COLORING THE INTERSECTION OF TWO MATROIDS

ELI BERGER AND HE GUO

Abstract. A result [\[1\]](#page-7-0) from 2006 of Aharoni and the first author of this paper states that for any two natural numbers p, q, where p divides q, if a matroid M is p-colorable and a matroid N is q-colorable then $M \cap N$ is $(p+q)$ -colorable. In this paper we show that the assumption that p divides q is in fact redundant, and we also prove that $M \cap N$ is even $p + q$ list-colorable.

The result uses topology and relies on a new parameter yielding a lower bound for the topological connectivity of the intersection of two matroids.

1. Introduction

A *hypergraph* is a pair $H = (V, E)$ where the *vertex set* V is a finite set and the *edge set* E is a set of subsets of V. For $U \subseteq V$, the *induced subhypergraph* of H on U is the hypergraph whose vertex set is U and whose edge set is $\{f \in E(H) \mid f \subseteq U\}$, and we denote the induced subhypergraph by $H[U]$. A set $X \subseteq V$ is called *independent* in H if there is no $e \in E$ such that $e \subseteq X$. We denote by $\mathcal{I}(H)$ the set of all independent sets in H.

A property of a set of the form $\mathcal{C} = \mathcal{I}(H)$ is that if $\sigma \in \mathcal{C}$ and $\tau \subseteq \sigma$ then $\tau \in \mathcal{C}$. A finite set of finite sets with such closed under taking subsets property is called an *(abstract simplicial) complex*. The reversed operator for $\mathcal I$ can be defined as follows.

Definition 1.1. Let C be an abstract simplicial complex on the set V. We write

 $circ(C) = \{e \subseteq V : e \notin C, (\forall x \in e)(e \setminus \{x\} \in C)\}.$

Observation 1.2. If C is an abstract simplicial complex on V then $C = \mathcal{I}((V, circ(C)))$.

Definition 1.3. Let $H = (V, E)$ be a hypergraph. For an edge $e \in E$, we write

$$
H - e = (V, E \setminus \{e\}).
$$

For a set $X \subseteq V$ *, we write*

$$
H/X = (V \setminus X, \{e \setminus X \mid e \in E, e \nsubseteq X\}),
$$

\n
$$
H \setminus X = (V \setminus X, \{e \in E \mid e \cap X = \emptyset\}),
$$

\n
$$
H \sim X = (V, \{e \in E \mid e \cap X = \emptyset\}).
$$

If $v \in V$ *then we write* $H \sim v = H \sim \{v\}$ *.*

Note that $H \setminus X$ and $H \sim X$ differ only by their vertex sets.

Definition 1.4. Let $H = (V, E)$ be a hypergraph, and suppose the following properties hold:

- $\bullet \emptyset \notin E$.
- *there are no two distinct edges* $C_1, C_2 \in E$ *such that* $C_1 \subseteq C_2$ *, and*
- *(circuit elimination axiom) for every two edges* $C_1, C_2 \in E$ *and every* $u \in C_1 \cap C_2$ *and* $v \in C_1$ $C_1 \setminus C_2$ *there exists* $C_3 \in E$ *, such that* $C_3 \subseteq C_1 \cup C_2$ *and* $v \in C_3$ *and* $u \notin C_3$ *.*

Date: June 2024.

Then we say that H *is a circuit representation of a matroid, and that* I(H) *is the independent set representation of this matroid. We call* V *the ground set of the matroid. The elements of* E *are called the circuits of the matroid and the elements of* $\mathcal{I}(H)$ *are called the independent sets of the matroid.*

In this paper, when saying that $\mathcal M$ is a matroid, we mean that $\mathcal M$ is the set of independent sets of some matroid. However, when applying the operators / and ∼, we refer to the application of these operators on the circuit representation of the matroid. Formally, if M is a matroid on the ground set V, whose circuit representation is $H = (V, circ(\mathcal{M}))$, and if $X \subseteq V$, then we define

$$
\mathcal{M}[X] = \mathcal{I}(H[X]) \quad \text{and} \quad \mathcal{M}/X = \mathcal{I}(H/X),
$$

and if $v \in V$ then we define

$$
\mathcal{M} \sim v = \mathcal{I}(H \sim v) \ .
$$

Note that the above definition of \mathcal{M}/X coincides with the usual definition of contraction in matroids. Equivalent to Definition [1.4,](#page-0-0) M is a matroid if the following hold:

- $\bullet \emptyset \in \mathcal{M}.$
- If $T \in \mathcal{M}$ and $S \subseteq T$, then $S \in \mathcal{M}$.
- (Independence augmentation property) If $S, T \in \mathcal{M}$ and $|S| < |T|$, then there exists $v \in T \setminus S$ such that $S \cup \{v\} \in \mathcal{M}$.

