# PARTIALLY ISOMETRIC TOEPLITZ OPERATORS WITH OPERATOR-VALUED SYMBOLS 

SRIJAN SARKAR<br>Dedicated to the memory of Dilip Kumar Guha, a loving and joyful grandfather.

#### Abstract

In this paper, we study partially isometric Toeplitz operators $T_{\Phi}$ on Hilbert space-valued Hardy spaces $H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)$ over the unit polydisc. We establish the following crucial phenomenon: the range of partially isometric Toeplitz operators is always a Beurling-type invariant subspace of $H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)$. Using this result, we prove that partially isometric Toeplitz operators always admit the following factorization: $$
T_{\Phi}=M_{\Gamma} M_{\Psi}^{*}
$$ where $\Gamma(\boldsymbol{z}), \Psi(\boldsymbol{z})$ are operator-valued inner functions on $\mathbb{D}^{n}$, governed by certain conditions that force $M_{\Gamma} M_{\Psi}^{*}$ to become a Toeplitz operator. Our results are new even in the case of Hardy spaces over the unit disc, and extend the work of Brown-Douglas, Deepak-PradhanSarkar on scalar-valued Hardy spaces.

## 1. Introduction and main results

From its inception, Toeplitz operators have played a vital role in the interplay between operator theory and function theory. This connection has been instrumental in finding new results across many disciplines like several complex variables, non-commutative geometry, mathematical physics, and engineering sciences. In recent times, there has been an active interest in extending the results of Toeplitz operators on scalar-valued Hardy spaces to vector-valued spaces. The primary reason has always been to find a deeper understanding between the operators and their corresponding symbols. Recent investigations show that analytic Toeplitz

[^0]SARKAR
operators with operator-valued symbols have many applications in systems engineering and $H^{\infty}$ control theory; for instance, see the celebrated monographs [1, 11].

For any Hilbert space $\mathcal{E}$, the $\mathcal{E}$-valued Hardy space on the unit polydisc $\mathbb{D}^{n}$ in the $n$ dimensional complex plane is defined by

$$
H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right):=\left\{\sum_{k \in \mathbb{N}^{n}} a_{\boldsymbol{k}} z^{k} \in \mathcal{O}\left(\mathbb{D}^{n}, \mathcal{E}\right): a_{\boldsymbol{k}} \in \mathcal{E}, \sum_{k \in \mathbb{N}^{n}}\left\|a_{\boldsymbol{k}}\right\|_{\mathcal{E}}^{2}<\infty\right\}
$$

The space of operator-valued bounded analytic functions on $\mathbb{D}^{n}$ is denoted by $H_{\mathcal{B}(\mathcal{E})}^{\infty}\left(\mathbb{D}^{n}\right)$, where $\mathcal{B}(\mathcal{E})$ denotes the class of all bounded operators on $\mathcal{E}$. Recall that a Toeplitz operator is defined in the following manner [10, 22].

Definition 1.1. A bounded linear operator $T$ on $H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)$ is said to be Toeplitz if there exists an operator-valued function $\Phi \in L_{\mathcal{B}(\mathcal{E})}^{\infty}\left(\mathbb{T}^{n}\right)$ such that $T=\left.P_{H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)} L_{\Phi}\right|_{H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)}$, where $L_{\Phi}$ is the Laurent operator (multiplication operator) associated to $\Phi$. In this case, $T$ is denoted by $T_{\Phi}$, and the function $\Phi$ is called the symbol of the operator $T_{\Phi}$.

It is immediate that when $\Phi(\boldsymbol{z})$ is an operator-valued bounded analytic function on $\mathbb{D}^{n}$, the corresponding Toeplitz operator is simply the multiplication operator on $H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)$. For this reason, we make a distinction and use the following convention throughout this article.

$$
\text { If } \Phi(z) \in H_{\mathcal{B}(\mathcal{E})}^{\infty}\left(\mathbb{D}^{n}\right) \text { then the corrsponding Toeplitz operator is denoted by } M_{\Phi} .
$$

It is worth mentioning, that unlike in the case of $H^{2}(\mathbb{D})$, the theory of Toeplitz operators on both $H^{2}\left(\mathbb{D}^{n}\right)$ and $H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)$ (where $n>1$ ) is far from being complete, as many natural questions remain unanswered. Several challenges appear whenever we leave the realm of scalar-valued functions and delve into the world of operator-valued symbols. We refer the reader to the exceptional monograph [10] by Douglas for results on matrix-valued Toeplitz operators. Recently, there has been spectacular progress on Halmos's question of subnormal Toeplitz operators, for matrix/operator-valued symbols by Curto, Hwang, and Lee in [5, 6, 7].

In this article, we further explore this theme: the correspondence of Toeplitz operators with their symbols under operator-theoretic conditions. From the algebraic characterization of Toeplitz operators developed by Brown and Halmos in [3], it can be realized that the only possibility for any $T_{\phi} \in \mathcal{B}\left(H^{2}(\mathbb{D})\right)$ to become an isometry is when its symbol $\phi$ is an inner function (that is, $\phi \in H^{\infty}(\mathbb{D})$, and $\left|\phi\left(e^{i t}\right)\right|=1$ a.e. on $\mathbb{T}$ ). Brown and Douglas were interested in the behaviour of Toeplitz operators under the general condition of it being a partial isometry. We recall that a bounded operator $T$ on a Hilbert space $\mathcal{H}$ is a partial isometry if $T$ is an isometry on the orthogonal complement of its kernel. In [2], the authors proved that the only partially isometric Toeplitz operators on $H^{2}(\mathbb{D})$ are of the form $T_{\phi}=M_{\theta}$, or else, $T_{\phi}=M_{\theta}^{*}$, where $\theta(z) \in H^{\infty}(\mathbb{D})$ is an inner function. Recently, this result was extended by Deepak-Pradhan-Sarkar for Toeplitz operators on $H^{2}\left(\mathbb{D}^{n}\right)$, where $n>1$.

Theorem. [8, Theorem 1.1] Let $\phi$ be a non-zero function in $L^{\infty}\left(\mathbb{T}^{n}\right)$. Then $T_{\phi}$ is a partial isometry if and only if there exist inner functions $\phi_{1}, \phi_{2} \in H^{\infty}\left(\mathbb{D}^{n}\right)$ such that $\phi_{1}$ and $\phi_{2}$ depends on different variables and $T_{\phi}=M_{\phi_{1}}^{*} M_{\phi_{2}}$.

In other words, the condition of partial isometry on $T_{\phi}$ forces a factorization of $\phi=\bar{\phi}_{1} \phi_{2}$ almost everywhere on $\mathbb{T}^{n}$. An immediate question is finding the corresponding result for Toeplitz operators with operator-valued symbols. Let us highlight an immediate obstacle to a straightforward generalization. In scalar-valued cases, both Brown-Douglas and Deepak-Pradhan-Sarkar's results show that if we start with $\phi \in H^{\infty}\left(\mathbb{D}^{n}\right)$, then the only possibility
for the analytic Toeplitz operator $M_{\phi}$ to be a partial isometry is when $M_{\phi}$ is an isometry, in other words, $\phi$ must be an inner function. There are many examples involving block Toeplitz operators which show that this no longer holds in the setting of operator-valued symbols. First, let us note that an operator-valued function $\Theta(\boldsymbol{z}) \in H_{\mathcal{B}(\mathcal{F}, \mathcal{E})}^{\infty}\left(\mathbb{D}^{n}\right)$ is said to be an inner function if $\Theta(z): \mathcal{F} \rightarrow \mathcal{E}$, is an isometry almost everywhere on $\mathbb{T}^{n}$ [21]. Now, let us consider the following bounded analytic matrix-valued symbol,

$$
\Theta(z):=\left[\begin{array}{ll}
0 & z \\
0 & 0
\end{array}\right] \in H_{\mathcal{B}\left(\mathbb{C}^{2}\right)}^{\infty}(\mathbb{D})
$$

then for each $\lambda \in \mathbb{T}$,

$$
\Theta(\lambda)^{*} \Theta(\lambda)=\left[\begin{array}{ll}
0 & 0 \\
\lambda & 0
\end{array}\right]\left[\begin{array}{ll}
0 & \lambda \\
0 & 0
\end{array}\right]=\left[\begin{array}{ll}
0 & 0 \\
0 & 1
\end{array}\right]
$$

This implies that $\Theta(z)$ is not an inner function. However,

$$
M_{\Theta}^{*} M_{\Theta}=T_{\Theta^{*} \Theta}=\left[\begin{array}{cc}
0 & 0 \\
0 & I_{H^{2}(\mathbb{D})}
\end{array}\right] \in H_{\mathbb{C}^{2}}^{2}(\mathbb{D}),
$$

shows that $M_{\Theta}$ is indeed a partial isometry. Thus, a non-constant analytic Toeplitz operator $M_{\Theta}$ can be a partial isometry without $\Theta(z)$ being an inner function. Motivated by this observation, and earlier results, we study the following intriguing question in this article: what are the partially isometric Toeplitz operators on vector-valued Hardy spaces?

At this moment, let us digress a little to highlight a connection of this question to the study of invariant subspaces of $M_{z} \oplus M_{z}^{*}$ on $H_{\mathcal{E}}^{2}(\mathbb{D}) \oplus H_{\mathcal{F}}^{2}(\mathbb{D})$ as observed by Gu and Luo in [15]. This work was again motivated by the characterization of invariant subspaces of $M_{z} \oplus M_{z}^{*}$ on $H^{2}(\mathbb{D}) \oplus H^{2}(\mathbb{D})$ by Timotin [26]. In their work, Gu and Luo observed that the invariant subspace of $M_{z} \oplus M_{z}^{*}$ is related to the range of the following operator.

$$
V_{\Phi}=\left[\begin{array}{ll}
T_{A} & T_{B} \\
H_{C} & H_{D}
\end{array}\right]: H_{\mathcal{E}}^{2}(\mathbb{D}) \oplus H_{\mathcal{F}}^{2}(\mathbb{D}) \rightarrow H_{\mathcal{E}}^{2}(\mathbb{D}) \oplus H_{\mathcal{F}}^{2}(\mathbb{D}),
$$

where

$$
\Phi(z)=\left[\begin{array}{ll}
A(z) & B(z) \\
C(z) & D(z)
\end{array}\right]: \mathcal{E} \oplus \mathcal{F} \rightarrow \mathcal{E} \oplus \mathcal{F} \quad(z \in \mathbb{D})
$$

and $T_{A}, T_{B}$, and $H_{C}, H_{D}$ are the corresponding Toeplitz and Hankel operators, respectively. Furthermore, the authors found that the range of $V_{\Phi}$ is closed in $H_{\mathcal{E}}^{2}(\mathbb{D}) \oplus H_{\mathcal{F}}^{2}(\mathbb{D})$ if and only if $V_{\Phi}$ is a partial isometry. This leads to the natural question of when $V_{\Phi}$ becomes a partial isometry. To this, they made the following statement.
"The above problem seems a difficult one since the partial isometric characterizations of Toeplitz operator $T_{A}$ (A is not necessarily analytic) and Hankel operator $H_{D}$ are only known when $A$ and $D$ are scalar functions in $L^{\infty}[2,23]$." In this article, we completely resolve this issue for Toeplitz operators; see Theorem 1.4 and Theorem 5.2. Thus, we strongly feel that our main result will have several consequences in characterizing invariant subspaces of sums of shift operators on vector-valued Hardy spaces over $\mathbb{D}, \mathbb{D}^{n}$, and motivate further applications.

One of the main difficulties in trying to find an answer to the above question (in italics) is that we no longer have the commutativity of the symbols, which is automatic in the scalar cases. Since the proofs in [3, 8] rely crucially on the commutativity of the symbols, the methods in [3, 8] are not applicable. Thus, it is essential to find a completely new approach to the above question. Based on earlier works, we aim to find a factorization of $T_{\Phi}$ into a product of Toeplitz operators corresponding to inner symbols. For this purpose, let us first
recall that a closed $\left(M_{z_{1}}, \ldots, M_{z_{n}}\right)$-joint invariant subspace of $H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)$ is said to be Beurlingtype if there exists a Hilbert space $\mathcal{F}$, and an inner function $\Theta(z) \in H_{\mathcal{B}(\mathcal{F}, \mathcal{E})}^{\infty}\left(\mathbb{D}^{n}\right)$ such that $\mathcal{S}=M_{\Theta} H_{\mathcal{F}}^{2}\left(\mathbb{D}^{n}\right)$. It is well-known, that given a subspace $\mathcal{S} \subseteq H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)$ if we consider the restriction operators $R_{i}:=M_{z_{i}} \mid \mathcal{S}$ for all $i \in\{1, \ldots, n\}$, then $\mathcal{S}$ is Beurling-type invariant subspace if and only if $\left[R_{i}^{*}, R_{j}\right]=0$ for all $i \neq j([20,25])$. Thus, if we can show that the range of Toeplitz operators satisfies the above algebraic conditions concerning the restriction operators, then we can associate inner functions to the corresponding symbol. In section 4 , we establish this connection by proving the following result.

