

A-DAVIS-WIELANDT RADIUS BOUNDS OF SEMI-HILBERTIAN SPACE OPERATORS

MESSAOUD GUESBA, SOMDATTA BARIK, PINTU BHUNIA, KALLOL PAUL

ABSTRACT. Consider \mathcal{H} is a complex Hilbert space and A is a positive operator on \mathcal{H} . The mapping $\langle \cdot, \cdot \rangle_A : \mathcal{H} \times \mathcal{H} \rightarrow \mathbb{C}$, defined as $\langle y, z \rangle_A = \langle Ay, z \rangle$ for all $y, z \in \mathcal{H}$, induces a seminorm $\|\cdot\|_A$. The A -Davis-Wielandt radius of an operator S on \mathcal{H} is defined as $d\omega_A(S) = \sup \left\{ \sqrt{|\langle Sz, z \rangle_A|^2 + \|Sz\|_A^4} : \|z\|_A = 1 \right\}$. We investigate some new bounds for $d\omega_A(S)$ which refine the existing bounds. We also give some bounds for the 2×2 off-diagonal block matrices.

1. Introduction and preliminaries

Here we collect all the technical ingredients that are necessary to read the paper. Throughout, \mathcal{H} is a complex Hilbert space and $\mathcal{B}(\mathcal{H})$ is the \mathbb{C}^* -algebra of bounded operators on \mathcal{H} . For $S \in \mathcal{B}(\mathcal{H})$, the null space, range space and closure of the range space of S are respectively denoted as $\mathcal{N}(S)$, $\mathcal{R}(S)$ and $\overline{\mathcal{R}(S)}$. A positive operator $A \in \mathcal{B}(\mathcal{H})$ defines a sesquilinear form $\langle \cdot, \cdot \rangle_A : \mathcal{H} \times \mathcal{H} \rightarrow \mathbb{C}$ defined as $\langle x, z \rangle_A = \langle Ax, z \rangle$. This gives a seminorm $\|\cdot\|_A$ defined by $\|z\|_A = \left\| A^{\frac{1}{2}}z \right\|$. Clearly, $\|z\|_A = 0$ iff $z \in \mathcal{N}(A)$. Therefore, $\|\cdot\|_A$ is a norm on \mathcal{H} iff A is one-one. Suppose $\|S\|_A = \sup_{\substack{z \in \overline{\mathcal{R}(A)} \\ z \neq 0}} \frac{\|Sz\|_A}{\|z\|_A} = \sup_{\substack{z \in \overline{\mathcal{R}(A)} \\ \|z\|_A=1}} \|Sz\|_A$ is the A -operator seminorm of $S \in \mathcal{B}(\mathcal{H})$. If there is a scalar $c > 0$ such that $\|Sz\|_A \leq c\|z\|_A$ for all $z \in \overline{\mathcal{R}(A)}$, then $\|S\|_A < \infty$. If $\|S\|_A < \infty$, then $\|S\|_A = \sup \left\{ |\langle Sx, z \rangle_A| : x, z \in \overline{\mathcal{R}(A)}, \|x\|_A = \|z\|_A = 1 \right\}$. An operator $R \in \mathcal{B}(\mathcal{H})$ is A -adjoint of $S \in \mathcal{B}(\mathcal{H})$ if $\langle Sx, z \rangle_A = \langle x, Rz \rangle_A$ for all $x, z \in \mathcal{H}$,

Dr. Pintu Bhunia would like to thank SERB, Govt. of India for the financial support in the form of National Post Doctoral Fellowship (N-PDF, File No. PDF/2022/000325) under the mentorship of Prof. Apoorva Khare.

or equivalently, $AR = S^*A$. If $AS = S^*A$ then S is A -selfadjoint and if AS is positive then S is A -positive and we write $S \geq_A 0$. Consider $\mathcal{B}_A(\mathcal{H})$ is the collection of operators that admit A -adjoints. From Douglas result [11], we have $\mathcal{B}_A(\mathcal{H}) = \{S \in \mathcal{B}(\mathcal{H}) : \mathcal{R}(S^*A) \subseteq \mathcal{R}(A)\} = \{S \in \mathcal{B}(\mathcal{H}) : \exists c > 0 : \|ASz\| \leq c\|Az\|, \forall z \in \mathcal{H}\}$. For $S \in \mathcal{B}_A(\mathcal{H})$, S admits A -adjoint. Furthermore, there exists a distinguished A -adjoint of S , namely, the reduced solution of $AZ = S^*A$, i.e., $S^{\sharp A} = A^\dagger S^*A$, where A^\dagger is the Moore-Penrose inverse of A . The operator $S^{\sharp A}$ satisfies $AS^{\sharp A} = S^*A$, $\mathcal{R}(S^{\sharp A}) \subseteq \overline{\mathcal{R}(A)}$, $\mathcal{N}(S^{\sharp A}) = \mathcal{N}(S^*A)$. Again, by Douglas result, we can see that $\mathcal{B}_{A^{1/2}}(\mathcal{H}) = \{S \in \mathcal{B}(\mathcal{H}) : \exists c > 0 : \|Ssz\|_A \leq c\|z\|_A, \forall z \in \mathcal{H}\}$. If $S \in \mathcal{B}_{A^{1/2}}(\mathcal{H})$, $\|S\|_A = \sup_{z \notin \mathcal{N}(A)} \frac{\|Ssz\|_A}{\|z\|_A} = \sup_{\substack{z \in \mathcal{H} \\ \|z\|_A=1}} \|Ssz\|_A$, see [2]. If $S \in \mathcal{B}_{A^{1/2}}(\mathcal{H})$ then $S(\mathcal{N}(A)) \subseteq \mathcal{N}(A)$ and $\|Ssz\|_A \leq \|S\|_A \|z\|_A$ for all $z \in \mathcal{H}$. The sets $\mathcal{B}_A(\mathcal{H})$ and $\mathcal{B}_{A^{1/2}}(\mathcal{H})$ are subalgebras (see [2]) and $\mathcal{B}_A(\mathcal{H}) \subseteq \mathcal{B}_{A^{1/2}}(\mathcal{H})$. Note that S is A -selfadjoint, but $S = S^{\sharp A}$ may not be true.

For example, consider $A = \begin{pmatrix} 1 & 1 \\ 1 & 1 \end{pmatrix} \in \mathcal{M}_2(\mathbb{C})^+$ and $S = \begin{pmatrix} 2 & 2 \\ 0 & 0 \end{pmatrix}$. Here S is A -selfadjoint, however $S^{\sharp A} = \begin{pmatrix} 1 & 1 \\ 1 & 1 \end{pmatrix} \neq S$. Note that, $S = S^{\sharp A}$ iff $\mathcal{R}(S^{\sharp A}) \subseteq \mathcal{R}(A)$ and S is A -selfadjoint. An operator S in $\mathcal{B}_A(\mathcal{H})$ is A -unitary if $\|Sx\|_A = \|S^{\sharp A}x\|_A = \|x\|_A$, $\forall x \in \mathcal{H}$. For more we refer to [1, 2]. If $S \in \mathcal{B}_A(\mathcal{H})$ then the following holds:

- (1) If $AS = SA$, then $S^{\sharp A} = P_{\overline{\mathcal{R}(A)}} S^*$, where $P_{\overline{\mathcal{R}(A)}}$ denote the orthogonal projection on $\overline{\mathcal{R}(A)}$.
- (2) $S^{\sharp A}S$, $SS^{\sharp A}$ are A -selfadjoint and are A -positive.
- (3) $S^{\sharp A} \in \mathcal{B}_A(\mathcal{H})$, $(S^{\sharp A})^{\sharp A} = P_{\overline{\mathcal{R}(A)}} S P_{\overline{\mathcal{R}(A)}}$, $((S^{\sharp A})^{\sharp A})^{\sharp A} = S^{\sharp A}$.
- (4) If $R \in \mathcal{B}_A(\mathcal{H})$ then $SR \in \mathcal{B}_A(\mathcal{H})$ and $(SR)^{\sharp A} = R^{\sharp A} S^{\sharp A}$. Furthermore, for all $S, R \in \mathcal{B}_{A^{1/2}}(\mathcal{H})$, we have

$$\|SR\|_A \leq \|S\|_A \|R\|_A. \quad (1.1)$$

- (5) $\|S^{\sharp A}\|_A = \|S\|_A = \|S^{\sharp A}S\|_A^{\frac{1}{2}} = \|SS^{\sharp A}\|_A^{\frac{1}{2}}$.