Definition 1.5. Given a complex C, the chromatic number $\chi(C)$ of C is the minimum number of sets *in* C such that their union is \bigcup C. The list chromatic number $\chi_{\ell}(\mathcal{C})$ of C is the minimum number k such that for any lists of colors $(L_v)_{v \in \bigcup \mathcal{C}}$ of size k, there exists a choice function $f: \bigcup \mathcal{C} \to \bigcup_{v \in \bigcup \mathcal{C}} L_v$ *such that* $f(v) \in L_v$ *for every v and* $f^{-1}(c) \in C$ *for every color c*.

Setting $L_v = \{1, \ldots, \chi_\ell(\mathcal{C})\}$ for each v proves

$$
\chi(\mathcal{C}) \leq \chi_{\ell}(\mathcal{C}).
$$

In [\[1\]](#page-7-0), it is proved that for two matroids $\mathcal M$ and $\mathcal N$ on the same ground set, then

$$
\chi(\mathcal{M} \cap \mathcal{N}) \le 2 \max(\chi(\mathcal{M}), \chi(\mathcal{N})).
$$

And it is also proved that if $\chi(\mathcal{M})$ divides $\chi(\mathcal{N})$, then

$$
\chi(\mathcal{M} \cap \mathcal{N}) \leq \chi(\mathcal{M}) + \chi(\mathcal{N}).
$$

In this paper, we extends these results.

Theorem 1.6. *For two matroids* M *and* N *on the same ground set,*

$$
\chi_{\ell}(\mathcal{M} \cap \mathcal{N}) \leq \chi(\mathcal{M}) + \chi(\mathcal{N}).
$$

2. THE TOPOLOGICAL PARAMETER n

Let $\mathcal C$ be an abstract simplicial complex. Assuming we fix some ring R , we can apply homology theory on C. We write $\eta(\mathcal{C})$ for the minimal value of k such that the reduced homology $\tilde{H}_{k-1}(\mathcal{C}, R)$ does not vanish. If C is the empty complex then we write $\eta(\mathcal{C}) = 0$ and if all reduced homology groups of C vanish then we write $\eta(\mathcal{C}) = \infty$.

For two complexes \mathcal{C}, \mathcal{D} on the disjoint sets, the *join* $\mathcal{C} * \mathcal{D}$ is $\{S \cup T \mid S \in \mathcal{C}, T \in \mathcal{D}\}\.$

Theorem 2.1. [\[1\]](#page-7-0) *Let* C *and* D *be two abstract simplicial complexes on the disjoint sets. Then*

$$
\eta(\mathcal{C} * \mathcal{D}) \ge \eta(\mathcal{C}) + \eta(\mathcal{D}).
$$

For two complexes on the same set, we can prove the following inequalities using the Mayer–Vietoris sequence:

Theorem 2.2. *Let* A *and* B *be two abstract simplicial complexes on the same set* V *. Then*

- (1) $n(A \cup B) > \min(n(A), n(B), n(A \cap B) + 1)$.
- (2) $\eta(\mathcal{A} \cap \mathcal{B}) \ge \min(\eta(\mathcal{A}), \eta(\mathcal{B}), \eta(\mathcal{A} \cup \mathcal{B}) - 1).$
- (3) $\eta(\mathcal{A}) \ge \min(\eta(\mathcal{A} \cup \mathcal{B}), \eta(\mathcal{A} \cap \mathcal{B})).$

Using inequality [\(1\)](#page-2-0) for $\mathcal{A} = \mathcal{I}(H \setminus \{v\})$ and $\mathcal{B} = 2^{\{v\}} * \mathcal{I}(H \setminus (\{v\} \cup N_H(v)))$ of Theorem [2.2,](#page-2-1) where 2^S is the power set of the set S and $N_H(v)$ is the set of neighbors of v in H, we can deduce the following

Theorem 2.3. Let $H = (V, E)$ be a hypergraph and let v be a vertex of H such that $\{v\} \notin E$. Then

$$
\eta(\mathcal{I}(H)) \ge \min\Big(\eta\big(\mathcal{I}(H \setminus \{v\})\big), \ \eta\big(\mathcal{I}(H/\{v\})\big) + 1\Big).
$$

Using inequality [\(3\)](#page-2-2) for $\mathcal{A} = \mathcal{I}(H)$ and $\mathcal{B} = 2^e * \mathcal{I}(H/e)$ of Theorem [2.2](#page-2-1) we can also deduce the following (see [\[2,](#page-7-1) Section 8.3] for the details of the proof.)

