(Submitted to *The Journal of Chemical Physics*)

A survey of the contributions to the Special Topic on Software for Atomistic Machine Learning.

## I. Introduction

Welcome to the Journal of Chemical Physics' Special Topic on Software for Atomistic Machine Learning. For some years now, search engines have been dominating our online experience and have essentially overtaken libraries, whether physical or digital, as the means to find information we are looking for. Most readers of an original research article find it by citation or direct search, and not by browsing journal volumes. Given this, one might wonder what the utility of a Special Topic issue of a scientific journal might be.

However, publishing papers on scientific software has traditionally been somewhat neglected, with few go-to journals for publishing, such as the Journal of Open Source Software or Computer Physics Communications. Typical published software papers tend to discuss relatively mature software packages. In this context, the Journal of Chemical Physics' initiative<sup>1</sup> to support software publications is especially welcome. Given the huge activity currently taking place across many sub-fields and communities in new software development for atomistic machine learning (ML), this landscape is changing fast. Arguably, many papers in this Special Topic issue might not have been written if it were not for the impetus provided by this Special Topic issue.

Beyond their individual value regarding specific software packages, these papers as a collection provide a snapshot at this moment in time of the kinds of tools that people use and the goals they set themselves and achieve for the software implementations of their methods. Table I presents an overview of the 28 invited and contributed articles.<sup>2-29</sup> Of these, 18 (64%) deal directly with machine-learning interatomic potentials (MLIPs). The other 10 articles cover a broad range of subjects, ranging from sampling to data set repositories and workflows.

In the following, we give an overview of these contributions.

## II. Contributions

Since their beginnings in the 1980s and 1990s, MLIPs have undergone tremendous development and now constitute a highly active field of research. Some modern MLIPs can predict forces with an accuracy close to the underlying ab-initio reference method for atomistic systems with many chemical elements and millions of atoms while still providing orders of magnitude of acceleration. These capabilities have increasingly enabled scientific applications using MLIPs that would not otherwise have been possible.

Consequently, there is a trend to **directly integrate MLIPs into molecular dynamics codes**. In this Special Topic, four contributions describe the integration of (a) neuro-evolution potentials into GPUMD (Graphics Processing Units Molecular Dynamics), including improved featurization, GPU code, active learning, and supporting Python packages `gpyumd`, `calorine`, and `pynep`;<sup>3</sup> (b) PhysNet into CHARMM (Chemistry at Harvard Macromolecular Mechanics) via a new MLpot extension of the pyCHARMM interface, with para-chloro-phenol as an example;<sup>12</sup> (c) general MLIPs into CASTEP (CAMbridge Serial Total Energy Package), including active learning, using the example of a GAP/SOAP model;<sup>16</sup> (d) ephemeral data-derived potentials with AIRSS (Ab Initio Random Structure Search).<sup>25</sup>

An important milestone in MLIP development was the introduction of **artificial neural network MLIPs** that were able to efficiently handle large ("high-dimensional") atomistic systems by Behler and Parrinello<sup>30</sup>. Six contributions in this Special Topic present MLIPs related to Behler-Parrinello networks: (a) neuro-evolution potentials;<sup>3</sup> (b) the atomic energy network (`ænet`) in a PyTorch implementation for GPU support;<sup>8</sup> (c) deep potentials via `DeePMD-kit`, recent improvements including attention-based features, learning dipoles and polarizabilities, long-range interactions, model compression, and GPU acceleration;<sup>18</sup> (d) multi-layer-perceptron-based MLIPs via PANNA (Properties from Artificial Neural Network Architectures), with improved GPU support based on TensorFlow and long-range electrostatic interactions through a variational charge equilibration scheme;<sup>21</sup> (e) ephemeral data-derived potentials (ED-DPs) for atomistic structure prediction, including ensemble-based uncertainties.<sup>25</sup>

TABLE I. *Overview of contributions to the Special Topic.* See Table II for acronyms.

