Abstract

The symmetrized weight enumerators of pairs of Type II code over \mathbb{F}_2 and \mathbb{Z}_4 , which are invariants for a specified group, have been examined in this paper. It is shown that, for degrees 8 and 16, the space of the invariants ring of that group coincides with the ring generated from those weight enumerators.

Keywords: Type II Code, Symmetrized weight enumerator, Invariant ring

Mathematics Subject Classification [2020]: Primary 94B05, Secondary 05E99

1. Introduction

Following the groundbreaking work of Gleason [1] the relationships between coding theory, the invariant theory of various finite groups, and modular forms were elucidated by Broué-Enguehard [7], Duke [14], Runge [2], Bannai et al [4]. These investigations demonstrate the relationship between combinatorics and number theory.

The algebraic method of computing rings of Hilbert modular forms for a specific generalized paramodular group was demonstrated by Runge [3].

Later, Oura [10] constructed a paramodular form using coding theory. He presented a theoretical argument in his writing. The assertion was not backed up by any instances. The concepts of Oura [10] serve as the basis for our research. To substantiate his claim, we primarily investigate Type II codes of lengths 8 and 16 over \mathbb{F}_2 and \mathbb{Z}_4 and construct weight polynomials of degrees 8 and 16. It seems that weight enumerators of codes can create the invariant ring of a finite group H mentioned in Section 3.

Numerous research works have been carried out on Type II codes over \mathbb{Z}_{2k} . It was shown in [4] that there is a Type II \mathbb{Z}_{2k} code of length n if and only if n is divisible by 8. Klemm [9], followed by Conway and Sloane [6], examined the requirements met by the weight enumerator of self-dual codes defined over the ring of integers modulo four. In [6],

Conway and Sloane mentioned four Type II codes, each of type $4^4, 4^3 2^2, 4^2 2^3$, and $4 \cdot 2^6$ of length 8 including the code $\mathcal{K}_{4m}, m \geq 1$, introduced by Klemm in [9]. Gaborit [8] discovered a mass formula for both the Type II codes, which are only present at lengths divisible by eight. Later, in [12], Pless et al. demonstrated 133 inequivalent Type II \mathbb{Z}_4 codes of length 16 using a new computer algorithm. Ten of these codes are direct sums of the four Type II codes of [6] and the remaining codes are discovered to be indecomposable. The generator matrices of the codes that we employ in 3 are available in [6]. We refer to [5] for the definition used in the section 2.

Throughout the paper, we use $\mathbb{Z}, \mathbb{Q}, \mathbb{R}, \mathbb{C}$ as the sets of integers, rationals, reals, and complex numbers, respectively. We put $\mathbb{Z}_l = \mathbb{Z}/l\mathbb{Z}$, and $\mathbb{F}_2 = \mathbb{Z}_2$. We sometimes regard $\mathbb{Z}_l = \{0, 1, \dots, l-1\}$ as integers. We denote $\exp(2\pi\sqrt{-1}\cdot)$ by $\mathbf{e}(\cdot)$, $A[B] = B^T A B$ where B^T denotes the transpose of B , and δ_{ij} is Kronecker delta which has its usual meaning.

In Section 2, we explain the terms used. In Section 3, we give our main results.

2. Preliminaries

The direct product of n copies of the cyclic group \mathbb{Z}_{2k} is denoted by \mathbb{Z}_{2k}^n . A subset of \mathbb{Z}_{2k}^n is called a linear code \mathcal{C} of length n if it forms an additive subgroup of \mathbb{Z}_{2k}^n . An element of \mathcal{C} is called a codeword of \mathcal{C} . A generator matrix of \mathcal{C} is a matrix whose rows generate \mathcal{C} . If $x = (x_1, x_2, \dots, x_n)$ and $y = (y_1, y_2, \dots, y_n) \in \mathbb{Z}_{2k}^n$ then the inner product of x and y is defined as follows:

$$\langle x, y \rangle = x_1 y_1 + x_2 y_2 + \dots + x_n y_n \pmod{2k}.$$

The dual code of \mathcal{C} , denoted by \mathcal{C}^\perp , is defined as $\mathcal{C}^\perp = \{x \in \mathbb{Z}_{2k}^n \mid \langle x, y \rangle = 0 \pmod{2k} \text{ for all } y \in \mathcal{C}\}$. If $\mathcal{C} = \mathcal{C}^\perp$ then \mathcal{C} is said to be self dual. We say \mathcal{C} is Type II if \mathcal{C} is self dual and $\langle x, x \rangle = 0 \pmod{4k}$ for any element $x \in \mathcal{C}$.