To simplify we write P instead of $P_{\overline{\mathcal{R}(A)}}$. An operator R in $\mathcal{B}_A(\mathcal{H})$ can be written as $R = \Re_A(R) + i\Im_A(R)$, where $\Re_A(R) = \frac{R+R^{\sharp A}}{2}$ and $\Im_A(R) = \frac{R-R^{\sharp A}}{2i}$. Recall that, $\omega(S) := \sup\{|\langle Sz, z \rangle| : z \in \mathcal{H}, \|z\| = 1\}$ is the numerical radius of $S \in \mathcal{B}(\mathcal{H})$, see [18]. For more facts, see [12, 16, 20, 28] and references therein. One of the generalization of the numerical radius is A -numerical radius of $S \in \mathcal{B}_A(\mathcal{H})$, it is defined by $\omega_A(S) := \sup\{|\langle Sz, z \rangle_A| : z \in \mathcal{H}, \|z\|_A = 1\}$. Obviously, for $A = I$ we obtain the (classical) numerical radius which received considerable attention in recent years by many researchers. We refer to [7, 8, 15, 17] and references therein. Clearly, $\omega_A(S) = \omega_A(S^{\sharp A})$ for any $S \in \mathcal{B}_A(\mathcal{H})$. Also, the A -numerical radius satisfies the power

inequality (see [24, 30]): for $S \in \mathcal{B}_{A^{1/2}}(\mathcal{H})$, $\omega_A(S^n) \leq \omega_A^n(S)$, $n = 1, 2, \dots$. It defines a seminorm on $\mathcal{B}_{A^{1/2}}(\mathcal{H})$, and it satisfies

$$\frac{1}{2} \|S\|_A \leq \omega_A(S) \leq \|S\|_A \quad \text{for every } S \in \mathcal{B}_{A^{1/2}}(\mathcal{H}). \quad (1.2)$$

Here $\omega_A(S) = \|S\|_A$ if S is A -selfadjoint. Recall that, the A -Crawford number of $S \in \mathcal{B}_{A^{1/2}}(\mathcal{H})$ is defined by $c_A(S) = \inf \{ |\langle Sz, z \rangle_A| : z \in \mathcal{H}, \|z\|_A = 1 \}$. For more basic facts, we refer to [14, 27, 30]. The Davis-Wielandt radius of $S \in \mathcal{B}(\mathcal{H})$ is defined as $d\omega(S) = \sup \left\{ \left(|\langle Sz, z \rangle|^2 + \|Tz\|^4 \right)^{1/2} : z \in \mathcal{H}, \|z\| = 1 \right\}$. For more about Davis-Wielandt radius we refer to [5, 6, 9, 23, 29, 31]. The A -Davis-Wielandt radius of $S \in \mathcal{B}_{A^{1/2}}(\mathcal{H})$ is defined (see [3]) as $d\omega_A(S) = \sup \left\{ \left(|\langle Sz, z \rangle_A|^2 + \|Sz\|_A^4 \right)^{1/2} : z \in \mathcal{H}, \|z\|_A = 1 \right\}$. It satisfies $\max \{ \omega_A(S), \|S\|_A^2 \} \leq d\omega_A(S) \leq \sqrt{\omega_A^2(S) + \|S\|_A^4}$.

Very recently some results on the A -Davis-Wielandt radius are studied (see [3]). In this manuscript we continue the study in this direction and we provide some new bounds of the A -Davis-Wielandt radius. Further, we give some new bounds for the Davis-Wielandt radius of 2×2 off-diagonal block matrices.

2. BOUNDS FOR THE A -DAVIS-WIELANDT RADIUS OF OPERATORS

To develop our first bound of A -Davis-Wielandt radius, the following inner-product inequality is necessary.

Lemma 2.1. [4, 21] *If $a, b, c \in \mathcal{H}$ and $\|c\|_A = 1$ and $0 \neq \alpha \in \mathbb{C}$, then*

$$|\langle a, c \rangle_A \langle c, b \rangle_A| \leq \frac{1}{|\alpha|} \left(\max\{1, |\alpha - 1|\} \|a\|_A \|b\|_A + |\langle a, b \rangle_A| \right).$$

In particular, for $\alpha = 2$,

$$|\langle a, c \rangle_A \langle c, b \rangle_A| \leq \frac{1}{2} \left(\|a\|_A \|b\|_A + |\langle a, b \rangle_A| \right).$$

Theorem 2.2. *Let $S \in \mathcal{B}_A(\mathcal{H})$ and $0 \neq \alpha \in \mathbb{C}$. Then*

$$d\omega_A^2(S) \leq \omega_A^2(S^{\sharp A} S + S) + \frac{2}{|\alpha|} \omega_A(S^{\sharp A} S^2) + \frac{\max\{1, |\alpha - 1|\}}{|\alpha|} \left\| (S^{\sharp A} S)^2 + S^{\sharp A} S \right\|_A.$$

Proof. Take $z \in \mathcal{H}$ and $\|z\|_A = 1$. We obtain

$$\begin{aligned} & |\langle Sz, z \rangle_A|^2 + \|Sz\|_A^4 \\ &= |\langle Sz, z \rangle_A + \langle Sz, Sz \rangle_A|^2 - 2\Re_A(\langle Sz, Sz \rangle_A \langle Sz, z \rangle_A) \\ &\leq |\langle (S + S^{\sharp A} S)z, z \rangle_A|^2 + 2|\langle S^{\sharp A} Sz, z \rangle_A \langle z, Sz \rangle_A| \\ &\leq |\langle (S + S^{\sharp A} S)z, z \rangle_A|^2 + \frac{2}{|\alpha|} \left[\max\{1, |\alpha - 1|\} \|S^{\sharp A} Sz\|_A \|Sz\|_A + |\langle S^{\sharp A} Sz, Sz \rangle_A| \right] \end{aligned}$$

(by Lemma 2.1)

$$\begin{aligned}
&\leq |\langle (S + S^{\sharp_A} S) z, z \rangle_A|^2 + \frac{\max\{1, |\alpha - 1|\}}{|\alpha|} \left(\|S^{\sharp_A} S z\|_A^2 + \|S z\|_A^2 \right) + \frac{2}{|\alpha|} |\langle S^{\sharp_A} S z, S z \rangle_A| \\
&\quad \text{(by the AM-GM inequality)} \\
&= |\langle (S + S^{\sharp_A} S) z, z \rangle_A|^2 + \frac{\max\{1, |\alpha - 1|\}}{|\alpha|} \left(\langle S^{\sharp_A} S z, S^{\sharp_A} S z \rangle_A + \langle S^{\sharp_A} S z, z \rangle_A \right) \\
&\quad + \frac{2}{|\alpha|} |\langle z, S^{\sharp_A} S^2 z \rangle_A| \\
&= |\langle (S + S^{\sharp_A} S) z, z \rangle_A|^2 + \frac{\max\{1, |\alpha - 1|\}}{|\alpha|} \left(\langle (S^{\sharp_A} S)^2 z, z \rangle_A + \langle S^{\sharp_A} S z, z \rangle_A \right) \\
&\quad + \frac{2}{|\alpha|} |\langle z, S^{\sharp_A} S^2 z \rangle_A| \\
&\leq \omega_A^2 (S^{\sharp_A} S + S) + \frac{2}{|\alpha|} \omega_A (S^{\sharp_A} S^2) + \frac{\max\{1, |\alpha - 1|\}}{|\alpha|} \left\| (S^{\sharp_A} S)^2 + S^{\sharp_A} S \right\|_A.
\end{aligned}$$

This gives the bound as desired. \square

Now from Theorem 2.2 (for $\alpha = 2$), we deduce the bound:

Corollary 2.3. *If $S \in \mathcal{B}_A(\mathcal{H})$ then*

$$d\omega_A^2(S) \leq \omega_A^2(S^{\sharp_A} S + S) + \omega_A(S^{\sharp_A} S^2) + \frac{1}{2} \left\| (S^{\sharp_A} S)^2 + S^{\sharp_A} S \right\|_A.$$

Again, considering $\alpha = n$ and $n \rightarrow \infty$ in Theorem 2.2, we get the bound:

Corollary 2.4. *If $S \in \mathcal{B}_A(\mathcal{H})$ then*

$$d\omega_A^2(S) \leq \omega_A^2(S^{\sharp_A} S + S) + \left\| (S^{\sharp_A} S)^2 + S^{\sharp_A} S \right\|_A.$$

To get next result we need the following semi-inner product inequality.

