## Abstract

In addition to standard and non-standard Lagrangians of classical mechanics, we consider, in this work, null Lagrangians that (i) identically satisfy the Euler-Lagrange equation and at the same time can be expressed as (ii) the total derivative of some scalar function. As an addendum to the properties in (i) and (ii) we find that null Lagrangians are also characterized by (iii) vanishing energy functions or Jacobi integrals. By working with higher-order SL(2, R) invariant Schwarzian derivatives introduced recently by Krivonos (Phys. Rev. D **109**, 065029(2024)) we demonstrate that these Schwarzians, especially the even –order ones, provide a natural basis to introduce higher-order null Lagrangians in Schwarzian mechanics.

Physical theories are often formulated using standard Lagrangian functions [1] represented by L = T - V, where T is the kinetic energy of the system under study and V, the corresponding potential function. There also exist Lagrangian functions which involve neither T nor V. Despite this, the sought functions lead to the equations of motion via the Euler-Lagrange equation. Consequently, these Lagrangian functions are qualified as 'non-standard'. The nonstandard Lagrangians play a role in the study of non-linear systems [2,3]. An additional family of Lagrangian functions often called the null Lagrangians (NLs) is also of considerable current interest. By a null Lagrangian, we mean one, the Euler-Lagrange equation of which vanishes identically. The relevance of NL to ordinary differential equations has been discussed by Olver [4] who clearly pointed out that the Euler-Lagrange equations E(NL) = 0vanish identically for all values of the arguments (say t, x) of NL only if it is a total derivative of some function P of t, x and of derivatives of x with respect to t. The function P is often called the gauge function. In the following, we deal with two well-known examples of null Lagrangians quoted by Musielak [5] and point out that, in addition to the wellknown properties of NL quoted above, the energy functions or Jacobi integrals of NLs also vanish identically.

The first null Lagrangian of our interest is given by

$$NL_1(\mathbf{x}, \dot{\mathbf{x}}) = \mathbf{c}_1 \mathbf{x} \dot{\mathbf{x}} \tag{1}$$

where  $c_1$  is an arbitrary constant and, as before, *x* is function of time *t*. Here over dot denotes differentiation with respect to time *t*. The first-order Lagrangian (1) leads to vanishing Euler-Lagrange equation with a gauge function  $P = (\frac{1}{2c_1})x^2$ . The second example of our interest is again a first-order Lagrangian

$$NL_2(x, \dot{x}) = \frac{a_1 \dot{x}}{a_2 x + a_4}$$
 (2)

Here, *a*'s are arbitrary constant. We have now  $E(NL_2) = 0$  with  $P = \frac{a_1}{a_2}|a_2x + a_4|$ . The Jacobi integral or the energy function of any first-order Lagrangian  $(L^{(1)})$ is given by

$$J(L^{(1)}) = x \frac{\delta L^{(1)}}{\delta \dot{x}} - L^{(1)}$$
(3)

Using Eqs. (1) and (2) successively in Eq. (3) we find that  $J(NL_1) = J(NL_2) = 0$ . This indicates that the essential properties of a null Lagrangian, namely, E(NL) = 0 and that NL is the gradient of a scalar function should be supplemented by simultaneous vanishing of its Jacobi integral.

The properties and applications of *NLs* have been explored in different areas of physics and mathematics [6,7]. The construction procedure of null Lagrangians

have also been studied in the literature [8] with particular emphasis on their use in the calculus of variations. The cases of both first and higher-order Lagrangians were considered. The object of the present work is to demonstrate that the null Lagrangian has a natural space in non-relativistic conformally invariant systems.

For an arbitrary function q(t) the expression

$$\{\mathbf{q}(\mathbf{t}),\mathbf{t}\} = \frac{\ddot{\mathbf{q}}(\mathbf{t})}{\dot{\mathbf{q}}(\mathbf{t})} - \frac{3}{2} \left(\frac{\ddot{\mathbf{q}}(\mathbf{t})}{\dot{\mathbf{q}}(\mathbf{t})}\right)^2 \qquad (4)$$

defines the well known Schwarzian derivative [9]. It is invariant under fractional transformation and allows one to construct the SL(2,R)-invariant action functional

$$S = 1/2 \int dt \{q(t), t\}$$
 (5)

such that any function of  $\{q(t),t\}$  can be used as Lagrangians to determine the equation of motion of a higher-derivative SL(2,R)-invariant system. One dimensional mechanics so defined is often called the Schwarzian mechanics[10].