Definition 2.1. An invariant ring of a finite subgroup G of $GL(n, \mathbb{C})$ acting on a polynomial ring $\mathbb{C}[x_1, x_2, \dots, x_n]$ over \mathbb{C} consists of all polynomials that remain unchanged under the action of every element of G . It is denoted by $\mathbb{C}[x_1, x_2, \dots, x_n]^G$. The action is defined as

$$A \cdot f(x_1, x_2, \dots, x_n) = f\left(\sum_{1 \leq j \leq n} A_{1j} x_j, \dots, \sum_{1 \leq j \leq n} A_{nj} x_j\right)$$

where $f \in \mathbb{C}[x_1, x_2, \dots, x_n]$ and $A = (A_{ij})_{1 \leq i, j \leq n}$.

There exists a homogeneous system of parameter $\theta_1, \theta_2, \dots, \theta_n$ such that the invariant ring $\mathbb{C}[x_1, x_2, \dots, x_n]^G$ is finitely generated free $\mathbb{C}[\theta_1, \theta_2, \dots, \theta_n]$ -module. It has the Hironaka decomposition, $\mathbb{C}[x_1, x_2, \dots, x_n]^G = \bigoplus_{1 \leq m \leq s} g_m \mathbb{C}[\theta_1, \theta_2, \dots, \theta_n]$ with $g_1 = 1$. This invariant ring is a graded ring and its dimension formula is defined by $\phi_G(t) = \sum_{d \geq 1} \dim \mathbb{C}[x_1, x_2, \dots, x_n]_d^G t^d$ where $\mathbb{C}[x_1, x_2, \dots, x_n]_d^G$ represents the number of

linearly independent invariant polynomials of degree d . The dimension formula for the Hironaka decomposition given in the above form is

$$\phi_G(t) = \sum_{A \in G} \frac{1 + t^{\deg(g_2)} + \dots + t^{\deg(g_s)}}{(1 - t^{\deg(\theta_1)}) \dots (1 - t^{\deg(\theta_n)})}.$$

By Molien it is given by

$$\phi_G(t) = \frac{1}{|G|} \sum_{\lambda \in G} \frac{1}{\det(I - t \cdot \lambda)}$$

where I is the identity matrix and t is a formal variable.

Let k_1, k_2, \dots, k_g be an ordered sequence of positive integers such that $k_i \mid k_{i+1}$ for $i = 1, 2, \dots, g-1$ and $R = \mathbb{Z}_{2k_1} \times \mathbb{Z}_{2k_2} \times \dots \times \mathbb{Z}_{2k_g}$ and let α be a positive integer such that $\alpha = k_1$ and $\alpha_i = \frac{k_i}{\alpha}$ for $i = 1, 2, \dots, g$. We set $D = \text{diag}(\alpha_1, \alpha_2, \dots, \alpha_g)$. Then we can form a subgroup $G = \langle \chi_\alpha, \xi_U, \eta_S, \mathbf{e}(1/8) \rangle$ of $GL(2^g(\alpha^g \alpha_1 \alpha_2 \dots \alpha_g), \mathbb{C})$ which operates on $\mathbb{C}[x_a \mid a \in R]$. The generators of G are formed using the followings

$$\chi_\alpha = \mathbf{e}(1/8)^g (2^g \alpha^g \alpha_1 \alpha_2 \dots \alpha_g)^{-1/2} (\mathbf{e}(\langle D^{-1}a, b \rangle / 2\alpha))_{a, b \in R} \quad (1)$$