Ref.	Package	ML	Language	License	Data	Comments
2	AGOX	—	Python	GPL3	Pt <sub>14</sub> /Au(100)	ASE; structure search
3	GPUMD	ANN	C++	GPL3	Si, C, MD17	CUDA; neuro-evolution potentials
4	QML-lightning	GPR	Python	MIT	QM9, MD17, 3PBA	PyTorch; FCHL19, GPR, RFF, SORF
5	PESPIP	LR	Mathematica C++, Fortran Perl, Python	—	H <sub>2</sub> O, hydrocarbons	permutationally invariant polynomials
6	—	GPR	—	—	Pt nanoparticles	GAP/SOAP application
7	SchNetPack2	ANN	Python	MIT	QM9, MD17, C <sub>2</sub> H <sub>6</sub> O	PyTorch; MD, FieldSchnet, PaiNN
8	anet- PyTorch	ANN	Python	MIT	TiO <sub>2</sub> , LiMoNiTiO amorphous Li <sub>x</sub> Si	PyTorch; atomic energy network
9	DScribe	—	Python, C++	Apache2	CsPb(Cl/Br) <sub>3</sub> , Cu clusters	atomistic featurization
10	mlcolvar	DR	Python	MIT	alanine dipeptide, aldol reaction, chignolin	dimensionality reduction, collective variables, enhanced sampling
11	AGOX	—	Python	GPL3	rutile SnO <sub>2</sub> (110)-(4×1), olivine (Mg <sub>2</sub> SiO <sub>4</sub> ) <sub>4</sub>	ASE; structure generation
12	CHARMM	ANN	Python	—	para-chloro-phenol	PhysNet integration
13	AL4GAP	GPR	Python	MIT	molten salts	ensemble active learning, GAP
14	XPOT	BO	Python	GPL2	Si, Cu, Si, a C	hyperparameter optimization
15	PES-Learn	ANN	Python	BSD3	methanol, HCOOH	benchmark multifidelity approaches
16	CASTEP	GPR	Python	CAL	Al <sub>2</sub> O <sub>3</sub> , Si, a-C	active-learning MLIP for CASTEP
17	q-pac	GPR	Python	MIT	QM9, ZnO, ZnO <sub>2</sub>	kernel charge equilibration
18	DeePMD-kit	ANN	Python, C/C++	LGPL3	H <sub>2</sub> O, Cu, HEA, OC2M, SPICE	TensorFlow; deep potentials
19	sphericart	—	C++, Python	Apache2	—	PyTorch; fast spherical harmonics
20	MLIP-3	NLR	C++	BSD	Cu(111)	moment tensor potentials
21	PANNA2	ANN	Python	MIT	rMD17, C, NaCl clusters	TensorFlow; ANN MLIP training
22	DeepQMC	ANN	Python	MIT	NH <sub>3</sub> , CO, N <sub>2</sub> , cyclobutadiene, reactions; ScO, TiO, VO, CrO	JAX; variational quantum Monte Carlo
23	SISSO++	SR	C++, Python	Apache2	—	symbolic regression
24	wfl, ExPyRe	—	Python	GPL2	—	ASE-based workflows
25	EDDP	ANN	Fortran, Julia	GPL2, MIT	C, Pb, ScH <sub>12</sub> , Zn(CN) <sub>2</sub>	ephemeral data-derived potentials
26	ColabFit Exchange	—	—	—	many datasets	dataset repository
27	ACEpoten- tials.jl	LR	Julia	MIT	6 elements, H <sub>2</sub> O, AlSi <sub>10</sub> , polyethylene glycol, CsPbBr <sub>3</sub>	linear GPR/ACE MLIPs
28	glp	AD	Python	MIT	SnSe	JAX; auto-differentiation, heat flux
29	QUIP	GPR	Fortran, Python, C	GPL2, ASL	Si, core e binding energies, MoNbTaVW	GAP MLIPs, MPI parallelization

**Message-passing neural networks** allow the exchange of information between atoms beyond their local environments by repeatedly passing messages between them. Two contributions provide such MLIPs: (a) the SchNetPack2 library provides improved support functionality, including data sparsity, equivariance, and PyTorch-based MD, and provides four MLIPs: SchNet, FieldSchnet (external fields), as well as PaiNN and SO3net (equivariance);<sup>7</sup> (b) the existing PhysNet MLIP is integrated into CHARMM.<sup>12</sup>

**Kernel-based learning** is another ML approach that many MLIPs employ. Gaussian process regression (GPR), in particular, has been frequently used since the introduction of Gaussian Approximation Potentials (GAP)<sup>31</sup>. Five contributions in this Special Topic deal with kernel-based MLIPs: (a) the QML-lightning package provides GPU-accelerated sparse approximate GPR and representations (random features, FCHL19);<sup>4</sup> (b) AL4GAP provides ensemble-based active learning for GAP MLIPs to study charge-neutral molten-salt mix-

TABLE II. *Glossary.*

Acronym	Meaning
a-C	Amorphous Carbon
AD	Automatic Differentiation
ACE	Atomic Cluster Expansion
AGOX	Atomistic Global Optimization X
AIRSS	Ab Initio Random Structure Search
AL	Active Learning
ANN	Artificial Neural Network
ASE	Atomic Simulation Environment
ASL	Academic Software License
BO	Bayesian Optimization
BSD	Berkeley Software Distribution
CAL	CASTEP Academic License
CASTEP	CAMbridge Serial Total Energy Package
CHARMM	Chemistry at HARvard Macromolecular Mechanics
CUDA	Compute Unified Device Architecture
DR	Dimensionality Reduction
EDDP	Ephemeral Data-Derived Potential
FCHL19	Faber, Christensen, Huang, Lilienfeld 2019
GAP	Gaussian Approximation Potential
GOFEE	Global Optimization with First-principles Energy Expressions
GPL	General Public License
GPR	Gaussian Process Regression
GPU	Graphics Processing Unit
GPUMD	Graphics Processing Units Molecular Dynamics
JAX	Just After eXecution
LGPL	Lesser General Public License
LR	Linear Regression
MIT	Massachusetts Institute of Technology
MD	Molecular Dynamics
ML	Machine Learning
MLIP	Machine-Learning Interatomic Potential
MIP	Message-Passing Interface
NLR	Non-Linear Regression
PaiNN	Polarizable atom interaction Neural Network
PANNA	Properties from Artificial Neural Network Architectures
PES	Potential Energy Surface
PIP	Permutationally Invariant Polynomial
PLUMED	PLUgIn for MolEcular Dynamics
QML	Quantum Machine Learning
QUIP	QUantum mechanics and Interatomic Potentials
RFF	Random Fourier Features
SISSO	Sure Independence Screening and Sparsifying Operator
SOAP	Smooth Overlap of Atomic Positions
SORF	Structured Orthogonal Randomized Features,
SR	Symbolic Regression
XPOT	Cross-Platform Optimizer for Potentials