Theorem 2.4. *Let* H *be a hypergraph and let* e *be an edge of* H *which does not contain any other edge. Then*

$$
\eta(\mathcal{I}(H)) \ge \min\left(\eta(\mathcal{I}(H-e)), \ \eta(\mathcal{I}(H/e)) + |e| - 1\right)
$$

.

Theorem [2.4](#page-2-3) was proved in $[4]$ for the case that H is a graph, but the same proof holds for general hypergraphs as well. While Theorem [2.4](#page-2-3) is extensively used for graphs, its use for hypergraphs is less common so far. It is used implicitly in [\[3\]](#page-7-3).

Repeatedly applying Theorem [2.3](#page-2-4) and Theorem [2.4](#page-2-3) gives a very powerful tool for obtaining lower bounds for η .

Theorem 2.5. Let $\mathcal{M}_1, \ldots, \mathcal{M}_k$ be matroids on the ground set V, and let $v \in V$. Then either

$$
\eta(\mathcal{M}_1 \cap \ldots \cap \mathcal{M}_k) \ge \eta((\mathcal{M}_1 \sim v) \cap \mathcal{M}_2 \cap \ldots \cap \mathcal{M}_k)
$$

or there exists C *such that*

 (1) $v \in C$ *.* (2) C *is a circuit of* \mathcal{M}_1 *.* (3) $C \in \bigcap_{i=2}^k \mathcal{M}_i$. (4) $\eta(M_1 \cap ... \cap M_k) \geq \eta((M_1/C) \cap (M_1/C) \cap ... \cap (M_k/C)) + |C| - 1.$

Proof. Let $H_i = (V, E_i) = (V, circ(\mathcal{M}_i))$ be the circuit representation of \mathcal{M}_i for $i = 1, ..., k$. For $I \subseteq \{1, \ldots, k\}$, let $\cup_{i \in I} H_i = (V, \cup_{i \in I} E_i)$ and let $H = \cup_{i=1}^k H_i$. So $\mathcal{I}(H) = \cap_{i=1}^k \mathcal{M}_i$.

Let C_1, \ldots, C_t be all the circuits of \mathcal{M}_1 satisfying that $v \in C_j$ and $C_j \in \bigcap_{i=2}^k \mathcal{M}_i$ for each $1 \leq j \leq t$.

Claim 2.6.

(1) I(H − C¹ − · · · − Ct) = (M¹ ∼ v) ∩ M² ∩ · · · ∩ Mk,

(2)
$$
\mathcal{I}((H - C_1 - \cdots - C_{j-1})/C_j) = \mathcal{I}(H/C_j),
$$

(3)
$$
\mathcal{I}(H/C_j) = (\mathcal{M}_1/C_j) \cap \cdots \cap (\mathcal{M}_k/C_j).
$$

Suppose the claim is true, then applying Theorem [2.4](#page-2-3) repeatedly, where each C_i in turn takes the role of e in the theorem, yields either by (1) that

$$
\eta(\mathcal{I}(H)) \geq \eta(\mathcal{I}(H - C_1 - \cdots - C_t)) = \eta((\mathcal{M}_1 \sim v) \cap \mathcal{M}_2 \cap \cdots \cap \mathcal{M}_k),
$$

or for some $1 \leq j \leq t$ by [\(2\)](#page-2-6) and [\(3\)](#page-2-7) that

$$
\eta(\mathcal{I}(H)) \ge \eta\Big(\mathcal{I}((H - C_1 - \dots - C_{j-1})/C_j)\Big) + |C_j| - 1
$$

= $\eta\Big(\mathcal{I}(H/C_j)\Big) + |C_j| - 1$
= $\eta\Big((\mathcal{M}_1/C_j) \cap \dots \cap (\mathcal{M}_k/C_j)\Big) + |C_j| - 1.$

Setting $C = C_j$ completes the proof.

