# A Construction of Quantum Stabilizer Codes from Classical Codes and Butson Hadamard Matrices 

Bülent Saraç, Damla Acar

#### Abstract

In this paper, we give a constructive proof to show that if there exist a classical linear code $\mathscr{C} \subseteq \mathbb{F}_{q}^{n}$ of dimension $k$ and a classical linear code $\mathscr{D} \subseteq \mathbb{F}_{q^{k}}^{m}$ of dimension $s$, where $q$ is a power of a prime number $p$, then there exists an $\llbracket n m, k s, \delta \rrbracket_{q}$ quantum stabilizer code with $\delta$ determined by $\mathscr{C}$ and $\mathscr{D}$ by identifying the stabilizer group of the code. In the construction, we use a particular type of Butson Hadamard matrices equivalent to multiple Kronecker products of the Fourier matrix of order $p$. We also consider the same construction of a quantum code for a general normalized Butson Hadamard matrix and search for a condition for the quantum code to be a stabilizer code.

## 1 Introduction and Preliminaries

Quantum error-correcting codes have experienced rapid growth since their inception by Shor in 10. One of the most important classes of these codes is quantum stabilizer codes, first introduced by Gottesman [4] and Calderbank et al. 3. Stabilizer codes have been extensively studied due to their relatively simple encoding algorithms and their structural advantages, which allow for connections to classical error-correcting codes for analysis.

In this paper, we propose a method for constructing quantum error-correcting codes that generalize Shor's code and the quantum codes discussed in [11. Our approach encompasses both binary and non-binary schemes. We use quantum digits (qudits for short) over $\mathbb{F}_{q}$ as a unit of quantum information, where $\mathbb{F}_{q}$ denotes the finite field with $q$ elements. The states of qudits are simply vectors in $\mathbb{C}^{q}$. This vector space is equipped with the standard inner product, with respect to which there is an orthonormal basis, whose elements are denoted $|x\rangle$, where $x$ runs through the elements of $\mathbb{F}_{q}$. Now the state of a system of $n$ qudits are represented by vectors in $\left(\mathbb{C}^{q}\right)^{\otimes n}$. The set $\left\{\left|x_{1}\right\rangle \otimes \cdots \otimes\left|x_{n}\right\rangle: x_{1}, \ldots, x_{n} \in \mathbb{F}_{q}\right\}$ forms an orthonormal basis for the Hilbert space $\left(\mathbb{C}^{q}\right)^{\otimes n}$. For the sake of simplicity, we denote the basis vector $\left|x_{1}\right\rangle \otimes \cdots \otimes\left|x_{n}\right\rangle$ as $\left|x_{1} \ldots x_{n}\right\rangle$. Thus every vector in $\left(\mathbb{C}^{q}\right)^{\otimes n}$ is a linear combination of the vectors $|\mathbf{x}\rangle$, where $\mathbf{x} \in \mathbb{F}_{q}^{n}$.

A quantum code of length $n$ is a nonzero subspace of $\left(\mathbb{C}^{q}\right)^{\otimes n}$. We denote a $q$-ary quantum code which encodes $k$ qudits of information into $n$-qudits as $\llbracket n, k \rrbracket_{q}$.

In order to provide information about the types of errors a quantum code can detect or correct, we first define the unitary operators on $\mathbb{C}^{q}$ by

$$
X(a)|x\rangle=|x+a\rangle, Z(b)|x\rangle=\omega^{\operatorname{tr}(b x)}|x\rangle
$$

where $a, b, x \in \mathbb{F}_{q}$, $\operatorname{tr}$ denotes the trace function from $\mathbb{F}_{q}$ to its prime field $\mathbb{F}_{p}$, and $\omega$ is a primitive $p$-th root of unity. Note that the operators $X(a)$ and $Z(b)$, for nonzero $a$ and $b$, coincide with the usual bit flip and phase flip errors, respectively, on (binary) quantum bits (or qubits). Let $\mathcal{E}=\{X(a) Z(b) \mid a, b \in$ $\left.\mathbb{F}_{q}\right\}$. Then $\mathcal{E}$ forms a basis for the vector space of linear operators on $\mathbb{C}^{q}$. Further, we observe that the following properties are satisfied, which make $\mathcal{E}$ a nice error basis on $\mathbb{C}^{q}$ (see [8):
(NE1) $\mathcal{E}$ contains the identity operator.
(NE2) $X(a) Z(b) X\left(a^{\prime}\right) Z\left(b^{\prime}\right)=\omega^{\operatorname{tr}\left(b a^{\prime}\right)} X\left(a+a^{\prime}\right) Z\left(b+b^{\prime}\right)$ for every $a, a^{\prime}, b, b^{\prime} \in \mathbb{F}_{q}$. Therefore the product of two elements of $\mathcal{E}$ is a scalar multiple of another element of $\mathcal{E}$.
(NE3) If $M, N$ are distinct elements of $\mathcal{E}$ then $\operatorname{Tr}\left(M^{\dagger} N\right)=0$.
Remark 1. Let $p=2$. If we take $\omega=-1$ for the binary case it results in omission of complex phases. Thus we use $\omega$ as a primitive 4 -th root of unity; more precisely, the imaginary unit $i$.

One can extend $\mathcal{E}$ to a suitable error basis on $n$ qudits, as follows. For $\mathbf{a}=\left(a_{1}, \ldots, a_{n}\right) \in \mathbb{F}_{q}^{n}$, we write $X(\mathbf{a})=X\left(a_{1}\right) \otimes \cdots \otimes X\left(a_{n}\right)$ and $Z(\mathbf{a})=$ $Z\left(a_{1}\right) \otimes \cdots \otimes Z\left(a_{n}\right)$ for the tensor products of $n$ error operators. Then $\mathcal{E}_{n}=$ $\left\{X(\mathbf{a}) Z(\mathbf{b}) \mid \mathbf{a}, \mathbf{b} \in \mathbb{F}_{q}^{n}\right\}$ forms a nice error basis on $\left(\mathbb{C}^{q}\right)^{\otimes n}$ (see [7]).

Binary stabilizer codes were first introduced by Gottesman in 4]. They have proved to form an important class of quantum codes because they provide an algebraic approach for error correction. Later, the stabilizer formation was extended to non-binary quantum error-correcting codes in [1] and investigated in detail in [6].

Let $\mathcal{P}_{n}=\left\{\omega^{c} X(\mathbf{a}) Z(\mathbf{b}): \mathbf{a}, \mathbf{b} \in \mathbb{F}_{q^{k}}, c \in \mathbb{F}_{p}\right\}$. Then $\mathcal{P}_{n}$ is a finite group of order $p q^{2 n}$ for $p>2$. Note that when $p=2$, we take $\omega=i$ and $c \in\{0,1,2,3\}$; hence $\left|\mathcal{P}_{n}\right|=4 q^{2 n} . \mathcal{P}_{n}$ is called the error group associated with $\mathcal{E}_{n}$ (see [6]).

Given a qunatum code $Q$ of length $n$, one may think of the subgroup

$$
\operatorname{Stab}(Q)=\left\{E \in \mathcal{P}_{n}: E \mathbf{v}=\mathbf{v} \text { for all } \mathbf{v} \in Q\right\}
$$

of $\mathcal{P}_{n}$, called the stabilizer group of $Q$. Note that $\operatorname{Stab}(Q)$ is an abelian subgroup of $\mathcal{P}_{n}$ with $\operatorname{Stab}(Q) \cap \mathcal{Z}\left(\mathcal{P}_{n}\right)=\{I\}$. Conversely, given an abelian subgroup $\mathcal{S}$ of $\mathcal{P}_{n}$ with $\mathcal{S} \cap \mathcal{Z}\left(\mathcal{P}_{n}\right)=\{I\}$, one can define the quantum code

$$
\operatorname{Fix}(\mathcal{S})=\left\{\mathbf{v} \in\left(\mathbb{C}^{q}\right)^{\otimes n}: E \mathbf{v}=\mathbf{v} \text { for all } E \in \mathcal{S}\right\}
$$

the joint eigenspace of $\mathcal{S}$ associated with the eigenvalue 1. Observe that if $Q$ is a quantum code, then $Q \subseteq \operatorname{Fix}(\operatorname{Stab}(Q))$. If the equality holds, then we call $Q$ a stabilizer code. Equivalently, a quantum code $Q$ is a stabilizer code if and only if there exists an abelian subgroup $\mathcal{S}$ of $\mathcal{P}_{n}$ with $\mathcal{S} \cap \mathcal{Z}\left(\mathcal{P}_{n}\right)=\{I\}$ such that $Q=\operatorname{Fix}(\mathcal{S})$. If $Q$ is a $q$-ary stabilizer code of length $n$, then $\mathcal{S}=\operatorname{Stab}(Q)$ is a finite abelian subgroup of $\mathcal{P}_{n}$ of order $q^{n} / \operatorname{dim}(Q)$. It follows that if $\mathcal{S}$ has a minimal generating set (of $r$ elements, say), then $|\mathcal{S}|=q^{r}$ since $\mathcal{S}$ is abelian and every non-central element of $\mathcal{P}_{n}$ has order $q$, which gives that $Q$ is an $\llbracket n, n-r \rrbracket_{q}$-code.

For a subgroup $\mathcal{S}$ of $\mathcal{P}_{n}$, we write $C_{\mathcal{P}_{n}}(\mathcal{S})$ to denote the centralizer of $\mathcal{S}$ in $\mathcal{P}_{n}$, namely $C_{\mathcal{P}_{n}}(\mathcal{S})=\left\{E \in \mathcal{P}_{n}: E S=S E\right.$ for every $\left.S \in \mathcal{S}\right\}$. Also, the subgroup of $\mathcal{P}_{n}$ generated by $\mathcal{S}$ and $\mathcal{Z}\left(\mathcal{P}_{n}\right)$ is $\mathcal{S Z}\left(\mathcal{P}_{n}\right)$. The following proposition, proved in [7], shows that the error detection capability of a stabilizer code is closely related to the subgroups $C_{\mathcal{P}_{n}}(\mathcal{S})$ and $\mathcal{S Z}\left(\mathcal{P}_{n}\right)$.

Proposition 1.1. Suppose that $\mathcal{S} \leq \mathcal{P}_{n}$ is the stabilizer group of a stabilizer code $Q$ with $\operatorname{dim} Q>1$. An error $E$ in $\mathcal{P}_{n}$ is detectable by the quantum code $Q$ if and only if either $E$ is an element of $\mathcal{S Z}\left(\mathcal{P}_{n}\right)$ or $E$ does not belong to the centralizer $C_{\mathcal{P}_{n}}(\mathcal{S})$.

The weight of an error operator $E=\omega^{c} E_{1} \otimes \cdots \otimes E_{n} \in \mathcal{P}_{n}$ is defined by $\mathrm{wt}(E)=\#\left\{i \mid E_{i} \neq I\right\}$, that is the number of tensor factors that are nonidentity. We say that a quantum code $Q$ has minimal distance $d$ if $d$ is a positive integer such that every error in $\mathcal{P}_{n}$ of weight less than $d$ can be detected by $Q$ whereas there is an error in $\mathcal{P}_{n}$ of weight $d$ which cannot be detected by $Q$. Thus, it follows easily from Proposition 1.1 that the minimum distance of a stabilizer code $Q$ with the stabilizer group $\mathcal{S}$ is given by

$$
d(Q)= \begin{cases}\min \left\{\mathrm{wt}(E) \mid E \in C_{\mathcal{P}_{n}}(\mathcal{S}) \backslash \mathcal{S}\right\}, & \text { if } S \subsetneq C_{\mathcal{P}_{n}}(\mathcal{S}) \\ \min \{\mathrm{wt}(E) \mid E \in \mathcal{S} \backslash\{I\}\}, & \text { if } \mathcal{S}=C_{\mathcal{P}_{n}}(\mathcal{S})\end{cases}
$$

It is known that a code of minimum distance $d$ can correct all errors of weight at most $\lfloor(d-1) / 2\rfloor$.

