v+1, \dots, u\}$  such that  $x_{v+1} \circ$  $\cdots \circ x_u \nsubseteq Q$ . Take any  $y_i \in Q_i$  for each  $i \in \{1, \cdots, v\}$ . Therefore we have  $y_1 \circ \cdots y_v \circ x_{v+1} \circ \cdots \circ x_u \subseteq Q$ . This implies that  $y_1 \circ \cdots y_v \subseteq Q$  as  $Q$  is a  $(u, v)$ absorbing prime hyperideal of A and  $x_{v+1} \circ \cdots \circ x_u \nsubseteq Q$ . Hence  $Q_1 \circ \cdots \circ Q_v \subseteq Q$ , as needed.

 $(\Leftarrow)$  Let  $x_1 \circ \cdots \circ x_u \subseteq Q$  for some  $x_1, \cdots, x_u \in A \setminus U(A)$  such that  $x_1 \circ \cdots \circ x_v \nsubseteq Q$ Q. Put  $Q_i = \langle x_i \rangle$  for each  $i \in \{1, \dots, u\}$ . Hence we have  $Q_1 \circ \cdots \circ Q_u \subseteq Q$  and  $Q_1 \circ \cdots \circ Q_v \nsubseteq Q$ . By the hypothesis, we conclude that  $Q_{v+1} \circ \cdots \circ Q_u \subseteq Q$ which implies  $x_{v+1} \circ \cdots \circ x_u \subseteq Q$ . This means that Q is a  $(u, v)$ -absorbing prime hyperideal of  $A$ .

**Proposition 5.14.** Let  $u, v \in \mathbb{N}$  with  $u > v$ , Q a  $(u, v)$ -absorbing prime hyperideal of A and  $x \in A \setminus (Q \cup U(A))$ . Then  $(Q : x)$  is a  $(u - 1, v - 1)$ -absorbing prime hyperideal of A.

*Proof.* Let  $x_1 \circ \cdots \circ x_{u-1} \subseteq (Q : x)$  for  $x_1, \cdots, x_{u-1} \in A \setminus U(A)$  such that  $x_1 \circ$  $\cdots \circ x_{v-1} \nsubseteq (Q : x)$ . So we have  $x \circ x_1 \circ \cdots \circ x_{u-1} \subseteq Q$ . Since Q is a  $(u, v)$ absorbing prime hyperideal of A and  $x \circ x_1 \circ \cdots \circ x_{v-1} \nsubseteq Q$ , we get the result that  $x_v \circ \cdots x_{u-1} \subseteq Q \subseteq (Q : x)$ . This shows that  $(Q : x)$  is a  $(u - 1, v - 1)$ -absorbing prime hyperideal of  $A$ .

Assume that A is a multiplicative hyperring. Then the set of all hypermatrices of A is denoted by  $M_m(A)$ . Let  $I = (I_{ij})_{m \times m}, J = (J_{ij})_{m \times m} \in P^*(M_m(A))$ . Then  $I \subseteq J$  if and only if  $I_{ij} \subseteq J_{ij}[1]$  $I_{ij} \subseteq J_{ij}[1]$ .

**Theorem 5.15.** Let  $u, v \in \mathbb{N}$  with  $u > v$  and Q be a hyperideal of A. If  $M_m(Q)$  is *a*  $(u, v)$ -absorbing prime hyperideal of  $M_m(A)$ , then Q is a  $(u, v)$ -absorbing prime *hyperideal of* A*.*

*Proof.* Let  $x_1 \circ \cdots \circ x_u \subseteq Q$  for  $x_1, \cdots, x_u \in A \setminus U(A)$ . Therefore we have

$$
\begin{pmatrix} x_1 \circ \cdots \circ x_u & 0 & \cdots & 0 \\ 0 & 0 & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \cdots & 0 \end{pmatrix} \subseteq M_m(Q).
$$