Let $\Omega(D)$ be a subgroup of $GL(g, \mathbb{Z})$ consisting with the set of elements $U \in GL(g, \mathbb{Z})$ such that $D^{-1}AD$ is an integer matrix. We set ξ_U as follows:

$$\begin{aligned} \Omega(D) &= \{a_{ij} \in GL(g, \mathbb{Z}) \mid a_{ji} \equiv 0 \pmod{(\alpha_i/\alpha_j)} \text{ for } 1 \leq j < i \leq g\} \\ \xi_U &= \left(\sqrt{\det(U)} \delta_{U_{a,b}} \right)_{a, b \in R} \quad \text{for } U \in \Omega(D) \end{aligned} \quad (2)$$

Let $\Lambda(D)$ be the set of symmetric elements $S \in \text{Mat}(g, \mathbb{Q})$ such that SD is an integer matrix and we set η_S as follows:

$$\begin{aligned} \Lambda(D) &= \left\{ S_{ij} \in \text{Mat}(g, \mathbb{Q}) \mid S_{ij} = S_{ji} \in \frac{1}{k_i} \mathbb{Z} \text{ for } 1 \leq i \leq j \leq g \right\} \\ \eta_S &= \text{diag}(\mathbf{e}(S[a]/4\alpha)) \quad \text{with } a \in R \quad \text{for } S \in \Lambda(D) \end{aligned} \quad (3)$$

In order to introduce the symmetrized weight enumerators, we use the equivalency relation $a \sim b \Leftrightarrow a = b$ or $a = -b$ on R where $a, b \in R$. We put $\bar{R} = R / \sim$. To examine the invariance characteristics of symmetrized weight enumerators we refer to [3], [10].

Definition 2.2. The symmetrized weight enumerators of the codes $\mathcal{C}_1, \mathcal{C}_2, \dots, \mathcal{C}_g$ is defined by

$$\mathcal{W}_{(\mathcal{C}_1, \mathcal{C}_2, \dots, \mathcal{C}_g)}(x_{\bar{a}} \text{ with } \bar{a} \in \bar{R}) = \sum_{c_1 \in \mathcal{C}_1, c_2 \in \mathcal{C}_2, \dots, c_g \in \mathcal{C}_g} \prod_{\bar{a} \in \bar{R}} x_{\bar{a}}^{n_{\bar{a}}(c_1, c_2, \dots, c_g)} \quad (4)$$

where $n_{\bar{a}}(c_1, c_2, \dots, c_g)$ designates the number of i such that $\bar{a} = \overline{(c_{1i}, c_{2i}, \dots, c_{gi})}$.

Now let $g = (g_{ab})_{a,b \in R}$ and ϕ be a function define as

$$\phi(g) = \left(\sum_{d \in R | \bar{d} = \bar{b}} g_{ad} \right)_{\bar{a}, \bar{b} \in \bar{R}} \quad (5)$$

Applying the function on equations (1), (2), (3) we find the symmetrized matrices $\phi(\chi_\alpha)$, $\phi(\xi_U)$, $\phi(\eta_S)$ respectively. Considering them as generators we can form $H = \langle \phi(\chi_\alpha), \phi(\xi_U), \phi(\eta_S), \mathbf{e}(1/8) \rangle$ which is subgroup of $GL(2^{g-1}(\alpha^g \alpha_1 \alpha_2 \dots \alpha_g + 1), \mathbb{C})$ that operates naturally on $\mathbb{C}[x_{\bar{a}}] = \mathbb{C}[x_{\bar{a}} \mid \bar{a} \in \bar{R}]$, where U and S travel through $\Omega(D)$ and $\Lambda(D)$ respectively.