Lemma 2.5. [22] *If $a, b, c \in \mathcal{H}$ and $\|c\|_A = 1$ then*

$$|\langle a, c \rangle_A \langle c, b \rangle_A| \leq \frac{1}{2} (\|a\|_A \|b\|_A + |\langle a, b \rangle_A|) - \delta(a, b, c),$$

$$\text{where } \delta(a, b, c) = \begin{cases} \frac{\|b\|_A}{\|a\|_A} \left(|\langle a, c \rangle_A| \inf_{\lambda \in \mathbb{C}} \|c - \lambda b\|_A - \frac{1}{2} \inf_{\mu \in \mathbb{C}} \|a - \mu b\|_A \right)^2 & \text{if } \|a\|_A \|b\|_A \neq 0 \\ 0 & \text{if } \|a\|_A \|b\|_A = 0. \end{cases}$$

Theorem 2.6. *If $S \in \mathcal{B}_A(\mathcal{H})$ then*

$$d\omega_A^2(S) \leq \omega_A^2(S^{\sharp_A} S + S) + \omega_A(S^{\sharp_A} S^2) + \frac{1}{2} \left\| (S^{\sharp_A} S)^2 + S^{\sharp_A} S \right\|_A - 2 \inf_{\|z\|_A=1} \delta(S^{\sharp_A} S z, S z, z),$$

$$\text{where } \delta(a, b, c) = \begin{cases} \frac{\|b\|_A}{\|a\|_A} \left(|\langle a, c \rangle_A| \inf_{\lambda \in \mathbb{C}} \|c - \lambda b\|_A - \frac{1}{2} \inf_{\mu \in \mathbb{C}} \|a - \mu b\|_A \right)^2 & \text{if } \|a\|_A \|b\|_A \neq 0 \\ 0 & \text{if } \|a\|_A \|b\|_A = 0. \end{cases}$$

Proof. Take $z \in \mathcal{H}$ and $\|z\|_A = 1$. Using Lemma 2.5, we obtain

$$\begin{aligned}
& |\langle Sz, z \rangle_A|^2 + \|Sz\|_A^4 \\
&= |\langle Sz, z \rangle_A + \langle Sz, Sz \rangle_A|^2 - 2\Re_A(\langle Sz, Sz \rangle_A \langle Sz, z \rangle_A) \\
&\leq |\langle (S + S^{\sharp_A} S)z, z \rangle_A|^2 + 2|\langle S^{\sharp_A} Sz, z \rangle_A \langle z, Sz \rangle_A| \\
&\leq |\langle (S + S^{\sharp_A} S)z, z \rangle_A|^2 + \|S^{\sharp_A} Sz\|_A \|Sz\|_A + |\langle S^{\sharp_A} Sz, Sz \rangle_A| - 2\delta(S^{\sharp_A} Sz, Sz, z) \\
&\leq |\langle (S + S^{\sharp_A} S)z, z \rangle_A|^2 + \frac{1}{2} \left(\langle (S^{\sharp_A} S)^2 z, z \rangle_A + \langle S^{\sharp_A} Sz, z \rangle_A \right) \\
&\quad + |\langle z, S^{\sharp_A} S^2 z \rangle_A| - 2\delta(T^{\sharp_A} Sz, Sz, z) \\
&\leq \omega_A^2(S + S^{\sharp_A} S) + \omega_A(S^{\sharp_A} S^2) + \frac{1}{2} \left\| (S^{\sharp_A} S)^2 + S^{\sharp_A} S \right\|_A - 2\delta(S^{\sharp_A} Sz, Sz, z),
\end{aligned}$$

which implies the desired bound. \square

We now obtain both upper and lower bounds.

Theorem 2.7. *If $S \in \mathcal{B}_A(\mathcal{H})$, then*

$$\begin{aligned}
& \max \{ \omega_A(\Re_A(S) + iS^{\sharp_A} S), \omega_A(\Im_A(S) + iS^{\sharp_A} S) \} \leq d\omega_A(S) \\
& \leq \min \left\{ \sqrt{\omega_A^2(\Re_A(S) + iS^{\sharp_A} S) + \|\Im_A(S)\|_A^2}, \sqrt{\omega_A^2(\Im_A(S) + iS^{\sharp_A} S) + \|\Re_A(S)\|_A^2} \right\}.
\end{aligned}$$

Proof. Take $z \in \mathcal{H}$ and $\|z\|_A = 1$. We have

$$\begin{aligned}
|\langle Sz, z \rangle_A|^2 + \|Sz\|_A^4 &= |\langle (\Re_A(S) + i\Im_A(S))z, z \rangle_A|^2 + \langle S^{\sharp_A} Sz, z \rangle_A^2 \\
&= |\langle \Re_A(S)z, z \rangle_A|^2 + |\langle \Im_A(S)z, z \rangle_A|^2 + \langle S^{\sharp_A} Sz, z \rangle_A^2 \\
&= |\langle (\Re_A(S) + iS^{\sharp_A} S)z, z \rangle_A|^2 + |\langle \Im_A(S)z, z \rangle_A|^2 \quad (2.1) \\
&\leq \omega_A^2(\Re_A(S) + iS^{\sharp_A} S) + \|\Im_A(S)\|_A^2.
\end{aligned}$$

This implies

$$d\omega_A^2(S) \leq \omega_A^2(\Re_A(S) + iS^{\sharp_A} S) + \|\Im_A(S)\|_A^2. \quad (2.2)$$

Similarly, we obtain

$$d\omega_A^2(S) \leq \omega_A^2(\Im_A(S) + iS^{\sharp_A} S) + \|\Re_A(S)\|_A^2. \quad (2.3)$$

Now combining the inequalities (2.2) and (2.3), we get the desired upper bound. Again from (2.1), we get

$$|\langle Sz, z \rangle_A|^2 + \|Sz\|_A^4 \geq |\langle (\Re_A(S) + iS^{\sharp_A} S)z, z \rangle_A|^2 \quad (2.4)$$

and

$$|\langle Sz, z \rangle_A|^2 + \|Sz\|_A^4 \geq |\langle (\Im_A(S) + iS^{\sharp_A} S)z, z \rangle_A|^2. \quad (2.5)$$

Now first taking the supremum over $\|z\|_A = 1$ and then combining them we obtain the desired lower bound. \square

From Theorem 2.7, we now obtain the result which gives the equality for the A -numerical radius.

Corollary 2.8. *If $S \in \mathcal{B}_A(\mathcal{H})$ with $(\Re_A(S^{\sharp_A}))^2 = \Im_A(S^{\sharp_A})$ then*

$$\omega_A(S) = \|\Re_A(S)\|_A \sqrt{1 + \|\Re_A(S)\|_A^2}.$$

Proof. First we suppose $S \in \mathcal{B}_A(\mathcal{H})$ with $S = S^{\sharp_A}$. Then S is A -selfadjoint and so $d\omega_A(S) = \sqrt{\|S\|_A^2 + \|S\|_A^4}$ (see [3]). From Theorem 2.7, it follows $d\omega_A(S) = \omega_A(S + iS^2)$. Hence, $\omega_A(S + iS^2) = \sqrt{\|S\|_A^2 + \|S\|_A^4}$. Now substitute S by $\Re_A(S^{\sharp_A})$ for $S \in \mathcal{B}_A(\mathcal{H})$, the result derives from the facts $\omega_A(S) = \omega_A(S^{\sharp_A})$ and $\|\Re_A(S)\|_A = \|\Re_A(S^{\sharp_A})\|_A$. \square

Remark 2.9. Theorem 2.7 is better than the existing bound in [3], namely

$$d\omega_A^2(S) \geq 2 \max\{\omega_A(S)c_A(S^{\sharp_A}S), c_A(S)\|S\|_A^2\} \quad (2.6)$$

for some operators. If we assume $A = \begin{pmatrix} 1 & 0 \\ 0 & 2 \end{pmatrix}$ and $S = \begin{pmatrix} 1 & 0 \\ 0 & 0 \end{pmatrix}$ then (2.6) gives $d\omega_A(S) \geq 0$, but Theorem 2.7 gives $d\omega_A(S) \geq \sqrt{2}$.