Theorem 1.2. If $T_{\Phi}$ is a non-zero partially isometric Toeplitz operator on $H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)$, then $\operatorname{ran} T_{\Phi}$ is a Beurling-type invariant subspace of $H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)$.

Let us note that classically, the kernel of the adjoint of Toeplitz operators on $H^{2}(\mathbb{D})$ are related with nearly invariant subspaces of $H^{2}(\mathbb{D})$. This observation was noted by Hayashi in [18], and further explored by Sarason in [24]. We believe that the above result should serve as an impetus to study the range of Toeplitz operators as well.

With the above characterization in mind, a curious reader with some attempts may guess that $T_{\Phi}$ may admit the following factorization.

$$
T_{\Phi}=M_{\Gamma} M_{\Psi}^{*},
$$

where $\Gamma, \Psi$ are operator-valued inner functions, but this leads us to another challenge: under what conditions does $M_{\Gamma} M_{\Psi}^{*}$ become a Toeplitz operator?

On the scalar-valued Hardy spaces, it is well-known when the product of two Toeplitz operators is again a Toeplitz operator. Brown and Halmos developed this result for $H^{2}(\mathbb{D})$ in [3], and Gu proved the corresponding result for $H^{2}\left(\mathbb{D}^{n}\right)$ in [13]. However, the answer to this question for Toeplitz operators with operator-valued symbols is still unclear. We refer the reader towards some important progress in the case of block Toeplitz operators by Gu and Zheng in [12, 14]. This is where we make another significant contribution. Section 3 is dedicated to establishing the following tractable conditions that make the above product into a Toeplitz operator.

Theorem 1.3. Let $\mathcal{F}, \mathcal{E}$ be Hilbert spaces and $\Gamma(\boldsymbol{z}), \Psi(\boldsymbol{z})$ be $\mathcal{B}(\mathcal{F}, \mathcal{E})$-valued bounded analytic functions on $\mathbb{D}^{n}$. More precisely, let

$$
\Gamma(\boldsymbol{z}):=\sum_{l \in \mathbb{N}^{n}} A_{l} z^{l} \in H_{\mathcal{B}(\mathcal{F}, \mathcal{E})}^{\infty}\left(\mathbb{D}^{n}\right) ; \quad \Psi(\boldsymbol{z}):=\sum_{\boldsymbol{m} \in \mathbb{N}^{n}} B_{\boldsymbol{m}} z^{m} \in H_{\mathcal{B}(\mathcal{F}, \mathcal{E})}^{\infty}\left(\mathbb{D}^{n}\right),
$$

where $A_{\boldsymbol{k}}, B_{\boldsymbol{k}} \in \mathcal{B}(\mathcal{F}, \mathcal{E})$ for all $\boldsymbol{k} \in \mathbb{N}^{n}$. Then $M_{\Gamma} M_{\Psi}^{*}$ is a Toeplitz operator on $H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)$ if and only if

$$
\begin{equation*}
A_{l+e_{i}} B_{\boldsymbol{m}+e_{i}}^{*}=0 \quad\left(\forall \boldsymbol{l}, \boldsymbol{m} \in \mathbb{N}^{n}\right) \tag{1.1}
\end{equation*}
$$

where $e_{i}=(0, \ldots, 0, \underset{i \text {-th position }}{1}, 0, \ldots, 0)$ for all $i \in\{1, \ldots, n\}$.
In section 5, we use Theorem 1.2 and Theorem 1.3 , to give a complete characterization for partially isometric Toeplitz operators on $H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)$.

Theorem 1.4. $T_{\Phi}$ is a non-zero partially isometric Toeplitz operator on $H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)$ if and only if there exist a Hilbert space $\mathcal{F}$, and inner functions $\Gamma(\boldsymbol{z}), \Psi(\boldsymbol{z}) \in H_{\mathcal{B}(\mathcal{F}, \mathcal{E})}^{\infty}\left(\mathbb{D}^{n}\right)$ satisfying conditions (1.1), such that

$$
T_{\Phi}=M_{\Gamma} M_{\Psi}^{*}
$$

As expected, there are numerous consequences of this result. We end section 5 with the characterization for partially isometric Toeplitz operators which are analytic (Theorem 5.2) and hyponormal (Theorem 5.3). In section 6, we give a different proof of the main result in [8].

Let us now describe the plan for the rest of this article. In section 2, we set notations, and definitions, and establish a few results essential for the later part. We end this article with section 7, where we have highlighted several interesting questions worthy of further investigation.

## 2. Preliminaries

In this section, we set the notations, definitions, and results needed throughout this article. Let us begin by looking at the equivalent way of defining $\mathcal{E}$-valued Hardy spaces on $\mathbb{D}^{n}$.

$$
H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right):=\left\{f \in \mathcal{O}\left(\mathbb{D}^{n}, \mathcal{E}\right):\|f\|_{2}^{2}:=\sup _{0<r<1} \int_{\mathbb{T}^{n}}\left\|f\left(r e^{i \theta_{1}}, \ldots, r e^{i \theta_{n}}\right)\right\|_{\mathcal{E}}^{2} d \mu<\infty\right\}
$$

where $\mu$ is the normalized Lebesgue measure on $\mathbb{T}^{n}$. This space of $\mathcal{E}$-valued analytic functions has a natural collection of shift operators, namely,

$$
M_{z_{i}} f:=z_{i} f, \quad\left(f \in H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)\right)
$$

for each $i \in\{1, \ldots, n\}$. We will denote by $M_{z}=\left(M_{z_{1}}, \ldots, M_{z_{n}}\right)$ as the tuple of shift operators. For $\boldsymbol{k}=\left(k_{1}, \ldots, k_{n}\right) \in \mathbb{N}^{n}$, we set the following convention,

$$
M_{z}^{k}=M_{z_{1}}^{k_{1}} \cdots M_{z_{n}}^{k_{n}}
$$

and for any $\boldsymbol{k}=\left(k_{1}, \ldots, k_{n}\right), \boldsymbol{l}=\left(l_{1}, \ldots, l_{n}\right) \in \mathbb{N}^{n}$, we say $\boldsymbol{k} \leq \boldsymbol{l}$ if $k_{i} \leq l_{i}$ for all $i \in\{1, \ldots, n\}$. For the tuple of shift operators $L_{e^{i \theta}}=\left(L_{e^{i \theta_{1}}}, \ldots, L_{e^{i \theta_{n}}}\right)$ on $L^{2}\left(\mathbb{T}^{n}\right)$, we set

$$
L_{e^{i \theta}}^{k}=L_{e^{i \theta_{1}}}^{k_{1}} \cdots L_{e^{i \theta_{n}}}^{k_{n}} .
$$

Brown and Halmos gave an algebraic characterization for Toeplitz operators on $H^{2}(\mathbb{D})$ [3]. It is well-known that there exists a natural extension of this result to Toeplitz operators on $H^{2}\left(\mathbb{D}^{n}\right)$ [19]. The following result shows that such a characterization holds for $H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)$ as well. The result can be proved verbatim from [19, Theorem 3.1, Theorem 5.2]. For the sake of completion, we give a sketch of the proof.
Theorem 2.1. A bounded operator $T$ on $H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)$ is a Toeplitz operator if and only if

$$
M_{z_{i}}^{*} T M_{z_{i}}=T
$$

for all $i \in\{1, \ldots, n\}$.
Proof. For each $k \in \mathbb{N}$, consider $\boldsymbol{k}_{d}:=(k, \ldots, k) \in \mathbb{N}^{n}$. From the assumption $M_{z_{i}}^{*} T M_{z_{i}}=T$, we immediately get

$$
M_{z}^{* k_{d}} T M_{z}^{\boldsymbol{k}_{d}}=T
$$

This implies that

$$
\left\langle T e_{\boldsymbol{i}+\boldsymbol{k}_{d}} \eta, e_{\boldsymbol{i}+\boldsymbol{k}_{d}} \zeta\right\rangle=\left\langle T M_{\boldsymbol{z}}^{\boldsymbol{k}_{d}} e_{\boldsymbol{i}} \eta, M_{z}^{\boldsymbol{k}_{d}} e_{\boldsymbol{j}} \zeta\right\rangle=\left\langle T e_{\boldsymbol{i}}, e_{\boldsymbol{j}}\right\rangle
$$

for all $\boldsymbol{i}, \boldsymbol{j} \in \mathbb{N}^{n}$, and $k \in \mathbb{N}$. Now for each $\boldsymbol{l}, \boldsymbol{m} \in \mathbb{Z}^{n}$ there exists $\boldsymbol{t}=\left(t_{1}, \ldots, t_{n}\right) \in \mathbb{N}^{n}$ such that $\boldsymbol{l}+\boldsymbol{k}_{d}, \boldsymbol{m}+\boldsymbol{k}_{d} \in \mathbb{N}^{n}$ for all $\boldsymbol{k}_{d} \geq \boldsymbol{t}$. Using this observation, if we set $A_{k}:=L_{e^{i \theta}}^{* \boldsymbol{k}_{d}} T P_{H_{\mathcal{\varepsilon}}^{2}\left(\mathbb{D}^{n}\right)} L_{e^{i \theta}}^{\boldsymbol{k}_{d}}$ for $k \in \mathbb{N} \backslash\{0\}$, then we get

$$
\left\langle A_{k} e_{\boldsymbol{l}}, e_{\boldsymbol{m}}\right\rangle_{L_{\mathcal{E}}^{2}\left(\mathbb{T}^{n}\right)}=\left\langle T P_{H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)} e_{\boldsymbol{l}+\boldsymbol{k}_{d}}, e_{\boldsymbol{m}+\boldsymbol{k}_{d}}\right\rangle_{L_{\mathcal{E}}^{2}\left(\mathbb{T}^{n}\right)}
$$

and therefore, for all $\boldsymbol{k}_{d} \geq \boldsymbol{t}$

$$
\left\langle A_{k} e_{\boldsymbol{l}}, e_{\boldsymbol{m}}\right\rangle \rightarrow\left\langle T e_{\boldsymbol{l}+t}, e_{\boldsymbol{m}+t}\right\rangle \text { as } k \rightarrow \infty
$$

This lets us define a bounded bilinear form $\mathrm{b}(\cdot, \cdot)$ on the linear span of $\left\{e_{s} \zeta: s \in \mathbb{Z}^{n}, \eta \in \mathcal{E}\right\}$, in the following manner,

$$
\mathrm{b}\left(e_{l} \eta, e_{\boldsymbol{m}} \zeta\right)=\lim _{k \rightarrow \infty}\left\langle A_{k} e_{l} \eta, e_{\boldsymbol{m}} \zeta\right\rangle
$$

for all $\boldsymbol{l}, \boldsymbol{m} \in \mathbb{Z}^{n}$ and $\eta, \zeta \in \mathcal{E}$. Therefore, there exists an operator $A_{\infty} \in \mathcal{B}\left(L_{\mathcal{E}}^{2}\left(\mathbb{T}^{n}\right)\right)$ such that

$$
\left\langle A_{\infty} f, g\right\rangle=\lim _{k \rightarrow \infty}\left\langle A_{k} f, g\right\rangle,
$$

for $f, g \in L_{\mathcal{E}}^{2}\left(\mathbb{T}^{n}\right)$. Let $\epsilon_{j}=(0, \ldots, 0, \underset{j \text {-th position }}{1}, 0, \ldots, 0)$, then for all $k$ sufficiently large (depending on $\boldsymbol{l}, \boldsymbol{m}$ and $j$ ), we get

$$
\left\langle L_{e^{i \theta}}^{* k_{\boldsymbol{d}}} T P_{H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)} L_{e^{i \theta}}^{k_{d}} e_{\boldsymbol{l}+\epsilon_{j}}, e_{\boldsymbol{m}+\epsilon_{j}}\right\rangle_{L_{\mathcal{E}}^{2}\left(\mathbb{T}^{n}\right)}=\left\langle T P_{H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)} e_{\boldsymbol{l}+\boldsymbol{k}_{d}+\epsilon_{j}}, e_{\boldsymbol{m}+\boldsymbol{k}_{d}+\epsilon_{j}}\right\rangle_{L_{\mathcal{\varepsilon}}^{2}\left(\mathbb{T}^{n}\right)}=\left\langle A_{k} e_{\boldsymbol{l}}, e_{\boldsymbol{m}}\right\rangle_{L_{\mathcal{E}}^{2}\left(\mathbb{T}^{n}\right)}
$$

This immediately gives

$$
\left\langle A_{\infty} e_{\boldsymbol{l}+\epsilon_{j}}, e_{\boldsymbol{m}+\epsilon_{j}}\right\rangle_{L_{\mathcal{E}}^{2}\left(\mathbb{T}^{n}\right)}=\lim _{k \rightarrow \infty}\left\langle L_{e^{i \theta}}^{* \boldsymbol{k}_{\boldsymbol{d}}} T P_{H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)} L_{e^{i \theta}}^{\boldsymbol{k}_{\boldsymbol{d}}} e_{\boldsymbol{l}+\epsilon_{j}}, e_{\boldsymbol{m}+\epsilon_{j}}\right\rangle_{L_{\mathcal{E}}^{2}\left(\mathbb{T}^{n}\right)}=\left\langle A_{\infty} e_{\boldsymbol{l}}, e_{\boldsymbol{m}}\right\rangle_{L_{\mathcal{E}}^{2}\left(\mathbb{T}^{n}\right)}
$$