3. Results

We consider our case for $g = 2$. Let, $k_1 = 1$, $k_2 = 2$ such that we get $R = \mathbb{F}_2 \times \mathbb{Z}_4$. We set $\alpha = 1$. Then we have $\alpha_1 = 1$, $\alpha_2 = 2$. To obtain the generators of G , we consider a few number of matrices $U \in \Omega(D)$ and $S \in \Lambda(D)$. We use Sage-math [11] to form them. However, for the sake of simplicity, keeping the group order unchanged we simply take the following two matrices from U and S .

$$u_1 = \begin{bmatrix} -1 & -1 \\ 0 & -1 \end{bmatrix}, u_2 = \begin{bmatrix} -1 & -1 \\ -2 & -1 \end{bmatrix} \in \Omega(D) \quad s_1 = \begin{bmatrix} 1 & 1 \\ 1 & 1/2 \end{bmatrix}, s_2 = \begin{bmatrix} 0 & 0 \\ 0 & 1/2 \end{bmatrix} \in \Lambda(D)$$

With all of the above parameters, we obtain the following χ_α from (1), ξ_{u_1} , ξ_{u_2} from (2), and η_{s_1}, η_{s_2} from (3). Here z denotes the 8-th root of unity.

$$\chi_\alpha = \begin{bmatrix} \frac{1}{4}z^3 + \frac{1}{4}z & \frac{1}{4}z^3 + \frac{1}{4}z & \frac{1}{4}z^3 + \frac{1}{4}z & \frac{1}{4}z^3 + \frac{1}{4}z & \frac{1}{4}z^3 + \frac{1}{4}z & \frac{1}{4}z^3 + \frac{1}{4}z & \frac{1}{4}z^3 + \frac{1}{4}z & \frac{1}{4}z^3 + \frac{1}{4}z \\ \frac{1}{4}z^3 + \frac{1}{4}z & \frac{1}{4}z^3 - \frac{1}{4}z & -\frac{1}{4}z^3 - \frac{1}{4}z & -\frac{1}{4}z^3 + \frac{1}{4}z & \frac{1}{4}z^3 + \frac{1}{4}z & \frac{1}{4}z^3 - \frac{1}{4}z & -\frac{1}{4}z^3 - \frac{1}{4}z & -\frac{1}{4}z^3 + \frac{1}{4}z \\ \frac{1}{4}z^3 + \frac{1}{4}z & -\frac{1}{4}z^3 - \frac{1}{4}z & \frac{1}{4}z^3 + \frac{1}{4}z & -\frac{1}{4}z^3 - \frac{1}{4}z & \frac{1}{4}z^3 + \frac{1}{4}z & -\frac{1}{4}z^3 - \frac{1}{4}z & \frac{1}{4}z^3 + \frac{1}{4}z & -\frac{1}{4}z^3 - \frac{1}{4}z \\ \frac{1}{4}z^3 + \frac{1}{4}z & -\frac{1}{4}z^3 + \frac{1}{4}z & -\frac{1}{4}z^3 - \frac{1}{4}z & \frac{1}{4}z^3 - \frac{1}{4}z & \frac{1}{4}z^3 + \frac{1}{4}z & -\frac{1}{4}z^3 + \frac{1}{4}z & -\frac{1}{4}z^3 - \frac{1}{4}z & \frac{1}{4}z^3 - \frac{1}{4}z \\ \frac{1}{4}z^3 + \frac{1}{4}z & \frac{1}{4}z^3 + \frac{1}{4}z & \frac{1}{4}z^3 + \frac{1}{4}z & \frac{1}{4}z^3 + \frac{1}{4}z & -\frac{1}{4}z^3 - \frac{1}{4}z & -\frac{1}{4}z^3 - \frac{1}{4}z & -\frac{1}{4}z^3 - \frac{1}{4}z & -\frac{1}{4}z^3 - \frac{1}{4}z \\ \frac{1}{4}z^3 + \frac{1}{4}z & \frac{1}{4}z^3 - \frac{1}{4}z & -\frac{1}{4}z^3 - \frac{1}{4}z & -\frac{1}{4}z^3 + \frac{1}{4}z & -\frac{1}{4}z^3 - \frac{1}{4}z & -\frac{1}{4}z^3 + \frac{1}{4}z & \frac{1}{4}z^3 + \frac{1}{4}z & \frac{1}{4}z^3 - \frac{1}{4}z \\ \frac{1}{4}z^3 + \frac{1}{4}z & -\frac{1}{4}z^3 - \frac{1}{4}z & \frac{1}{4}z^3 + \frac{1}{4}z & -\frac{1}{4}z^3 - \frac{1}{4}z & -\frac{1}{4}z^3 - \frac{1}{4}z & \frac{1}{4}z^3 + \frac{1}{4}z & -\frac{1}{4}z^3 - \frac{1}{4}z & \frac{1}{4}z^3 + \frac{1}{4}z \\ \frac{1}{4}z^3 + \frac{1}{4}z & -\frac{1}{4}z^3 + \frac{1}{4}z & -\frac{1}{4}z^3 - \frac{1}{4}z & \frac{1}{4}z^3 - \frac{1}{4}z & -\frac{1}{4}z^3 - \frac{1}{4}z & \frac{1}{4}z^3 - \frac{1}{4}z & \frac{1}{4}z^3 + \frac{1}{4}z & -\frac{1}{4}z^3 + \frac{1}{4}z \end{bmatrix}$$