A generalization of the Cauchy-Schwarz inequality is as the lemma.

Lemma 2.10. [25] *If $S \in \mathcal{B}_A(\mathcal{H})$ and $x, z \in \mathcal{H}$ with $\|z\|_A = \|x\|_A = 1$ then*

$$|\langle Sx, z \rangle_A|^2 \leq \langle S^{\sharp_A}Sx, x \rangle_A^{\frac{1}{2}} \langle SS^{\sharp_A}z, z \rangle_A^{\frac{1}{2}}.$$

We now obtain an upper bound.

Theorem 2.11. *If $S \in \mathcal{B}_A(\mathcal{H})$ then*

$$d\omega_A^2(S) \leq \|S\|_A^4 + 2\|S\|_A^2 - \sqrt{c_A(S^{\sharp_A}S)c_A(SS^{\sharp_A})}.$$

Proof. Take $z \in \mathcal{H}$ and $\|z\|_A = 1$. We obtain

$$\begin{aligned} & |\langle Sz, z \rangle_A|^2 + \|Sz\|_A^4 \\ & \leq \langle S^{\sharp_A}Sz, z \rangle_A^{\frac{1}{2}} \langle SS^{\sharp_A}z, z \rangle_A^{\frac{1}{2}} + \|Sz\|_A^4 \\ & \quad (\text{by Lemma 2.10}) \\ & \leq \frac{1}{2} (\langle S^{\sharp_A}Sz, z \rangle_A + \langle SS^{\sharp_A}z, z \rangle_A) + \|Sz\|_A^4 \\ & \quad (\text{by the AM-GM inequality}) \end{aligned}$$

$$\begin{aligned}
&= \frac{1}{2} \left(\langle S^{\sharp A} S z, z \rangle_A^{\frac{1}{2}} + \langle S S^{\sharp A} z, z \rangle_A^{\frac{1}{2}} \right)^2 - \langle S^{\sharp A} S z, z \rangle_A^{\frac{1}{2}} \langle S S^{\sharp A} z, z \rangle_A^{\frac{1}{2}} + \|S z\|_A^4 \\
&\leq \frac{1}{2} \left(\|S^{\sharp A} S z\|_A^{\frac{1}{2}} + \|S S^{\sharp A} z\|_A^{\frac{1}{2}} \right)^2 + \|S z\|_A^4 - \langle T^{\sharp A} S z, z \rangle_A^{\frac{1}{2}} \langle S S^{\sharp A} z, z \rangle_A^{\frac{1}{2}} \\
&\leq \frac{1}{2} \left(\|S^{\sharp A} S\|_A^{\frac{1}{2}} + \|S S^{\sharp A}\|_A^{\frac{1}{2}} \right)^2 + \|S\|_A^4 - \sqrt{c_A(S^{\sharp A} S) c_A(S S^{\sharp A})} \\
&= 2 \|S\|_A^2 + \|S\|_A^4 - \sqrt{c_A(S^{\sharp A} S) c_A(S S^{\sharp A})},
\end{aligned}$$

which gives the desired bound. \square

Remark 2.12. Theorem 2.11 is better than the existing bound in [13], namely

$$d\omega_A^2(S) \leq \max\{\|S\|_A^2, \|S\|_A^4\} + \omega_A(S^{\sharp A} S^2) \quad (2.7)$$

for some operators. For example, if we consider $A = S = \begin{pmatrix} 1 & 0 \\ 0 & 2 \end{pmatrix}$ then (2.7) gives $d\omega_A^2(S) \leq 24$, whereas Theorem 2.11 gives $d\omega_A^2(S) \leq 23$.

We next obtain a bound which is a refinement of the existing bound given in [13].

Theorem 2.13. *If $S \in \mathcal{B}_A(\mathcal{H})$ then*

$$d\omega_A^2(S) \leq \omega_A^2(e^{i\theta} S + S^{\sharp A} S) + 2\|S\|_A^2 \|\Re_A(e^{i\theta} S)\|_A, \quad \forall \theta \in \mathbb{R}.$$

Proof. For any $z \in \mathcal{H}$ and $\|z\|_A = 1$, we obtain

$$\begin{aligned}
|\langle S z, z \rangle_A|^2 + \|S z\|_A^4 &= |\langle (S + S^{\sharp A} S) z, z \rangle_A|^2 - 2\|S z\|_A^2 \langle \Re_A(S) z, z \rangle_A \\
&\leq |\langle (S + S^{\sharp A} S) z, z \rangle_A|^2 + 2\|S z\|_A^2 \langle \Re_A(S) z, z \rangle_A \\
&\leq \omega_A^2(S + S^{\sharp A} S) + 2\|S\|_A^2 \|\Re_A(S)\|_A.
\end{aligned}$$

This implies

$$d\omega_A^2(S) \leq \omega_A^2(S + S^{\sharp A} S) + 2\|S\|_A^2 \|\Re_A(S)\|_A. \quad (2.8)$$

Replacing S by $e^{i\theta} S$, we obtain the desired bound. \square

Remark 2.14. Following Theorem 2.13, we get

$$d\omega_A^2(S) \leq \omega_A^2(S \pm S^{\sharp A} S) + 2\|S\|_A^2 \|\Re_A(S)\|_A. \quad (2.9)$$

Clearly, (2.9) is sharper than the existing bound in [13], namely

$$d\omega_A^2(S) \leq \omega_A^2(S^{\sharp A} S - S) + 2\|S\|_A^2 \|\omega_A(S)\|_A. \quad (2.10)$$

We now obtain a lower bound.

Theorem 2.15. *If $S \in \mathcal{B}_A(\mathcal{H})$ then*

$$d\omega_A^2(S) + 2\|S\|_A^2 \|\Re_A(S)\|_A \geq \max \{ \omega_A^2(S + S^{\sharp_A} S), \omega_A^2(S - S^{\sharp_A} T) \}.$$

Proof. Take $z \in \mathcal{H}$, $\|z\|_A = 1$, we get

$$\begin{aligned} |\langle Sz, z \rangle_A|^2 + \|Sz\|_A^4 &\geq |\langle (S + S^{\sharp_A} S)z, z \rangle_A|^2 - 2\|Sz\|_A^2 |\langle \Re_A(S)z, z \rangle_A| \\ &\geq |\langle (S + S^{\sharp_A} S)z, z \rangle_A|^2 - 2\|S\|_A^2 \|\Re_A(S)\|_A. \end{aligned}$$

From this we get

$$d\omega_A^2(S) + 2\|S\|_A^2 \|\Re_A(S)\|_A \geq \omega_A^2(S + S^{\sharp_A} S). \quad (2.11)$$

Replacing S by $-S$, we get

$$d\omega_A^2(S) + 2\|S\|_A^2 \|\Re_A(S)\|_A \geq \omega_A^2(S - S^{\sharp_A} S). \quad (2.12)$$

Combining (2.11) and (2.12), we obtain the bound as desired. \square

Remark 2.16. Theorem 2.15 is better than the existing bound in [3], namely

$$d\omega_A^2(S) \geq 2 \max \{ \omega_A(S) c_A(S^{\sharp_A} S), c_A(S) \|S\|_A^2 \} \quad (2.13)$$

for some operators. If we consider the same example as in Remark 2.12 then (2.13) gives $d\omega_A^2(S) \geq 8$ but Theorem 2.15 gives $d\omega_A^2(S) \geq 20$.

Now the following lemmas are needed.

Lemma 2.17. [10] *If $S \in \mathcal{B}(\mathcal{H})$ is A -positive, and $z \in \mathcal{H}$, $\|z\|_A = 1$ then*

$$\langle Sz, z \rangle_A^n \leq \langle S^n z, z \rangle_A \text{ for all } n \in \mathbb{N}.$$

Lemma 2.18. [22] *If $x, z \in \mathcal{H}$ and $\|x\|_A \neq 0$ then*

$$|\langle x, z \rangle_A| \leq \|z\|_A \left(\|x\|_A - \frac{\inf_{\lambda \in \mathbb{C}} \|x - \lambda z\|_A^2}{2\|x\|_A} \right).$$

We now develop a bound.