Proof of the claim. To verify [\(1\)](#page-2-5), for S in the LHS, S does not contain edges of $\cup_{i=2}^{k} H_i$, therefore $S \in \bigcap_{i=2}^k \mathcal{M}_i$. And $S \setminus \{v\}$ does not contain any edge $f \in H_i$ satisfying $f \subseteq V \setminus \{v\}$, since such $f \neq C_j$ for every $1 \leq j \leq t$. Therefore $S \setminus \{v\} \in \mathcal{M}_1[V \setminus \{v\}]$ and $S \in \mathcal{M} \sim v$. Thus the LHS is contained in the RHS. For T in the RHS, $T \in \bigcap_{i=2}^k \mathcal{M}_i$ implies T is independent in $\bigcup_{i=2}^k H_i$. And T does not contain any edge of $H_1[V \setminus \{v\}]$. Furthermore, T does not contain any $C \in H_1$ such that $v \in C$ and $C \neq C_i$ for every $1 \leq j \leq t$. Suppose not, then such C must contain an edge of some H_i for $2 \leq i \leq k$ as C_1, \ldots, C_t are all the edges of H_1 including v and containing no edge of $\cup_{i=2}^t H_i$, which contradicts to the assumption $T \in \mathcal{M}_i$. Therefore the RHS is contained in the LHS.

To verify [\(2\)](#page-2-6), the RHS is contained in the LHS, since $(H - C_1 - \cdots - C_{j-1})/C_j$ and H/C_j have the same vertex set and the edge set of the former is contained in that of the latter. And for any S in the LHS, we claim that S does not contain $C_{\ell} \setminus C_j$ for any $1 \leq \ell \leq j-1$: suppose not, i.e., $C_{\ell} \setminus C_j \subseteq S$ for some $1 \leq \ell \leq j-1$. Since $v \in C_j \cap C_\ell$, then by the circuit elimination axiom, there exists a circuit C' of \mathcal{M}_1 such that $C' \subseteq (C_j \cup C_\ell) \setminus \{v\}$. Then S contains $C' \setminus C_j$, contradicting the assumption $S \in \mathcal{I}(H/C_j)$. Therefore the LHS is contained in the RHS.

To verify [\(3\)](#page-2-7), since $C_j \in \bigcap_{i=2}^k \mathcal{M}_i$, no edge of $\bigcup_{i=2}^k H_i$ is contained in C_j . And since $C_j \in circ(\mathcal{M}_1)$, no edge of H_1 other than C_i itself is contained in C_i . Therefore

$$
H/C_j = (\cup_{i=1}^k H_i)/C_j = \cup_{i=1}^k (H_i/C_j).
$$

By definition $\mathcal{I}(H_i/C_j) = \mathcal{M}_i/C_j$ for each $i = 1, ..., k$, therefore $\mathcal{I}(H/C_j) = \bigcap_{i=1}^k (\mathcal{M}_i/C_j)$.

3. THE COMBINATORIAL PARAMETER $\nu_{p,q}(\mathcal{M}, \mathcal{N})$

For sets A_1, \ldots, A_k and an element v, we write $\#v(A_1, \ldots, A_k)$ for the number of sets among A_1, \ldots, A_k to which v belongs. For two natural numbers p, q and two matroids \mathcal{M}, \mathcal{N} on the same ground set V we define

$$
\nu_{p,q}(\mathcal{M},\mathcal{N}) = \max_{\substack{A_1,\ldots,A_p \in \mathcal{M} \\ B_1,\ldots,B_q \in \mathcal{N}}} \sum_{v \in V} \min\big(\#v(A_1,\ldots,A_p),\ \#v(B_1,\ldots,B_q)\big).
$$

Note that $\nu_{1,1}(\mathcal{M}, \mathcal{N})$ is the size of the largest set which is independent in both M and N.

Observation 3.1. The parameter ν is monotone in p, q, M and N, i.e., if p, q, p', q' are natural *numbers and* M, N, M', N' are matroids such that $p \leq p'$, $q \leq q'$, $M \subseteq M'$ and $N \subseteq N'$ then $\nu_{p,q}(\mathcal{M},\mathcal{N}) \leq \nu_{p',q'}(\mathcal{M}',\mathcal{N}')$

Observation 3.2. *For any two natural numbers* p, q *and two matroids* M, N *on the same ground set* V *, there exist sets* $A_1, \ldots, A_p \in \mathcal{M}$ and $B_1, \ldots, B_q \in \mathcal{N}$ such that $\sum_{i=1}^p |A_i| = \sum_{j=1}^q |B_j| = \nu_{p,q}(\mathcal{M}, \mathcal{N})$ *and every* $v \in V$ *satisfies* $\#v(A_1, \ldots, A_p) = \#v(B_1, \ldots, B_q)$ *.*