$$\xi_{u_1} = \begin{bmatrix} 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 \\ 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 \\ 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 \end{bmatrix} \quad \xi_{u_2} = \begin{bmatrix} z^2 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & z^2 \\ 0 & 0 & z^2 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & z^2 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & z^2 & 0 \\ 0 & z^2 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & z^2 & 0 & 0 & 0 \\ 0 & 0 & 0 & z^2 & 0 & 0 & 0 & 0 \end{bmatrix}$$

$$\eta_{s_1} = \begin{bmatrix} 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & z & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & -1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & z & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & z^2 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & -z^3 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & -z^2 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & -z^3 \end{bmatrix} \quad \eta_{s_2} = \begin{bmatrix} 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & z & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & -1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & z & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & z & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & -1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & z \end{bmatrix}$$

Now, we have $G = \langle \chi_\alpha, \xi_{u_1}, \xi_{u_2}, \eta_{s_1}, \eta_{s_2}, \mathbf{e}(1/8) \rangle$ where, $\mathbf{e}(1/8)$ is a 8×8 diagonal matrix, and $|G| = 589824$. Applying the equivalence relation defined in (5) on R we form $H = \langle \phi(\chi_\alpha), \phi(\xi_{u_1}), \phi(\xi_{u_2}), \phi(\eta_{s_1}), \phi(\eta_{s_2}), \mathbf{e}(1/8) \rangle$, and $|H| = 294912$. The generator matrices of H are as follows

$$\phi(\chi_\alpha) = \begin{bmatrix} \frac{1}{4}z^3 + \frac{1}{4}z & \frac{1}{2}z^3 + \frac{1}{2}z & \frac{1}{4}z^3 + \frac{1}{4}z & \frac{1}{4}z^3 + \frac{1}{4}z & \frac{1}{2}z^3 + \frac{1}{2}z & \frac{1}{4}z^3 + \frac{1}{4}z \\ \frac{1}{4}z^3 + \frac{1}{4}z & 0 & -\frac{1}{4}z^3 - \frac{1}{4}z & \frac{1}{4}z^3 + \frac{1}{4}z & 0 & -\frac{1}{4}z^3 - \frac{1}{4}z \\ \frac{1}{4}z^3 + \frac{1}{4}z & -\frac{1}{2}z^3 - \frac{1}{2}z & \frac{1}{4}z^3 + \frac{1}{4}z & \frac{1}{4}z^3 + \frac{1}{4}z & -\frac{1}{2}z^3 - \frac{1}{2}z & \frac{1}{4}z^3 + \frac{1}{4}z \\ \frac{1}{4}z^3 + \frac{1}{4}z & \frac{1}{2}z^3 + \frac{1}{2}z & \frac{1}{4}z^3 + \frac{1}{4}z & -\frac{1}{4}z^3 - \frac{1}{4}z & -\frac{1}{2}z^3 - \frac{1}{2}z & -\frac{1}{4}z^3 - \frac{1}{4}z \\ \frac{1}{4}z^3 + \frac{1}{4}z & 0 & -\frac{1}{4}z^3 - \frac{1}{4}z & -\frac{1}{4}z^3 - \frac{1}{4}z & 0 & \frac{1}{4}z^3 + \frac{1}{4}z \\ \frac{1}{4}z^3 + \frac{1}{4}z & -\frac{1}{2}z^3 - \frac{1}{2}z & \frac{1}{4}z^3 + \frac{1}{4}z & -\frac{1}{4}z^3 - \frac{1}{4}z & \frac{1}{2}z^3 + \frac{1}{2}z & -\frac{1}{4}z^3 - \frac{1}{4}z \end{bmatrix}$$