Theorem 2.19. *Suppose $S \in \mathcal{B}_A(\mathcal{H})$. Then for all $\alpha \in [0, 1]$,*

$$d\omega_A^2(S) \leq \left\| \alpha S^{\sharp_A} S + (1 - \alpha) S S^{\sharp_A} + (S^{\sharp_A} S)^2 \right\|_A - (\alpha\mu + (1 - \alpha)\eta),$$

where

$$\mu = \inf_{\|z\|_A=1} \left[\inf_{\lambda \in \mathbb{C}} \|Sz - \lambda z\|_A^2 - \frac{\inf_{\lambda \in \mathbb{C}} \|Sz - \lambda z\|_A^4}{4\|Sz\|_A^2} \right]$$

and

$$\eta = \inf_{\|z\|_A=1} \left[\inf_{\lambda \in \mathbb{C}} \|S^{\sharp A} z - \lambda z\|_A^2 - \frac{\inf_{\lambda \in \mathbb{C}} \|S^{\sharp A} z - \lambda z\|_A^4}{4\|S^{\sharp A} z\|_A^2} \right].$$

Proof. Take $z \in \mathcal{H}$, $\|z\|_A = 1$ and $\alpha \in [0, 1]$. By using lemma 2.18, we obtain

$$\begin{aligned} |\langle Sz, z \rangle_A|^2 &= \alpha |\langle Sz, z \rangle_A|^2 + (1 - \alpha) |\langle z, S^{\sharp A} z \rangle_A|^2 \\ &\leq \alpha \left(\|Sz\|_A - \frac{\inf_{\lambda \in \mathbb{C}} \|Sz - \lambda z\|_A^2}{2\|Sz\|_A} \right)^2 \\ &\quad + (1 - \alpha) \left(\|S^{\sharp A} z\|_A - \frac{\inf_{\lambda \in \mathbb{C}} \|S^{\sharp A} z - \lambda z\|_A^2}{2\|S^{\sharp A} z\|_A} \right)^2 \\ &= \alpha \|Sz\|_A^2 + (1 - \alpha) \|S^{\sharp A} z\|_A^2 - \alpha \left(\inf_{\lambda \in \mathbb{C}} \|Sz - \lambda z\|_A^2 - \frac{\inf_{\lambda \in \mathbb{C}} \|Sz - \lambda z\|_A^4}{4\|Sz\|_A^2} \right) \\ &\quad - (1 - \alpha) \left(\inf_{\lambda \in \mathbb{C}} \|S^{\sharp A} z - \lambda z\|_A^2 - \frac{\inf_{\lambda \in \mathbb{C}} \|S^{\sharp A} z - \lambda z\|_A^4}{4\|S^{\sharp A} z\|_A^2} \right) \\ &\leq \langle (\alpha S^{\sharp A} S + (1 - \alpha) S S^{\sharp A}) z, z \rangle_A - (\alpha \mu + (1 - \alpha) \eta). \end{aligned}$$

Therefore, we have

$$\begin{aligned} &|\langle Sz, z \rangle_A|^2 + \|Sz\|_A^4 \\ &= \langle (\alpha S^{\sharp A} S + (1 - \alpha) S S^{\sharp A}) z, z \rangle_A + \langle S^{\sharp A} S z, z \rangle_A^2 - (\alpha \mu + (1 - \alpha) \eta) \\ &\leq \langle (\alpha S^{\sharp A} S + (1 - \alpha) S S^{\sharp A}) z, z \rangle_A + \langle (S^{\sharp A} S)^2 z, z \rangle_A - (\alpha \mu + (1 - \alpha) \eta) \\ &\quad \text{(by Lemma 2.17)} \\ &\leq \left\| \alpha S^{\sharp A} S + (1 - \alpha) S S^{\sharp A} + (S^{\sharp A} S)^2 \right\|_A - (\alpha \mu + (1 - \alpha) \eta). \end{aligned}$$

This gives

$$d\omega_A^2(S) \leq \left\| \alpha S^{\sharp A} S + (1 - \alpha) S S^{\sharp A} + (S^{\sharp A} S)^2 \right\|_A - (\alpha \mu + (1 - \alpha) \eta). \quad (2.14)$$

□

Remark 2.20. (i) Form Theorem 2.19 (for $\alpha = 0$) we obtain

$$d\omega_A^2(S) \leq \|S S^{\sharp A} + (S^{\sharp A} S)^2\|_A - \eta. \quad (2.15)$$

(ii) The bound (2.15) is better than the existing bound in [13], namely

$$d\omega_A^2(S) \leq \sqrt{\omega_A((S^{\sharp A} S)^2 + (S^{\sharp A} S)^4) + 2\omega_A^2(S^{\sharp A} S^2)} \quad (2.16)$$

for some operators. For example, if we consider $A = \begin{pmatrix} 1 & 0 \\ 0 & 2 \end{pmatrix}$ and $S = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix}$ then (2.16) gives $d\omega_A^2(S) \leq \frac{\sqrt{5}}{4}$ but (2.15) gives $d\omega_A^2(S) \leq \frac{1}{2}$.

We now present another upper bound.

Theorem 2.21. *If $S \in \mathcal{B}_A(\mathcal{H})$ then $d\omega_A^2(S) \leq \min\{\beta, \gamma\}$, where*

$$\beta = \min_{\alpha \in [0,1]} \left\{ \left\| \frac{\alpha}{4} S^{\sharp A} S + \left(1 - \frac{3\alpha}{4}\right) S S^{\sharp A} + (S^{\sharp A} S)^2 \right\|_A + \frac{\alpha}{2} \omega_A(S^2) - (1 - \alpha)\eta \right\},$$

$$\gamma = \min_{\alpha \in [0,1]} \left\{ \left\| \left(1 - \frac{3\alpha}{4}\right) S^{\sharp A} S + \frac{\alpha}{4} S S^{\sharp A} + (S^{\sharp A} S)^2 \right\|_A + \frac{\alpha}{2} \omega_A(S^2) - (1 - \alpha)\mu \right\}$$

and μ, η are as in Theorem 2.19.

Proof. Suppose $z \in \mathcal{H}$, $\|z\|_A = 1$ and $\alpha \in [0, 1]$. Then we obtain

$$\begin{aligned} |\langle Sz, z \rangle_A|^2 &= \alpha |\langle Sz, z \rangle_A|^2 + (1 - \alpha) |\langle z, T^{\sharp A} z \rangle_A|^2 \\ &\leq \alpha |\langle Sz, z \rangle_A|^2 + (1 - \alpha) \left(\|S^{\sharp A} z\|_A - \frac{\inf_{\lambda \in \mathbb{C}} \|S^{\sharp A} z - \lambda z\|_A^2}{2\|S^{\sharp A} z\|_A} \right)^2 \\ &\quad \text{(by Lemma 2.18)} \\ &= \alpha |\langle Sz, z \rangle_A|^2 + (1 - \alpha) \|S^{\sharp A} z\|_A^2 \\ &\quad - (1 - \alpha) \left(\inf_{\lambda \in \mathbb{C}} \|S^{\sharp A} z - \lambda z\|_A^2 - \frac{\inf_{\lambda \in \mathbb{C}} \|S^{\sharp A} z - \lambda z\|_A^4}{4\|S^{\sharp A} z\|_A^2} \right) \\ &\leq \alpha |\langle Sz, z \rangle_A|^2 + (1 - \alpha) \|S^{\sharp A} z\|_A^2 - (1 - \alpha)\eta. \end{aligned}$$