Lemma 3.3. If M, N are matroids on a common ground set then for every natural number q

$$
\nu_{1,1}(\mathcal{M},\mathcal{N}) \geq \lceil \frac{\nu_{q,q}(\mathcal{M},\mathcal{N})}{q} \rceil.
$$

Proof. Let V be the common ground set. By Edmonds' matroid intersection theorem there exist sets $I, V_1, V_2 \subseteq V$ such that $V = V_1 \cup V_2$ and $V_1 \cap V_2 = \emptyset$ and $I \in \mathcal{M} \cap \mathcal{N}$ and $I \cap V_1$ is the largest among subsets of V_1 which are independent in M, and $I \cap V_2$ is the largest among subsets of V_2 which are independent in N .

Now for every $A_1, \ldots, A_q \in \mathcal{M}$ and $B_1, \ldots, B_q \in \mathcal{N}$ we have

$$
\sum_{v \in V} \min (\#v(A_1, ..., A_q), \#v(B_1, ..., B_q))
$$
\n
$$
= \sum_{v \in V_1} \min (\#v(A_1, ..., A_q), \#v(B_1, ..., B_q)) + \sum_{v \in V_2} \min (\#v(A_1, ..., A_q), \#v(B_1, ..., B_q))
$$
\n
$$
\leq \sum_{v \in V_1} \#v(A_1 \cap V_1, ..., A_q \cap V_1) + \sum_{v \in V_2} \#v(B_1 \cap V_2, ..., B_q \cap V_2)
$$
\n
$$
\leq q \cdot |I \cap V_1| + q \cdot |I \cap V_2| = q|I| \leq q\nu_{1,1}(\mathcal{M}, \mathcal{N}),
$$

which completes the proof. \Box

Lemma 3.4. Let M, N be two matroids on the same ground set V such that $\nu_{1,1}(M, N) > 0$. Let p, q be natural numbers with $p \leq q$. Then there exist sets $X_1, \ldots, X_p \in \mathcal{M}$ and $Y_1, \ldots, Y_q \in \mathcal{N}$ and an *element* $z \in V$ *with the following properties:*

• *Every* $v \in V \setminus \{z\}$ *satisfies* $\#v(X_1, \ldots, X_n) = \#v(Y_1, \ldots, Y_n)$ *,*

$$
\bullet \#z(X_1,\ldots,X_p)=p,
$$

• $\sum_{i=1}^{q} |Y_i| = \nu_{p,q}(\mathcal{M}, \mathcal{N}).$

Proof. Write $r = \nu_{1,1}(\mathcal{M}, \mathcal{N})$. Let $Z \in \mathcal{M} \cap \mathcal{N}$ have size r, and let $A_1, \ldots, A_p \in \mathcal{M}$ and $B_1, \ldots, B_q \in \mathcal{N}$ be chosen such that

- (1) $\sum_{v \in V} \min (\#v(A_1, ..., A_p), \#v(B_1, ..., B_q)) = \nu_{p,q}(\mathcal{M}, \mathcal{N}) - 1$,
- (2) Subject to the above condition $\sum_{v \in Z} \min (\#v(A_1, \ldots, A_p), \#v(B_1, \ldots, B_q))$ is maximal,
- (3) Subject to the above two conditions $\sum_{i=1}^{p} |A_i| + \sum_{j=1}^{q} |B_j|$ is minimal.

Note that $\sum_{i=1}^p |A_i| + \sum_{j=1}^q |B_j|$ is minimal in condition [\(3\)](#page-4-0) guarantees that for every $v \in V$,

(4)
$$
\#v(A_1, ..., A_p) = \#v(B_1, ..., B_q),
$$

since if $\#v(A_1,\ldots,A_p) > \#v(B_1,\ldots,B_q)$ for some $v \in V$, we can remove v from some of A_i including it, which does not violate conditions [\(1\)](#page-4-1) and [\(2\)](#page-4-2), but has a smaller total size, a contradiction. Similarly, we can get a contradiction if $\#v(A_1, \ldots, A_p) < \#v(B_1, \ldots, B_q)$ for some $v \in V$.