$$\phi(\xi_{u_1}) = \begin{bmatrix} 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 & 0 \\ 0 & 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 1 \end{bmatrix} \quad \phi(\xi_{u_2}) = \begin{bmatrix} z^2 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & z^2 & 0 \\ 0 & 0 & z^2 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & z^2 \\ 0 & z^2 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & z^2 & 0 & 0 \end{bmatrix}$$

$$\phi(\eta_{s_1}) = \begin{bmatrix} 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & z & 0 & 0 & 0 & 0 \\ 0 & 0 & -1 & 0 & 0 & 0 \\ 0 & 0 & 0 & z^2 & 0 & 0 \\ 0 & 0 & 0 & 0 & -z^3 & 0 \\ 0 & 0 & 0 & 0 & 0 & -z^2 \end{bmatrix} \quad \phi(\eta_{s_2}) = \begin{bmatrix} 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & z & 0 & 0 & 0 & 0 \\ 0 & 0 & -1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & z & 0 \\ 0 & 0 & 0 & 0 & 0 & -1 \end{bmatrix}$$

Proposition 3.1. *The dimension formula for the group H is as follows*

$$\begin{aligned}\Phi_H(t) &= \frac{1 - t^8 + 3t^{16} + 4t^{24} + 5t^{32} + 3t^{40} + 7t^{48} + 2t^{56}}{(1 - t^8)^3(1 - t^{24})^3} \\ &= 1 + 2t^8 + 6t^{16} + 20t^{24} + 46t^{32} + 96t^{40} + 195t^{48} + \dots\end{aligned}\quad (6)$$

Let $\mathfrak{R} = \mathbb{C}[a, b, c, d, e, f]^H$ represent the invariant ring of H . From the dimension formula of H , we have the following theorems.

Theorem 3.2. *The symmetrized weight enumerators $\mathcal{W}_{(\mathcal{E}_8, \mathcal{D}_8)}$ and $\mathcal{W}_{(\mathcal{E}_8, \mathcal{K}_8)}$ can be considered as the basis of the subspace of degree 8 of \mathfrak{R} .*

Proof. Two polynomials of degree 8 exist in \mathfrak{R} , as per the dimension formula (6). We use \mathcal{E}_8 as \mathbb{F}_2 and $\mathcal{D}_8, \mathcal{K}_8$ as \mathbb{Z}_4 to find them from codes. These codes have the following generator matrices.

$$\mathcal{E}_8 : \begin{bmatrix} 1 & 1 & 1 & 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 1 & 1 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 1 & 1 & 1 \\ 1 & 0 & 1 & 0 & 1 & 0 & 1 & 0 \end{bmatrix} \quad \mathcal{D}_8 : \begin{bmatrix} 0 & 0 & 1 & 1 & 0 & 2 & 1 & 3 \\ 0 & 0 & 0 & 2 & 1 & 3 & 1 & 1 \\ 1 & 1 & 0 & 2 & 0 & 0 & 1 & 3 \\ 0 & 2 & 0 & 2 & 0 & 2 & 0 & 2 \\ 0 & 0 & 0 & 0 & 0 & 0 & 2 & 2 \end{bmatrix} \quad \mathcal{K}_8 : \begin{bmatrix} 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 \\ 0 & 2 & 0 & 0 & 0 & 0 & 0 & 2 \\ 0 & 0 & 2 & 0 & 0 & 0 & 0 & 2 \\ 0 & 0 & 0 & 2 & 0 & 0 & 0 & 2 \\ 0 & 0 & 0 & 0 & 2 & 0 & 0 & 2 \\ 0 & 0 & 0 & 0 & 0 & 2 & 0 & 2 \\ 0 & 0 & 0 & 0 & 0 & 0 & 2 & 2 \end{bmatrix}$$