With any error of type $\omega^{c} X(\mathbf{a}) Z(\mathbf{b})$, we associate the vector $(\mathbf{a} \mid \mathbf{b})$ in $\mathbb{F}_{q}^{2 n}$, where $\mathbf{a}, \mathbf{b} \in \mathbb{F}_{q}^{n}$, and define a map $\psi$ by

$$
\begin{equation*}
\psi: \mathcal{P}_{n} \rightarrow \mathbb{F}_{q}^{2 n}, \omega^{c} X(\mathbf{a}) Z(\mathbf{b}) \longmapsto(\mathbf{a} \mid \mathbf{b}) \tag{1.1}
\end{equation*}
$$

Note that $\psi$ is a group homomorphism from the multiplicative group $\mathcal{P}_{n}$ onto the additive group $\mathbb{F}_{q}^{2 n}$, through which some multiplicative properties in $\mathcal{P}_{n}$ translates into additive properties in $\mathbb{F}_{q}^{2 n}$. For instance, if $E=\omega^{c} X(\mathbf{a}) Z(\mathbf{b})$ and $E^{\prime}=\omega^{c^{\prime}} X\left(\mathbf{a}^{\prime}\right) Z\left(\mathbf{b}^{\prime}\right)$ are the elements of $\mathcal{P}_{n}$, then the commutator $\left[E, E^{\prime}\right]=$ $E^{-1} E^{\prime-1} E E^{\prime}$ is equal to $\omega^{\operatorname{tr}\left(\mathbf{b} \cdot \mathbf{a}^{\prime}-\mathbf{b}^{\prime} \cdot \mathbf{a}\right)} I$, and hence the errors $E$ and $E^{\prime}$ commute if and only if $\operatorname{tr}\left(\mathbf{b} \cdot \mathbf{a}^{\prime}-\mathbf{b}^{\prime} \cdot \mathbf{a}\right)=0$. This motivates the definition of a function $\langle\cdot, \cdot\rangle_{s}: \mathbb{F}_{q}^{2 n} \times \mathbb{F}_{q}^{2 n} \rightarrow \mathbb{F}_{p}$ by

$$
\left\langle(\mathbf{a} \mid \mathbf{b}),\left(\mathbf{a}^{\prime} \mid \mathbf{b}^{\prime}\right)\right\rangle_{s}:=\operatorname{tr}\left(\mathbf{b} \cdot \mathbf{a}^{\prime}-\mathbf{b}^{\prime} \cdot \mathbf{a}\right)
$$

which is an inner product on $\mathbb{F}_{q}^{2 n}$ as an $\mathbb{F}_{p}$-space, called the trace symplectic inner product. It follows that the errors $E=\omega^{c} X(\mathbf{a}) Z(\mathbf{b})$ and $E^{\prime}=$ $\omega^{c^{\prime}} X\left(\mathbf{a}^{\prime}\right) Z\left(\mathbf{b}^{\prime}\right)$ in $\mathcal{P}_{n}$ commute if and only if the vectors $(\mathbf{a} \mid \mathbf{b})$ and $\left(\mathbf{a}^{\prime} \mid \mathbf{b}^{\prime}\right)$ in $\mathbb{F}_{q}^{2 n}$ are orthogonal according to the trace symplectic inner product. We sometimes express the orthonality of the vectors $(\mathbf{a} \mid \mathbf{b})$ and $\left(\mathbf{a}^{\prime} \mid \mathbf{b}^{\prime}\right)$ by writing $(\mathbf{a} \mid \mathbf{b}) \perp_{s}\left(\mathbf{a}^{\prime} \mid \mathbf{b}^{\prime}\right)$.

Let $\overline{\mathcal{S}}$ be the image of a subgroup $\mathcal{S}$ of $\mathcal{P}_{n}$ under $\psi$. Then $\overline{\mathcal{S}}$ is an $\mathbb{F}_{p}$-subspace of $\mathbb{F}_{q}^{2 n}$. The symplectic dual of $\overline{\mathcal{S}}$ (denoted $\overline{\mathcal{S}}^{\perp_{s}}$ ) consists of the elements of $\mathbb{F}_{q}^{2 n}$ that are orthogonal to every element in $\overline{\mathcal{S}}$. Note that $\psi$ maps $C_{\mathcal{P}_{n}}(\mathcal{S})$ onto $\overline{\mathcal{S}}^{\perp_{s}}$. In view of Proposition 1.1, we define the symplectic weight of a vector $(\mathbf{a} \mid \mathbf{b})$ in $\mathbb{F}_{q}^{2 n}($ denoted $\operatorname{swt}(\mathbf{a} \mid \mathbf{b}))$ to be the weight of the error $X(\mathbf{a}) Z(\mathbf{b})$ in $\mathcal{P}_{n}$. Equivalently, $\operatorname{swt}(\mathbf{a} \mid \mathbf{b})$ is the number of the $i$ 's such that $\left(a_{i}, b_{i}\right) \neq(0,0)$ for $\mathbf{a}=\left(a_{1}, \ldots, a_{n}\right)$ and $\mathbf{b}=\left(b_{1}, \ldots, b_{n}\right)$.

A Butson-Hadamard (BH) matrix $H$ of order $n$ is an $n \times n$ matrix whose entries are primitive roots of unity such that $H H^{\dagger}=n I_{n}$, where $H^{\dagger}$ is the complex conjugate transpose of $H$ and $I_{n}$ is the identity matrix of order $n$. Thus the rows of a Butson Hadamard matrix are pairwise orthogonal with respect to the Hermitian inner product. If the entries of $H$ are $k$-th roots of unity then we say that $H$ is a $\mathrm{BH}(n, k)$ matrix. Butson Hadamard matrices were introduced by Butson in [2] and has been studied in various aspects. Two Butson Hadamard matrices are said to be equivalent if they are of the same type, say $\mathrm{BH}(n, k)$, and one can be obtained from the other by permuting rows (or columns) or multiplying rows (or columns) by a $k$-th root of unity. It is readily checked that every BH matrix is equivalent to a BH matrix whose first row and first column consist of 1's, which is called normalized. One of the simplest examples of a normalized BH matrix is the Fourier matrix $\left[\zeta_{n}^{(i-1)(j-1)}\right]_{i, j=1}^{n} \in \mathrm{BH}(n, n)$, where $\zeta_{n}$ is a primitive $n$-th rooth of unity. Moreover, one can construct a BH matrix $\left[\zeta_{n}^{\mathbf{x} \mathbf{y}^{T}}\right]_{\mathbf{x}, \mathbf{y} \in \mathbb{F}_{p}^{n}} \in \mathrm{BH}\left(p^{n}, p\right)$, which is, indeed, the $n$-fold Kronecker product of the Fourier matrix of order $p$.

The organization of our paper is as follows. In the second section, we give our general method for constructing a quantum code using $p$-ary and $q$-ary classical codes and a $\operatorname{BH}\left(q^{k}, p\right)$ matrix, where $p$ is a prime and $q$ is a power of $p$. In the third section, we look for a BH matrix for which our construction gives a stabilizer quantum code. In particular, we show that if the BH matrix used in the construction has a particular form such that it is equivalent to a Kronecker product of the Fourier matrix of order $p$, then the resulting quantum code is a stabilizer code. In the next section, we search for a converse, and consider a certain $q$-ary classical code in the construction. In particular, we prove that if the resulting quantum code is a stabilizer code, then the BH matrix used in the construction must be equivalent to a Kronecker product of the Fourier matrix of order $p$. In Section 5, we give an algorithm of error correction for quantum stabilizer codes obtained by our construction as stabilizer codes. The last section is given as appendix devoted to provide a proof of the fact that the BH matrices considered in Section 3 and Theorem 4.2 are equivalent to a Knocker product of Fourier matrices.

## 2 The General Construction

Let $\mathscr{C} \subseteq \mathbb{F}_{q}^{n}$ be a $q$-ary $\left[n, k, d_{1}\right]$ classical linear code, where $1 \leq k<r$. We shall use the codewords of $\mathscr{C}$ to create quantum states in $\left(\mathbb{C}^{q}\right)^{\otimes n}$, as follows: Let $\left\{f_{\lambda}: \lambda \in \mathbb{F}_{q^{k}}\right\}$ be a set of functions from $\mathscr{C}$ into $\mathbb{F}_{p}$ and let

$$
\begin{equation*}
\phi_{\lambda}:=\frac{1}{\sqrt{q^{k}}} \sum_{\mathbf{c} \in \mathscr{C}} \omega^{f_{\lambda}(\mathbf{c})}|\mathbf{c}\rangle \tag{2.1}
\end{equation*}
$$

for all $\lambda \in \mathbb{F}_{q^{k}}$, where $\omega=e^{2 \pi i / p}$. Note that the $\phi_{\lambda}$ 's form an orthonormal basis for a subspace of $\left(\mathbb{C}^{q}\right)^{\otimes n}$ if and only if the $q^{k} \times q^{k}$ matrix

$$
\begin{equation*}
H=\left[\omega^{f_{\lambda}(\mathbf{c})}\right]_{\lambda \in \mathbb{F}_{q^{k}}, \mathbf{c} \in \mathscr{C}}, \tag{2.2}
\end{equation*}
$$

with rows indexed by the elements of $\mathbb{F}_{q^{k}}$ and columns indexed by the elements of $\mathscr{C}$, both written in a fixed order, forms a $\mathrm{BH}\left(q^{k}, p\right)$ matrix.

Let $\mathscr{D} \subseteq \mathbb{F}_{q^{k}}^{m}$ be a classical linear code of dimension $s$ and define

$$
\begin{equation*}
\Phi_{\Lambda}:=\phi_{\lambda_{1}} \otimes \ldots \otimes \phi_{\lambda_{m}} \in\left(\mathbb{C}^{q}\right)^{\otimes n m} \tag{2.3}
\end{equation*}
$$

for all $\Lambda=\left(\lambda_{1}, \ldots, \lambda_{m}\right) \in \mathscr{D}$. We form a quantum code, denoted $Q_{H}(\mathscr{C}, \mathscr{D})$, of length $n m$ to be the subspace of $\left(\mathbb{C}^{q}\right)^{\otimes n m}$ spanned by $\Phi_{\Lambda}$ for all $\Lambda \in \mathscr{D}$, i.e.,

$$
\begin{equation*}
Q_{H}(\mathscr{C}, \mathscr{D}):=\operatorname{span}\left\{\Phi_{\Lambda}: \Lambda \in \mathscr{D}\right\} . \tag{2.4}
\end{equation*}
$$

Note that $Q_{H}(\mathscr{C}, \mathscr{D})$ is a $q^{k s}$-dimensional subspace of $\left(\mathbb{C}^{q}\right)^{\otimes n m}$, namely, $Q_{H}(\mathscr{C}, \mathscr{D})$ is an $\llbracket n m, k s, \delta \rrbracket_{q}$ quantum code where $\delta$ is the minimum distance of $Q_{H}(\mathscr{C}, \mathscr{D})$. On the other hand, there exists a one-to-one correspondance $\nu: \mathbb{F}_{q}^{k s} \rightarrow \mathscr{D}$, and so one can set the logical state $|\mathbf{a}\rangle_{L}$ as $\Phi_{\nu(\mathbf{a})}$ for each $\mathbf{a} \in \mathbb{F}_{q}^{k s}$. Then $Q_{H}(\mathscr{C}, \mathscr{D})$ is a quantum code of length $n m$ that encodes $k s$ logical $q$-states.

Example 1. If $p=q=2, \mathscr{C}=\mathscr{D}=\{000,111\} \subseteq \mathbb{F}_{2}^{3}$, and

$$
H=\left(\begin{array}{cc}
1 & 1 \\
1 & -1
\end{array}\right)
$$

in (2.2), then the construction of the quantum code $Q_{H}(\mathscr{C}, \mathscr{D})$ as in (2.4) coincides with the well-known Shor's 9-qubit code.

Example 2. Let $p=q=3, \mathscr{C}=\mathscr{D}=\{000,111,222\}$, and

$$
H=\left(\begin{array}{ccc}
1 & 1 & 1 \\
1 & \omega & \omega^{2} \\
1 & \omega^{2} & \omega
\end{array}\right)
$$

in (2.2), where $w=e^{2 \pi i / 3}$. Then the quantum code obtained as in (2.4) is the same as the nine-qutrit error correcting code considered in Sect. V of [9].