So,

$$\begin{aligned} &|\langle Sz, z \rangle_A|^2 + \|Sz\|_A^4 \\ &\leq \alpha |\langle Sz, z \rangle_A|^2 + (1 - \alpha) \langle S S^{\sharp A} z, z \rangle_A + \langle S^{\sharp A} S z, z \rangle_A^2 - (1 - \alpha)\eta \\ &\leq \alpha |\langle Sz, z \rangle_A|^2 + (1 - \alpha) \langle S S^{\sharp A} z, z \rangle_A + \left\langle (S^{\sharp A} S)^2 z, z \right\rangle_A - (1 - \alpha)\eta \\ &\quad \text{(by Lemma 2.17)} \\ &\leq \frac{\alpha}{2} (\|Sz\|_A \|S^{\sharp A} z\|_A + |\langle Sz, S^{\sharp A} z \rangle_A|) + (1 - \alpha) \langle S S^{\sharp A} z, z \rangle_A + \left\langle (S^{\sharp A} S)^2 z, z \right\rangle_A \\ &\quad - (1 - \alpha)\eta \quad \text{(by Lemma 2.1)} \\ &\leq \frac{\alpha}{4} (\|Sz\|_A^2 + \|S^{\sharp A} z\|_A^2) + \frac{\alpha}{2} |\langle S^2 z, z \rangle_A| + (1 - \alpha) \langle S S^{\sharp A} z, z \rangle_A + \left\langle (S^{\sharp A} S)^2 z, z \right\rangle_A \\ &\quad - (1 - \alpha)\eta \quad \text{(by the AM-GM inequality)} \end{aligned}$$

$$\begin{aligned}
&= \left\langle \left(\frac{\alpha}{4} S^{\sharp_A} S + \left(1 - \frac{3\alpha}{4} \right) S S^{\sharp_A} + (S^{\sharp_A} S)^2 \right) z, z \right\rangle_A + \frac{\alpha}{2} |\langle S^2 z, z \rangle_A| - (1 - \alpha)\eta \\
&\leq \left\| \frac{\alpha}{4} S^{\sharp_A} S + \left(1 - \frac{3\alpha}{4} \right) S S^{\sharp_A} + (S^{\sharp_A} S)^2 \right\|_A + \frac{\alpha}{2} \omega_A(S^2) - (1 - \alpha)\eta.
\end{aligned}$$

This gives

$$d\omega_A^2(S) \leq \left\| \frac{\alpha}{4} S^{\sharp_A} S + \left(1 - \frac{3\alpha}{4} \right) S S^{\sharp_A} + (S^{\sharp_A} S)^2 \right\|_A + \frac{\alpha}{2} \omega_A(S^2) - (1 - \alpha)\eta.$$

Considering the minimum over $\alpha \in [0, 1]$, we get

$$d\omega_A^2(S) \leq \min_{\alpha \in [0, 1]} \left\{ \left\| \frac{\alpha}{4} S^{\sharp_A} S + \left(1 - \frac{3\alpha}{4} \right) S S^{\sharp_A} + (S^{\sharp_A} S)^2 \right\|_A + \frac{\alpha}{2} \omega_A(S^2) - (1 - \alpha)\eta \right\}. \quad (2.17)$$

Similarly, we get

$$d\omega_A^2(S) \leq \min_{\alpha \in [0, 1]} \left\{ \left\| \left(1 - \frac{3\alpha}{4} \right) S^{\sharp_A} S + \frac{\alpha}{4} S S^{\sharp_A} + (S^{\sharp_A} S)^2 \right\|_A + \frac{\alpha}{2} \omega_A(S^2) - (1 - \alpha)\mu \right\}. \quad (2.18)$$

Combining (2.17) and (2.18) we get the result as desired. \square

From Theorem 2.21 (for $\alpha = 1$) we obtain the bound:

Corollary 2.22. *If $S \in \mathcal{B}_A(\mathcal{H})$ then*

$$d\omega_A^2(S) \leq \frac{1}{4} \left\| S^{\sharp_A} S + S S^{\sharp_A} + 4 (S^{\sharp_A} S)^2 \right\|_A + \frac{1}{2} \omega_A(S^2). \quad (2.19)$$

Remark 2.23. The bound (2.19) is better than the following bound in [13], namely

$$d\omega_A^2(S) \leq \frac{1}{2} [\omega_A((S^{\sharp_A} S)^2 + S^{\sharp_A} S) + \omega_A((S^{\sharp_A} S)^2 - S^{\sharp_A} S)] + \omega_A(S^{\sharp_A} S^2) \quad (2.20)$$

for some operator. If we consider the same example as in Remark 2.12, the bound (2.20) gives $d\omega_A^2(S) \leq 24$ whereas (2.19) gives $d\omega_A^2(S) \leq 20$.

To achieve the next result we need the inequality.

Lemma 2.24. [19] *If $a, c > 0$ and $0 \leq \alpha \leq 1$ then*

$$a^\alpha c^{1-\alpha} \leq \alpha a + (1 - \alpha)c \leq (\alpha a^r + (1 - \alpha)c^r)^{\frac{1}{r}}, \quad \text{for all } r \geq 1.$$

Theorem 2.25. *If $S \in \mathcal{B}_A(\mathcal{H})$ then*

$$d\omega_A^{4n}(S) \leq 4^{n-1} \left\| (S^{\sharp_A} S)^n + (S^{\sharp_A} S)^{2n} \right\|_A \left\| (S S^{\sharp_A})^n + (S^{\sharp_A} S)^{2n} \right\|_A \quad \text{for each } n \in \mathbb{N}.$$

Proof. Take $z \in \mathcal{H}$ and $\|z\|_A = 1$, we get

$$\begin{aligned}
& |\langle Sz, z \rangle_A|^2 + \|Sz\|_A^4 \\
& \leq 2 \left(\frac{|\langle Sz, z \rangle_A|^{2n} + \|Sz\|_A^{4n}}{2} \right)^{\frac{1}{n}} \quad (\text{by Lemma 2.24}) \\
& = 2^{1-\frac{1}{n}} \left(|\langle Sz, z \rangle_A|^{2n} + \langle T^{\sharp_A} Sz, z \rangle_A^{2n} \right)^{\frac{1}{n}} \\
& \leq 2^{1-\frac{1}{n}} \left(\langle S^{\sharp_A} Sz, z \rangle_A^{\frac{n}{2}} \langle SS^{\sharp_A} z, z \rangle_A^{\frac{n}{2}} + \langle S^{\sharp_A} Sz, z \rangle_A^{2n} \right)^{\frac{1}{n}} \quad (\text{by Lemma 2.10}) \\
& \leq 2^{1-\frac{1}{n}} \left[\left(\langle S^{\sharp_A} Sz, z \rangle_A^n + \langle S^{\sharp_A} Sz, z \rangle_A^{2n} \right) \left(\langle SS^{\sharp_A} z, z \rangle_A^n + \langle S^{\sharp_A} Sz, z \rangle_A^{2n} \right) \right]^{\frac{1}{2n}} \\
& \quad (\text{since } (ab + cd)^2 \leq (a^2 + c^2)(b^2 + d^2) \text{ with } a, b, c, d \geq 0) \\
& \leq 2^{1-\frac{1}{n}} \left(\langle (S^{\sharp_A} S)^n z, z \rangle_A + \langle (S^{\sharp_A} S)^{2n} z, z \rangle_A \right)^{\frac{1}{2n}} \\
& \quad \times \left(\langle (SS^{\sharp_A})^n z, z \rangle_A + \langle (S^{\sharp_A} S)^{2n} z, z \rangle_A \right)^{\frac{1}{2n}} \quad (\text{by Lemma 2.17}) \\
& \leq 2^{1-\frac{1}{n}} \left(\left\| (S^{\sharp_A} S)^n + (S^{\sharp_A} S)^{2n} \right\|_A \left\| (SS^{\sharp_A})^n + (S^{\sharp_A} S)^{2n} \right\|_A \right)^{\frac{1}{2n}}.
\end{aligned}$$

Thus,

$$d\omega_A^2(S) \leq 2^{1-\frac{1}{n}} \left(\left\| (S^{\sharp_A} S)^n + (S^{\sharp_A} S)^{2n} \right\|_A \left\| (SS^{\sharp_A})^n + (S^{\sharp_A} S)^{2n} \right\|_A \right)^{\frac{1}{2n}}.$$

This gives the bound. \square

From Theorem 2.25 (for $n = 1$), we obtain the bound:

Corollary 2.26. *If $S \in \mathcal{B}_A(\mathcal{H})$ then*

$$d\omega_A^2(S) \leq \|SS^{\sharp_A} + (S^{\sharp_A} S)^2\|_A^{\frac{1}{2}} \|S^{\sharp_A} S + (S^{\sharp_A} S)^2\|_A^{\frac{1}{2}}. \quad (2.21)$$

Remark 2.27. The bound (2.21) is better than the existing bound in [3], namely

$$d\omega_A^2(S) \leq \|S^{\sharp_A} S + (S^{\sharp_A} S)^{\sharp_A} S^{\sharp_A} S\|_A \quad (2.22)$$

for some operators. For the same example as in Remark 2.20, the bound (2.22) gives $d\omega_A^2(S) \leq \frac{3}{4}$, but (2.21) gives $d\omega_A^2(S) \leq \frac{\sqrt{3}}{2\sqrt{2}}$.