Therefore we have

$$
\sum_{j=1}^q |B_j| = \sum_{v \in V} \#v(B_1, \dots, B_q) = \nu_{p,q}(\mathcal{M}, \mathcal{N}) - 1 < \nu_{p,q}(\mathcal{M}, \mathcal{N}) \leq \nu_{q,q}(\mathcal{M}, \mathcal{N}) \leq qr,
$$

which implies at least one set among B_1, \ldots, B_q has size less than r. Without loss of generality $|B_q| < r$. By the independence augmentation property, this implies that for some $z \in Z \setminus B_q$ we have $B'_q = B_q \cup \{z\} \in \mathcal{N}.$

We now claim that for every $i \in \{1, \ldots, p\}$ we have $A_i \cup \{z\} \in \mathcal{M}$. Suppose not, then, say, $A_p \cup \{z\} \notin \mathcal{M}$, so it contains some circuit C of M and $z \in C$. Take some $c \in C \setminus Z$. Then $c \in A_p$. By the independence augmentation property, $C \setminus \{c\} \in \mathcal{M}$ can be extended to a size $|A_p|$ set $A'_p =$ $(A_p \cup \{z\}) \setminus \{c\} \in \mathcal{M}$. Since

$$
\#c(A_1,\ldots,A_{p-1},A'_p)=0=\#c(A_1,\ldots,A_{p-1},A_p)-1
$$

and

$$
\min(\#z(A_1,\ldots,A_{p-1},A'_p), \#z(B_1,\ldots,B_{q-1},B'_q)) = \min(\#z(A_1,\ldots,A_p), \#z(B_1,\ldots,B_q)) + 1,
$$

by (4) we now have

$$
\sum_{v \in V} \min(\#v(A_1, \dots, A_{p-1}, A'_p), \#v(B_1, \dots, B_{q-1}, B'_q))
$$

=
$$
\sum_{v \in V} \min(\#v(A_1, \dots, A_{p-1}, A_p), \#v(B_1, \dots, B_{q-1}, B_q)) = \nu_{p,q}(\mathcal{M}, \mathcal{N}) - 1
$$

and

$$
\sum_{v \in Z} \min(\#v(A_1, \ldots, A_{p-1}, A'_p), \#v(B_1, \ldots, B_{q-1}, B'_q)) = \sum_{v \in Z} \min(\#v(A_1, \ldots, A_p), \#v(B_1, \ldots, B_q)) + 1
$$

contradicting the way in which A_1, \ldots, A_q and B_1, \ldots, B_q were chosen. This finishes the proof of the claim.

Now the sets $X_i = A_i \cup \{z\}$ (for $i = 1, \ldots, p$) and $Y_j = B_j$ (for $j = 1, \ldots, q - 1$) and $Y_q = B_q \cup \{z\}$ satisfy the required conditions of the lemma. \Box

4. Relation between the parameters

Theorem 4.1. *Let* p, q *be two natural numbers and let* M, N *be two matroids on the same ground set. Then*

$$
\eta(\mathcal{M} \cap \mathcal{N}) \ge \frac{\nu_{p,q}(\mathcal{M}, \mathcal{N})}{p+q}.
$$

Proof. The proof is by induction on the size of the common ground set V. When $V = \emptyset$, $\eta(\mathcal{M} \cap \mathcal{N}) =$ $\nu_{p,q}(\mathcal{M}, \mathcal{N}) = 0$. The statement is true.

Next we turn to $|V| \ge 1$. We assume without loss of generality $p \le q$ and by Lemma [3.4,](#page-4-4) there exist sets $X_1, \ldots X_p \in \mathcal{M}$ and $Y_1, \ldots, Y_q \in \mathcal{N}$ and an element $z \in V$ with the following properties:

- Every $v \in V \setminus \{z\}$ satisfies $\#v(X_1,\ldots,X_p) = \#v(Y_1,\ldots,Y_q)$,
- $\#z(X_1, \ldots, X_p) = p$,
- • $\sum_{i=1}^q |Y_i| = \nu_{p,q}(\mathcal{M}, \mathcal{N}).$

We apply Theorem [2.5](#page-2-8) with M taking the role of M_1 . Then either

$$
\eta(\mathcal{M} \cap \mathcal{N}) \ge \eta((\mathcal{M} \sim z) \cap \mathcal{N})
$$

or there is some circuit C in M such that $z \in C, C \in \mathcal{N}$, and

(6)
$$
\eta(\mathcal{M} \cap \mathcal{N}) \geq \eta((\mathcal{M}/C) \cap (\mathcal{N}/C)) + |C| - 1.
$$