More generally, if $\mathscr{C}=\mathscr{D}=\left\{(\lambda, \ldots, \lambda): \lambda \in \mathbb{F}_{q}\right\} \subseteq \mathbb{F}_{q}^{m}$, the one-dimensional linear code over $\mathbb{F}_{q^{k}}$ spanned by $(1,1, \ldots, 1) \in \mathbb{F}_{q}^{m}$, and $H$ is any $B H(q, p)$
matrix, then the quantum code $Q_{H}(\mathscr{C}, \mathscr{D})$ in (2.4) is among the $\llbracket m^{2}, 1, m \rrbracket_{q}$ quantum error-correcting codes studied in [5]. In view of the next section, we see that if the matrix $H$ is chosen to be a normalized Butson-Hadamard matrix of Fourier type, then $Q_{H}(\mathscr{C}, \mathscr{D})$ turns out to be a stabilizer code.

Remark 2. Let $\mathscr{D}$ be a $q^{k}$-ary linear code of length $m$. If there exists a positive integer $i$ with $1 \leq i \leq m$ such that for every codeword $\Lambda$ in $\mathscr{D}$, the $i$-th coordinate of $\Lambda$ is zero, then we can project $\mathscr{D}$ onto a $q^{k}$-ary linear code $\mathscr{D}^{\prime}$ of length $m-1$ by deleting the $i$-th coordinate of each codeword of $\mathscr{D}$, where the minimum distance remains unaltered, and use $\mathscr{D}^{\prime}$ instead of $\mathscr{D}$ in the construction of $Q_{H}(\mathscr{C}, \mathscr{D})$. Thus, throughout this note, we shall assume that the code $\mathscr{D}$ in the above construction, is non-trivial (i,e., neither 0 nor $\mathbb{F}_{q^{k}}^{m}$ ) and that for every integer $1 \leq i \leq m$, there exists a codeword in $\mathscr{D}$ whose $i$-th coordinate is equal to 1 .

Proposition 2.1. Let $\mathscr{C}$ be a $q$-ary linear code of dimension $k$ and length $n$, and let $\mathscr{D}$ be a $q^{k}$-ary linear code of dimension $s$ and length $m$ (where $0<$ $s<m)$. Let $H$ and $H^{\prime}$ be $B H\left(q^{k}, p\right)$ matrices. If $Q_{H}(\mathscr{C}, \mathscr{D})=Q_{H^{\prime}}(\mathscr{C}, \mathscr{D})$, then $H$ and $H^{\prime}$ are row-equivalent $B H$ matrices. The converse also holds when $\mathscr{D}=\left\{(\lambda, \ldots, \lambda): \lambda \in \mathbb{F}_{q^{k}}\right\} \subseteq \mathbb{F}_{q^{k}}^{m}$ is the one-dimensional linear code over $\mathbb{F}_{q^{k}}$.

Proof. Assume that $Q_{H}(\mathscr{C}, \mathscr{D})=Q_{H^{\prime}}(\mathscr{C}, \mathscr{D})$. Given $\lambda \in \mathbb{F}_{q^{k}}$, we use the notations $\phi_{\lambda}$ or $\phi_{\lambda}^{\prime}$ accordingly the coefficients of the quantum states in (2.1) come from $H$ or $H^{\prime}$. Similarly, we write $\Phi_{\Lambda}^{\prime}$ to mean the tensor products of states of the form $\phi_{\lambda}^{\prime}$ in (2.3).

Since the sets $\left\{\phi_{\lambda}: \lambda \in \mathbb{F}_{q^{k}}\right\}$ and $\left\{\phi_{\lambda}^{\prime}: \lambda \in \mathbb{F}_{q^{k}}\right\}$ are orthonormal, they are independent; hence we have

$$
\operatorname{span}\left\{\phi_{\lambda}: \lambda \in \mathbb{F}_{q^{k}}\right\}=\operatorname{span}\{|\mathbf{c}\rangle: \mathbf{c} \in \mathscr{C}\}=\operatorname{span}\left\{\phi_{\lambda}^{\prime}: \lambda \in \mathbb{F}_{q^{k}}\right\}
$$

It follows that there exist $b_{\lambda \mu} \in \mathbb{C}\left(\lambda, \mu \in \mathbb{F}_{q^{k}}\right)$ such that

$$
\begin{equation*}
\phi_{\lambda}=\sum_{\mu \in \mathbb{F}_{q^{k}}} b_{\lambda \mu} \phi_{\mu}^{\prime} \tag{2.5}
\end{equation*}
$$

for all $\lambda \in \mathbb{F}_{q^{k}}$. On the other hand, since $Q_{H}(\mathscr{C}, \mathscr{D})=Q_{H^{\prime}}(\mathscr{C}, \mathscr{D})$, there exist $a_{\Lambda M} \in \mathbb{C}(\Lambda, M \in \mathscr{D})$ such that $\Phi_{\Lambda}=\sum_{M \in \mathscr{D}} a_{\Lambda M} \Phi_{M}^{\prime}$ for all $\Lambda \in \mathscr{D}$. Rewriting $\Phi_{\Lambda}$ for $\Lambda=\left(\lambda_{1}, \ldots, \lambda_{m}\right) \in \mathscr{D}$ as

$$
\begin{aligned}
\Phi_{\Lambda} & =\left(\sum_{\mu \in \mathbb{F}_{q^{k}}} b_{\lambda_{1} \mu} \phi_{\mu}^{\prime}\right) \otimes \cdots \otimes\left(\sum_{\mu \in \mathbb{F}_{q^{k}}} b_{\lambda_{1} \mu} \phi_{\mu}^{\prime}\right) \\
& =\sum_{\left(\mu_{1}, \ldots, \mu_{m}\right) \in \mathbb{F}_{q^{k}}^{m}}\left(\prod_{i=1}^{m} b_{\lambda_{i} \mu_{i}}\right)\left(\phi_{\mu_{1}}^{\prime} \otimes \cdots \otimes \phi_{\mu_{m}}^{\prime}\right),
\end{aligned}
$$

we see that for all $\Lambda=\left(\lambda_{1}, \ldots, \lambda_{m}\right) \in \mathscr{D}, \prod_{i=1}^{m} b_{\lambda_{i} \mu_{i}}=a_{\Lambda M}$ if $M=\left(\mu_{1}, \ldots, \mu_{m}\right) \in$ $\mathscr{D}$ and $\prod_{i=1}^{m} b_{\lambda_{i} \mu_{i}}=0$ if $M=\left(\mu_{1}, \ldots, \mu_{m}\right) \notin \mathscr{D}$.

Considering the equation (2.5), we see that there exists a function $\sigma$ : $\mathbb{F}_{q^{k}} \rightarrow \mathbb{F}_{q^{k}}$ such that $b_{\lambda \sigma(\lambda)} \neq 0$. Since we assume that $\mathscr{D}$ is non-trivial, at least one of the standard basis element of $\mathbb{F}_{q^{k}}^{m}$ does not belong to $\mathscr{D}$. Without loss of generality, we assume that $(1,0, \ldots, 0) \notin \mathscr{D}$. Let $\lambda \in \mathbb{F}_{q^{k}}$. By our assumption on $\mathscr{D}$ (see Remark 2), there exists $\left(\lambda_{1}, \ldots, \lambda_{m}\right) \in \mathscr{D}$ with $\lambda_{1}=\lambda$. Then we must have $\left(\sigma\left(\lambda_{1}\right), \ldots, \sigma\left(\lambda_{m}\right)\right) \in \mathscr{D}$. Let $\alpha \in \mathbb{F}_{q^{k}} \backslash\{0\}$. Then $\left(\alpha+\sigma\left(\lambda_{1}\right), \sigma\left(\lambda_{2}\right), \ldots, \sigma\left(\lambda_{m}\right)\right) \notin \mathscr{D}$. This gives that $b_{\lambda_{\nu}} . b_{\lambda_{2} \sigma\left(\lambda_{2}\right)} \ldots b_{\lambda_{m} \sigma\left(\lambda_{m}\right)}=0$, where $\nu=\alpha+\sigma(\lambda)$; hence $b_{\lambda \nu}=0$. It follows that $b_{\lambda \mu}=0$ for all $\mu \in \mathbb{F}_{q^{k}}$ with $\mu \neq \sigma(\lambda)$. Therefore, $\phi_{\lambda}=b_{\lambda \sigma(\lambda)} \phi_{\sigma(\lambda)}^{\prime}$ for all $\lambda \in \mathbb{F}_{q^{k}}$, and so $\sigma$ is a permutation on $\mathbb{F}_{q^{k}}$. It is now straightforward to check that $b_{\lambda \sigma(\lambda)}$ is a power of $\omega$ for all $\lambda \in \mathbb{F}_{q^{k}}$. This completes the proof of the first assertion since we also have $H=\left[b_{\lambda \mu}\right] H^{\prime}$. Now the second assertion follows since in case $\mathscr{D}=\left\{(\lambda, \ldots, \lambda): \lambda \in \mathbb{F}_{q}\right\} \subseteq \mathbb{F}_{q}^{m}$, the row-equivalence of $H$ and $H^{\prime}$ implies that $\Phi_{\Lambda}$ is a constant multiple of $\Phi_{\Lambda}^{\prime}$ for every $\Lambda \in \mathscr{D}$.

## 3 A Quantum Stabilizer Code

In this section, we use our general construction of quantum codes described in the preceding section to produce quantum stabilizer codes by choosing a particular set $\left\{f_{\lambda}: \lambda \in \mathbb{F}_{q^{k}}\right\}$ of functions from $\mathscr{C}$ into $\mathbb{F}_{p}$ in the formation of the $\phi_{\lambda}$ 's in (2.1). We start with two lemmas.
Lemma 3.1. Let $\mathscr{C} \subseteq \mathbb{F}_{q}^{n}$ be a linear code over $\mathbb{F}_{q}$ and let $\mathbf{u} \in \mathbb{F}_{q}^{n}$. Then $\operatorname{tr}_{q / p}(\mathbf{u} . \mathbf{c})=0$ for all $\mathbf{c} \in \mathscr{C}$ if and only if $\mathbf{u} \in \mathscr{C} \mathscr{C}^{\perp}$.

Proof. It is enough to prove the "only if" part of the statement. So, suppose that $\operatorname{tr}_{q / p}(\mathbf{u} . \mathbf{c})=0$ for all $\mathbf{c} \in \mathscr{C}$. Choose an arbitrary nonzero element $\lambda \in \mathbb{F}_{q}$. Then $\mathscr{C}=\{\lambda \mathbf{c}: \mathbf{c} \in \mathscr{C}\}$, and so $\operatorname{tr}_{q / p}(\lambda(\mathbf{u} . \mathbf{c}))=0$ for all $\mathbf{c} \in \mathscr{C}$. Since $\lambda \in \mathbb{F}_{q}$ is arbitrary, this implies that $\mathbf{u . c}=0$ for all $\mathbf{c} \in \mathscr{C}$; hence $\mathbf{u} \in \mathscr{C} \perp$.
Lemma 3.2. Let $\mathscr{C} \subseteq \mathbb{F}_{q}^{n}$ be a linear code over $\mathbb{F}_{q}$ and let $\phi=\sum_{\mathbf{c} \in \mathscr{C}} \omega^{f(\mathbf{c})}|\mathbf{c}\rangle \in$ $\left(\mathbb{C}^{q}\right)^{\otimes n}$, where $f: \mathscr{C} \rightarrow \mathbb{F}_{p}$ is a function. Let $\mathbf{u} \in \mathbb{F}_{q}^{n}$. Then $Z(\mathbf{u})$ stabilizes $\phi$ if and only if $\mathbf{u} \in \mathscr{C}{ }^{\perp}$.
Proof. This is clear by Lemma 3.1since $Z(\mathbf{u}) \phi=\sum_{\mathbf{c} \in \mathscr{C}} \omega^{f(c)+\operatorname{tr}_{q / p}(\mathbf{u . c})}|\mathbf{c}\rangle$.
Let $\mathscr{C} \subseteq \mathbb{F}_{q}^{n}$ be a classical linear code over $\mathbb{F}_{q}$ of dimension $k$, where $q=p^{r}$ and $1 \leq k<n$, and $\mathscr{D} \subseteq \mathbb{F}_{q^{k}}^{m}$ be a classical linear code over $\mathbb{F}_{q^{k}}$ of dimension $s$ with $1 \leq s<m$. Note that $\mathscr{C}$ is also a vector space over $\mathbb{F}_{p}$ by restriction of scalars. Let $\mathcal{L}\left(\mathscr{C}, \mathbb{F}_{p}\right)$ be the $\mathbb{F}_{p}$-dual of $\mathscr{C}$. That is, $\mathcal{L}\left(\mathscr{C}, \mathbb{F}_{p}\right)$ is the set of all $\mathbb{F}_{p}$-linear transformations from $\mathscr{C}$ to $\mathbb{F}_{p}$. Then $\mathcal{L}\left(\mathscr{C}, \mathbb{F}_{p}\right)$ is a vector space over $\mathbb{F}_{p}$ of dimension $r k$; in other words, $\mathcal{L}\left(\mathscr{C}, \mathbb{F}_{p}\right)$ contains $q^{k}$ linear transformations
 We set $f_{\lambda}=\kappa(\lambda)$ for each $\lambda \in \mathbb{F}_{q^{k}}$, form the matrix $H=\left[\omega^{f_{\lambda}(\mathbf{c})}\right]_{\lambda \in \mathbb{F}_{q^{k}}, \mathbf{c} \in \mathscr{C}}$ which is necessarily a BH matrix, and define $Q_{H}(\mathscr{C}, \mathscr{D})$ as in (2.4). As shown in Corollary A.6, $H$ is equivalent to the $r k$-fold Kronecker product of the Fourier matrix of order $p$.