We use the variables a, b, c, d, e, f instead of $x_0, x_1, x_2, x_0, x_1, x_2$ in (4) and calculate the symmetrized weight enumerators $\mathcal{W}_{(\mathcal{E}_8, \mathcal{D}_8)}$ and $\mathcal{W}_{(\mathcal{E}_8, \mathcal{K}_8)}$ (Refer to the appendix). They are invariants under the action of H by magma [13]. To ascertain whether $\mathcal{W}_{(\mathcal{E}_8, \mathcal{D}_8)}$ and $\mathcal{W}_{(\mathcal{E}_8, \mathcal{K}_8)}$ are linearly independent, we consider the monomials a^8, b^8 .

Furthermore, we can directly compute the two bases of degree 8 polynomials using magma [13], and we can therefore express the weight enumerators in terms of those.

□

Theorem 3.3. *$\mathcal{W}_{(\mathcal{E}_8, \mathcal{D}_8)}^2, \mathcal{W}_{(\mathcal{E}_8, \mathcal{K}_8)}^2, \mathcal{W}_{(\mathcal{E}_8 \oplus \mathcal{E}_8, \mathcal{D}_8 \oplus \mathcal{K}_8)}, \mathcal{W}_{(\mathcal{E}_8 \oplus \mathcal{E}_8, \mathcal{K}_{16})}, \mathcal{W}_{(\mathcal{D}_{16}, \mathcal{D}_8 \oplus \mathcal{D}_8)},$ and $\mathcal{W}_{(\mathcal{D}_{16}, \mathcal{D}_8 \oplus \mathcal{K}_8)}$ can be treated as the basis of the subspace of degree 16 of \mathfrak{R} .*

Proof. For degree 16 polynomials, we have $\dim = 6$. To find the invariant weight enumerators we use direct sum of length 8 codes, \mathcal{D}_{16} as \mathbb{F}_2 and \mathcal{K}_{16} as \mathbb{Z}_4 . The generating

matrices of \mathcal{D}_{16} and \mathcal{K}_{16} are as follows.

$$\mathcal{D}_{16} = \begin{pmatrix} 1111000000000000 \\ 0011110000000000 \\ 0000111100000000 \\ 0000001111000000 \\ 0000000011110000 \\ 0000000000111100 \\ 0000000000001111 \\ 1010101010101010 \end{pmatrix}, \quad \mathcal{K}_{16} = \begin{pmatrix} 1111111111111111 \\ 0200000000000002 \\ 0020000000000002 \\ 0002000000000002 \\ 0000200000000002 \\ 0000020000000002 \\ 0000002000000002 \\ 0000000200000002 \\ 0000000020000002 \\ 0000000002000002 \\ 0000000000200002 \\ 0000000000020002 \\ 0000000000002002 \\ 0000000000000202 \\ 0000000000000022 \end{pmatrix}$$

We calculate the symmetrized weight enumerators $\mathcal{W}_{(\mathcal{E}_8, \mathcal{D}_8)}^2$, $\mathcal{W}_{(\mathcal{E}_8, \mathcal{K}_8)}^2$, $\mathcal{W}_{(\mathcal{E}_8 \oplus \mathcal{E}_8, \mathcal{D}_8 \oplus \mathcal{K}_8)}$, $\mathcal{W}_{(\mathcal{E}_8 \oplus \mathcal{E}_8, \mathcal{K}_{16})}$, $\mathcal{W}_{(\mathcal{D}_{16}, \mathcal{D}_8 \oplus \mathcal{D}_8)}$, and $\mathcal{W}_{(\mathcal{D}_{16}, \mathcal{D}_8 \oplus \mathcal{K}_8)}$ (Refer to the appendix). By Magma all of them are invariants under the action of H . To verify their linear independence, we pick up the following monomials

$$ac^3d^3f^9, a^2c^2d^4f^8, c^4d^4f^8, d^8f^8, ab^2cd^2e^2f^8, b^4e^4f^8$$

We find that all six weight enumerators are linearly independent. Furthermore, six bases of degree 16 of \mathfrak{R} can be identified directly using magma, and the six weight enumerators can be expressed in terms of those basis polynomials.