This implies that

$$
A_{\infty} L_{e^{i \theta_{j}}}=L_{e^{i \theta_{j}}} A_{\infty},
$$

for all $j=1, \ldots, n$. Hence, there exists $\Phi(z) \in L_{\mathcal{B}(\mathcal{E})}^{\infty}\left(\mathbb{T}^{n}\right)$ such that

$$
A_{\infty}=L_{\Phi}
$$

which further implies that $T=\left.P_{H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)} L_{\Phi}\right|_{H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)}$.
Conversely, if we begin with $T=\left.P_{H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)} L_{\Phi}\right|_{H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)}$ for some $\Phi(z) \in L_{\mathcal{B}(\mathcal{E})}^{\infty}\left(\mathbb{T}^{n}\right)$, then for any $f, g \in H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)$ and $j=1, \ldots, n$ we get

$$
\left\langle M_{z_{j}}^{*} T M_{z_{j}} f, g\right\rangle_{H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)}=\left\langle\Phi e^{i \theta_{j}} f, e^{i \theta_{j}} g\right\rangle_{L_{\mathcal{E}}^{2}\left(\mathbb{T}^{n}\right)}=\langle\Phi f, g\rangle_{L_{\mathcal{E}}^{2}\left(\mathbb{T}^{n}\right)}
$$

In other words,

$$
\left\langle M_{z_{j}}^{*} T M_{z_{j}} f, g\right\rangle_{H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)}=\left\langle\left. P_{H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)} L_{\Phi}\right|_{H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)} f, g\right\rangle_{H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)},
$$

which implies that $M_{z_{j}}^{*} T M_{z_{j}}=T$ for all $j=1, \ldots, n$. This completes the proof.
This property plays an important role in developing many results on Toeplitz operators and will be used throughout this article. Let us show an instance where this is useful.

Theorem 2.2. Let $T_{\Phi}$ be a Toeplitz operator on $H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)$, then $T_{\Phi}$ is an isometry if and only if $\Phi$ is an inner function in $H_{\mathcal{B}(\mathcal{E})}^{\infty}\left(\mathbb{D}^{n}\right)$.

Proof. $T_{\Phi}$ is an isometry gives,

$$
\begin{aligned}
I_{H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)}=T_{\Phi}^{*} T_{\Phi}=M_{z_{i}}^{*} T_{\Phi}^{*} M_{z_{i}} M_{z_{i}}^{*} T_{\Phi} M_{z_{i}} & =M_{z_{i}}^{*} T_{\Phi}^{*} T_{\Phi} M_{z_{i}}-M_{z_{i}}^{*} T_{\Phi}^{*} P_{\operatorname{ker} M_{z_{i}}^{*}} T_{\Phi} M_{z_{i}} \\
& =I_{H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)}-M_{z_{i}}^{*} T_{\Phi}^{*} P_{\operatorname{ker}} M_{z_{i}}^{*} T_{\Phi} M_{z_{i}},
\end{aligned}
$$

for any $i \in\{1, \ldots, n\}$. Thus, we get that $M_{z_{i}}^{*} T_{\Phi}^{*} P_{\text {ker } M_{z_{i}}^{*}} T_{\Phi} M_{z_{i}}=0$, which further implies,

$$
0=P_{\text {ker } M_{z_{i}}^{*}} T_{\Phi} M_{z_{i}}=\left(I_{H^{2}\left(\mathbb{D}^{n}\right)}-M_{z_{i}} M_{z_{i}}^{*}\right) T_{\Phi} M_{z_{i}}=T_{\Phi} M_{z_{i}}-M_{z_{i}} T_{\Phi}
$$

This shows that $M_{z_{i}} T_{\Phi}=T_{\Phi} M_{z_{i}}$ for all $i \in\{1, \ldots, n\}$ and hence, $\Phi$ must be in $H_{\mathcal{B}(\mathcal{E})}^{\infty}\left(\mathbb{D}^{n}\right)$. Since $T_{\Phi}$ is an isometry, $\Phi$ must be an inner function in $H_{\mathcal{B}(\mathcal{E})}^{\infty}\left(\mathbb{D}^{n}\right)$. The converse direction is straightforward. This completes the proof.

Corollary 2.3. Let $T_{\Phi}$ be a Toeplitz operator on $H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)$, then $T_{\Phi}$ is a unitary if and only if $\Phi$ is a constant unitary on $\mathcal{E}$.
Proof. From the assumption, both $T_{\Phi}$ and $T_{\Phi^{*}}=T_{\Phi}^{*}$ are isometries. Following the above result, both $\Phi$, and $\Phi^{*}$ must be inner functions in $H_{\mathcal{B}(\mathcal{E})}^{\infty}\left(\mathbb{D}^{n}\right)$. Thus, $\Phi$ must be a constant operator on $\mathcal{E}$. Since, $T_{\Phi}$ is unitary, $\Phi$ must be a constant unitary on $\mathcal{E}$. This completes the proof.

Similar, to the case of $T_{\Phi}$ on $H_{\mathcal{E}}^{2}(\mathbb{D})$, we can consider the following decomposition on $\mathbb{D}^{n}$,

$$
T_{F G}=T_{F} T_{G}+H_{F^{*}}^{*} H_{G}
$$

where $H_{F}:=\left.J P_{H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)^{\perp}} L_{\Phi}\right|_{H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)}: H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right) \rightarrow H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)$ is the Hankel operator with symbol $\Phi$, and $J: L_{\mathcal{E}}^{2}\left(\mathbb{T}^{n}\right) \rightarrow L_{\mathcal{E}}^{2}\left(\mathbb{T}^{n}\right)$ is the unitary defined by $J(f)(\boldsymbol{z})=\overline{\boldsymbol{z}} I_{\mathcal{E}} f(\overline{\boldsymbol{z}})$, where $f \in L_{\mathcal{E}}^{2}\left(\mathbb{T}^{n}\right)$. It is well known that Hankel operators satisfy the following property for each $i \in\{1, \ldots, n\}$.

$$
\begin{equation*}
M_{z_{i}}^{*} H_{F}=H_{F} M_{z_{i}} . \tag{2.2}
\end{equation*}
$$

We refer the reader to the monographs [4, 23] for an elaborate discussion of the above facts. Using the above intertwining property, we can immediately establish the following well-known fact.

Theorem 2.4. If $T_{F} T_{G}$ is a Toeplitz operator on $H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)$, then $T_{F} T_{G}=T_{F G}$.
Proof. $T_{F} T_{G}=T_{F G}-H_{F^{*}}^{*} H_{G}$. If $T_{F} T_{G}=T_{Y}$, then

$$
T_{Y}=T_{F G}-H_{F^{*}}^{*} H_{G}
$$

implies that $T_{Y-F G}=H_{F^{*}}^{*} H_{G}$. But then

$$
M_{z_{i}}^{* n} H_{F^{*}}^{*} H_{G} M_{z_{i}}^{n}=H_{F^{*}}^{*} H_{G}
$$

Using the intertwining identity, we get

$$
M_{z_{i}}^{* n} H_{F^{*}}^{*} M_{z_{i}}^{* n} H_{G}=H_{F^{*}}^{*} H_{G},
$$

and therefore, for each $x \in H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)$, we get

$$
\left\|H_{F^{*}}^{*} H_{G} x\right\| \leq\left\|M_{z_{i}}^{* n} H_{G} x\right\| \underset{n \rightarrow \infty}{\rightarrow} 0
$$

because $M_{z_{i}}$ is a pure isometry for all $i \in\{1, \ldots, n\}$, that is, $M_{z_{i}}^{* n} \rightarrow 0$ in the strong operator topology. This implies that $H_{F^{*}}^{*} H_{G}=0$, in other words, $T_{F} T_{G}=T_{F G}$.

Before ending this section, let us briefly recall some concepts on partial isometries.
Definition 2.5. $T \in \mathcal{B}(\mathcal{H})$ is a partial isometry if $T$ is an isometry on the orthogonal complement of its kernel inside $\mathcal{H}$.

It is well-known that $T$ is a partial isometry on $\mathcal{H}$ if and only if $T$ satisfies any one of the following equivalent conditions.
(i) $T T^{*}$ is a projection.
(ii) $T T^{*} T=T$.

From this description, the following useful facts can be deduced.
(i) $T$ is a partial isometry if and only if $T^{*}$ is also a partial isometry.
(ii) The range of a partially isometric operator must be a closed subspace of $\mathcal{H}$.

Furthermore, it should be noted that if $T$ is a partial isometry, then $I_{\mathcal{H}}-T T^{*}=P_{\text {ker } T^{*}}$, that is, the orthogonal projection onto the closed subspace ker $T^{*}$. We refer the readers to some fundamental results on partial isometries by Halmos, McLaughlin, and Wallen in [16, 17].

## 3. Product of Toeplitz operators

In this section, we aim to establish necessary and sufficient conditions for which a certain product of Toeplitz operators corresponding to analytic symbols is again a Toeplitz operator.

Lemma 3.1. Let $\mathcal{F}, \mathcal{E}$ be Hilbert spaces and $\Gamma(\boldsymbol{z}) \in H_{\mathcal{B}(\mathcal{F}, \mathcal{E})}^{\infty}\left(\mathbb{D}^{n}\right)$ and $\Psi(\boldsymbol{z}) \in H_{\mathcal{B}(\mathcal{F}, \mathcal{E})}^{\infty}\left(\mathbb{D}^{n}\right)$. Then the following are equivalent
(i) $M_{\Gamma} M_{\Psi}^{*}$ is a Toeplitz operator on $H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)$.
(ii) $M_{z_{i}}^{*} M_{\Gamma} P_{\text {ker } M_{z_{i}^{*}}} M_{\Psi}^{*} M_{z_{i}}=0$, for all $i \in\{1, \ldots, n\}$.

Proof. For proving the equivalence between (i) and (ii), let us note that for any $i \in\{1, \ldots, n\}$

$$
\begin{aligned}
M_{z_{i}}^{*} M_{\Gamma} M_{\Psi}^{*} M_{z_{i}} & =M_{z_{i}}^{*} M_{\Gamma}\left(M_{z_{i}} M_{z_{i}}^{*}\right) M_{\Psi}^{*} M_{z_{i}}+M_{z_{i}}^{*} M_{\Gamma}\left(I_{H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)}-M_{z_{i}} M_{z_{i}}^{*}\right) M_{\Psi}^{*} M_{z_{i}} \\
& =M_{\Gamma} M_{\Psi}^{*}+M_{z_{i}}^{*} M_{\Gamma} P_{\operatorname{ker} M_{z_{i}}^{*}} M_{\Psi}^{*} M_{z_{i}} .
\end{aligned}
$$

From Theorem 2.1, it follows that $M_{\Gamma} M_{\Psi}^{*}$ is a Toeplitz operator if and only if for all $i \in$ $\{1, \ldots, n\}, M_{z_{i}}^{*} M_{\Gamma} P_{\text {ker } M_{z_{i}}^{*}} M_{\Psi}^{*} M_{z_{i}}=0$,

We can further strengthen the above condition in the following manner.
Lemma 3.2. Let $\mathcal{F}, \mathcal{E}$ be Hilbert spaces and $\Gamma(\boldsymbol{z}) \in H_{\mathcal{B}(\mathcal{F}, \mathcal{E})}^{\infty}\left(\mathbb{D}^{n}\right)$ and $\Psi(\boldsymbol{z}) \in H_{\mathcal{B}(\mathcal{F}, \mathcal{E})}^{\infty}\left(\mathbb{D}^{n}\right)$. Then the following are equivalent for any $i \in\{1, \ldots, n\}$.
(i) $M_{z_{i}}^{*} M_{\Gamma} P_{\text {ker } M_{z_{i}^{*}}^{*}} M_{\Psi}^{*} M_{z_{i}}=0$
(ii) $M_{z_{i}}^{*} M_{\Gamma} P_{\mathcal{E}} M_{\Psi}^{*} M_{z_{i}}=0$.