We now obtain a lower bound.

Theorem 2.28. *If $S \in \mathcal{B}_A(\mathcal{H})$ then*

$$d\omega_A^2(S) \geq \max \{ c_A^2(S) (1 + \|S\|_A^2), \omega_A^2(S) (1 + c_A^2(S^{\sharp_A} S)) \}.$$

Proof. Suppose $z \in \mathcal{H}$ and $\|z\|_A = 1$. Then

$$|\langle Sz, z \rangle_A|^2 + \|Sz\|_A^4 \geq |\langle Sz, z \rangle_A|^2 + |\langle Sz, z \rangle_A|^2 \|Sz\|_A^2 \geq c_A^2(S) (1 + \|Sz\|_A^2).$$

This implies

$$d\omega_A^2(S) \geq c_A^2(S) (1 + \|S\|_A^2). \quad (2.23)$$

We also have

$$|\langle Sz, z \rangle_A|^2 + \|Sz\|_A^4 \geq |\langle Sz, z \rangle_A|^2 (1 + \|Sz\|_A^2) \geq |\langle Sz, z \rangle_A|^2 (1 + c_A^2(S^{\sharp_A} S)).$$

From this we get

$$d\omega_A^2(S) \geq \omega_A^2(S) (1 + c_A^2(S^{\sharp_A} S)). \quad (2.24)$$

Combining (2.23) and (2.24), we get

$$d\omega_A^2(S) \geq \max \{ c_A^2(S) (1 + \|S\|_A^2), \omega_A^2(S) (1 + c_A^2(S^{\sharp_A} S)) \}.$$

This completes the proof. \square

We conclude this section by giving another lower bound.

Theorem 2.29. *Let $S \in \mathcal{B}_A(\mathcal{H})$ and $m_A(S) = \inf_{\|x\|_A=1} \|Sx\|_A$. Then*

$$d\omega_A^2(S) \geq \max \{ (1 + m_A^2(S)) \omega_A^2(S), (1 + \|S\|_A^2) c_A^2(S) \}.$$

Proof. Take $z \in \mathcal{H}$ and $\|z\|_A = 1$. We obtain

$$|\langle Sz, z \rangle_A|^2 + \|Sz\|_A^4 \geq |\langle Sz, z \rangle_A|^2 + |\langle Sz, z \rangle_A|^2 m_A^2(S) = (1 + m_A^2(S)) |\langle Sz, z \rangle_A|^2.$$

This gives

$$d\omega_A^2(S) \geq (1 + m_A^2(S)) \omega_A^2(S). \quad (2.25)$$

Moreover, we see

$$|\langle Sz, z \rangle_A|^2 + \|Sz\|_A^4 \geq (1 + \|Sz\|_A^2) |\langle Sz, z \rangle_A|^2 \geq (1 + \|Sz\|_A^2) c_A^2(S).$$

So

$$d\omega_A^2(S) \geq (1 + \|S\|_A^2) c_A^2(S). \quad (2.26)$$

Combining (2.25) and (2.26), we get the result as desired. \square

It should be mentioned here that the bound in Theorem 2.29 is also studied in [5] in the setting of Hilbert space operators.

3. BOUNDS FOR THE A_0 -DAVIS-WIELANDT RADIUS OF BLOCK MATRICES

Consider 2×2 block diagonal matrix $A_0 = \begin{bmatrix} A & 0 \\ 0 & A \end{bmatrix}$. Clearly, $A_0 \in \mathcal{B}(\mathcal{H} \oplus \mathcal{H})$ is positive. Therefore, A_0 induces $\langle x, z \rangle_{A_0} = \langle A_0 x, z \rangle = \langle x_1, z_1 \rangle_A + \langle x_2, z_2 \rangle_A$, for all $x = (x_1, x_2)$ and $z = (z_1, z_2) \in \mathcal{H} \oplus \mathcal{H}$. If $S_{ij} \in \mathcal{B}_A(\mathcal{H})$ for $i, j = 1, 2$, then $\begin{bmatrix} S_{11} & S_{12} \\ S_{21} & S_{22} \end{bmatrix} \in \mathcal{B}_{A_0}(\mathcal{H} \oplus \mathcal{H})$ and $\begin{bmatrix} S_{11} & S_{12} \\ S_{21} & S_{22} \end{bmatrix}^{\sharp_{A_0}} = \begin{bmatrix} S_{11}^{\sharp_A} & S_{21}^{\sharp_A} \\ S_{12}^{\sharp_A} & S_{22}^{\sharp_A} \end{bmatrix}$, shown in [26]. To start our analysis we begin with the lemmas.

Lemma 3.1. [3] *If $S \in \mathcal{B}_A(\mathcal{H})$ and V is A -unitary, then $d\omega_A(V^{\sharp_A} S V) = d\omega_A(S)$.*

Lemma 3.2. [26] *If $S, T \in \mathcal{B}_A(\mathcal{H})$ then $\omega_{A_0} \left(\begin{bmatrix} S & 0 \\ 0 & T \end{bmatrix} \right) = \max \{ \omega_A(S), \omega_A(T) \}$.*

Lemma 3.3. [26] *If $S, T \in \mathcal{B}_A(\mathcal{H})$ then $\omega_{A_0} \left(\begin{bmatrix} S & T \\ T & S \end{bmatrix} \right) = \max \{ \omega_A(S+T), \omega_A(S-T) \}$.*

In particular, $\omega_{A_0} \left(\begin{bmatrix} 0 & S \\ S & 0 \end{bmatrix} \right) = \omega_A(S)$.

We now prove our results.

Proposition 3.4. *If $S, T \in \mathcal{B}_A(\mathcal{H})$ then $d\omega_{A_0} \left(\begin{bmatrix} S & 0 \\ 0 & T \end{bmatrix} \right) = \max \{ d\omega_A(S), d\omega_A(T) \}$.*

Proof. Let $X = \begin{bmatrix} T & 0 \\ 0 & S \end{bmatrix}$. Suppose $u = (z, 0) \in \mathcal{H} \oplus \mathcal{H}$, $\|z\|_A = 1$. Clearly $\|u\|_{A_0} = 1$. Then $|\langle Tz, z \rangle_A|^2 + \|Tz\|_A^4 = |\langle Xu, u \rangle_{A_0}|^2 + \|Xu\|_{A_0}^4 \leq d\omega_{A_0}^2(X)$. Hence, we obtain $d\omega_A^2(T) \leq d\omega_{A_0}^2(X)$. Similarly, we can see that $d\omega_A^2(S) \leq d\omega_{A_0}^2(X)$. Therefore, we infer that $\max \{ d\omega_A(T), d\omega_A(S) \} \leq d\omega_{A_0}(X)$.

Now, let $v = (z, y) \in \mathcal{H} \oplus \mathcal{H}$ and $\|v\|_{A_0} = 1$, then

$$\begin{aligned} \sqrt{|\langle Xv, v \rangle_{A_0}|^2 + \|Xv\|_{A_0}^4} &= \sqrt{|\langle Tz, z \rangle_A + \langle Sy, y \rangle_A|^2 + \|Tz\|_A^4 + \|Sy\|_A^4} \\ &\leq \sqrt{|\langle Tz, z \rangle_A|^2 + \|Tz\|_A^4} + \sqrt{|\langle Sy, y \rangle_A|^2 + \|Sy\|_A^4} \\ &\leq d\omega_A(T) \|z\|_A^2 + d\omega_A(S) \|y\|_A^2 \\ &\leq \max \{ d\omega_A(T), d\omega_A(S) \}. \end{aligned}$$

This gives $d\omega_{A_0}(X) \leq \max \{ d\omega_A(T), d\omega_A(S) \}$. □

We now discuss the following equality.