tures.<sup>13</sup> (c) the `q-pac` package implements kernel charge equilibration based on sparse GPR for long-range electrostatic interactions, non-local charge transfer, and energetic response to external fields;<sup>17</sup> (d) the QUIP package allows training and deployment of GAP models, recent additions including distributed training via the Message Passing Interface (MPI) and compressed features;<sup>29</sup> (e) an application study develops a GAP/SOAP MLIP to obtain the pressure-temperature phase diagram of Pt and to simulate the spontaneous crystallization of a large Pt nanoparticle.<sup>6</sup>

**Other** ML approaches can be used to develop MLIPs, notably linear regression. Three contributions describe such MLIPs: (a) the `ACEpotentials.jl` Julia package provides MLIPs based on linear GPR and the atomic cluster expansion (ACE) representation, including uncertainties and active learning;<sup>27</sup> (b) the `PESPIP` package provides MLIPs based on permutationally invariant polynomials in Morse-transformed interatomic distances, including their optimization;<sup>5</sup> (c) the `MLIP-3` package provides moment tensor potentials, including fragment-based active learning for large simulation cells.<sup>20</sup>

Besides the MLIPs themselves, seven contributions provide **auxiliary tooling and analysis** that focus on specific aspects of MLIPs but are not specific to one MLIP: (a) the `Dscribe` library provides many atomistic representations, and has been extended to include Valle-Oganov materials fingerprints and derivatives for all representations;<sup>9</sup> (b) the `sphericart` package implements efficient real-valued spherical harmonics, a key ingredient of many representations for MLIPs, including stable Cartesian derivatives;<sup>19</sup> (c) the `XPOT` (Cross-Platform Optimizer for Potentials) package provides hyperparameter optimization for MLIPs;<sup>14</sup> (d) `PES-Learn` benchmarks four approaches to train neural-network MLIPs on data with different levels of fidelity (e.g., low and high accuracy);<sup>15</sup> (e) the `wf1` (Workflow) and `ExPyRe` (Execute Python Remotely) packages provide workflow management routines tailored for atomistic simulations and MLIP development;<sup>24</sup> (f) the ColabFit Exchange repository hosts hundreds of diverse datasets of atomistic systems in extended XYZ format for MLIP benchmarking and development.<sup>26</sup> (g) the `glp` package demonstrates how to use automatic differentiation to efficiently obtain forces, stress, and heat flux for message-passing MLIPs;<sup>28</sup>

The remaining five contributions span a wide range of **other areas**: (a) the `mlcolvar` library implements multiple dimensionality reduction methods to identify collective variables for analysis and enhanced sampling in MD simulations, including an interface to the PLUMED (PLUgIn for MolEcular Dynamics) software;<sup>10</sup> (b) the `AGOX` (Atomistic Global Optimization X) package enables developing global optimization algorithms for atomistic structure search, including random search, basin hopping, evolutionary algorithms, and global optimization with first-principles energy expressions (GOFEE);<sup>2</sup> (c) the same `AGOX` package also includes structure generation based on local optimization in “complementary en-

ergy” landscapes (oversmoothed MLIPs), favoring structures with fewer distinct local motifs;<sup>11</sup> (d) the DeepQMC package provides a framework for neural network-based variational quantum Monte Carlo methods, including PauliNet, FermiNet, and DeepErwin.<sup>22</sup> (e) the SISSO++ (Sure Independence Screening and Sparsifying Operator) software offers symbolic regression, including recent improvements in expression representation, support for units, nonlinear parametrization, and the solver algorithm.<sup>23</sup>

### III. Summary

This Special Topic on Software for Atomistic Machine Learning contains 28 invited and contributed articles. They range from MLIPs based on neural networks, kernel models, and linear regression, as well as their integration into MD codes, to auxiliary tooling, structure search, dimensionality reduction, quantum Monte Carlo methods, and symbolic regression. We hope you enjoy reading this community effort at capturing the state of the field at this moment.

The Journal of Chemical Physics encourages and welcomes submissions of original articles describing software implementations relevant to the broad remit of the journal.