The Schwarzian derivative (4) can be written in an alternative form

$$\{\mathbf{q}(t),t\} = \frac{\mathrm{d}}{\mathrm{d}t} \left(\frac{\ddot{\mathbf{q}}(t)}{\dot{\mathbf{q}}(t)}\right) - \frac{1}{2} \left(\frac{\ddot{\mathbf{q}}(t)}{\dot{\mathbf{q}}(t)}\right)^2,\tag{6}$$

where  $\frac{\ddot{q}(t)}{\dot{q}(t)}$  is called the pre-Schwarzian

derivative. While the Schwarzian derivative is invariant under SL(2, R) transformation  $q(t) = \frac{af(t)+b}{cf(t)+d}$ , with a, b, c, d real or complex constants such that ad - bc =0, the pre-Schwarzian is not. Interestingly, if one chooses to work with a Lagrangian defined by the square of the pre-Schwarzian derivative, namely,

$$L^{(2)} = \frac{1}{2} \left( \frac{\ddot{q}(t)}{\dot{q}(t)} \right)^2,$$
 (7)

one arrives at the following results[11]. The second-order energy function  $J\left(L^{(2)}\right) = \ddot{q}(t)\frac{dL^{(2)}}{d\ddot{q}} - L^{(2)} + \dot{q}(t)\left(\frac{dL^{(2)}}{d\dot{q}(t)} - \frac{d}{dt}\left(\frac{dL^{(2)}}{dq(t)}\right)\right)$  becomes equal to  $-\{q(t),t\}$  and while the equation of motion is obtained as a fourth-order nonlinear differential equation

$$q^{(4)}(t)\dot{q}(t)^{2} - 4\dot{q}(t)\ddot{q}(t) \ddot{q}(t) + 3\ddot{q}^{(3)}(t) = 0$$
(8)

The result in (8) has been obtained from the higher-order Euler-Lagrange equation[12]

$$ELeq = \sum_{i=0}^{n} (-1)^{i} \frac{d^{i}}{dt^{i}} \frac{\partial L}{\partial q^{(i)}} \qquad (9)$$

for n = 2. In this context, it appears rather interesting to envisage a similar study for a third-order Lagrangian defined by the Schwarzian derivative. The energy function of our third-order Lagrangian can be obtained from the general expression

$$J(L) = \sum_{r=1}^{n} q^{(r)}(t) \sum_{k=0}^{n} r(-1)^{k} \frac{d^{k}}{dt^{k}} \frac{\partial L}{\partial q^{(r+k)}(t)}$$
(10)

for the Jacobi integral of the  $n^{th}$ -order Lagrangian. Interestingly, we find  $J(L^{(3)}) = \{q(t),t\}$  and an equation of motion which is exactly the same as that in (8). Thus it is natural to compute results for equations of motion and Jacobi integrals using Lagrangians represented by higherorder Schwarzian derivatives and thus gain some physical insight from them. We shall see in the course of our study this will provide an opportunity to look for null Lagrangians in Schwarzian mechanics.

Higher-order generalization of the Schwarzian derivative in (4) has been considered by a number of authors. For example, more than fifty years ago Aharonov [13] provided definitions of higher-order analogues of  $\{q(t),t\}$ . Relatively recently, Tamanoi [14] introduced another set of higher-order Schwarzians. In close analogy with Aharonov invariants, Schippers [15] defined higher Schwarzians  $S_n\{q(t)\}$  inductively by means of the recurrence relation

$$S_{n+1}(q(t)) = \frac{d}{dt}S_n(q(t)) - (n-1)\frac{\ddot{q}(t)}{\dot{q}(t)}S_n(q(t))$$
(11)

 $n \ge 3$ , with  $S_3(q(t)) = \{q(t), t\}$ . The higher-order Schwarzians obtained from (11) is not invariant under SL(2, R) transformation. The same is true for other such existing results.