Note that the above setting of $f_{\lambda}$ 's yields that $f_{\lambda_{1}}+f_{\lambda_{2}}=f_{\lambda_{1}+\lambda_{2}}$ and $f_{c \lambda}=c f_{\lambda}$ for all $\lambda, \lambda_{1}, \lambda_{2} \in \mathbb{F}_{q^{k}}$ and $c \in \mathbb{F}_{p}$. Given any $\Lambda=\left(\lambda_{1}, \ldots, \lambda_{m}\right) \in \mathscr{D}$, define a mapping $F_{\Lambda}: \mathscr{C}^{m} \rightarrow \mathbb{F}_{p}$ by $F_{\Lambda}\left(\mathbf{c}_{1}, \ldots, \mathbf{c}_{m}\right)=f_{\lambda_{1}}\left(\mathbf{c}_{1}\right)+\cdots+f_{\lambda_{m}}\left(\mathbf{c}_{m}\right)$ for all $\left(\mathbf{c}_{1}, \ldots, \mathbf{c}_{m}\right) \in \mathscr{C}^{m}$. Then $F_{\Lambda}$ is a linear transformation of $\mathbb{F}_{p}$-spaces. Moreover, by definition of $f_{\lambda}$ 's above, the set $\left\{F_{\Lambda}: \Lambda \in \mathscr{D}\right\}$ is a vector space over $\mathbb{F}_{p}$ in a natural way since $F_{\Lambda_{1}}+F_{\Lambda_{2}}=F_{\Lambda_{1}+\Lambda_{2}}$ and $h . F_{\Lambda}=F_{h \Lambda}$ for all $h \in \mathbb{F}_{p}$ and $\Lambda, \Lambda_{1}, \Lambda_{2} \in \mathscr{D}$.

For $\mathbf{x} \in \mathbb{F}_{q}^{n}$, define the mapping $\rho_{\mathbf{x}}: \mathscr{C} \rightarrow \mathbb{F}_{p}$ by $\rho_{\mathbf{x}}(\mathbf{c})=\operatorname{tr}_{q / p}(\mathbf{c} . \mathbf{x})$. Then $\rho_{\mathbf{x}}$ is a linear transformation of $\mathbb{F}_{p}$-spaces, and given $\mathbf{x}, \mathbf{y} \in \mathbb{F}_{q}^{n}, \rho_{\mathbf{x}}=\rho_{\mathbf{y}}$ if and only if $\mathbf{x}-\mathbf{y} \in \mathscr{C}^{\perp}$ by Lemma 3.1. Thus we sometimes write $\rho_{\overline{\mathbf{x}}}$ for $\rho_{\mathbf{x}}$, where $\overline{\mathbf{x}}$ denotes the image of $\mathbf{x}$ under the canonical projection $\mathbb{F}_{q}^{n} \rightarrow \mathbb{F}_{q}^{n} / \mathscr{C} \perp$. Note that for each $\lambda \in \mathbb{F}_{q}$, there corresponds $\mathbf{x}_{\lambda}$ such that $f_{\lambda}=\rho_{\overline{\mathbf{x}}_{\lambda}}$. This correspondence
 $f_{\lambda}=\rho_{\overline{\mathbf{x}}_{\lambda}}$. Define

$$
\mathscr{D}^{\Theta}:=\left\{\left(\mathbf{x}_{\lambda_{1}}, \ldots, \mathbf{x}_{\lambda_{m}}\right):\left(\lambda_{1}, \ldots, \lambda_{m}\right) \in \mathscr{D} \text { and } \mathbf{x}_{\lambda_{i}} \in \Theta\left(\lambda_{i}\right) \text { for all } 1 \leq i \leq m\right\}
$$

That is,

$$
\mathscr{D}^{\Theta}=\bigcup_{\left(\lambda_{1}, \ldots, \lambda_{m}\right) \in \mathscr{D}} \Theta\left(\lambda_{1}\right) \times \cdots \times \Theta\left(\lambda_{m}\right)
$$

Then, clearly, $\mathscr{D}^{\Theta}$ is an additive code over $\mathbb{F}_{q}$. Note that all the vectors in $\left(\mathscr{C}^{\perp}\right)^{(m)}$ are elements of $\mathscr{D}^{\Theta}$ corresponding to the zero codeword in $\mathscr{D}$. Thus, $\left(\mathscr{C}^{\perp}\right)^{(m)} \subseteq \mathscr{D}^{\Theta}$.

Now we are ready to state and prove the main theorem of this section.
Theorem 3.3. With the above notation, $Q_{H}(\mathscr{C}, \mathscr{D})$ is an $\llbracket n m, k s, \delta \rrbracket_{q}$ quantum stabilizer code and $\delta=\min \{d(\mathscr{C}), \ell\}$, where $\ell=\min \left\{\mathrm{wt}(\mathbf{X}): \mathbf{X} \in \mathscr{D}^{\Theta} \backslash\right.$ $\left.\left(\mathscr{C}^{\perp}\right)^{(m)}\right\}$. Moreover, the stabilizer group $\mathcal{S}$ of $Q_{H}(\mathscr{C}, \mathscr{D})$ consists of the errors of the form $X\left(\mathbf{c}_{1}, \ldots, \mathbf{c}_{m}\right) Z\left(\mathbf{d}_{1}, \ldots, \mathbf{d}_{m}\right)$, where $\left(\mathbf{c}_{1}, \ldots, \mathbf{c}_{m}\right) \in \bigcap_{\Lambda \in \mathscr{D}} \operatorname{ker}\left(F_{\Lambda}\right)$ and $\mathbf{d}_{1}, \ldots, \mathbf{d}_{m} \in \mathscr{C}^{\perp}$, and the centralizer $C_{\mathcal{P}_{n}}(\mathcal{S})$ of $\mathcal{S}$ consists of the errors of the form $\omega^{c} X\left(\mathbf{u}_{1}, \ldots, \mathbf{u}_{m}\right) Z\left(\mathbf{v}_{1}, \ldots, \mathbf{v}_{m}\right)$, where $c \in \mathbb{F}_{p}, \mathbf{u}_{1}, \ldots, \mathbf{u}_{m} \in \mathscr{C}$ and $\left(\mathbf{v}_{1}, \ldots, \mathbf{v}_{m}\right) \in \mathscr{D}^{\Theta}$.

Proof. If $\mathbf{d}_{1}, \ldots, \mathbf{d}_{m} \in \mathscr{C}^{\perp}$, then $Z\left(\mathbf{d}_{1}, \ldots, \mathbf{d}_{m}\right) \in \mathscr{C}^{\perp}$ by Lemma 3.2, On the other hand, given $\mathbf{e} \in \mathscr{C}$ and $\lambda \in \mathbb{F}_{q^{k}}$, we have

$$
X(\mathbf{e}) \phi_{\lambda}=\sum_{\mathbf{c} \in \mathscr{C}} \omega^{f_{\lambda}(\mathbf{c})}|\mathbf{c}+\mathbf{e}\rangle=\sum_{\mathbf{c} \in \mathscr{C}} \omega^{f_{\lambda}(\mathbf{c}-\mathbf{e})}|\mathbf{c}\rangle=\omega^{-f_{\lambda}(e)} \phi_{\lambda},
$$

and so

$$
X\left(\mathbf{c}_{1}, \ldots, \mathbf{c}_{m}\right) \Phi_{\Lambda}=\omega^{F_{\Lambda}\left(\mathbf{c}_{1}, \ldots, \mathbf{c}_{m}\right)} \Phi_{\Lambda}
$$

for all $\mathbf{c}_{1}, \ldots, \mathbf{c}_{m} \in \mathscr{C}$ and $\Lambda \in \mathscr{D}$. Thus, given codewords $\mathbf{c}_{1}, \ldots, \mathbf{c}_{m}$ of $\mathscr{C}$, $X\left(\mathbf{c}_{1}, \ldots, \mathbf{c}_{m}\right) \in \mathcal{S}$ if and only if $\left(\mathbf{c}_{1}, \ldots, \mathbf{c}_{m}\right) \in \bigcap_{\Lambda \in \mathscr{D}} \operatorname{ker}\left(F_{\Lambda}\right)$. Therefore, $\mathcal{S}$ contains all the errors of the form $X\left(\mathbf{c}_{1}, \ldots, \mathbf{c}_{m}\right) Z\left(\mathbf{d}_{1}, \ldots, \mathbf{d}_{m}\right)$ for which $\mathbf{c}_{1}, \ldots, \mathbf{c}_{m} \in \mathscr{C}$ with $\left(\mathbf{c}_{1}, \ldots, \mathbf{c}_{m}\right) \in \bigcap_{\Lambda \in \mathscr{D}} \operatorname{ker}\left(F_{\Lambda}\right)$ and $\mathbf{d}_{1}, \ldots, \mathbf{d}_{m} \in \mathscr{C}^{\perp}$. Clearly, the number of the errors $Z\left(\mathbf{d}_{1}, \ldots, \mathbf{d}_{m}\right)$, where $\mathbf{d}_{1}, \ldots, \mathbf{d}_{m} \in \mathscr{C}^{\perp}$ is
equal to $\left|\mathscr{C}^{\perp}\right|=q^{(n-k) m}$. We shall show that the number of errors $X\left(\mathbf{c}_{1}, \ldots, \mathbf{c}_{m}\right)$, where $\left(\mathbf{c}_{1}, \ldots, \mathbf{c}_{m}\right) \in \bigcap_{\Lambda \in \mathscr{D}} \operatorname{ker}\left(F_{\Lambda}\right)$ is equal to $q^{k(m-s)}$.