Proof. Let us begin with the direction $(i) \Longrightarrow(i i)$. Note that for any $i \in\{1, \ldots, n\}$,

$$
M_{z_{i}}^{*} M_{\Gamma} P_{\operatorname{ker} M_{z_{i}^{*}}} M_{\Psi}^{*} M_{z_{i}}=0
$$

implies that

$$
M_{z_{i}}^{*} M_{\Gamma}\left(M_{z_{j}} M_{z_{j}}^{*}+I_{H_{\mathcal{F}}^{2}\left(\mathbb{D}^{n}\right)}-M_{z_{j}} M_{z_{j}}^{*}\right) P_{\operatorname{ker} M_{z_{i}}^{*}} M_{\Psi}^{*} M_{z_{i}}=0
$$

for any $j \in\{1, \ldots, n\} \backslash\{i\}$. In other words,

$$
M_{z_{i}}^{*} M_{\Gamma} M_{z_{j}} M_{z_{j}}^{*} P_{\operatorname{ker} M_{z_{i}}^{*}} M_{\Psi}^{*} M_{z_{i}}+M_{z_{i}}^{*} M_{\Gamma} P_{\operatorname{ker} M_{z_{j}}^{*}}^{*} P_{\operatorname{ker} M_{z_{i}}^{*}}^{*} M_{\Psi}^{*} M_{z_{i}}=0
$$

Since $j \neq i$, we can use that the commutator $\left[M_{z_{j}}, M_{z_{i}}^{*}\right]=0$ to get

$$
M_{z_{j}} M_{z_{i}}^{*} M_{\Gamma} P_{\text {ker } M_{z_{i}}^{*}}^{*} M_{\Psi}^{*} M_{z_{i}} M_{z_{j}}^{*}+M_{z_{i}}^{*} M_{\Gamma} P_{\text {ker } M_{z_{j}}^{*}}^{*} P_{\text {ker } M_{z_{i}}^{*}}^{*} M_{\Psi}^{*} M_{z_{i}}=0
$$

By our assumption $M_{z_{i}}^{*} M_{\Gamma} P_{\text {ker } M_{z_{i}}^{*}} M_{\Psi}^{*} M_{z_{i}}=0$, we get

$$
M_{z_{i}}^{*} M_{\Gamma} P_{\text {ker } M_{z_{j}}^{*}}^{*} P_{\text {ker } M_{z_{i}}^{*}} M_{\Psi}^{*} M_{z_{i}}=0
$$

Continuing in the same manner as above, we find that the above condition implies that for any $k \in\{1, \ldots, n\} \backslash\{i, j\}$, we get

$$
M_{z_{i}}^{*} M_{\Gamma} M_{z_{k}} M_{z_{k}}^{*} P_{\operatorname{ker} M_{z_{j}}^{*}} P_{\operatorname{ker} M_{z_{i}}^{*}} M_{\Psi}^{*} M_{z_{i}}+M_{z_{1}}^{*} M_{\Gamma} P_{\text {ker } M_{z_{k}}^{*}} P_{\text {ker } M_{z_{j}}^{*}}^{*} P_{\text {ker } M_{z_{i}}^{*}}^{*} M_{\Psi}^{*} M_{z_{i}}=0
$$

which further implies that

$$
M_{z_{i}}^{*} M_{\Gamma} P_{\text {ker } M_{z_{k}}^{*}}^{*} P_{\text {ker } M_{z_{j}}^{*}}^{*} P_{\text {ker } M_{z_{i}}^{*}}^{*} M_{\Psi}^{*} M_{z_{i}}=0
$$

Iterating the same procedure for $n-3$ many times with distinct numbers in $\{1, \ldots, n\} \backslash\{i, j, k\}$, we can conclude that,

$$
M_{z_{i}}^{*} M_{\Gamma} P_{\mathcal{E}} M_{\Psi}^{*} M_{z_{i}}=0
$$

since $P_{\mathcal{E}}=\prod_{i=1}^{n} P_{\text {ker } M_{z_{i}}^{*}}$. To prove the opposite direction, let us observe that,

$$
M_{z_{i}}^{*} M_{\Gamma} P_{\mathcal{E}} M_{\Psi}^{*} M_{z_{i}}=0
$$

for some $i \in\{1, \ldots, n\}$ will imply that

$$
M_{z_{i}}^{*} M_{\Gamma} P_{\operatorname{ker} M_{z_{1}}^{*}} P_{\text {ker } M_{z_{i}}^{*}}\left(\prod_{k=2 ; k \neq i}^{n} P_{\operatorname{ker} M_{z_{k}}^{*}}\right) M_{\Psi}^{*} M_{z_{i}}=0
$$

This implies that

$$
\begin{aligned}
& M_{z_{i}}^{*} M_{\Gamma} P_{\text {ker } M_{z_{i}}^{*}}\left(\prod_{k=2 ; k \neq i}^{n} P_{\operatorname{ker} M_{z_{k}}^{*}}^{*}\right) M_{\Psi}^{*} M_{z_{i}} \\
& =M_{z_{i}}^{*} M_{\Gamma} M_{z_{1}} M_{z_{1}}^{*} P_{\operatorname{ker} M_{z_{i}}^{*}}\left(\prod_{k=2 ; k \neq i}^{n} P_{\operatorname{ker} M_{z_{k}}^{*}}\right) M_{\Psi}^{*} M_{z_{i}} \\
& =M_{z_{1}} M_{z_{i}}^{*} M_{\Gamma} P_{\operatorname{ker} M_{z_{i}}^{*}}\left(\prod_{k=2 ; k \neq i}^{n} P_{\operatorname{ker} M_{z_{k}}^{*}}\right) M_{\Psi}^{*} M_{z_{i}} M_{z_{1}}^{*} .
\end{aligned}
$$

and therefore, using recursion, for any $m \in \mathbb{N}$ we get

$$
M_{z_{i}}^{*} M_{\Gamma} P_{\text {ker } M_{z_{i}}^{*}}^{*} \Pi_{k=2 ; k \neq i}^{n} P_{\text {ker } M_{z_{k}}^{*}}^{*} M_{\Psi}^{*} M_{z_{i}}=M_{z_{1}}^{m} M_{z_{i}}^{*} M_{\Gamma} P_{\operatorname{ker} M_{z_{i}}^{*}}^{*} \Pi_{k=2 ; k \neq i}^{n} P_{\text {ker } M_{z_{k}}^{*}}^{*} M_{\Psi}^{*} M_{z_{i}} M_{z_{1}}^{* m}
$$

This will imply that for any $f \in H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)$,

$$
\begin{aligned}
& \left\|M_{z_{i}}^{*} M_{\Gamma} P_{\text {ker } M_{z_{i}}^{*}} \Pi_{k=2 ; k \neq i}^{n} P_{\text {ker } M_{z_{k}}^{*}}^{*} M_{\Psi}^{*} M_{z_{i}} f\right\| \\
& =\left\|M_{z_{1}}^{m} M_{z_{i}}^{*} M_{\Gamma} P_{\text {ker } M_{z_{i}}^{*}} \Pi_{k=2 ; k \neq i}^{n} P_{\operatorname{ker} M_{z_{k}}^{*}} M_{\Psi}^{*} M_{z_{i}} M_{z_{1}}^{* m} f\right\| \\
& \leq\left\|M_{z_{1}}^{* m} f\right\|_{m \rightarrow \infty}^{\rightarrow} 0 .
\end{aligned}
$$

Hence, we get

$$
M_{z_{i}}^{*} M_{\Gamma} P_{\text {ker } M_{z_{i}}^{*}} \Pi_{k=2 ; k \neq i}^{n} P_{\text {ker } M_{z_{k}}^{*}}^{*} M_{\Psi}^{*} M_{z_{i}}=0
$$

We will repeat the same process co-ordinate-wise. For instance, the above will imply that,

$$
M_{z_{i}}^{*} M_{\Gamma} P_{\text {ker } M_{z_{2}}^{*}}^{*} P_{\text {ker } M_{z_{i}}^{*}}^{*} \Pi_{k=3 ; k \neq i}^{n} P_{\text {ker } M_{z_{k}}^{*}}^{*} M_{\Psi}^{*} M_{z_{i}}=0
$$

which gives,

$$
M_{z_{i}}^{*} M_{\Gamma} P_{\operatorname{ker} M_{z_{i}}^{*}} \Pi_{k=3 ; k \neq i}^{n} P_{\operatorname{ker} M_{z_{k}}^{*}} M_{\Psi}^{*} M_{z_{i}}=M_{z_{2}} M_{z_{i}}^{*} M_{\Gamma} P_{\operatorname{ker} M_{z_{i}}^{*}} \Pi_{k=3 ; k \neq i}^{n} P_{\operatorname{ker} M_{z_{k}}^{*}} M_{\Psi}^{*} M_{z_{i}} M_{z_{2}}^{*}
$$

Again as above, for any $m \in \mathbb{N}$ we have

$$
M_{z_{i}}^{*} M_{\Gamma} P_{\text {ker } M_{z_{i}}^{*}} \Pi_{k=3 ; k \neq i}^{n} P_{\text {ker } M_{z_{k}}^{*}}^{*} M_{\Psi}^{*} M_{z_{i}}=M_{z_{2}}^{m} M_{z_{i}}^{*} M_{\Gamma} P_{\operatorname{ker} M_{z_{i}}^{*}} \Pi_{k=3 ; k \neq i}^{n} P_{\text {ker } M_{z_{k}}^{*}}^{*} M_{\Psi}^{*} M_{z_{i}} M_{z_{2}}^{* m}
$$

which as in the earlier case, will give

$$
M_{z_{i}}^{*} M_{\Gamma} P_{\text {ker } M_{z_{i}}^{*}} \Pi_{k=3 ; k \neq i}^{n} P_{\text {ker } M_{z_{k}}^{*}} M_{\Psi}^{*} M_{z_{i}}=0
$$

Repeating the same process for all co-ordinates in $\{3, \ldots, n\} \backslash\{i\}$, will give us

$$
M_{z_{i}}^{*} M_{\Gamma} P_{\text {ker } M_{z_{i}}^{*}} M_{\Psi}^{*} M_{z_{i}}=0
$$

This completes the proof.
We are now ready to establish our main result on the product of Toeplitz operators.

Proof of Theorem 1.3. From Lemma 3.1 and 3.2, we know that $M_{\Gamma} M_{\Psi}^{*}$ is a Toeplitz operator on $H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)$ if and only if

$$
T_{\overline{z_{i}} \Gamma} P_{\mathcal{E}} T_{z_{i} \Psi^{*}}=M_{z_{i}}^{*} M_{\Gamma} P_{\mathcal{E}} M_{\Psi}^{*} M_{z_{i}}=0
$$

for all $i \in\{1, \ldots, n\}$. Now for any $\boldsymbol{j}, \boldsymbol{k} \in \mathbb{N}^{n}$ and $\eta, \zeta \in \mathcal{E}$ we get

$$
\left\langle P_{\mathcal{E}} T_{z_{i} \Psi^{*}} \boldsymbol{z}^{\boldsymbol{k}} \eta, P_{\mathcal{E}} T_{z_{i} \Gamma^{*}} z^{\boldsymbol{j}} \zeta\right\rangle=\left\langle P_{\mathcal{E}} T_{z_{i}^{k_{i}+1} \Psi^{*}} \hat{z}_{i}^{\hat{k}_{i}} \eta, P_{\mathcal{E}} T_{z_{i}^{j_{i}+1} \Gamma^{*}} \hat{z}_{i}^{\hat{j}_{i}} \zeta\right\rangle
$$

where for any $i \in\{1, \ldots, n\}$ and $\boldsymbol{m} \in \mathbb{N}^{n}$,

$$
\hat{\boldsymbol{z}}_{i}^{\hat{m}_{i}}:=\prod_{k=1 ; k \neq i}^{n} z_{k}^{m_{k}}
$$

By this notation we have $\boldsymbol{z}^{m}=z_{i}^{m_{i}} \hat{\boldsymbol{z}}_{i}^{\hat{m}_{i}}$. Now note that from our assumption

$$
\Gamma(\boldsymbol{z}):=\sum_{l \in \mathbb{N}^{n}} \boldsymbol{z}^{l} A_{l} ; \quad \Psi(\boldsymbol{z}):=\sum_{m \in \mathbb{N}^{n}} z^{m} B_{\boldsymbol{m}}
$$

where $A_{\boldsymbol{l}}:=A_{\left(l_{1}, \ldots, l_{n}\right)}, B_{\boldsymbol{m}}:=B_{\left(m_{1}, \ldots, m_{n}\right)} \in \mathcal{B}(\mathcal{F}, \mathcal{E})$ for all $\boldsymbol{l}=\left(l_{1}, \ldots, l_{n}\right)$, and $\boldsymbol{m}=$ $\left(m_{1}, \ldots, m_{n}\right)$ in $\mathbb{N}^{n}$. Now,

$$
\begin{aligned}
P_{\mathcal{E}} T_{z_{i} j_{i}+1} \Gamma^{*} \hat{z}_{i}^{\hat{j}_{i}} \zeta & =P_{\mathcal{E}} P_{H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)} z_{i}^{j_{i}+1} \hat{z}_{i}^{\hat{\boldsymbol{j}}_{i}} \Gamma(\boldsymbol{z})^{*} \zeta \\
& =P_{\mathcal{E}} \sum_{l \in \mathbb{N}^{n}} z_{i}^{j_{i}+1} \hat{\boldsymbol{z}}_{i}^{\hat{j}_{i}} \bar{z}^{l} A_{l}^{*} \zeta \\
& =P_{\mathcal{E}} \sum_{l \in \mathbb{N}^{n}} z_{i}^{j_{i}-l_{i}+1} \hat{\boldsymbol{z}}_{i}^{\hat{j}_{i}} \overline{\bar{z}}_{i} \hat{l}_{i}
\end{aligned} A_{l}^{*} \zeta .
$$