In a recent publication Krivonos [16] proposed a physical model for the origin of higher Schwarzians and treated them as Goldstone fields associated with the generators of the Virasoro algebra [17]. This provided a new set of SL(2,R) invariant higher Schwarzians. We denote them by  $\sigma$ , s rather than z, s as in ref.16 such that  $\sigma_3 = \{q(t), t\}$  the Schwarzian derivative while  $\sigma_4, \sigma_5$  etc stand for higher Schwarzians. In the following we choose these higher Schwarzians from ref.16 as Lagrangian functions and compute the Euler-Lagrange equation and Jacobi integrals by using (9) and (10) respectively. For  $L^{(4)} = \sigma_4$  we found

$$ELeq = 0 \quad and \quad J(L^{(4)}) = 0$$
 (12)

with the Gauge function  $P = \{q(t), t\}$ . Thus the higher Schwarzian  $\sigma_4$  represents a null Lagrangian.

Let us now consider the next higherorder Lagrangian given by  $L^{(5)} = \sigma_5$ . In this case we get a sixth-order nonlinear equation of motion

$$\dot{\mathbf{q}}(t)^{4} \mathbf{q}^{(6)}(t) - 6 \dot{\mathbf{q}}(t)^{3} \ddot{\mathbf{q}}(t) \mathbf{q}^{(5)}(t) - 10 \dot{q}(t)^{3} \ddot{q}(t)$$

$$q^{(4)}(t) + \frac{45}{2} \dot{q}(t)^{2} \ddot{q}(t)^{2} q^{(4)}(t) + 30 \dot{q}(t)^{2} \ddot{q}(t)$$

$$\ddot{q}(t)^{(2)} - 60 \dot{q}(t)^{3} \ddot{q}(t) q^{(5)}(t) + \frac{45}{2} \ddot{q}(t)^{5} = 0$$
(13)

with the Jacobi integral

$$J(L^{(5)}) = \frac{45\ddot{q}(t)^4}{4\dot{q}(t)^4} - \frac{25\ddot{q}(t)^2\,\ddot{q}(t)}{4\dot{q}(t)^3} + \frac{5\,\ddot{q}(t)^2}{\dot{q}(t)^2} + \frac{10\ddot{q}(t)\,\ddot{q}^{(4)}(t)}{\dot{q}(t)^2} - \frac{2q^{(5)}(t)}{q(t)},$$
(14)

with  $q^{(n)}(t) = \frac{d^n q(t)}{dt^n}$ . Clearly'  $L^{(5)}$  is not a null Lagrangian although  $\sigma_5$  is SL(2, R) invariant. The reason behind is that  $L^{(5)}$  does not follow from a Gauge function. But working with a sixth-order Lagrangian defined by  $L^{(6)} = \sigma_6$  we found

$$ELeq = 0 \quad and \quad J(L^{(6)}) = 0 \quad (15)$$

and with the gauge function

$$P = \frac{q^{(5)}(t)}{\dot{q}(t)} - \frac{5\ddot{q}(t)q^{(4)}(t)}{\dot{q}(t)^2} - \frac{5\ddot{q}(t)^2}{\dot{q}(t)^2} + \frac{20\ddot{q}(t)^2\ddot{q}(t)}{\dot{q}(t)^3} - \frac{45\ddot{q}(t)^4}{4\dot{q}(t)^4}$$
(16)

In this way we could demonstrate that all even-order higher Schwarzians of Krivonos[16] represent null Lagrangians while the odd-order ones are non-null.

We conclude by noting that fist-order null Lagrangians corresponding to both standard and non-standard Lagrangians have been extensively treated in the literature with a view to look for their usefulness in physics [18,19]. This is , however, not the case with higher-order null Lagrangians, Thus it remains an interesting curiosity to look for the role of higher-order null Lagrangians and/or of higher Schwarzians of Krivonos in physical theories.