Let $\left\{F_{\Lambda_{1}}, \ldots, F_{\Lambda_{r k s}}\right\}$ be an $\mathbb{F}_{p}$-basis for $\left\{F_{\Lambda}: \Lambda \in \mathscr{D}\right\}$. Each $F_{\Lambda_{i}}$ can be represented by a $1 \times r k m$ matrix, say $R_{i}$ with respect to a fixed ordered basis of $\mathscr{C}^{m}$. Then the $r k s \times r k s$ matrix

$$
\mathcal{R}=\left(\begin{array}{c}
R_{1} \\
\vdots \\
R_{r k s}
\end{array}\right)
$$

represents the $\mathbb{F}_{p}$-linear transformation $F: \mathscr{C}^{m} \rightarrow \mathbb{F}_{p}^{r k s}$ defined by $F(x)=$ $\left(F_{\Lambda_{1}}(x), \ldots, F_{\Lambda_{r k s}}(x)\right)$ with respect to the same ordered basis of $\mathscr{C}^{m}$. Since

$$
c_{1} R_{1}+\cdots+c_{r k s} R_{r k s}=0 \text { if and only if } c_{1} F_{\Lambda_{1}}+\cdots+c_{r k s} F_{\Lambda_{r k s}}=0
$$

for any $c_{1}, \ldots, c_{r k s} \in \mathbb{F}_{p}$, we see that the set $\left\{R_{1}, \ldots, R_{r k s}\right\}$ is linearly independent over $\mathbb{F}_{p}$. Thus $\mathcal{R}$ has rank $r k s$, or equivalently, has nullity $r k(m-s)$. Since $\operatorname{ker}(F)=\bigcap_{i=1}^{r k s} \operatorname{ker}\left(F_{\Lambda_{i}}\right), \operatorname{dim}_{\mathbb{F}_{p}}\left(\bigcap_{\Lambda \in \mathscr{D}} \operatorname{ker}\left(F_{\Lambda}\right)\right)=\operatorname{dim}_{\mathbb{F}_{p}}\left(\bigcap_{i=1}^{r k s} \operatorname{ker}\left(F_{\Lambda_{i}}\right)\right)=$ $r k(m-s)$. Then the number of errors $X\left(\mathbf{c}_{1}, \ldots, \mathbf{c}_{m}\right)$, where $\left(\mathbf{c}_{1}, \ldots, \mathbf{c}_{m}\right) \in$ $\bigcap_{\Lambda \in \mathscr{D}} \operatorname{ker}\left(F_{\Lambda}\right)$ is equal to $p^{r k(m-s)}=q^{k(m-s)}$.

It follows that $|\mathcal{S}| \geq q^{(n-k) m} q^{k(m-s)}=q^{n m-k s}$. On the other hand, since $Q_{H}(\mathscr{C}, \mathscr{D}) \subseteq \operatorname{Fix}(\mathcal{S})$, we have

$$
q^{k s}=\operatorname{dim}_{\mathbb{F}_{q}}\left(Q_{H}(\mathscr{C}, \mathscr{D})\right) \leq \operatorname{dim}_{\mathbb{F}_{q}}(\operatorname{Fix}(\mathcal{S}))=\frac{q^{n m}}{|\mathcal{S}|}
$$

and so $|\mathcal{S}| \leq q^{n m-k s}$. This gives that $|\mathcal{S}|=q^{n m-k s}$, and hence $\mathcal{S}$ consists of the errors of the form $X\left(\mathbf{c}_{1}, \ldots, \mathbf{c}_{m}\right) Z\left(\mathbf{d}_{1}, \ldots, \mathbf{d}_{m}\right)$ for which $\mathbf{c}_{1}, \ldots, \mathbf{c}_{m} \in \mathscr{C}$ with $\left(\mathbf{c}_{1}, \ldots, \mathbf{c}_{m}\right) \in \bigcap_{\Lambda \in \mathscr{D}} \operatorname{ker}\left(F_{\Lambda}\right)$ and $\mathbf{d}_{1}, \ldots, \mathbf{d}_{m} \in \mathscr{C}^{\perp}$. This shows, in particular, that $Q_{H}(\mathscr{C}, \mathscr{D})$ is a stabilizer code.

Finally, we shall show that $\delta=\min \{d(\mathscr{C}), \ell\}$. To see this, we first need to determine $\overline{\mathcal{S}}^{\perp_{s}}$. We claim that $\overline{\mathcal{S}}^{\perp_{s}}$ consists of $\left(\mathbf{u}_{1}, \ldots, \mathbf{u}_{m} \mid \mathbf{v}_{1}, \ldots, \mathbf{v}_{m}\right)$ for which $\mathbf{u}_{1}, \ldots, \mathbf{u}_{m} \in \mathscr{C}$ and $\left(\mathbf{v}_{1}, \ldots, \mathbf{v}_{m}\right) \in \mathscr{D}^{\Theta}$. By above, we see that $\overline{\mathcal{S}}$ consists of the sequences $\left(\mathbf{c}_{1}, \ldots, \mathbf{c}_{m} \mid \mathbf{d}_{1}, \ldots, \mathbf{d}_{m}\right)$ such that $\left(\mathbf{c}_{1}, \ldots, \mathbf{c}_{m}\right) \in \bigcap_{\Lambda \in \mathscr{D}} \operatorname{ker}\left(F_{\Lambda}\right)$ and $\mathbf{d}_{1}, \ldots, \mathbf{d}_{m} \in \mathscr{C}^{\perp}$. Let $(\mathbf{U} \mid \mathbf{V})=\left(\mathbf{u}_{1}, \ldots, \mathbf{u}_{m} \mid \mathbf{v}_{1}, \ldots, \mathbf{v}_{m}\right)$ be such that $\mathbf{u}_{1}, \ldots, \mathbf{u}_{m} \in \mathscr{C}$ and $\left(\mathbf{v}_{1}, \ldots, \mathbf{v}_{m}\right) \in \mathscr{D}^{\Theta}$. Let $(\mathbf{C} \mid \mathbf{D})=\left(\mathbf{c}_{1}, \ldots, \mathbf{c}_{m} \mid\right.$ $\left.\mathbf{d}_{1}, \ldots, \mathbf{d}_{m}\right) \in \overline{\mathcal{S}}$. By the choice of $\mathbf{v}_{1}, \ldots, \mathbf{v}_{m}$, there exists $\Lambda=\left(\lambda_{1}, \ldots, \lambda_{m}\right) \in \mathscr{D}$ such that $\mathbf{v}_{i} \in \Theta\left(\lambda_{i}\right)$ for each $1 \leq i \leq m$. In other words, $f_{\lambda_{i}}=\rho_{\mathbf{v}_{i}}$ for each $1 \leq i \leq m$. This gives that

$$
\begin{equation*}
\operatorname{tr}_{q / p}(\mathbf{C} . \mathbf{V})=\sum_{i=1}^{m} \operatorname{tr}_{q / p}\left(\mathbf{c}_{i} \cdot \mathbf{v}_{i}\right)=\sum_{i=1}^{m} f_{\lambda_{i}}\left(\mathbf{c}_{i}\right)=F_{\Lambda}\left(\mathbf{c}_{1}, \ldots, \mathbf{c}_{m}\right)=0 \tag{3.1}
\end{equation*}
$$

It follows that $\langle(\mathbf{C} \mid \mathbf{D}),(\mathbf{U} \mid \mathbf{V})\rangle_{s}=\operatorname{tr}_{q / p}(\mathbf{d} . \mathbf{u}-\mathbf{v} . \mathbf{c})=0$; hence $(\mathbf{U} \mid \mathbf{V}) \in \overline{\mathcal{S}}^{\perp_{s}}$. Now let $(\mathbf{U} \mid \mathbf{V})=\left(\mathbf{u}_{1}, \ldots, \mathbf{u}_{m} \mid \mathbf{v}_{1}, \ldots, \mathbf{v}_{m}\right) \in \overline{\mathcal{S}}^{\perp}$. Note that given any $\mathbf{d} \in$
$\mathscr{C}^{\perp},(0, \ldots, 0 \mid \mathbf{d}, 0, \ldots, 0),(0, \ldots, 0 \mid 0, \mathbf{d}, 0, \ldots, 0), \ldots,(0, \ldots, 0 \mid 0, \ldots, 0, \mathbf{d})$ all lie in $\overline{\mathcal{S}}$. Thus we have $\operatorname{tr}_{q / p}\left(\mathbf{u}_{i} \cdot \mathbf{d}\right)=0$ for all $\mathbf{d} \in \mathscr{C}^{\perp}$ and $1 \leq i \leq m$. It follows, from Lemma 3.1, that $\mathbf{u}_{i} \in \mathscr{C}$ for all $1 \leq i \leq m$. Now we shall show that $\mathbf{v} \in \mathscr{D}^{\Theta}$. To see this, it is enough to show that $\mathscr{D}^{\Theta}$ is equal to the additive code

$$
\begin{equation*}
\mathcal{V}:=\left\{\left(\mathbf{z}_{1}, \ldots, \mathbf{z}_{m}\right): \sum_{i=1}^{m} \operatorname{tr}_{q / p}\left(\mathbf{z}_{i} . \mathbf{c}_{i}\right)=0 \text { for all }\left(\mathbf{c}_{1}, \ldots, \mathbf{c}_{m}\right) \in \bigcap_{\Lambda \in \mathscr{D}} \operatorname{ker}\left(F_{\Lambda}\right)\right\} \tag{3.2}
\end{equation*}
$$

over $\mathbb{F}_{q}$. By (3.1), we see that $\mathscr{D}^{\Theta} \subseteq \mathcal{V}$. To see the reverse inclusion, define $R_{\mathbf{y}_{1}, \ldots, \mathbf{y}_{m}}: \mathbb{F}_{q}^{n m} \rightarrow \mathbb{F}_{p}$ by $R_{\mathbf{y}_{1}, \ldots, \mathbf{y}_{m}}\left(\mathbf{z}_{1}, \ldots, \mathbf{z}_{m}\right)=\operatorname{tr}_{q / p}\left(\sum_{i=1}^{m} \mathbf{y}_{i} \cdot \mathbf{z}_{i}\right)$ for all $\mathbf{y}_{1}, \ldots, \mathbf{y}_{m}, \mathbf{z}_{1}, \ldots, \mathbf{z}_{m} \in \mathbb{F}_{q}^{n}$. Note that $\mathcal{V}=\bigcap\left\{\operatorname{ker}\left(R_{\mathbf{c}_{1}, \ldots, \mathbf{c}_{m}}\right):\left(\mathbf{c}_{1}, \ldots, \mathbf{c}_{m}\right) \in\right.$ $\left.\bigcap_{\Lambda \in \mathscr{D}} \operatorname{ker}\left(F_{\Lambda}\right)\right\}$. Moreover, $\left\{R_{\mathbf{c}_{1}, \ldots, \mathbf{c}_{m}}:\left(\mathbf{c}_{1}, \ldots, \mathbf{c}_{m}\right) \in \bigcap_{\Lambda \in \mathscr{D}} \operatorname{ker}\left(F_{\Lambda}\right)\right\}$ is an $\mathbb{F}_{p^{-}}$ space, in a natural way, and the correspondence $\left(\mathbf{c}_{1}, \ldots, \mathbf{c}_{m}\right) \mapsto R_{\mathbf{c}_{1}, \ldots, \mathbf{c}_{m}}$ is an $\mathbb{F}_{p}$-space isomorphism. Thus, by similar arguments as used above, one can see that the $\mathbb{F}_{p}$-dimension of $\mathcal{V}$ is equal to

$$
\operatorname{dim}_{\mathbb{F}_{p}}\left(\mathbb{F}_{q}^{n m}\right)-\operatorname{dim}_{\mathbb{F}_{p}}\left(\bigcap_{\Lambda \in \mathscr{D}} \operatorname{ker}\left(F_{\Lambda}\right)\right)=r n m-r k m+r k s
$$

and so $|\mathcal{V}|=q^{(n-k) m} q^{k s}$. One can also see that $\left|\mathscr{D}^{\Theta}\right|=q^{(n-k) m} . q^{k s}$. Since we already have $\mathscr{D}^{\Theta} \subseteq \mathcal{V}$, we must have the equality $\mathscr{D}^{\Theta}=\mathcal{V}$. Therefore, $\overline{\mathcal{S}}^{\perp_{s}}$ consists of $\left(\mathbf{u}_{1}, \ldots, \mathbf{u}_{m} \mid \mathbf{v}_{1}, \ldots, \mathbf{v}_{m}\right)$ for which $\mathbf{u}_{1}, \ldots, \mathbf{u}_{m} \in \mathscr{C}$ and $\left(\mathbf{v}_{1}, \ldots, \mathbf{v}_{m}\right) \in \mathscr{D}^{\Theta}$.