Since  $M_m(Q)$  is a  $(u, v)$ -absorbing prime hyperideal of  $M_m(A)$  and

$$
\begin{pmatrix} x_1 & \cdots & \circ & x_u & 0 & \cdots & 0 \\ 0 & 0 & \cdots & 0 & 0 \\ \vdots & \vdots & \ddots & \vdots & \vdots \\ 0 & 0 & \cdots & 0 \end{pmatrix} = \begin{pmatrix} x_1 & 0 & \cdots & 0 \\ 0 & 0 & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \cdots & 0 \end{pmatrix} \circ \cdots \circ \begin{pmatrix} x_u & 0 & \cdots & 0 \\ 0 & 0 & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \cdots & 0 \end{pmatrix}
$$

we conclude that

$$
\begin{pmatrix} x_1 & 0 & \cdots & 0 \\ 0 & 0 & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \cdots & 0 \end{pmatrix} \circ \cdots \circ \begin{pmatrix} x_v & 0 & \cdots & 0 \\ 0 & 0 & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \cdots & 0 \end{pmatrix} = \begin{pmatrix} x_1 \circ \cdots \circ x_v & 0 & \cdots & 0 \\ 0 & 0 & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \cdots & 0 \end{pmatrix} \subseteq M_m(Q)
$$

$$
\begin{pmatrix} x_{v+1} & 0 & \cdots & 0 \\ 0 & 0 & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \cdots & 0 \end{pmatrix} \circ \cdots \circ \begin{pmatrix} x_u & 0 & \cdots & 0 \\ 0 & 0 & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \cdots & 0 \end{pmatrix} = \begin{pmatrix} x_{v+1} & \circ & \cdots & 0 & \cdots & 0 \\ 0 & 0 & \cdots & 0 & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots & \ddots & \vdots \\ 0 & 0 & \cdots & 0 & \cdots & 0 \end{pmatrix} \subseteq M_m(Q).
$$

Thus we get the result that  $x_1 \circ \cdots \circ x_v \subseteq Q$  or  $x_{v+1} \circ \cdots \circ x_u \subseteq Q$ . Hence Q is a  $(u, v)$ -absorbing prime hyperideal of A.

Suppose that  $(A, +, \circ)$  is a commutative multiplicative hyperring and x is an indeterminate. Then  $(A[x], +, \diamond)$  is a polynomail multiplicative hyperring where  $tx^n \diamond sx^m = (t \circ s)x^{n+m}$  [\[11\]](#page-13-20).

<span id="page-11-0"></span>**Theorem 5.16.** Let  $u, v \in \mathbb{N}$  with  $u > v$ . If Q is a  $(u, v)$ -absorbing prime hyperideal *of*  $(A, +, \circ)$ *, then*  $Q[x]$  *is a*  $(u, v)$ *-absorbing prime hyperideal of*  $(A[x], +, \circ)$ *.* 

*Proof.* Assume that  $t_1(x) \diamond \cdots \diamond t_u(x) \subseteq Q[x]$ . Without loss of generality, we may assume that  $t_i(x) = a_i x^{n_i}$  for each  $i \in \{1, \dots, u\}$  and  $a_i \in A$ . Therefore  $a_1 \circ \cdots \circ a_i$  $a_ux^{n_1+\cdots+n_u} \subseteq Q[x]$ . This implies that  $a_1 \circ \cdots \circ a_u \subseteq Q$ . Since Q is a  $(u, v)$ -absorbing prime hyperideal of  $(A, +, \circ)$ , we obtain  $a_1 \circ \cdots \circ a_v \subseteq Q$  or  $a_{v+1} \circ \cdots \circ a_u \subseteq Q$ which implies  $t_1(x) \diamond \cdots \diamond t_v(x) = a_1 x^{n_1} \diamond \cdots \diamond a_v x^{n_v} = a_1 \circ \cdots \circ a_v x^{n_1 + \cdots + n_v} \subseteq Q[x]$ or  $t_{v+1}(x) \diamond \cdots \diamond t_u(x) = a_{v+1} x^{n_1} \diamond \cdots \diamond a_u x^{n_u} = a_{v+1} \circ \cdots \circ a_u x^{n_{v+1} + \cdots + n_u} \subseteq Q[x]$ . Thus  $Q[x]$  is a  $(u, v)$ -absorbing prime hyperideal of  $(A[x], +, \diamond)$ .