Similarly,

$$
P_{\mathcal{E}} T_{z_{i} \Psi^{*}} z^{k} \eta=P_{\mathcal{E}} T_{z_{i}^{k_{i}+1} \Psi^{*}} \hat{z}_{i}^{\hat{k}_{i}} \eta=B_{\left(k_{1}, \ldots, k_{i-1}, k_{i}+1, k_{i+1}, \ldots, k_{n}\right)}^{*} \eta .
$$

Hence,

$$
\left\langle P_{\mathcal{E}} T_{z_{i} \Psi^{*}} \boldsymbol{z}^{\boldsymbol{k}} \eta, P_{\mathcal{E}} T_{z_{i} \Gamma^{*}} z^{\boldsymbol{j}} \zeta\right\rangle=\left\langle B_{\left(k_{1}, \ldots, k_{i-1}, k_{i}+1, k_{i+1}, \ldots, k_{n}\right)}^{*} \eta, A_{\left(j_{1}, \ldots, j_{i-1}, j_{i}+1, j_{i+1}, \ldots, j_{n}\right)}^{*} \zeta\right\rangle
$$

for any $\eta, \zeta \in \mathcal{E}$. Therefore, for any $i \in\{1, \ldots, n\}$ we get $T_{\overline{\bar{z}_{i}} \Gamma} P_{\mathcal{E}} T_{z_{i} \Psi^{*}}=0$ if and only if

$$
A_{\left(j_{1}, \ldots, j_{i-1}, j_{i}+1, j_{i+1}, \ldots, j_{n}\right)} B_{\left(k_{1}, \ldots, k_{i-1}, k_{i+1}, k_{i+1}, \ldots, k_{n}\right)}^{*}=0
$$

for all $\boldsymbol{j}, \boldsymbol{k} \in \mathbb{N}^{n}$. Using Lemma 3.1 and Lemma 3.2, we get $M_{\Gamma} M_{\Psi}^{*}$ is a Toeplitz operator if and only if

$$
A_{l+e_{i}} B_{m+e_{i}}^{*}=0
$$

for all $i \in\{1, \ldots, n\}$, and $\boldsymbol{l}, \boldsymbol{m} \in \mathbb{N}^{n}$. This completes the proof.
Remark 3.1. It is natural to ask what will be the symbol of the Toeplitz operator in the above case. We will just observe the simple case when $n=1$. From the conditions in Theorem
1.3, we get that $A_{l+1} B_{m+1}^{*}=0$ for all $l, m \in \mathbb{N}$. Hence,

$$
\begin{aligned}
\Gamma(z) \Psi(z)^{*}=\sum_{l \in \mathbb{N}} A_{l} z^{l} \sum_{m \in \mathbb{N}} B_{m}^{*} \bar{z}^{m} & =A_{0} \sum_{m \in \mathbb{N}} B_{m}^{*} \bar{z}^{m}+\sum_{l \in \mathbb{N} ; l \neq 0} A_{l} z^{l} B_{0}^{*} \\
& =A_{0} \sum_{m \in \mathbb{N} ; m \neq 0} B_{m}^{*} \bar{z}^{m}+\sum_{l \in \mathbb{N}} A_{l} z^{l} B_{0}^{*} \\
& =A_{0}(\Psi(z)-\Psi(0))^{*}+\Gamma(z) B_{0}^{*}
\end{aligned}
$$

Therefore,

$$
M_{\Gamma} M_{\Psi}^{*}=T_{\tilde{\Gamma}+\tilde{\Psi}^{*}}=T_{\tilde{\Gamma}}+T_{\tilde{\Psi}^{*}}
$$

where

$$
\tilde{\Gamma}(z)=\Gamma(z) B_{0}^{*} ; \quad \tilde{\Psi}(z)=(\Psi(z)-\Psi(0)) A_{0}^{*}
$$

## 4. Beurling-type Toeplitz ranges

In the scalar cases, the main result in [8] shows that a partially isometric Toeplitz operator $T_{\phi}$ on $H^{2}\left(\mathbb{D}^{n}\right)$ must be of the following form.

$$
T_{\phi}=M_{\phi_{1}}^{*} M_{\phi_{2}}
$$

where $\phi_{1}, \phi_{2}$ are inner functions on $\mathbb{D}^{n}$, but depending on disjoint set of variables. As a consequence of this factorization, one observes that

$$
\operatorname{ran} T_{\phi}=M_{\phi_{1}} H^{2}\left(\mathbb{D}^{n}\right) ; \quad \operatorname{ran} T_{\phi}^{*}=M_{\phi_{2}} H^{2}\left(\mathbb{D}^{n}\right)
$$

In other words, the range of the partially isometric Toeplitz operator must be Beurlingtype. This section aims to prove that this result is true even for vector-valued Hardy spaces. Since the commutativity of the symbols is lacking in vector-valued Hardy spaces, we have to pursue a completely new and different approach based on the characterization of Beurlingtype invariant subspaces of $H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)$ via restriction operators. We begin by first showing that the range of partially isometric Toeplitz operators is shift-invariant subspaces of $H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)$.
Proposition 4.1. Let $T_{\Phi} \in \mathcal{B}\left(H_{\mathcal{B}(\mathcal{E})}^{2}\left(\mathbb{D}^{n}\right)\right)$ be a partial isometry, then the range of $T_{\Phi}$ is a $\left(M_{z_{1}}, \ldots, M_{z_{n}}\right)$-joint invariant closed subspace of $H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)$.

Proof. We already know that $T_{\Phi}$ is a partial isometry if and only if $T_{\Phi}^{*}$ is a partial isometry. Thus, $T_{\Phi}$ is a partial isometry implies that both $\operatorname{ran} T_{\Phi}$ and $\operatorname{ran} T_{\Phi}^{*}$ are closed subspaces of $H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)$. Thus, we only need to show the $\left(M_{z_{1}}, \ldots, M_{z_{n}}\right)$-joint invariance of $\operatorname{ran} T_{\Phi}$. To prove this, let us note that for any $f \in \operatorname{ran} T_{\Phi}$, we have the following inequalities for any arbitrary but fixed $i \in\{1, \ldots, n\}$.

$$
\left\|z_{i} f\right\| \geq\left\|T_{\Phi}^{*} M_{z_{i}} f\right\| \geq\left\|M_{z_{i}}^{*} T_{\Phi}^{*} M_{z_{i}} f\right\|=\left\|T_{\Phi}^{*} f\right\|=\|f\|=\left\|z_{i} f\right\|
$$

and thus, $\left\|T_{\Phi}^{*} z_{i} f\right\|=\left\|z_{i} f\right\|$. Since $T_{\Phi}^{*}$ is a partial isometry we must have $z_{i} f \in \operatorname{ran} T_{\Phi}$. Since $i$ was arbitrarily chosen, this must be true for all $i \in\{1, \ldots, n\}$. This completes the proof.

Before proving our next result, let us highlight some useful facts involving shift-invariant subspaces of $H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)$. Given any $\left(M_{z_{1}}, \ldots, M_{z_{n}}\right)$-joint invariant closed subspace (say) $\mathcal{S} \subseteq$ $H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)$, we can always associate the following restriction operators

$$
R_{i}:=\left.M_{z_{i}}\right|_{\mathcal{S}}
$$

SARKAR
for each $i \in\{1, \ldots, n\}$. It is well known these operators play a crucial role in characterizing shift-invariant subspaces of $H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)$. We define the subspace $\mathcal{S}$ to be doubly commuting if

$$
\left[R_{i}^{*}, R_{j}\right]=0
$$

for all distinct $i, j \in\{1, \ldots, n\}$. From [25], we know that the following equivalence holds: (i) $\mathcal{S}$ is doubly commuting,
(ii) $\mathcal{S}$ is a Beurling-type subspace of $H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)$, that is, by definition, there exists a Hilbert space $\mathcal{F}$, and an inner function $\Theta(\boldsymbol{z}) \in H_{\mathcal{B}(\mathcal{E})}^{\infty}\left(\mathbb{D}^{n}\right)$ such that

$$
\mathcal{S}=M_{\Theta} H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)
$$

In the following result, we prove that the range of a partially isometric Toeplitz operator always admits the above description.

Proof of Theorem 1.2. Our approach is to show that if $T_{\Phi}$ is a partial isometry then ran $T_{\Phi}^{*}$ is a Beurling-type invariant subspace of $H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)$. This will prove what we want because then,
$T_{\Phi}$ is a partial isometry $\Longleftrightarrow T_{\Phi}^{*}$ is a partial isometry $\Longrightarrow \operatorname{ran} T_{\Phi}$ is Beurling-type.
It is evident from the preceding discussion that we need to prove ran $T_{\Phi}^{*}$ is doubly commuting. In other words, for any distinct $i, j \in\{1, \ldots, n\}$, the following conditions should be satisfied.

$$
R_{i}^{*} R_{j}=R_{j} R_{i}^{*}
$$

Since $T_{\Phi}$ is a partial isometry, we can further deduce that,

$$
R_{i}=\left.M_{z_{i}}\right|_{\operatorname{ran} T_{\Phi}^{*}}=M_{z_{i}} T_{\Phi}^{*} T_{\Phi} \quad(\forall i \in\{1, \ldots, n\})
$$

Now let us establish a few conditions essential for the sequel. From Proposition 4.1, we know that $\operatorname{ran} T_{\Phi}$ is a $\left(M_{z_{1}}, \ldots, M_{z_{n}}\right)$-joint invariant subspace, and therefore,

$$
T_{\Phi} T_{\Phi}^{*} M_{z_{i}} T_{\Phi}=M_{z_{i}} T_{\Phi}
$$

Acting on the left by $M_{z_{i}}^{*}$ gives

$$
M_{z_{i}}^{*} T_{\Phi} T_{\Phi}^{*} M_{z_{i}} T_{\Phi}=T_{\Phi}
$$

which further implies that

$$
\begin{aligned}
& T_{\Phi}+M_{z_{i}}^{*} T_{\Phi} P_{\text {ker } M_{z_{i}}^{*}} T_{\Phi}^{*} M_{z_{i}} T_{\Phi} \\
& =T_{\Phi} T_{\Phi}^{*} T_{\Phi}+M_{z_{i}}^{*} T_{\Phi} P_{\text {ker } M_{z_{i}}^{*}}^{*} T_{\Phi}^{*} M_{z_{i}} T_{\Phi} \\
& =M_{z_{i}}^{*} T_{\Phi} M_{z_{i}} M_{z_{i}}^{*} T_{\Phi}^{*} M_{z_{i}} T_{\Phi}+M_{z_{i}}^{*} T_{\Phi} P_{\text {ker } M_{z_{i}}^{*}} T_{\Phi}^{*} M_{z_{i}} T_{\Phi} \\
& =M_{z_{i}}^{*} T_{\Phi}\left(M_{z_{i}} M_{z_{i}}^{*}+P_{\text {ker } M_{z_{i}}^{*}}\right) T_{\Phi}^{*} M_{z_{i}} T_{\Phi} \\
& =M_{z_{i}}^{*} T_{\Phi} T_{\Phi}^{*} M_{z_{i}} T_{\Phi} \\
& =T_{\Phi}
\end{aligned}
$$

Therefore, we get

$$
M_{z_{i}}^{*} T_{\Phi} P_{\text {ker } M_{z_{i}}^{*}} T_{\Phi}^{*} M_{z_{i}} T_{\Phi}=0
$$

which again implies that

$$
T_{\Phi}^{*} M_{z_{i}}^{*} T_{\Phi} P_{\operatorname{ker} M_{z_{i}}^{*}} T_{\Phi}^{*} M_{z_{i}} T_{\Phi}=0
$$

and hence,

$$
P_{\mathrm{ker} M_{z_{i}}^{*}} T_{\Phi}^{*} M_{z_{i}} T_{\Phi}=0
$$

In other words, since $P_{\text {ker } M_{z_{i}}^{*}}=I_{H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)}-M_{z_{i}} M_{z_{i}}^{*}$, we get

$$
\begin{equation*}
M_{z_{i}} T_{\Phi}^{*} T_{\Phi}=T_{\Phi}^{*} M_{z_{i}} T_{\Phi} \tag{4.3}
\end{equation*}
$$

Since $i$ was arbitrarily chosen, the above identity holds for all $i \in\{1, \ldots, n\}$. Now, if we act on the right of both sides by $T_{\Phi}^{*}$ and on the left of both sides by $T_{\Phi}$, we get

$$
T_{\Phi} M_{z_{i}} T_{\Phi}^{*} T_{\Phi} T_{\Phi}^{*}=T_{\Phi} T_{\Phi}^{*} M_{z_{i}} T_{\Phi} T_{\Phi}^{*}
$$