Let $\mathbf{c} \in \mathscr{C}$ and suppose that $(\mathbf{c}, \mathbf{0}, \ldots, \mathbf{0}) \in \operatorname{ker}\left(F_{\Lambda}\right)$ for all $\Lambda \in \mathscr{D}$. By our assumption on $\mathscr{D}$ (see Remark 22) the first coordinates of the elements of $\mathscr{D}$ form $\operatorname{up} \mathbb{F}_{q^{k}}$. It follows that $c \in \bigcap_{\lambda \in \mathbb{F}_{q^{k}}} \operatorname{ker}\left(f_{\lambda}\right)=0$. This gives that for every nonzero $\mathbf{c} \in \mathscr{C}$, the element $(\mathbf{c}, \mathbf{0}, \ldots, \mathbf{0} \mid \mathbf{0}, \ldots, \mathbf{0})$ of $\left(\mathbb{F}_{q}^{n}\right)^{2 m}$ lies in $\overline{\mathcal{S}}^{\perp_{s}} \backslash \overline{\mathcal{S}}$. Therefore, $\operatorname{swt}\left(\overline{\mathcal{S}}^{\perp_{s}} \backslash \overline{\mathcal{S}}\right) \leq d(\mathscr{C})$. On the other hand, for any nonzero $\Lambda=\left(\lambda_{1}, \ldots, \lambda_{m}\right) \in \mathscr{D}$, an element $\mathbf{D}=\left(\mathbf{x}_{\lambda_{1}}, \ldots, \mathbf{x}_{\lambda_{m}}\right) \in \mathscr{D}^{\Theta}$ cannot belong to $\left(\mathscr{C}^{\perp}\right)^{(m)}$; hence the element $(\mathbf{0}, \ldots, \mathbf{0} \mid \mathbf{D})$ of $\left(\mathbb{F}_{q}^{n}\right)^{2 m}$ belongs to $\overline{\mathcal{S}}^{\perp_{s}} \backslash \overline{\mathcal{S}}$. Therefore, we also have $\operatorname{swt}\left(\overline{\mathcal{S}}^{\perp_{s}} \backslash \overline{\mathcal{S}}\right) \leq \ell$. Consequently, $\operatorname{swt}\left(\overline{\mathcal{S}}^{\perp_{s}} \backslash \overline{\mathcal{S}}\right) \leq \min \{d(\mathscr{C}), \ell\}$.

Now suppose that $\operatorname{swt}\left(\overline{\mathcal{S}}^{\perp_{s}} \backslash \overline{\mathcal{S}}\right)<\min \{d(\mathscr{C}), \ell\}$. Let $(\mathbf{C} \mid \mathbf{D}) \in \overline{\mathcal{S}}^{\perp_{s}} \backslash \overline{\mathcal{S}}$ such that $\operatorname{swt}(\mathbf{C} \mid \mathbf{D})=\operatorname{swt}\left(\overline{\mathcal{S}}^{\perp_{s}} \backslash \overline{\mathcal{S}}\right)$. Since $\operatorname{swt}(\mathbf{C} \mid \mathbf{D})<d(\mathscr{C})$ and $\mathbf{C} \in \mathscr{C}^{(m)}$, we must have $\mathbf{C}=\mathbf{0}$. But since $\mathbf{D} \notin\left(\mathscr{C}^{\perp}\right)^{(m)}$, we get $\ell \leq \operatorname{swt}(\mathbf{C} \mid \mathbf{D})<\ell$, a contradiction. Therefore, $\operatorname{swt}\left(\overline{\mathcal{S}}^{\perp_{s}} \backslash \overline{\mathcal{S}}\right)=\min \{d(\mathscr{C}), \ell\}$.

Corollary 3.4. Let the situation be as in Theorem 3.3. If $d(\mathscr{C}) \leq d(\mathscr{D})$, then $\delta=d(\mathscr{C})$.

Proof. It is not difficult to see that the number $\ell$ in Theorem 3.3 is at least $d(\mathscr{D})$. Now the result follows since $\delta=\min \{d(\mathscr{D}), \ell\}$.

Corollary 3.5. Let the situation be as in Theorem 3.3. Suppose that $\mathscr{D}=$ $\left\{(\lambda, \ldots, \lambda): \lambda \in \mathbb{F}_{q^{k}}\right\} \subset \mathbb{F}_{q^{k}}^{m}$. Then $\delta=\min \{d(\mathscr{C}), m\}$ and the stabilizer group
of $Q_{H}(\mathscr{C}, \mathscr{D})$ consists of the errors $X\left(\mathbf{c}_{1}, \ldots \mathbf{c}_{m}\right) Z\left(\mathbf{d}_{1} \ldots \mathbf{d}_{m}\right)$, where $\mathbf{c}_{1}, \ldots, \mathbf{c}_{m} \in$ $\mathscr{C}$ with $\sum_{i=1}^{m} \mathbf{c}_{i}=0$ and $\mathbf{d}_{1}, \ldots, \mathbf{d}_{m} \in \mathscr{C}^{\perp}$.
Proof. It is known from the proof of Theorem 3.3 that $\mathscr{D}^{\Theta}$ is equal to the code

$$
\mathcal{V}:=\left\{\left(\mathbf{z}_{1}, \ldots, \mathbf{z}_{m}\right): \sum_{i=1}^{m} \operatorname{tr}_{q / p}\left(\mathbf{z}_{i} . \mathbf{c}_{i}\right)=0 \text { for all }\left(\mathbf{c}_{1}, \ldots, \mathbf{c}_{m}\right) \in \bigcap_{\Lambda \in \mathscr{D}} \operatorname{ker}\left(F_{\Lambda}\right)\right\}
$$

over $\mathbb{F}_{q}$. Since $\mathscr{D}=\left\{(\lambda, \ldots, \lambda): \lambda \in \mathbb{F}_{q^{k}}\right\} \subset \mathbb{F}_{q^{k}}^{m}, \bigcap_{\Lambda \in \mathscr{D}} \operatorname{ker}\left(F_{\Lambda}\right)=\left\{\left(c_{1}, \ldots, c_{m}\right) \in\right.$ $\left.\mathscr{C}^{(m)}: c_{1}+\cdots+c_{m} \in \bigcap_{\lambda \in \mathbb{F}_{q^{k}}} f_{\lambda}=0\right\}$ such that $f_{\lambda}$ 's are all linear transformations from $\mathscr{C}$ to $\mathbb{F}_{p}$. So $\mathscr{D}^{\Theta}=\left\{\left(c_{1}, \cdots, c_{m}\right) \in \mathscr{C}^{(m)}: c_{1}+\cdots+c_{m}=0\right\}$. Therefore the stabilizer group of $Q_{H}(\mathscr{C}, \mathscr{D})$ consists of the errors $X\left(\mathbf{c}_{1}, \ldots \mathbf{c}_{m}\right) Z\left(\mathbf{d}_{1} \ldots \mathbf{d}_{m}\right)$, where $\mathbf{c}_{1}, \ldots, \mathbf{c}_{m} \in \mathscr{C}$ with $\sum_{i=1}^{m} \mathbf{c}_{i}=0$ and $\mathbf{d}_{1}, \ldots, \mathbf{d}_{m} \in \mathscr{C} \perp$. For a suitable $\lambda$, $x_{\lambda}$ could be $(10 \ldots 0)$. Then $\operatorname{wt}(\mathbf{X})=m$, where $\mathbf{X}$ is the $m$-fold tensor product of $x_{\lambda}$. The result follows since $\ell=m$.

Proposition 3.6. Let the situation be as in Theorem 3.3, where $\mathscr{D}=\{(\lambda, \ldots, \lambda)$ : $\left.\lambda \in \mathbb{F}_{q^{k}}\right\} \subset \mathbb{F}_{q^{k}}^{m}$. Then

$$
Q_{H}(\mathscr{C}, \mathscr{D})=\operatorname{span}\left\{\sum_{\substack{\left(\mathbf{c}_{1}, \ldots, \mathbf{c}_{m}\right) \in \mathscr{C}^{(m)} \\ \mathbf{c}_{1}+\cdots+\mathbf{c}_{m}=c}}\left|\mathbf{c}_{1} \ldots \mathbf{c}_{m}\right\rangle: \mathbf{c} \in \mathscr{C}\right\}
$$

Proof. Let

$$
\mathcal{A}=\left\{\sum_{\substack{\left(\mathbf{c}_{1}, \ldots, \mathbf{c}_{m}\right) \in \mathscr{C}(m) \\ \mathbf{c}_{1}+\cdots+\mathbf{c}_{m}=c}}\left|\mathbf{c}_{1} \ldots \mathbf{c}_{m}\right\rangle: \mathbf{c} \in \mathscr{C}\right\}
$$

Since for any $\Lambda=(\lambda, \ldots, \lambda) \in \mathscr{D}$,

$$
\begin{aligned}
\Phi_{\Lambda}=\phi_{\lambda}^{\otimes m} & =\frac{1}{\sqrt{q^{k m}}} \sum_{\left(\mathbf{c}_{1}, \ldots, \mathbf{c}_{m}\right) \in \mathscr{C}(m)} \omega^{f_{\lambda}\left(\sum_{i=1}^{m} \mathbf{c}_{i}\right)}\left|\mathbf{c}_{1} \ldots \mathbf{c}_{m}\right\rangle \\
& =\frac{1}{\sqrt{q^{k m}}} \sum_{\left(\mathbf{c}_{1}, \ldots, \mathbf{c}_{m}\right) \in \mathscr{C}(m)} \omega^{f_{\lambda}(\mathbf{c})} \sum_{\mathbf{c}_{1}+\cdots+\mathbf{c}_{m}=\mathbf{c}}\left|\mathbf{c}_{1} \ldots \mathbf{c}_{m}\right\rangle
\end{aligned}
$$

we have $Q_{H}(\mathscr{C}, \mathscr{D}) \subseteq \operatorname{span} \mathcal{A}$. Since $\operatorname{dim}\left(Q_{H}(\mathscr{C}, \mathscr{D})\right)=q^{k}=\operatorname{dim}(\operatorname{span} \mathcal{A})$, we have the equality $Q_{H}(\mathscr{C}, \mathscr{D})=\operatorname{span} \mathcal{A}$.

## 4 In Search of a Converse

Lemma 4.1. Let $\mathscr{C}$ be a non-empty subset of $\mathbb{F}_{q}^{n}$ and let $\phi_{i}=\sum_{\mathbf{c} \in \mathscr{C}} \omega^{\alpha_{i}(\mathbf{c})}|\mathbf{c}\rangle$, $\psi_{i}=\sum_{\mathbf{c} \in \mathscr{C}} \omega^{\beta_{i}(\mathbf{c})}|\mathbf{c}\rangle$ be elements of $\left(\mathbb{C}^{q}\right)^{\otimes n}$ for every $1 \leq i \leq m$, where $\omega=$ $e^{2 \pi i / p}$ and the $\alpha_{i}$ and $\beta_{i}$ are functions from $\mathscr{C}$ into $\mathbb{F}_{p}$. Suppose that

$$
\phi_{1} \otimes \cdots \otimes \phi_{m}=\psi_{1} \otimes \cdots \otimes \psi_{m}
$$

Then there exist $b_{r} \in \mathbb{F}_{p}(1 \leq r \leq m)$ such that $\psi_{r}=\omega^{b_{r}} \phi_{r}$ for all $1 \leq r \leq m$.
Proof. By assumption, we have the equality

$$
\sum_{\left(\mathbf{c}_{1}, \ldots, \mathbf{c}_{m}\right) \in \mathscr{C}^{m}} \omega^{\sum_{i=1}^{m} \alpha_{i}\left(\mathbf{c}_{i}\right)}\left|\mathbf{c}_{1} \ldots \mathbf{c}_{m}\right\rangle=\sum_{\left(\mathbf{c}_{1}, \ldots, \mathbf{c}_{m}\right) \in \mathscr{C}^{m}} \omega^{\sum_{i=1}^{m} \beta_{i}\left(\mathbf{c}_{i}\right)}\left|\mathbf{c}_{1} \ldots \mathbf{c}_{m}\right\rangle
$$

where $\mathscr{C}^{m}$ denotes the $m$-fold Cartesian product of $\mathscr{C}$. Hence $\sum_{i=1}^{m} \alpha_{i}\left(\mathbf{c}_{i}\right)=$ $\sum_{i=1}^{m} \beta_{i}\left(\mathbf{c}_{i}\right)$ for every $\left(\mathbf{c}_{1}, \ldots, \mathbf{c}_{m}\right) \in \mathscr{C}^{m}$. Fix a $\mathbf{c}_{0} \in \mathscr{C}$. Then

$$
\alpha_{r}(\mathbf{c})+\sum_{\substack{i=1 \\ i \neq r}}^{m} \alpha_{i}\left(\mathbf{c}_{0}\right)=\beta_{r}(\mathbf{c})+\sum_{\substack{i=1 \\ i \neq r}}^{m} \beta_{i}\left(\mathbf{c}_{0}\right)
$$

for all $\mathbf{c} \in \mathscr{C}$ and $1 \leq r \leq m$. Let

$$
b_{r}=\sum_{\substack{i=1 \\ i \neq r}}^{m}\left(\alpha_{i}\left(\mathbf{c}_{0}\right)-\beta_{i}\left(\mathbf{c}_{0}\right)\right)
$$

Then $\alpha_{r}(\mathbf{c})+b_{r}=\beta_{r}(\mathbf{c})$ for all $\mathbf{c} \in \mathscr{C}$ and $1 \leq r \leq m$. It, therefore, follows that $\psi_{r}=\omega^{b_{r}} \phi_{r}$ for all $1 \leq r \leq m$.