In view of Theorem [5.16,](#page-11-0) we get the following result.

**Corollary 5.17.** Suppose that Q is a  $(u, v)$ -absorbing prime hyperideal of A. Then  $Q[x]$  is a  $(u, v)$ -absorbing prime hyperideal of  $A[x]$ .

Recall from [\[19\]](#page-13-18) that a mapping  $\theta$  from the multiplicative hyperring  $(A_1, +_1, \circ_1)$ into the multiplicative hyperring  $(A_2, +_2, \circ_2)$  is a hyperring good homomorphism if  $\theta(x +_1 y) = \theta(x) +_2 \theta(y)$  and  $\theta(x \circ_1 y) = \theta(x) \circ_2 \theta(y)$  for all  $x, y \in A_1$ .

<span id="page-11-1"></span>Theorem 5.18. *Assume that* A<sup>1</sup> *and* A<sup>2</sup> *are two multiplicative hyperrins such that*  $\theta: A_1 \longrightarrow A_2$  *is a hyperring good homomorphism and*  $\theta(x) \notin U(A_2)$  *for every*  $x \in A_1 \backslash U(A_1)$ *. Let*  $u, v \in \mathbb{N}$  *with*  $u > v$ *. Then the following hold.* 

- (i) If  $Q_2$  *is a*  $(u, v)$ -absorbing prime hyperideal of  $A_2$ , then  $\theta^{-1}(Q_2)$  *is a*  $(u, v)$ *absorbing prime hyperideal of* A1*.*
- (ii) *If*  $\theta$  *is surjective and*  $Q_1$  *is a is a*  $(u, v)$ *-absorbing prime C-hyperideal of*  $A_1$  *with*  $Ker(\theta) \subseteq Q_1$ *, then*  $\theta(Q_1)$  *is a*  $(u, v)$ *-absorbing prime hyperideal of* A2*.*

*Proof.* (i) Let  $x_1 \circ_1 \cdots \circ_1 x_u \subseteq \theta^{-1}(Q_2)$  for some  $x_1, \dots, x_u \in A_1$ . Then we get  $\theta(x_1 \circ_1 \cdots \circ_1 x_u) = \theta(x_1) \circ_2 \cdots \circ_2 \theta(x_u) \subseteq Q_2$  because  $\theta$  is a good homomorphism. Since  $Q_2$  is a  $(u, v)$ -absorbing prime hyperideal of  $A_2$ , we obtain  $\theta(x_1 \circ_1 \cdots \circ_1 x_v)$  =  $\theta(x_1) \circ_2 \cdots \circ_2 \theta(x_v) \subseteq Q_2$  which means  $x_1 \circ_1 \cdots \circ_1 x_v \subseteq \theta^{-1}(Q_2)$  or  $\theta(x_{v+1} \circ_1 \cdots \circ_1$  $x_u$ ) =  $\theta(x_{v+1}) \circ_2 \cdots \circ_2 \theta(x_u) \subseteq Q_2$  which implies  $x_{v+1} \circ_1 \cdots \circ_1 x_u \subseteq \theta^{-1}(Q_2)$ . Thus  $\theta^{-1}(Q_2)$  is a  $(u, v)$ -absorbing prime hyperideal of  $A_1$ .

(ii) Let  $y_1 \circ_2 \cdots \circ_2 y_u \subseteq \theta(Q_1)$  for  $y_1, \cdots, y_u \in A_2$ . Then there exists  $x_i \in A_1$ such that  $\theta(x_i) = y_i$  for each  $i \in \{1, \dots, u\}$  because  $\theta$  is surjective. Therefore  $\theta(x_1 \circ_1 \cdots \circ_1 x_u) = \theta(x_1) \circ_2 \cdots \circ_2 \theta(x_u) \subseteq \theta(Q_1)$ . Now, pick any  $t \in x_1 \circ_1 \cdots \circ_1 x_u$ . Then  $\theta(t) \in \theta(x_1 \circ_1 \cdots \circ_1 x_u) \subseteq \theta(Q_1)$  and so there exists  $s \in Q_1$  such that