If [\(6\)](#page-5-0) occurs, write $I = C \setminus \{z\}$ and $s = |I| = |C| - 1$. Let $A_1, \ldots, A_p \in \mathcal{M}$ and $B_1, \ldots, B_q \in \mathcal{N}$ satisfy $\nu_{p,q}(\mathcal{M}, \mathcal{N}) = \sum_{u \in V} \min (\#u(A_1, \ldots, A_p), \#u(B_1, \ldots, B_q)).$

We can find sets $S_1, \ldots S_p, T_1, \ldots, T_q$, each of size s, such that $A_i \setminus S_i \in \mathcal{M}/C$ for all $i \in \{1, \ldots, p\}$ and $(B_j \setminus \{z\}) \setminus T_j \in \mathcal{N}/C$ for all $j \in \{1, \ldots, q\}$. In detail, to construct S_i , we take $A_i \cap C$ and add any $s - |A_i \cap C|$ other elements. Since C is a circuit in M, $C \nsubseteq A_i$ and then $|A_i \cap C| < |C| = s + 1$. To construct T_i , we take $(B_j \setminus \{z\}) \cap C$ and add any $s - |(B_j \setminus \{z\}) \cap C|$ other elements.

Write $A'_i = A_i \setminus S_i$, which is in \mathcal{M}/C , for all $i \in \{1, ..., p\}$, and $B'_j = (B_j \setminus \{z\}) \setminus T_j$, which is in \mathcal{N}/C , for all $j \in \{1, \ldots, q\}$. We now claim that for each $u \in V$ we have

$$
\min (\#u(A_1, ..., A_p), \#u(B_1, ..., B_q))
$$

$$
\leq \min (\#u(A'_1, ..., A'_p), \#u(B'_1, ..., B'_q)) + \#u(S_1, ..., S_p, T_1, ..., T_q).
$$

Indeed, when $u \neq z$ this is trivial, since $u \in A_i$ if and only if $u \in A'_i$ or S_i , and $u \in B_j$ if and only if $u \in B'_j$ or T_j ; and for $u = z$ it follows from that fact that whenever $z \in A_i$ we must have also $z \in S_i$ so that

$$
\#z(A_1,\ldots,A_p)\leq \#z(S_1,\ldots,S_p,T_1,\ldots,T_q).
$$

We thus have

$$
\nu_{p,q}(\mathcal{M}, \mathcal{N}) = \sum_{u \in V} \min \left(\#u(A_1, \dots, A_p), \#u(B_1, \dots, B_q) \right)
$$

\n
$$
\leq \sum_{u \in V} \left(\min \left(\#u(A'_1, \dots, A'_p), \#u(B'_1, \dots, B'_q) \right) + \#u(S_1, \dots, S_p, T_1, \dots, T_q) \right)
$$

\n
$$
\leq \nu_{p,q}(\mathcal{M}/C, \mathcal{N}/C) + (p + q)s
$$

and by the induction hypothesis

$$
\eta(\mathcal{M} \cap \mathcal{N}) \geq \eta((\mathcal{M}/C) \cap (\mathcal{N}/C)) + s \geq \frac{\nu_{p,q}(\mathcal{M}/C, \mathcal{N}/C)}{p+q} + s \geq \frac{\nu_{p,q}(\mathcal{M}, \mathcal{N})}{p+q}.
$$

If [\(5\)](#page-5-1) occurs, applying Theorem [2.5](#page-2-8) again to $\mathcal{M} \sim z$ and \mathcal{N} with \mathcal{N} taking the role of \mathcal{M}_1 , either

$$
\eta(\mathcal{M} \cap \mathcal{N}) \ge \eta((\mathcal{M} \sim z) \cap \mathcal{N}) \ge \eta((\mathcal{M} \sim z) \cap (\mathcal{N} \sim z)) \sum_{\text{Theorem 2.1}} \eta(2^{\{z\}}) = \infty,
$$

in which case we have $\eta(\mathcal{M} \cap \mathcal{N}) \geq \frac{\nu_{p+q}(\mathcal{M},\mathcal{N})}{p+q}$, or there exists a circuit D in N such that $z \in D$ and $D \in \mathcal{M} \sim z$ and

$$
\eta(\mathcal{M} \cap \mathcal{N}) \ge \eta\Big((\mathcal{M} \sim z) \cap \mathcal{N}\Big) \ge \eta\Big(\big((\mathcal{M} \sim z)/D\big) \cap (\mathcal{N}/D)\Big) + |D| - 1.
$$