Using the $M_{z_{i}}$-invariance of $\operatorname{ran} T_{\Phi}$ we get

$$
\begin{equation*}
M_{z_{i}} T_{\Phi} T_{\Phi}^{*}=T_{\Phi} M_{z_{i}} T_{\Phi}^{*} \quad(i \in\{1, \ldots, n\}) \tag{4.4}
\end{equation*}
$$

and therefore, using identity (4.3), we get

$$
R_{i}^{*} R_{j}=T_{\Phi}^{*} T_{\Phi} M_{z_{i}}^{*} M_{z_{j}} T_{\Phi}^{*} T_{\Phi}=T_{\Phi}^{*} M_{z_{i}}^{*} T_{\Phi} T_{\Phi}^{*} M_{z_{j}} T_{\Phi}=T_{\Phi}^{*} M_{z_{i}}^{*} M_{z_{j}} T_{\Phi}=T_{\Phi}^{*} M_{z_{j}} M_{z_{i}}^{*} T_{\Phi}
$$

and

$$
R_{j} R_{i}^{*}=M_{z_{j}} T_{\Phi}^{*} T_{\Phi} M_{z_{i}}^{*} T_{\Phi}^{*} T_{\Phi}=M_{z_{j}} T_{\Phi}^{*} T_{\Phi} M_{z_{i}}^{*}
$$

The last equality follows from the fact that $\operatorname{ker} T_{\Phi}^{*}$ is $\left(M_{z_{1}}^{*}, \ldots, M_{z_{n}}^{*}\right)$-joint invariant. Therefore, $\operatorname{ran} T_{\Phi}^{*}$ is a doubly commuting shift-invariant subspace if and only if

$$
\begin{equation*}
T_{\Phi}^{*} M_{z_{j}} M_{z_{i}}^{*} T_{\Phi}=M_{z_{j}} T_{\Phi}^{*} T_{\Phi} M_{z_{i}}^{*} \tag{4.5}
\end{equation*}
$$

for all distinct $i, j \in\{1, \ldots, n\}$. Using the identity (4.3), we can again observe that

$$
\begin{aligned}
& T_{\Phi}^{*} M_{z_{j}} P_{\text {ker } T_{\Phi}^{*}} M_{z_{i}}^{*} T_{\Phi} \\
& =T_{\Phi}^{*} M_{z_{j}} M_{z_{i}}^{*} T_{\Phi}-T_{\Phi}^{*} M_{z_{j}} T_{\Phi} T_{\Phi}^{*} M_{z_{i}}^{*} T_{\Phi} \\
& =T_{\Phi}^{*} M_{z_{j}} M_{z_{i}}^{*} T_{\Phi}-M_{z_{j}} T_{\Phi}^{*} T_{\Phi} T_{\Phi}^{*} T_{\Phi} M_{z_{i}}^{*} \\
& =T_{\Phi}^{*} M_{z_{j}} M_{z_{i}}^{*} T_{\Phi}-M_{z_{j}} T_{\Phi}^{*} T_{\Phi} M_{z_{i}}^{*} .
\end{aligned}
$$

Therefore, condition (4.5) is again equivalent to $T_{\Phi}^{*} M_{z_{j}} P_{\operatorname{ker} T_{\Phi}^{*}} M_{z_{i}}^{*} T_{\Phi}=0$. We will now show that this identity holds. From the identities (4.3) and (4.4), we can get for any distinct $i, j \in\{1, \ldots, n\}$.

$$
\begin{aligned}
M_{z_{i}}^{*} T_{\Phi} T_{\Phi}^{*} M_{z_{i}} M_{z_{j}}^{*} T_{\Phi} T_{\Phi}^{*} M_{z_{j}} & =M_{z_{i}}^{*} T_{\Phi} T_{\Phi}^{*} M_{z_{j}}^{*} M_{z_{i}} T_{\Phi} T_{\Phi}^{*} M_{z_{j}} \\
& =M_{z_{i}}^{*} T_{\Phi} M_{z_{j}}^{*} T_{\Phi}^{*} T_{\Phi} M_{z_{i}} T_{\Phi}^{*} M_{z_{j}} \\
& =M_{z_{i}}^{*} T_{\Phi} M_{z_{j}}^{*} M_{z_{i}} T_{\Phi}^{*} M_{z_{j}} \\
& =M_{z_{i}}^{*} T_{\Phi} M_{z_{i}} M_{z_{j}}^{*} T_{\Phi}^{*} M_{z_{j}} \\
& =T_{\Phi} T_{\Phi}^{*} .
\end{aligned}
$$

Therefore, for any distinct $i, j \in\{1, \ldots, n\}$, we get

$$
\begin{equation*}
M_{z_{i}}^{*} T_{\Phi} T_{\Phi}^{*} M_{z_{i}} M_{z_{j}}^{*} T_{\Phi} T_{\Phi}^{*} M_{z_{j}}=T_{\Phi} T_{\Phi}^{*}=M_{z_{j}}^{*} T_{\Phi} T_{\Phi}^{*} M_{z_{j}} M_{z_{i}}^{*} T_{\Phi} T_{\Phi}^{*} M_{z_{i}} \tag{4.6}
\end{equation*}
$$

From this, we can further deduce that

$$
\begin{aligned}
M_{z_{i}}^{*} P_{\operatorname{ker} T_{\Phi}^{*}} M_{z_{i}} M_{z_{j}}^{*} P_{\operatorname{ker} T_{\Phi}^{*}} M_{z_{j}} & =M_{z_{i}}^{*} M_{z_{i}} M_{z_{j}}^{*} P_{\operatorname{ker} T_{\Phi}^{*}} M_{z_{j}}-M_{z_{i}}^{*} T_{\Phi} T_{\Phi}^{*} M_{z_{i}} M_{z_{j}}^{*} P_{\text {ker } T_{\Phi}^{*}} M_{z_{j}} \\
& =M_{z_{j}}^{*} P_{\operatorname{ker} T_{\Phi}^{*}} M_{z_{j}}-M_{z_{i}}^{*} T_{\Phi} T_{\Phi}^{*} M_{z_{i}} M_{z_{j}}^{*} P_{\operatorname{ker} T_{\Phi}^{*}} M_{z_{j}} \\
& =M_{z_{j}}^{*} P_{\operatorname{ker} T_{\Phi}^{*}} M_{z_{j}}-M_{z_{i}}^{*} T_{\Phi} T_{\Phi}^{*} M_{z_{i}} M_{z_{j}}^{*} M_{z_{j}} \\
& +M_{z_{i}}^{*} T_{\Phi} T_{\Phi}^{*} M_{z_{i}} M_{z_{j}}^{*} T_{\Phi} T_{\Phi}^{*} M_{z_{j}} \\
& =M_{z_{j}}^{*} P_{\operatorname{ker} T_{\Phi}^{*}} M_{z_{j}}-M_{z_{i}}^{*} T_{\Phi} T_{\Phi}^{*} M_{z_{i}}+T_{\Phi} T_{\Phi}^{*} .
\end{aligned}
$$

Since the right-hand side is self-adjoint, the above implies that for any distinct $i, j \in\{1, \ldots, n\}$,

$$
\begin{equation*}
M_{z_{i}}^{*} P_{\operatorname{ker} T_{\Phi}^{*}} M_{z_{i}} M_{z_{j}}^{*} P_{\operatorname{ker} T_{\Phi}^{*}} M_{z_{j}}=M_{z_{j}}^{*} P_{\operatorname{ker} T_{\Phi}^{*}} M_{z_{j}} M_{z_{i}}^{*} P_{\operatorname{ker} T_{\Phi}^{*}} M_{z_{i}} \tag{4.7}
\end{equation*}
$$

Now let us compute $C_{i}^{*} C_{i}$, where $C_{i}=\left.P_{\operatorname{ker} T_{\Phi}^{*}} M_{z_{i}}\right|_{\operatorname{ker} T_{\Phi}^{*}}$ for $i \in\{1, \ldots, n\}$.

$$
C_{i}^{*} C_{i}=P_{\operatorname{ker} T_{\Phi}^{*}} M_{z_{i}}^{*} P_{\operatorname{ker} T_{\Phi}^{*}}^{*} M_{z_{i}} P_{\operatorname{ker} T_{\Phi}^{*}}=M_{z_{i}}^{*} P_{\operatorname{ker} T_{\Phi}^{*}} M_{z_{i}} P_{\operatorname{ker} T_{\Phi}^{*}}=M_{z_{i}}^{*} P_{\operatorname{ker} T_{\Phi}^{*}}^{*} M_{z_{i}}
$$

The second and last equalities follow by using the fact that $\operatorname{ran} T_{\Phi}$ is $\left(M_{z_{1}}, \ldots, M_{z_{n}}\right)$-joint invariant. Now, let us observe that

$$
\begin{aligned}
I_{\operatorname{ker} T_{\Phi}^{*}}-C_{i}^{*} C_{i}=I_{\operatorname{ker} T_{\Phi}^{*}}-M_{z_{i}}^{*} P_{\operatorname{ker} T_{\Phi}^{*}} M_{z_{i}} & =I_{H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)}-T_{\Phi} T_{\Phi}^{*}-M_{z_{i}}^{*} P_{\operatorname{ker} T_{\Phi}^{*}} M_{z_{i}} \\
& =I_{H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)}-T_{\Phi} T_{\Phi}^{*}-I_{H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)}+M_{z_{i}}^{*} T_{\Phi} T_{\Phi}^{*} M_{z_{i}} \\
& =M_{z_{i}}^{*} T_{\Phi} T_{\Phi}^{*} M_{z_{i}}-T_{\Phi} T_{\Phi}^{*}
\end{aligned}
$$

By compressing the above identity with respect to $P_{\text {ker } T_{\Phi}^{*}}$, we get,

$$
I_{\operatorname{ker} T_{\Phi}^{*}}-C_{i}^{*} C_{i}=P_{\operatorname{ker} T_{\Phi}^{*}} M_{z_{i}}^{*} T_{\Phi} T_{\Phi}^{*} M_{z_{i}} P_{\operatorname{ker} T_{\Phi}^{*}},
$$

Therefore, for each $i \in\{1, \ldots, n\}$, there exists isometries,
such that

$$
Y_{i}\left(I_{\operatorname{ker} T_{\Phi}^{*}}-C_{i}^{*} C_{i}\right)^{\frac{1}{2}}=T_{\Phi}^{*} M_{z_{i}} P_{\operatorname{ker} T_{\Phi}^{*}} .
$$

Now using conditions (4.3), (4.4), and (4.6), we deduce that

$$
\begin{aligned}
\left(I_{\mathrm{ker} T_{\Phi}^{*}}-C_{i}^{*} C_{i}\right)\left(I_{\mathrm{ker} T_{\Phi}^{*}}-C_{j}^{*} C_{j}\right) & =\left(M_{z_{i}}^{*} T_{\Phi} T_{\Phi}^{*} M_{z_{i}}-T_{\Phi} T_{\Phi}^{*}\right)\left(M_{z_{j}}^{*} T_{\Phi} T_{\Phi}^{*} M_{z_{j}}-T_{\Phi} T_{\Phi}^{*}\right) \\
& =M_{z_{i}}^{*} T_{\Phi} T_{\Phi}^{*} M_{z_{i}} M_{z_{j}}^{*} T_{\Phi} T_{\Phi}^{*} M_{z_{j}}-M_{z_{i}}^{*} T_{\Phi} T_{\Phi}^{*} M_{z_{i}} T_{\Phi} T_{\Phi}^{*} \\
& -T_{\Phi} T_{\Phi}^{*} M_{z_{j}}^{*} T_{\Phi} T_{\Phi}^{*} M_{z_{j}}+T_{\Phi} T_{\Phi}^{*} \\
& =T_{\Phi} T_{\Phi}^{*}-M_{z_{i}}^{*} T_{\Phi} M_{z_{i}} T_{\Phi}^{*} T_{\Phi} T_{\Phi}^{*} \\
& -T_{\Phi} M_{z_{j}}^{*} T_{\Phi}^{*} T_{\Phi} T_{\Phi}^{*} M_{z_{j}}+T_{\Phi} T_{\Phi}^{*} \\
& =T_{\Phi} T_{\Phi}^{*}-T_{\Phi} T_{\Phi}^{*}-T_{\Phi} T_{\Phi}^{*}+T_{\Phi} T_{\Phi}^{*} \\
& =0 .
\end{aligned}
$$

Since, both $\left(I_{\operatorname{ker} T_{\Phi}^{*}}-C_{i}^{*} C_{i}\right)$ and $\left(I_{\operatorname{ker} T_{\Phi}^{*}}-C_{j}^{*} C_{j}\right)$ are non-negative operators, therefore, we have

$$
\left(I_{\mathrm{ker} T_{\Phi}^{*}}-C_{i}^{*} C_{i}\right)^{\frac{1}{2}}\left(I_{\mathrm{ker} T_{\Phi}^{*}}-C_{j}^{*} C_{j}\right)^{\frac{1}{2}}=0
$$

This implies that

$$
T_{\Phi}^{*} M_{z_{j}} P_{\operatorname{ker} T_{\Phi}^{*}} M_{z_{i}}^{*} T_{\Phi}=Y_{j}\left(I_{\operatorname{ker} T_{\Phi}^{*}}-C_{j}^{*} C_{j}\right)^{\frac{1}{2}}\left(I_{\operatorname{ker} T_{\Phi}^{*}}-C_{i}^{*} C_{i}\right)^{\frac{1}{2}} Y_{i}^{*}=0 .
$$

This completes the proof.

## 5. Partially isometric Toeplitz operators

This section will prove that partially isometric Toeplitz operators always admit a factorization into Toeplitz operators corresponding to inner symbols.