Theorem 4.2. Let $H$ be a normalized $B H\left(q^{k}, p\right)$ matrix, where $p$ is a prime number and $q=p^{r}$ for some positive integer $r$. Let $\mathscr{C} \subseteq \mathbb{F}_{q}^{n}$ be a classical linear code over $\mathbb{F}_{q}$ of dimension $k$, where $1 \leq k<n$, and $\mathscr{D}=\{(\lambda, \ldots, \lambda): \lambda \in$ $\left.\mathbb{F}_{q^{k}}\right\} \subset \mathbb{F}_{q^{k}}^{m}$ be the one-dimensional linear code over $\mathbb{F}_{q^{k}}$. If the quantum code $Q_{H}(\mathscr{C}, \mathscr{D})$ is a stabilizer code, then $H$ is equivalent to the rk-fold Kronecker product of the Fourier matrix of order $p$.

Proof. Let $\mathscr{C}=\left\{\mathbf{c}_{1}=0, \mathbf{c}_{2}, \ldots, \mathbf{c}_{q^{k}}\right\}$. We can write $H=\left[\omega^{f_{i}\left(\mathbf{c}_{j}\right)}\right]_{1 \leq i, j \leq q^{k}}$, where $\omega=e^{2 \pi i / p}$ and $f_{i}: \mathscr{C} \rightarrow \mathbb{F}_{p}$ is a function for each $1 \leq i \leq q^{k}$. Now, $Q_{H}(\mathscr{C}, \mathscr{D})$ is the linear span of $\left\{\phi_{1}^{\otimes m}, \ldots, \phi_{q^{k}}^{\otimes m}\right\}$ over $\mathbb{F}_{q}$, where

$$
\phi_{i}=\frac{1}{\sqrt{q^{k}}} \sum_{j=1}^{q^{k}} \omega^{f_{i}\left(\mathbf{c}_{j}\right)}\left|\mathbf{c}_{j}\right\rangle \in\left(\mathbb{C}^{q}\right)^{\otimes n}
$$

Suppose that $Q=Q_{H}(\mathscr{C}, \mathscr{D})$ is a stabilizer code and let $\mathcal{S}=\operatorname{Stab}(Q)$. By Lemma 3.2, $\left(\mathbf{0}, \ldots, \mathbf{0} \mid \mathbf{d}_{1}, \ldots, \mathbf{d}_{m}\right) \in \overline{\mathcal{S}}$ for all $\mathbf{d}_{1}, \ldots, \mathbf{d}_{m} \in \mathscr{C}^{\perp}$. Let $\mathbf{s}=$ $\left(\mathbf{u}_{1}, \ldots, \mathbf{u}_{m} \mid \mathbf{v}_{1}, \ldots, \mathbf{v}_{m}\right) \in \overline{\mathcal{S}}$. Then $\mathbf{s}$ is sympletically orthogoanl to the elements of $\overline{\mathcal{S}}$ of the forms $(\mathbf{0}, \ldots, \mathbf{0} \mid \mathbf{d}, \mathbf{0}, \ldots, \mathbf{0}), \ldots,(\mathbf{0}, \ldots, \mathbf{0} \mid \mathbf{0}, \ldots, \mathbf{0}, \mathbf{d})$ for all $\mathbf{d} \in \mathscr{C}^{\perp}$. Thus, $\operatorname{tr}_{q / p}\left(\mathbf{u}_{i} . d\right)=0$ for all $1 \leq i \leq m$ and $\mathbf{d} \in \mathscr{C}^{\perp}$. Therefore, $\mathbf{u}_{i} \in \mathscr{C}$ for all $1 \leq i \leq m$ by Lemma 3.1. Note that there exists $h \in \mathbb{F}_{p}$ such that $\omega^{h} X\left(\mathbf{u}_{1}, \ldots, \mathbf{u}_{m}\right) Z\left(\mathbf{v}_{1}, \ldots, \mathbf{v}_{m}\right) \phi_{j}^{\otimes m}=\phi_{j}^{\otimes m}$ for all $1 \leq i \leq m$ and $\mathbf{u} \in \mathscr{C}^{\perp}$. This gives that $\omega^{h} X\left(\mathbf{u}_{1}\right) Z\left(\mathbf{v}_{1}\right) \phi_{j} \otimes \cdots \otimes X\left(\mathbf{u}_{m}\right) Z\left(\mathbf{v}_{m}\right) \phi_{j}=\phi_{j} \otimes \cdots \otimes \phi_{j}$, and so there exists $h_{i j} \in \mathbb{F}_{p}\left(1 \leq i \leq m, 1 \leq j \leq q^{k}\right)$ such that $X\left(\mathbf{u}_{i}\right) Z\left(\mathbf{v}_{i}\right) \phi_{j}=\omega^{h_{i j}} \phi_{j}$
for all $1 \leq i \leq m$ and $1 \leq j \leq q^{k}$ by Lemma 4.1. Since $X\left(\mathbf{u}_{i}\right) Z\left(\mathbf{v}_{i}\right) \phi_{j}=$ $\sum_{\mathbf{c} \in \mathscr{C}} \omega^{f_{j}\left(\mathbf{c}-\mathbf{u}_{i}\right)} \omega^{\operatorname{tr}_{q / p}\left(\mathbf{v}_{i} \cdot \mathbf{c}\right)}|\mathbf{c}\rangle$, we have

$$
\begin{equation*}
f_{j}\left(\mathbf{c}-\mathbf{u}_{i}\right)+\operatorname{tr}_{q / p}\left(\mathbf{v}_{i} . \mathbf{c}\right)=f_{j}(\mathbf{c})+h_{i j} \tag{4.1}
\end{equation*}
$$

for all $\mathbf{c} \in \mathscr{C}, 1 \leq i \leq m$, and $1 \leq j \leq q^{k}$. Since $H$ is assumed to be normalized, $f_{1}(\mathbf{c})=0$ for all $\mathbf{c} \in \mathscr{C}$ and $f_{i}(0)=0$ for all $1 \leq i \leq q^{k}$. In parrticular, (4.1) yields $\operatorname{tr}_{q / p}\left(\mathbf{v}_{i} . \mathbf{c}\right)=h_{i 1}$ for all $\mathbf{c} \in \mathscr{C}$ and $1 \leq i \leq m$. Substituting $\mathbf{c}=0$ and $j=1$ in (4.1), we obtain $h_{i 1}=0$ for all $1 \leq i \leq m$. Hence $\mathbf{v}_{i} \in \mathscr{C}^{\perp}$ for all $1 \leq i \leq m$ by Lemma 3.1. Since $\sum_{i=1}^{m} h_{i j}=-h$, this also shows that $h=0$. Note that (4.1) turns into $f_{j}\left(\mathbf{c}-\mathbf{u}_{i}\right)=f_{j}(\mathbf{c})+h_{i j}$, where $h_{i j}=f_{j}\left(-\mathbf{u}_{i}\right)=-f_{j}\left(\mathbf{u}_{i}\right)$ for all $1 \leq i \leq m$ and $1 \leq j \leq q^{k}$, and $\sum_{i=1}^{m} f_{j}\left(\mathbf{u}_{i}\right)=0$ for all $1 \leq j \leq q^{k}$. It follows that

$$
\begin{equation*}
f_{j}\left(\mathbf{c}-\mathbf{u}_{i}\right)=f_{j}(\mathbf{c})-f_{j}\left(\mathbf{u}_{i}\right) \tag{4.2}
\end{equation*}
$$

for all $\mathbf{c} \in \mathscr{C}, 1 \leq i \leq m$, and $1 \leq j \leq q^{k}$. Replacing $\mathbf{c}$ by $\mathbf{c}+\mathbf{u}_{i}$ in (4.2), we obtain that $f_{j}\left(\mathbf{c}+\mathbf{u}_{i}\right)=f_{j}(\mathbf{c})+f_{j}\left(\mathbf{u}_{i}\right)$ for all $\mathbf{c} \in \mathscr{C}, 1 \leq i \leq m$, and $1 \leq j \leq q^{k}$. In particular, we have $f_{j}\left(\sum_{i=1}^{m} \mathbf{u}_{i}\right)=\sum_{i=1}^{m} f_{j}\left(\mathbf{v}_{i}\right)=0$ for all $1 \leq j \leq q^{k}$. Since $H$, whose rank is $q^{k}$, has its first column consisting of 1 's, this is possible only when $\sum_{i=1}^{m} \mathbf{u}_{i}=0$. It follows that $\overline{\mathcal{S}}$ is contained in
$\mathcal{A}:=\left\{\left(\mathbf{u}_{1}, \ldots, \mathbf{u}_{m} \mid \mathbf{v}_{1}, \ldots, \mathbf{v}_{m}\right): \mathbf{v}_{i} \in \mathscr{C}^{\perp}, \mathbf{u}_{i} \in \mathscr{C}, \forall 1 \leq i \leq m\right.$ with $\left.\sum_{i=1}^{m} \mathbf{u}_{i}=0\right\}$.
Rewriting $\mathcal{A}$ as

$$
\left\{\left(\mathbf{u}_{1}, \ldots \mathbf{u}_{m-1},-\sum_{i=1}^{m-1} \mathbf{u}_{i} \mid \mathbf{v}_{1}, \ldots, \mathbf{v}_{m}\right): \mathbf{u}_{1}, \ldots \mathbf{u}_{m} \in \mathscr{C}, \mathbf{v}_{1}, \ldots, \mathbf{v}_{m} \in \mathscr{C}^{\perp}\right\}
$$

we have $|\overline{\mathcal{S}}|=q^{n m-k}=\left(q^{k}\right)^{m-1}\left(q^{n-k}\right)^{m}=|\mathcal{A}|$; hence $\overline{\mathcal{S}}=\mathcal{A}$. Now (4.2) gives that $f_{j}\left(\mathbf{c}-\mathbf{c}^{\prime}\right)=f_{j}(\mathbf{c})-f_{j}\left(\mathbf{c}^{\prime}\right)$ for all $\mathbf{c}, \mathbf{c}^{\prime} \in \mathscr{C}$ and $1 \leq j \leq q^{k}$, proving that $f_{j}: \mathscr{C} \rightarrow \mathbb{F}_{p}$ is a linear transformation of $\mathbb{F}_{p}$-spaces.

## A Appendix: Equivalence of Fourier-type BH Matrices

Throughout this brief note, $R$ will denote a finite Frobenius ring and $M$ a finite $R$-bimodule. We also denote the set of all non-degenerate bilinear forms on $M$ by $\operatorname{BLF}(M)$.

Let $B: M \times M \longrightarrow R$ be a non-degenerate bilinear form on $M$. Associated to $B$ are there right $R$-module homomorphisms, for all $x \in M$, defined by

$$
\begin{aligned}
B(x): & M \longrightarrow R \\
y & \longmapsto B(x, y)
\end{aligned}
$$

that is $B(x)(y)=B(x, y)$ for all $x, y \in M$. It follows that $B(x) \in M^{*}=$ $\operatorname{Hom}\left(M_{R}, R_{R}\right)$ for every $x \in M$. Note the following properties:

- $B\left(x_{1}+x_{2}\right)=B\left(x_{1}\right)+B\left(x_{2}\right)$ for all $x_{1}, x_{2} \in M$.
- $B(r x)=r B(x)$ in the left $R$-module $M^{*}$ for all $r \in R$ and $x \in M$.
- $B(x)=B\left(x^{\prime}\right)$ if and only if $x=x^{\prime}$ for all $x, x^{\prime} \in M$.
- $M^{*}=\{B(x): x \in M\}$.