In the last case, similar as above, we can find sets $S'_1, \ldots, S'_p, T'_1, \ldots, T'_q$, each of size $t = |D|-1$, such that for each $1 \leq i \leq p$, $X'_i := (X_i \setminus \{z\}) \setminus S'_i \in (\mathcal{M} \sim z)/D$ using the fact that $z \in X_i$, and for each $1 \leq j \leq q$, $Y'_j := Y_j \setminus T'_j \in \mathcal{N}/D$. Thus

$$
\#u(Y_1,\ldots,Y_q)\leq \min\big(\#u(X'_1,\ldots,X'_p),\; \#u(Y'_1,\ldots,Y'_q)\big)+\#(S'_1,\ldots,S'_p,T'_1,\ldots,T'_q),
$$

since for $u \neq z$, $\#u(Y_1,\ldots,Y_q) = \#u(X_1,\ldots,X_p)$, and for $u = z$, $z \in Y_j$ implies $z \in T'_j$. Therefore

$$
\nu_{p,q}(\mathcal{M}, \mathcal{N}) = \sum_{i=1}^{q} |Y_i| = \sum_{u \in V} \#u(Y_1, \dots, Y_q)
$$

\n
$$
\leq \sum_{u \in V} \left(\min \left(\#u(X'_1, \dots, X'_p), \#u(Y'_1, \dots, Y'_q) \right) + \#(S'_1, \dots, S'_p, T'_1, \dots, T'_q) \right)
$$

\n
$$
\leq \nu_{p,q} \left((\mathcal{M} \sim z)/D, \mathcal{N}/D \right) + (p + q)t,
$$

and by the induction hypothesis,

$$
\eta(\mathcal{M} \cap \mathcal{N}) \ge \eta\Big(\big((\mathcal{M} \sim z)/D\big) \cap \big(\mathcal{N}/D\big)\Big) + t \ge \frac{\nu_{p,q}\big((\mathcal{M} \sim z)/D,\mathcal{N}/D\big)}{p+q} + t \ge \frac{\nu_{p,q}(\mathcal{M},\mathcal{N})}{p+q},
$$
\nwhich completes the proof.

5. Proof of Theorem [1.6](#page-1-1)

Notation 5.1. *For a complex* C *on the ground set* V, *let* $\Delta_{\eta}(\mathcal{C}) = \max_{\emptyset \neq S \subseteq V(\mathcal{C})} \frac{|S|}{\eta(\mathcal{C}[S])}$.

Applying Theorem 4.2 in [\[1\]](#page-7-0), for a complex C, it is proved in Corollary 8.6 of [1] that $\chi(\mathcal{C}) \leq [\Delta_n(\mathcal{C})]$. In [\[2\]](#page-7-1), this bound is extended to the list chromatic number.

Theorem 5.2. *For a complex* $\mathcal{C}, \chi_{\ell}(\mathcal{C}) \leq [\Delta_n(\mathcal{C})]$.

Proof of Theorem [1.6.](#page-1-1) Let V be the common ground set of M and N and let $C = M \cap N$.

Let $p = \chi(\mathcal{M})$ and $q = \chi(\mathcal{N})$. Let $A_1, \ldots, A_p \in \mathcal{M}$ satisfying that $\cup_{i=1}^p A_i = V$ and let $B_1, \ldots, B_q \in \mathcal{M}$ M satisfying that $\bigcup_{j=1}^{q} B_j = V$. Then

$$
\min(\#v(A_1, ..., A_p), \#v(B_1, ..., B_q)) \ge 1
$$

for every $v \in V$, which implies that $\nu_{p,q}(\mathcal{M}, \mathcal{N}) \geq |V|$. Thus Theorem [4.1](#page-5-2) implies that $\eta(\mathcal{C}) \geq \frac{|V|}{p+\mathcal{C}}$ $\frac{|V|}{p+q},$ which is equivalent to

$$
\frac{|V|}{\eta(\mathcal{C})} \le p + q.
$$

Noting that $\chi(\mathcal{M}[S]) \leq \chi(\mathcal{M})$ and $\chi(\mathcal{N}[S]) \leq \chi(\mathcal{N})$ for every $S \subseteq V$, the above argument works for any non-empty subset S of V , therefore we have

$$
\Delta_{\eta}(\mathcal{C}) \leq \chi(\mathcal{M}) + \chi(\mathcal{N}),
$$

which together with Theorem [5.2](#page-7-4) completes the proof. \Box