Proof of Theorem 1.4. From Theorem 1.2, we know that $T_{\Phi}$ is a partial isometry implies that both $\operatorname{ran} T_{\Phi}$ and $\operatorname{ran} T_{\phi}^{*}$ are Beurling-type invariant subspace of $H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)$. Thus, there exist Hilbert spaces $\mathcal{F}, \mathcal{G}$ and inner functions $\Gamma(\boldsymbol{z}) \in H_{\mathcal{B}(\mathcal{F}, \mathcal{E})}^{\infty}\left(\mathbb{D}^{n}\right), \Psi(\boldsymbol{z}) \in H_{\mathcal{B}(\mathcal{G}, \mathcal{E})}^{\infty}\left(\mathbb{D}^{n}\right)$ such that

$$
\operatorname{ran} T_{\Phi}=M_{\Gamma} H_{\mathcal{F}}^{2}\left(\mathbb{D}^{n}\right)
$$

and

$$
\operatorname{ran} T_{\Phi}^{*}=M_{\Psi} H_{\mathcal{G}}^{2}\left(\mathbb{D}^{n}\right)
$$

From the above identities, it follows that,

$$
T_{\Phi} T_{\Phi}^{*}=M_{\Gamma} M_{\Gamma}^{*} ; \quad T_{\Phi}^{*} T_{\Phi}=M_{\Psi} M_{\Psi}^{*}
$$

Since $T_{\Phi}$ is partial isometry, it further implies that

$$
M_{\Psi} M_{\Psi}^{*}=T_{\Phi}^{*} T_{\Phi}=T_{\Phi}^{*} T_{\Phi} T_{\Phi}^{*} T_{\Phi}=T_{\Phi}^{*} M_{\Gamma} M_{\Gamma}^{*} T_{\Phi}
$$

and therefore, $\left\|M_{\Psi}^{*} h\right\|=\left\|M_{\Gamma}^{*} T_{\Phi} h\right\|$ for any $h \in H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)$. Further note that since $M_{\Psi}$ is an isometry, we have ran $M_{\Psi}^{*}=H_{\mathcal{G}}^{2}\left(\mathbb{D}^{n}\right)$. Thus, we can define an isometry $X: H_{\mathcal{G}}^{2}\left(\mathbb{D}^{n}\right) \rightarrow H_{\mathcal{F}}^{2}\left(\mathbb{D}^{n}\right)$ by

$$
X M_{\Psi}^{*} h=M_{\Gamma}^{*} T_{\Phi} h
$$

in other words, $X M_{\Psi}^{*}=M_{\Gamma}^{*} T_{\Phi}$ on $H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)$. Using this map, we can observe that

$$
T_{\Phi}=M_{\Gamma} M_{\Gamma}^{*} T_{\Phi}=M_{\Gamma} X M_{\Psi}^{*}
$$

This further implies that

$$
X=M_{\Gamma}^{*} T_{\Phi} M_{\Psi}
$$

and hence,

$$
M_{z_{i}}^{*} X M_{z_{i}}=M_{z_{i}}^{*} M_{\Gamma}^{*} T_{\Phi} M_{\Psi} M_{z_{i}}=M_{\Gamma}^{*} M_{z_{i}}^{*} T_{\Phi} M_{z_{i}} M_{\Psi}=M_{\Gamma}^{*} T_{\Phi} M_{\Psi}=X
$$

for all $i \in\{1, \ldots, n\}$. Moreover,

$$
X X^{*}=M_{\Gamma}^{*} T_{\Phi} M_{\Psi} M_{\Psi}^{*} T_{\Phi}^{*} M_{\Gamma}=M_{\Gamma}^{*} T_{\Phi} T_{\Phi}^{*} T_{\Phi} T_{\Phi}^{*} M_{\Gamma}=M_{\Gamma}^{*} T_{\Phi} T_{\Phi}^{*} M_{\Gamma}=M_{\Gamma}^{*} M_{\Gamma} M_{\Gamma}^{*} M_{\Gamma}=I_{H_{\mathcal{F}}^{2}\left(\mathbb{D}^{n}\right)}
$$

shows that $X$ is a unitary between $H_{\mathcal{G}}^{2}\left(\mathbb{D}^{n}\right)$ and $H_{\mathcal{F}}^{2}\left(\mathbb{D}^{n}\right)$. Again, for any $i \in\{1, \ldots, n\}$, we get

$$
I_{H_{\mathcal{F}}^{2}\left(\mathbb{D}^{n}\right)}=X X^{*}=M_{z_{i}}^{*} X M_{z_{i}} M_{z_{i}}^{*} X^{*} M_{z_{i}}=I_{H_{\mathcal{F}}^{2}\left(\mathbb{D}^{n}\right)}-M_{z_{i}}^{*} X P_{\text {ker }} M_{z_{i}}^{*} X^{*} M_{z_{i}} .
$$

This implies that $M_{z_{i}}^{*} X P_{\text {ker } M_{z_{i}}^{*}} X^{*} M_{z_{i}}=0$, and hence $\left(I_{H_{\mathcal{F}}^{2}\left(\mathbb{D}^{n}\right)}-M_{z_{i}} M_{z_{i}}^{*}\right) X^{*} M_{z_{i}}=0$ and therefore,

$$
\begin{equation*}
X^{*} M_{z_{i}}=M_{z_{i}} X^{*} \tag{5.8}
\end{equation*}
$$

for all $i \in\{1, \ldots, n\}$. Similarly, for any $i \in\{1, \ldots, n\}$ we have

$$
I_{H_{\mathcal{G}}^{2}\left(\mathbb{D}^{n}\right)}=X^{*} X=M_{z_{i}}^{*} X^{*} M_{z_{i}} M_{z_{i}}^{*} X M_{z_{i}}=I_{H_{\mathcal{G}}^{2}\left(\mathbb{D}^{n}\right)}-M_{z_{i}}^{*} X^{*} P_{\text {ker } M_{z_{i}}^{*}} X M_{z_{i}} .
$$

This implies that $M_{z_{i}}^{*} X^{*} P_{\text {ker } M_{z_{i}}^{*}} X M_{z_{i}}=0$ and thus, we get

$$
\begin{equation*}
X M_{z_{i}}=M_{z_{i}} X \tag{5.9}
\end{equation*}
$$

for all $i \in\{1, \ldots, n\}$. From conditions (5.8) and (5.9), it implies that $X$ must be a constant unitary from $H_{\mathcal{G}}^{2}(\mathbb{D})$ to $H_{\mathcal{F}}^{2}(\mathbb{D})$. Therefore, we can re-write the map $X$ as $I_{H^{2}\left(\mathbb{D}^{n}\right)} \otimes X$, where $X: \mathcal{G} \rightarrow \mathcal{F}$ is a unitary. Based on these observations, we can now write

$$
T_{\Phi}=M_{\Gamma}\left(I_{H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)} \otimes X\right) M_{\Psi}^{*}=M_{\Gamma} M_{\tilde{\Psi}}^{*}
$$

where $\tilde{\Psi}(\boldsymbol{z}):=\Psi(\boldsymbol{z}) X^{*} \in H_{\mathcal{B}(\mathcal{F}, \mathcal{E})}^{\infty}\left(\mathbb{D}^{n}\right)$ is an inner function. Since $T_{\Phi}=M_{\Gamma} M_{\tilde{\Psi}}^{*}$ is a Toeplitz operator, from Theorem [1.3, we must have

$$
A_{l+e_{i}} X B_{m+e_{i}}^{*}=0 \quad\left(\boldsymbol{m}, \boldsymbol{n} \in \mathbb{N}^{n}\right)
$$

where $e_{i}=(0, \ldots, 0, \underset{\text { ith position }}{1}, 0, \ldots, 0)$ for all $i \in\{1, \ldots, n\}$ and

$$
\Gamma(\boldsymbol{z}):=\sum_{l \in \mathbb{N}^{n}} A_{l} z^{l} \in H_{\mathcal{B}(\mathcal{F}, \mathcal{E})}^{\infty}\left(\mathbb{D}^{n}\right) ; \quad \Psi(\boldsymbol{z}):=\sum_{\boldsymbol{m} \in \mathbb{N}^{n}} B_{\boldsymbol{m}} z^{\boldsymbol{m}} \in H_{\mathcal{B}(\mathcal{F}, \mathcal{E})}^{\infty}\left(\mathbb{D}^{n}\right)
$$

Conversely, if the Toeplitz operator admits a factorization like $T_{\Phi}=M_{\Gamma} M_{\Psi}^{*}$. Then

$$
T_{\Phi} T_{\Phi}^{*}=M_{\Gamma} M_{\Psi}^{*} M_{\Psi} M_{\Gamma}^{*}=M_{\Gamma} M_{\Gamma}^{*}
$$

shows that $T_{\Phi}$ is a partial isometry. This completes the proof.
The above result can be used to see direct correspondence between partially isometric Toeplitz operators and their symbols.

Corollary 5.1. If $T_{\Phi}$ is a partially isometric Toeplitz operator on $H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)$ then $\Phi(\boldsymbol{z})$ is a partial isometry almost everywhere on $\mathbb{T}^{n}$.

Proof. From Theorem 1.4 and Theorem 2.4, we get

$$
T_{\Phi}=M_{\Gamma} M_{\Psi}^{*}=T_{\Gamma \Psi^{*}}
$$

This implies that $\Phi(\boldsymbol{z})=\Gamma(\boldsymbol{z}) \Psi(\boldsymbol{z})^{*}$ a.e. on $\mathbb{T}^{n}$. Since $\Gamma(\boldsymbol{z}), \Psi(\boldsymbol{z})$ are inner functions it implies that $\Gamma(\boldsymbol{z}) \Gamma(\boldsymbol{z})^{*}$ is projection-valued and $\Psi(\boldsymbol{z})^{*} \Psi(\boldsymbol{z})=I_{\mathcal{F}}$ a.e. on $\mathbb{T}^{n}$ and therefore,

$$
\left.\Phi(\boldsymbol{z}) \Phi(\boldsymbol{z})^{*}=\Gamma(\boldsymbol{z}) \Psi^{*}(\boldsymbol{z}) \Psi(\boldsymbol{z}) \Gamma^{*}(\boldsymbol{z})=\Gamma(\boldsymbol{z}) \Gamma^{*}(\boldsymbol{z}) \quad \text { (a.e. on } \mathbb{T}^{n}\right)
$$

This shows that $\Phi(\boldsymbol{z})$ is a partial isometry almost everywhere on $\mathbb{T}^{n}$. This completes the proof.

Remark 5.1. The converse direction is not true and we present an example here. Let $\theta(z)=\frac{z}{2}$, and let us consider the symbol $\Phi \in L_{\mathcal{B}\left(\mathbb{C}^{2}\right)}^{\infty}(\mathbb{T})$ defined by

$$
\Phi\left(e^{i t}\right):=\left[\begin{array}{cc}
\theta\left(e^{i t}\right) & \left(1-\left|\theta\left(e^{i t}\right)\right|^{2}\right)^{\frac{1}{2}} \\
0 & 0
\end{array}\right]=\left[\begin{array}{cc}
\theta\left(e^{i t}\right) & \frac{\sqrt{3}}{2} \\
0 & 0
\end{array}\right] \in \mathcal{B}\left(\mathbb{C}^{2}\right) .
$$

It is clear that

$$
\Phi\left(e^{i t}\right)^{*} \Phi\left(e^{i t}\right)=\left[\begin{array}{ll}
1 & 0 \\
0 & 0
\end{array}\right]
$$

Thus, $\Phi\left(e^{i t}\right)$ is a partial isometry on $\mathbb{T}$. However, the corresponding Toeplitz operator

$$
T_{\Phi}=\left[\begin{array}{cc}
T_{\theta} & T_{\frac{\sqrt{3}}{2}} \\
0 & 0
\end{array}\right] \in H_{\mathbb{C}^{2}}^{2}(\mathbb{D})
$$

is not partially isometric. One can easily that if we want $T_{\Phi} T_{\Phi}^{*} T_{\Phi}=T_{\Phi}$, then a necessary condition is $T_{\theta} T_{\theta}^{*}=T_{\frac{1}{4}}$. This is not possible as $\theta(z)$ is analytic.

We will now completely characterize partially isometric Toeplitz operators with analytic symbols.