Let $\operatorname{Aut}\left({ }_{R} M\right)$ (respectively, $\operatorname{Aut}\left(M_{R}\right)$ ) denote the group of left (respectively, right) $R$-module automorphisms of $M$, equipped with the usual composition of maps. Given $\gamma \in \operatorname{Aut}\left({ }_{R} M\right)$ and $\eta \in \operatorname{Aut}\left(M_{R}\right)$, one can define two mappings assosiated with $B$ as follows:

$$
\begin{gathered}
B^{\prime}: M \times M \longrightarrow R \\
(x, y) \longmapsto B(\gamma(x), y) \\
B^{\prime \prime}: M \times M \longrightarrow R \\
\\
(x, y) \longmapsto B(x, \eta(y))
\end{gathered}
$$

Observe that both $B^{\prime}$ and $B^{\prime \prime}$ are non-degenerate bilinear forms. Thus both groups $\operatorname{Aut}\left({ }_{R} M\right)$ and $\operatorname{Aut}\left(M_{R}\right)$ act on $\operatorname{BLF}(M)$. We write $B^{\prime}=B \cdot \gamma$ and $B^{\prime \prime}=B \cdot \eta$.

Theorem A.1. Let $B$ be any non-degenerate bilinear form on $M$. Then we have

$$
\begin{aligned}
\operatorname{BLF}(M) & =\left\{B \cdot \gamma: \gamma \in \operatorname{Aut}\left({ }_{R} M\right)\right\} \\
& =\left\{B \cdot \eta: \eta \in \operatorname{Aut}\left(M_{R}\right)\right\}
\end{aligned}
$$

Proof. The arguments above the theorem show that $\left\{B \cdot \gamma: \gamma \in \operatorname{Aut}\left({ }_{R} M\right)\right\}$ lies in $\operatorname{BLF}(M)$.

Conversely, let $B^{\prime}$ be any other non-degenerate bilinear form on $M$. We shall show that $B^{\prime}=B \cdot \gamma$ for a suitable $\gamma \in \operatorname{Aut}\left({ }_{R} M\right)$.

Let $M=\left\{0, x_{1}, \ldots, x_{n}\right\}$. Since

$$
M^{*}=\left\{B(0), B\left(x_{1}\right), \ldots, B\left(x_{n}\right)\right\}=\left\{B^{\prime}(0), B^{\prime}\left(x_{1}\right), \ldots, B^{\prime}\left(x_{n}\right)\right\},
$$

there exists $\sigma \in S_{n}$ such that $B^{\prime}\left(x_{i}\right)=B\left(x_{\sigma(i)}\right)$. Now define $\gamma: M \rightarrow M$ by $\gamma(0)=0$ and $\gamma\left(x_{i}\right)=x_{\sigma(i)}$ for each $i=1, \ldots, n$. Notice that

$$
B^{\prime}(x, y)=B(\gamma(x), y)
$$

for all $x, y \in M$. Thus we complete the proof by showing that $\gamma \in \operatorname{Aut}\left({ }_{R} M\right)$.
Let $x_{i}+x_{j}=x_{k}$. Since

$$
\begin{aligned}
B\left(x_{\sigma(k)}\right) & =B^{\prime}\left(x_{k}\right) \\
& =B^{\prime}\left(x_{i}+x_{j}\right) \\
& =B^{\prime}\left(x_{i}\right)+B^{\prime}\left(x_{j}\right) \\
& =B\left(x_{\sigma(i)}\right)+B\left(x_{\sigma(j)}\right) \\
& =B\left(x_{\sigma(i)}+x_{\sigma(j)}\right)
\end{aligned}
$$

we have $x_{\sigma(i)}+x_{\sigma(j)}=x_{\sigma(k)}$. It follows that

$$
\gamma\left(x_{i}+x_{j}\right)=\gamma\left(x_{k}\right)=x_{\sigma(k)}=x_{\sigma(i)}+x_{\sigma(j)}=\gamma\left(x_{i}\right)+\gamma\left(x_{j}\right)
$$

i.e. $\gamma$ is additive. On the other hand if $r \in R$ and $r x_{i}=x_{j}$, then

$$
\begin{aligned}
B\left(x_{\sigma(j)}\right) & =B^{\prime}\left(x_{j}\right) \\
& =B^{\prime}\left(r x_{i}\right) \\
& =r B^{\prime}\left(x_{i}\right) \\
& =r B\left(x_{\sigma(i)}\right) \\
& =B\left(r x_{\sigma(i)}\right),
\end{aligned}
$$

hence $x_{\sigma(j)}=r x_{\sigma(i)}$, which yields

$$
\gamma\left(r x_{i}\right)=\gamma\left(x_{j}\right)=x_{\sigma(j)}=r x_{\sigma(i)}=r \gamma\left(x_{i}\right)
$$

as desired. This completes the proof of the first equality. By symmetric arguments, one easily prove the other equality.

Proposition A.2. Let $\chi$ be a generating character of $R$ and let $B, B^{\prime}$ be two non-degenerate bilinear forms of the $R$-bimodule $M=\left\{x_{0}=0, x_{1}, \ldots, x_{n}\right\}$. Then the matrices

$$
H=\left[\chi\left(B\left(x_{i}, x_{j}\right)\right)\right]_{0 \leq i, j \leq n}
$$

and

$$
H^{\prime}=\left[\chi\left(B^{\prime}\left(x_{i}, x_{j}\right)\right)\right]_{0 \leq i, j \leq n}
$$

are equivalent (by row permutation).
Proof. There exists an $\sigma \in S_{n}$ such that $B^{\prime}\left(x_{i}, x_{j}\right)=B\left(x_{\sigma(i), x_{j}}\right)$ for all $0 \leq$ $i, j \leq n$ by the proof of TheoremA.1. Thus $H^{\prime}=\left[\chi\left(B^{\prime}\left(x_{i}, x_{j}\right)\right)\right]=\left[B\left(x_{\sigma(i)}, x_{j}\right)\right]$ is $H$ with rows permuted by $\sigma$.
Lemma A.3. Let $\chi$ and $\chi^{\prime}$ be two generating characters of the ring $R$. Then there exists a unit element $a \in R$ such that $\chi^{\prime}=\chi^{a}$.
Proof. Since $\chi$ is a generating character then there exists an element $r$ of $R$ such that $\chi^{\prime}=\chi r$. Similarly, there exists an element $r^{\prime}$ of $R$ such that $\chi=\chi^{\prime} r^{\prime}$. Therefore $\chi\left(1-r r^{\prime}\right)=0$ and $\chi \neq 0$. Then $\chi^{\prime}=\chi r=\chi^{r}$ and $r$ is a unit element of $R$.

Proposition A.4. Let $\chi$ and $\chi^{\prime}$ be two generating characters of the ring $R$ and let $B$ be a non-degenerate bilinear form on the $R$-bimodule $M=\left\{x_{0}=\right.$ $\left.0, x_{1}, \ldots, x_{n}\right\}$. Then the matrices

$$
H=\left[\chi\left(B\left(x_{i}, x_{j}\right)\right)\right]_{0 \leq i, j \leq n}
$$

and

$$
H^{\prime}=\left[\chi^{\prime}\left(B\left(x_{i}, x_{j}\right)\right)\right]_{0 \leq i, j \leq n}
$$

are equivalent (by row permutation).
Proof. By above lemma, there exists a unit element $a \in R$ such that $\chi^{\prime}=\chi^{a}$. Since $a$ is unit, we have $a M=M$. It follows that there exists $\sigma \in S_{n}$ such that $a x_{i}=x_{\sigma(i)}$ for all $i=1, \ldots, n$. Now

$$
\begin{aligned}
H^{\prime} & =\left[\chi^{\prime}\left(B\left(x_{i}, x_{j}\right)\right)\right]=\left[\chi^{a}\left(B\left(x_{i}, x_{j}\right)\right)\right] \\
& =\left[\chi\left(a B\left(x_{i}, x_{j}\right)\right)\right]=\left[\chi\left(B\left(a x_{i}, x_{j}\right)\right)\right] \\
& =\left[\chi\left(B\left(x_{\sigma(i)}, x_{j}\right)\right)\right]
\end{aligned}
$$

is clearly the matrix $\left[\chi\left(B\left(x_{i}, x_{j}\right)\right)\right]$ with rows permuted by $\sigma$.
Proposition A.5. For the $R$-bimodule $M=\left\{x_{0}=0, x_{1}, \ldots, x_{n}\right\}$, the matrices of the form

$$
\left[\chi\left(B\left(x_{i}, x_{j}\right)\right)\right]_{0 \leq i, j \leq n},
$$

where $\chi$ is a generating character of $R$ and $B: M \times M \rightarrow R$ is a non-degenerate bilinear form on $M$, are all equivalent.

Proof. For every non-degenerate bilinear form $B^{\prime}$ on $M$ distinct from $B$ according to Proposition A.2, $H^{\prime}=\left[\chi\left(B^{\prime}\left(x_{i}, x_{j}\right)\right)\right]_{0 \leq i, j \leq n}$ is equivalent to $H$. Similarly for every $\chi^{\prime}$ distinct from $\chi$ according to Proposition A.4, $H^{\prime \prime}=$ $\left[\chi^{\prime}\left(B\left(x_{i}, x_{j}\right)\right)\right]_{0 \leq i, j \leq n}$ is equivalent to $H$. This completes the proof.
Corollary A.6. Let $H=\left[\omega^{f_{i}\left(\mathbf{c}_{j}\right)}\right]_{1 \leq i, j \leq q^{k}}$, where $\omega=e^{2 \pi i / p}$ and $f_{i}: \mathscr{C} \rightarrow \mathbb{F}_{p}$ is a linear transformation for each $1 \leq i \leq q^{k}$. Then $H$ is equivalent to $a$ Kronecker product of Fourier matrices.

Proof. Since $f_{i} \in \mathcal{L}\left(\mathscr{C}, \mathbb{F}_{p}\right)$ for $1 \leq i, j \leq q^{k}$ and $\mathscr{C}$ is isomorphic to $\mathbb{F}_{q^{k}}$ then we use the composition of $\mathbb{F}_{p}$-space isomorphisms $\kappa: \mathscr{C} \rightarrow \mathbb{F}_{q^{k}} \rightarrow \mathcal{L}\left(\mathscr{C}, \mathbb{F}_{p}\right)$. Let $B: \mathscr{C} \times \mathscr{C} \rightarrow \mathbb{F}_{p}$ be a transformation defined as $B\left(c, c^{\prime}\right)=f_{i}\left(c^{\prime}\right)$ such that $\kappa(c)=f_{i}$. Then $B$ is a non-degenerate bilinear form. Also $\chi: \mathbb{F}_{p} \rightarrow \mathbb{C}^{*}, \chi(a)=$ $\omega^{a}$ is a generating character for $\mathbb{F}_{p}$. If we combine these we say

$$
H=\left[\omega^{f_{i}\left(\mathbf{c}_{j}\right)}\right]_{1 \leq i, j \leq q^{k}}=\left[\chi\left(B\left(c_{i}, c_{j}\right)\right)\right]_{1 \leq i, j \leq q^{k}}
$$

On the other hand $B^{\prime}: \mathbb{F}_{q^{k}} \times \mathbb{F}_{q^{k}} \rightarrow \mathbb{F}_{q^{k}}, B(i, j)=i j$ is a non-degenerate bilinear form and $\chi^{\prime}: \mathbb{F}_{q^{k}} \rightarrow \mathcal{C}^{*}, \chi^{\prime}(a)=\omega^{a}$ is a generating character. Then the Fourier matrix $F_{i j}=\left[\omega^{i j}\right]=\left[\chi^{\prime}\left(B^{\prime}(i, j)\right)\right]_{1 \leq i, j \leq q^{k}}$. The desired result is obtained by Proposition A.5.