or

 $\theta(t) = \theta(s)$ . Then we get  $\theta(t-s) = 0$  which means  $t-s \in Ker(\theta) \subseteq Q_1$  and so  $t \in Q_1$ . Therefore  $x_1 \circ_1 \cdots \circ_1 x_u \subseteq Q_1$  as  $Q_1$  is a C-hyperideal. Since  $Q_1$  is a  $(u, v)$ -absorbing prime hyperideal of  $A_1$ , we get the result that  $x_1 \circ_1 \cdots \circ_1 x_v \subseteq Q_1$ or  $x_{v+1} \circ_1 \cdots \circ_1 x_u \subseteq Q_1$ . This means  $y_1 \circ_2 \cdots \circ_2 y_v = \theta(x_1 \circ_1 \cdots \circ_1 x_v) \subseteq \theta(Q_1)$ or  $y_{v+1} \circ_2 \cdots \circ_2 y_u = \theta(x_{v+1} \circ_1 \cdots \circ_1 x_u) \subseteq \theta(Q_1)$ . Consequently,  $\theta(Q_1)$  is a  $(u, v)$ -absorbing prime hyperideal of  $A_2$ .

Now, we have the following result.

**Corollary 5.19.** Let the hyperideal  $Q_1$  of A be subset the C-hyperideal  $Q_2$  of A,  $x + Q_1 \notin U(A/Q_1)$  for all  $x \in A \setminus U(A)$  and  $u, v \in \mathbb{N}$  with  $u > v$ . Then  $Q_2$  is a  $(u, v)$ -absorbing prime hyperideal of A if and only if  $Q_2/Q_1$  is a  $(u, v)$ -absorbing prime hyperideal of  $A/Q_1$ .

*Proof.* Consider the homomorphism  $\pi : A \longrightarrow A/Q_1$  defined by  $\pi(a) = a + Q_1$ . Since  $\pi$  is a good epimorphism, the claim follows from Theorem [5.18](#page-11-1)

Let  $S$  be a non-empty subset of  $A$ . If  $S$  is closed under the hypermultiplication and S contains 1, then S refers to a multiplicative closed subset (briefly,  $MCS[1]$  $MCS[1]$ . Consider the set  $(A \times S/\sim)$  of equivalence classes denoted by  $S^{-1}A$  such that  $(x_1, r_1) \sim (x_2, r_2)$  if and only if there exists  $r \in S$  with  $r \circ r_1 \circ x_2 = r \circ r_2 \circ x_1$ . The equivalence class of  $(x, r) \in A \times S$  is denoted by  $\frac{x}{r}$ . The triple  $(S^{-1}A, \oplus, \odot)$  is a multiplicative hyperring where

 $\frac{x_1}{r_1} \oplus \frac{x_2}{r_2} = \frac{r_1 \circ x_2 + r_2 \circ x_1}{r_1 \circ r_2} = \left\{ \frac{a+b}{c} \mid a \in r_1 \circ x_2, b \in r_2 \circ x_1, c \in r_1 \circ r_2 \right\}$ <br>  $\frac{x_1}{r_1} \odot \frac{x_2}{r_2} = \frac{x_1 \circ a_2}{r_1 \circ r_2} = \left\{ \frac{a}{b} \mid a \in x_1 \circ x_2, b \in r_1 \circ r_2 \right\}$ 

The localization map  $\pi : A \longrightarrow S^{-1}A$ , defined by  $a \mapsto \frac{a}{1}$ , is a homomorphism of hyperrings. Moreover, if I is a hyperideal of A, then  $S^{-1}I$  is a hyperideal of  $S^{-1}A$ [\[27\]](#page-13-21).

**Theorem 5.20.** Assume that Q is a C-hyperideal of A, S a MCS such that  $Q \cap S =$  $\emptyset$  *and*  $u, v \in \mathbb{N}$  *with*  $u > v$ *. If* Q *is a*  $(u, v)$ *-absorbing prime hyperideal of* A, then  $S^{-1}Q$  is a  $(u-1, v-1)$ -absorbing prime hyperideal of  $S^{-1}A$ .