Theorem 5.2. Let $\Phi(\boldsymbol{z}) \in H_{\mathcal{B}(\mathcal{E})}^{\infty}\left(\mathbb{D}^{n}\right)$, then $M_{\Phi}$ is a partial isometry on $H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)$ if and only if there exists a Hilbert space $\mathcal{F}$, an inner function $\Gamma(\boldsymbol{z}) \in H_{\mathcal{B}(\mathcal{E})}^{\infty}\left(\mathbb{D}^{n}\right)$, and an isometry $V: \mathcal{F} \rightarrow \mathcal{E}$ such that

$$
\Phi(\boldsymbol{z})=\Gamma(\boldsymbol{z}) V^{*} \quad\left(\boldsymbol{z} \in \mathbb{D}^{n}\right)
$$

Proof. If $M_{\Phi}$ is a partial isometry, then by Theorem 1.4, we will get the following factorization

$$
M_{\Phi}=M_{\Gamma} M_{\Psi}^{*}
$$

for some Hilbert space $\mathcal{F}$, and inner functions $\Gamma(\boldsymbol{z}), \Psi(\boldsymbol{z}) \in H_{\mathcal{B}(\mathcal{F}, \mathcal{E})}^{\infty}\left(\mathbb{D}^{n}\right)$. Since $\Phi(\boldsymbol{z})$ is a bounded analytic function, we know

$$
M_{z_{i}} M_{\Phi}=M_{\Phi} M_{z_{i}}
$$

which gives,

$$
M_{z_{i}} M_{\Gamma} M_{\Psi}^{*}=M_{\Gamma} M_{\Psi}^{*} M_{z_{i}}
$$

and therefore,

$$
M_{\Gamma} M_{z_{i}} M_{\Psi}^{*}=M_{\Gamma} M_{\Psi}^{*} M_{z_{i}}
$$

Using the fact that $M_{\Gamma}$ is an isometry we get

$$
M_{z_{i}} M_{\Psi}^{*}=M_{\Psi}^{*} M_{z_{i}}
$$

This implies that $M_{\Psi}$ must be a constant isometry from $H_{\mathcal{F}}^{2}(\mathbb{D})$ to $H_{\mathcal{E}}^{2}(\mathbb{D})$. Thus, $M_{\Psi}=$ $I_{H^{2}\left(\mathbb{D}^{n}\right)} \otimes V$ for some isometry $V: \mathcal{F} \rightarrow \mathcal{E}$, and using this we get

$$
M_{\Phi}=M_{\Gamma}\left(I_{H^{2}\left(\mathbb{D}^{n}\right)} \otimes V^{*}\right)=M_{\Gamma V^{*}}
$$

Conversely, if the bounded analytic function admits the factorization $\Phi(\boldsymbol{z})=\Gamma(\boldsymbol{z}) V^{*}$ for some inner function $\Gamma(\boldsymbol{z}) \in H_{\mathcal{B}(\mathcal{E})}^{\infty}\left(\mathbb{D}^{n}\right)$, and some isometry $V: \mathcal{F} \rightarrow \mathcal{E}$, then

$$
T_{\Phi} T_{\Phi}^{*}=M_{\Gamma}\left(I_{H^{2}\left(\mathbb{D}^{n}\right)} \otimes V^{*}\right)\left(I_{H^{2}\left(\mathbb{D}^{n}\right)} \otimes V\right) M_{\Gamma}^{*}=M_{\Gamma} M_{\Gamma}^{*}
$$

shows that $T_{\Phi}$ is a partial isometry. This completes the proof.
We will now characterize partially isometric Toeplitz operators which are hyponormal. Let us recall that a bounded operator $T$ on a Hilbert space $\mathcal{H}$ is said to be hyponormal if $T^{*} T \geq T T^{*}$. The following result is an extension of [8, Corollary 5.1], and the initial part of the proof follows from their method.
Theorem 5.3. Let $T_{\Phi}$ be a partially isometric Toeplitz operator on $H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)$. Then the following statements are equivalent.
(i) $T_{\Phi}$ is hyponormal,
(ii) there exists Hilbert spaces $\mathcal{F}, \mathcal{G}$ and inner functions $\Psi(\boldsymbol{z}) \in H_{\mathcal{B}(\mathcal{F}, \mathcal{E})}^{\infty}\left(\mathbb{D}^{n}\right)$ and
$\Theta(\boldsymbol{z}) \in H_{\mathcal{B}(\mathcal{F}, \mathcal{G})}^{\infty}\left(\mathbb{D}^{n}\right)$ such that

$$
T_{\Phi}=M_{\Psi} M_{\Theta} M_{\Psi}^{*}
$$

Proof. $T_{\Phi}$ is a partial isometry will imply that $T_{\Phi}=M_{\Gamma} M_{\Psi}^{*}$. Using this identity we get,

$$
T_{\Phi}^{*} T_{\Phi}-T_{\Phi} T_{\Phi}^{*}=M_{\Psi} M_{\Psi}^{*}-M_{\Gamma} M_{\Gamma}^{*}
$$

Now, hyponormality of $T_{\Phi}$ implies that

$$
M_{\Gamma} M_{\Gamma}^{*} \leq M_{\Psi} M_{\Psi}^{*}
$$

By Douglas's lemma [9], there must exist a contraction $Z: H_{\mathcal{F}}^{2}\left(\mathbb{D}^{n}\right) \rightarrow H_{\mathcal{G}}^{2}\left(\mathbb{D}^{n}\right)$ such that

$$
M_{\Gamma}=M_{\Psi} Z
$$

This implies that for any $i \in\{1, \ldots, n\}$

$$
M_{\Psi} M_{z_{i}} Z=M_{z_{i}} M_{\Psi} Z=M_{z_{i}} M_{\Gamma}=M_{\Gamma} M_{z_{i}}=M_{\Psi} Z M_{z_{i}}
$$

which further implies that $Z M_{z_{i}}=M_{z_{i}} Z$. Thus, there exists $\Theta(\boldsymbol{z}) \in H_{\mathcal{B}(\mathcal{F}, \mathcal{G})}^{\infty}\left(\mathbb{D}^{n}\right)$ such that

$$
Z=M_{\Theta}
$$

Furthermore, $\Theta(\boldsymbol{z})$ is an inner function because so are $\Gamma(\boldsymbol{z})$ and $\Psi(\boldsymbol{z})$. Thus, we get

$$
T_{\Phi}=M_{\Gamma} M_{\Psi}^{*}=M_{\Psi} M_{\Theta} M_{\Psi}^{*}
$$

Conversely, if $T_{\Phi}=M_{\Psi} M_{\Theta} M_{\Psi}^{*}$, then

$$
T_{\Phi} T_{\Phi}^{*}=M_{\Psi} M_{\Theta} M_{\Psi}^{*} M_{\Psi} M_{\Theta}^{*} M_{\Psi}^{*}=M_{\Psi} M_{\Theta} M_{\Theta}^{*} M_{\Psi}^{*} \leq M_{\Psi} M_{\Psi}^{*}=T_{\Phi}^{*} T_{\Phi},
$$

implies that $T_{\Phi}$ is hyponormal. This completes the proof.

## 6. An alternative proof for Toeplitz operators on $H^{2}\left(\mathbb{D}^{n}\right)$

This section will adapt the preceding results' ideas to characterize partially isometric Toeplitz operators on scalar-valued Hardy space on unit polydisc. This is an alternative approach to recently obtained results by Deepak-Pradhan-Sarkar in [8].

Theorem 6.1. Let $\zeta, \psi$ be bounded analytic functions $\mathbb{D}^{n}$. Then the following are equivalent (i) $M_{\zeta} M_{\psi}^{*}$ is a Toeplitz operator,
(ii) $M_{\zeta}$ and $M_{\psi}^{*}$ depend on disjoint set of variables.
(iii) $\left[M_{\zeta}, M_{\psi}^{*}\right]=0$.

Proof. Let us denote the bounded analytic functions $\zeta, \psi$ on $\mathbb{D}^{n}$ in the following form

$$
\zeta(\boldsymbol{z}):=\sum_{l \in \mathbb{N}^{n}} a_{l} z^{l} ; \quad \psi(\boldsymbol{z}):=\sum_{\boldsymbol{m} \in \mathbb{N}^{n}} b_{\boldsymbol{m}} z^{m} \quad\left(z \in \mathbb{D}^{n}\right)
$$

From Theorem 1.3, we know that $M_{\zeta} M_{\psi}^{*}$ is a Toeplitz operator if and only if,

$$
a_{\boldsymbol{l}+e_{i}} \bar{b}_{m+e_{i}}=0 .
$$

for all $\boldsymbol{l}, \boldsymbol{m} \in \mathbb{N}^{n}$ and $i \in\{1, \ldots, n\}$. From this identity it follows that for any given $i \in$ $\{1, \ldots, n\}$, either $a_{\boldsymbol{l}+e_{i}}=0$ for all $\boldsymbol{l} \in \mathbb{N}^{n}$, or $b_{\boldsymbol{m}+e_{i}}=0$ for all $\boldsymbol{m} \in \mathbb{N}^{n}$ or both. If $a_{\boldsymbol{l}+e_{i}}=0$, for all $\boldsymbol{l} \in \mathbb{N}^{n}$, then it implies that $\zeta(\boldsymbol{z})$ does not depend on the $z_{i}$-variable. Similarly, if $b_{\boldsymbol{m}+e_{i}}=0$, for all $\boldsymbol{m} \in \mathbb{N}^{n}$, then it will imply that $\psi(\boldsymbol{z})$ does not depend on the $z_{i}$-variable. Thus, from this discussion it follows that if $M_{\zeta} M_{\psi}^{*}$ is a Toeplitz operator then for each $i \in\{1, \ldots, n\}$, any one of the following cases can hold:
$(i) \zeta(\boldsymbol{z})$ depend on the variable $z_{i}$, but $\psi(\boldsymbol{z})$ does not depend on the variable $z_{i}$,
(ii) $\psi(\boldsymbol{z})$ depend on the variable $z_{i}$, but $\zeta(\boldsymbol{z})$ does not depend on the variable $z_{i}$,
(iii) both $\zeta(\boldsymbol{z})$ and $\psi(\boldsymbol{z})$ does not depend on the variable $z_{i}$.

This completes the $(i) \Longrightarrow(i i)$ proof. The other directions $(i i) \Longrightarrow(i i i)$, and $(i i i) \Longrightarrow(i)$ can be easily verified.

We are now ready to give a new proof for the main result in [8, Theorem 1.1].
Theorem 6.2. A Toeplitz operator $T_{\phi}$ on $H^{2}\left(\mathbb{D}^{n}\right)$ is a partial isometry if and only if there exist inner functions $\zeta, \psi \in H^{\infty}\left(\mathbb{D}^{n}\right)$ depending on the disjoint set of variables such that

$$
T_{\phi}=M_{\psi}^{*} M_{\zeta}
$$

Proof. We proceed as in the proof of Theorem 1.4. Since $T_{\phi}$ is a partial isometry, we know from Theorem [1.2, that both $\operatorname{ran} T_{\phi}$ and $\operatorname{ran} T_{\phi}^{*}$ are Beurling type invariant subspaces of $H^{2}\left(\mathbb{D}^{n}\right)$. This means that there must exist inner functions $\gamma, \psi \in H^{\infty}\left(\mathbb{D}^{n}\right)$ such that

$$
\operatorname{ran} T_{\phi}=M_{\gamma} H^{2}\left(\mathbb{D}^{n}\right) ; \quad \operatorname{ran} T_{\phi}^{*}=M_{\psi} H^{2}\left(\mathbb{D}^{n}\right)
$$

If we follow the proof of Theorem [1.4, we can construct an unitary $X: \mathbb{C} \rightarrow \mathbb{C}$ such that

$$
T_{\phi}=M_{\gamma} X M_{\psi}^{*}
$$

In other words, $T_{\phi}=M_{\zeta} M_{\psi}^{*}$, where $\zeta(\boldsymbol{z}):=\lambda \gamma(\boldsymbol{z})$ for some uni-modular constant $\lambda \in \mathbb{C}$. From the above Theorem 6.1, $M_{\zeta} M_{\psi}^{*}$ is a Toeplitz operator if and only if $\zeta$ and $\psi$ depends on the disjoint set of variables. Thus, we can write,

$$
T_{\phi}=M_{\psi}^{*} M_{\zeta}
$$

Conversely, if the Toeplitz operator admits the factorization $T_{\phi}=M_{\psi}^{*} M_{\zeta}$ for some inner function $\psi, \zeta$ depending on disjoint set of variables, then

$$
T_{\phi} T_{\phi}^{*}=M_{\psi}^{*} M_{\zeta} M_{\zeta}^{*} M_{\psi}=M_{\psi}^{*} M_{\psi} M_{\zeta} M_{\zeta}^{*}=M_{\zeta} M_{\zeta}^{*}
$$

shows that $T_{\phi}$ is a partial isometry. This completes the proof.

## 7. Some Related questions

Based on the results of this article, we can ask several interesting questions for Toeplitz operators on vector-valued Hardy spaces worthy of further investigation.
(A) Characterize Toeplitz operators with shift-invariant range spaces.

A significant contribution of this article is to show that if we start with a somewhat nice Toeplitz operator, then the range is Beurling-type. This gives rise to a fascinating problem.
(B) Characterize Toeplitz operators with Beurling-type range spaces.

In Corollary 5.1, we have seen that a partially isometric Toeplitz operator has a partially isometric symbol a.e. on $\mathbb{T}^{n}$, but what can we say about the converse?
(C) Characterize symbols $\Phi \in L_{\mathcal{B}(\mathcal{E})}^{\infty}\left(\mathbb{T}^{n}\right)$ such that $T_{\Phi}$ is a partial isometry.

Unlike in the scalar cases, it is still not clear when partially isometric Toeplitz operators on $H_{\mathcal{E}}^{2}\left(\mathbb{D}^{n}\right)$ become power partial isometries, so we end with the following question.
(D) Characterize Toeplitz operators which are power partial isometries.