*Proof.* Let  $\frac{x_1}{r_1} \odot \cdots \odot \frac{x_{u-1}}{r_{u-1}} = \frac{x_1 \circ \cdots \circ x_{u-1}}{r_1 \circ \cdots \circ r_{u-1}}$  $\frac{x_1 \circ \cdots \circ x_{u-1}}{x_1 \circ \cdots \circ x_{u-1}}$  ⊆  $S^{-1}Q$  for  $x_1, \cdots, x_{u-1} \in A \setminus U(A)$  and  $r_1, \dots, r_{u-1} \in S$  such that  $\frac{x_1}{r_1} \odot \dots \odot \frac{x_{v-1}}{r_{v-1}} \nsubseteq S^{-1}Q$ . Take any  $a \in x_1 \circ \dots \circ x_{u-1}$  and  $r \in r_1 \circ \cdots \circ r_{u-1}$ . Hence  $\frac{a}{r} \in \frac{x_1 \circ \cdots \circ x_{u-1}}{r_1 \circ \cdots \circ r_{u-1}}$  $\frac{x_1 \circ \cdots \circ x_{u-1}}{r_1 \circ \cdots \circ r_{u-1}}$  and so  $\frac{a}{r} = \frac{a'}{r'}$  $\frac{a'}{r'}$  for some  $a' \in Q$  and  $r' \in S$ . Then there exists  $t \in S$  such that  $t \circ a \circ r' = t \circ a' \circ r$ . This means  $t \circ a \circ r' \subseteq Q$ . Since  $a \in x_1 \circ \cdots \circ x_{u-1}$ , we conclude that  $t \circ a \circ r' \subseteq t \circ x_1 \circ \cdots \circ x_{u-1} \circ r'$ . Therefore we have  $t \circ x_1 \circ \cdots \circ x_{u-1} \circ r' \subseteq Q$  as  $Q$  is a C-hyperideal of A and  $t \circ x_1 \circ \cdots \circ x_{u-1} \circ r' \cap Q \neq \emptyset$ . Take any  $s \in t \circ r'$ . If  $s \circ x_1 \circ \cdots \circ x_{v-1} \subseteq Q$ , then we get  $\frac{x_1}{r_1} \odot \cdots \odot \frac{x_{v-1}}{r_{v-1}} = \frac{x_1 \circ \cdots \circ x_{v-1}}{r_1 \circ \cdots \circ r_{v-1}} = \frac{s \circ x_1 \circ \cdots \circ x_{v-1}}{s \circ r_1 \circ \cdots \circ r_{v-1}} \subseteq S^{-1}Q$  w  $\frac{x_1 \circ \cdots \circ x_{v-1}}{r_1 \circ \cdots \circ r_{v-1}} = \frac{s \circ x_1 \circ \cdots \circ x_{v-1}}{s \circ r_1 \circ \cdots \circ r_{v-1}}$  $\frac{s \circ x_1 \circ \cdots \circ x_{v-1}}{s \circ r_1 \circ \cdots \circ r_{v-1}} \subseteq S^{-1}Q$  which is impossible. Since Q is a  $(u, v)$ -absorbing prime hyperideal of A, s∘ $x_1 \circ \cdots \circ x_{u-1} \subseteq Q$  and s∘ $x_1 \circ \cdots \circ x_{v-1} \nsubseteq Q$ , we have  $x_v \circ \cdots \circ x_{u-1} \subseteq Q$  which implies  $\frac{x_v}{r_v} \odot \cdots \odot \frac{x_{u-1}}{r_{u-1}} = \frac{x_v \circ \cdots \circ x_{u-1}}{r_v \circ \cdots \circ r_{u-1}}$  $rac{x_v \circ \cdots \circ x_{u-1}}{r_v \circ \cdots \circ r_{u-1}} \subseteq S^{-1}Q.$ This shows that  $S^{-1}Q$  is a  $(u-1, v-1)$ -absorbing prime hyperideal of  $S^{-1}A$ .  $\square$