Lemma 3.5. *If $S, T \in \mathcal{B}_A(\mathcal{H})$ then*

$$d\omega_{A_0} \left(\begin{bmatrix} S & T \\ T & S \end{bmatrix} \right) = d\omega_{A_0} \left(\begin{bmatrix} S-T & 0 \\ 0 & S+T \end{bmatrix} \right).$$

In particular,

$$d\omega_{A_0} \left(\begin{bmatrix} 0 & S \\ S & 0 \end{bmatrix} \right) = d\omega_A(S). \quad (3.1)$$

Proof. Let $U = \frac{1}{\sqrt{2}} \begin{bmatrix} I & I \\ -I & I \end{bmatrix}$ and $W = \begin{bmatrix} S & T \\ T & S \end{bmatrix}$. Then $\begin{bmatrix} P(S-T) & 0 \\ 0 & P(S+T) \end{bmatrix} = U^{\sharp_{A_0}} W U$. Using Lemma 3.1, we get $d\omega_{A_0}(U^{\sharp_{A_0}} W U) = d\omega_{A_0}(W)$. So, $d\omega_{A_0} \left(\begin{bmatrix} S & T \\ T & S \end{bmatrix} \right) = d\omega_{A_0} \left(\begin{bmatrix} P(S-T) & 0 \\ 0 & P(S+T) \end{bmatrix} \right)$. Taking $U = I$ in Lemma 3.1, we can observe that $d\omega_A(PS) = d\omega_A(S)$. So,

$$d\omega_{A_0} \left(\begin{bmatrix} S & T \\ T & S \end{bmatrix} \right) = d\omega_{A_0} \left(\begin{bmatrix} P(S-T) & 0 \\ 0 & P(S+T) \end{bmatrix} \right) = d\omega_{A_0} \left(\begin{bmatrix} S-T & 0 \\ 0 & S+T \end{bmatrix} \right).$$

In particular, we get

$$d\omega_{A_0} \left(\begin{bmatrix} 0 & S \\ S & 0 \end{bmatrix} \right) = d\omega_{A_0} \left(\begin{bmatrix} -S & 0 \\ 0 & S \end{bmatrix} \right) = \max \{d\omega_A(-S), d\omega_A(S)\} = d\omega_A(S).$$

□

We now develop a bound of A_0 -Davis–Wielandt radius for $\begin{bmatrix} 0 & B \\ C & 0 \end{bmatrix}$ in $\mathcal{B}_A(\mathcal{H} \oplus \mathcal{H})$.

Theorem 3.6. *If $C, B \in \mathcal{B}_A(\mathcal{H})$ then*

$$\begin{aligned} & d\omega_{A_0}^2 \left(\begin{bmatrix} 0 & B \\ C & 0 \end{bmatrix} \right) \\ & \leq \frac{1}{4} \max \left\{ \omega_A \left(BB^{\sharp_A} + C^{\sharp_A}C + 4(C^{\sharp_A}C)^2 \right), \omega_A \left(B^{\sharp_A}B + CC^{\sharp_A} + 4(B^{\sharp_A}B)^2 \right) \right\} \\ & \quad + \frac{1}{2} \max \{ \omega_A(BC), \omega_A(CB) \}. \end{aligned}$$

Proof. Let $S = \begin{bmatrix} 0 & B \\ C & 0 \end{bmatrix}$ and $z \in \mathcal{H} \oplus \mathcal{H}$ with $\|z\|_{A_0} = 1$. Then

$$\begin{aligned} & |\langle Sz, z \rangle_{A_0}|^2 + \|Sz\|_{A_0}^4 \\ & \leq \frac{1}{2} \left(\|Sz\|_{A_0} \|S^{\sharp_A}z\|_{A_0} + \left| \langle Sz, S^{\sharp_A}z \rangle_{A_0} \right| \right) + \|Sz\|_{A_0}^4 \quad (\text{by Lemma 2.1}) \end{aligned}$$

$$\begin{aligned}
&\leq \frac{1}{4} \left(\|Sz\|_{A_0}^2 + \|S^{\sharp A}z\|_{A_0}^2 \right) + \frac{1}{2} \left| \langle S^2z, z \rangle_{A_0} \right| + \|Sz\|_{A_0}^4 \quad (\text{by AM-GM inequality}) \\
&\leq \frac{1}{4} \langle (S^{\sharp A}S + SS^{\sharp A})z, z \rangle_{A_0} + \langle (S^{\sharp A}S)^2z, z \rangle_{A_0} + \frac{1}{2} \left| \langle S^2z, z \rangle_{A_0} \right| \quad (\text{by Lemma 2.17}) \\
&= \frac{1}{4} \langle (S^{\sharp A}S + SS^{\sharp A} + 4(S^{\sharp A}S)^2)z, z \rangle_{A_0} + \frac{1}{2} \left| \langle S^2z, z \rangle_{A_0} \right| \\
&\leq \frac{1}{4} \omega_{A_0} \left(S^{\sharp A}S + SS^{\sharp A} + 4(S^{\sharp A}S)^2 \right) + \frac{1}{2} \omega_{A_0} (S^2) \\
&= \frac{1}{4} \omega_{A_0} \left(\begin{bmatrix} BB^{\sharp A} + C^{\sharp A}C + 4(C^{\sharp A}C)^2 & 0 \\ 0 & B^{\sharp A}B + CC^{\sharp A} + 4(B^{\sharp A}B)^2 \end{bmatrix} \right) \\
&\quad + \frac{1}{2} \omega_{A_0} \left(\begin{bmatrix} BC & 0 \\ 0 & CB \end{bmatrix} \right) \\
&= \frac{1}{4} \max \left\{ \omega_A \left(BB^{\sharp A} + C^{\sharp A}C + 4(C^{\sharp A}C)^2 \right), \omega_A \left(B^{\sharp A}B + CC^{\sharp A} + 4(B^{\sharp A}B)^2 \right) \right\} \\
&\quad + \frac{1}{2} \max \{ \omega_A (BC), \omega_A (CB) \} \quad (\text{by Lemma 3.2}).
\end{aligned}$$

This implies the bound as desired. □

We now need the lemma.

Lemma 3.7. [13] *If $x, u, v \in \mathcal{H}$ then*

$$|\langle x, v \rangle_A|^2 + |\langle x, u \rangle_A|^2 \leq \|x\|_A^2 \left(\max \{ \|v\|_A^2, \|u\|_A^2 \} + |\langle v, u \rangle_A| \right).$$

We next obtain another upper bound of A_0 -Davis–Wielandt radius of $\begin{bmatrix} 0 & B \\ C & 0 \end{bmatrix}$.

Theorem 3.8. *If $C, B \in \mathcal{B}_A(\mathcal{H})$, then*

$$\begin{aligned}
&d\omega_{A_0}^2 \left(\begin{bmatrix} 0 & B \\ C & 0 \end{bmatrix} \right) \\
&\leq \frac{1}{2} \max \left\{ \omega_A \left((C^{\sharp A}C)^2 + C^{\sharp A}C \right), \omega_A \left(B^{\sharp A}B + (B^{\sharp A}B)^2 \right) \right\} \\
&\quad + \frac{1}{2} \max \left\{ \omega_A \left((C^{\sharp A}C)^2 - C^{\sharp A}C \right), \omega_A \left(B^{\sharp A}B - (B^{\sharp A}B)^2 \right) \right\} \\
&\quad + \omega_{A_0} \left(\begin{bmatrix} 0 & C^{\sharp A}CB \\ B^{\sharp A}BC & 0 \end{bmatrix} \right).
\end{aligned}$$

Proof. Let $S = \begin{bmatrix} 0 & B \\ C & 0 \end{bmatrix}$ and $z \in \mathcal{H} \oplus \mathcal{H}$ with $\|z\|_{A_0} = 1$. Replacing $x = z$, $v = Sz$, $u = S^{\sharp A}Sz$ in Lemma 3.7, we obtain

$$\begin{aligned}
& |\langle Sz, z \rangle_{A_0}|^2 + \|Sz\|_{A_0}^4 = |\langle z, Sz \rangle_{A_0}|^2 + \langle z, S^{\sharp A}Sz \rangle_{A_0}^2 \\
& \leq \|z\|_{A_0}^2 \left(\max \left\{ \|Sz\|_{A_0}^2, \|S^{\sharp A}Sz\|_{A_0}^2 \right\} + \left| \langle Sz, S^{\sharp A}Sz \rangle_{A_0} \right| \right) \\
& = \frac{1}{2} \left(\|Sz\|_{A_0}^2 + \|S^{\sharp A}Sz\|_{A_0}^2 + \left| \|Sz\|_{A_0}^2 - \|S^{\sharp A}Sz\|_{A_0}^2 \right| \right) + \left| \langle S^2z, Sz \rangle_{A_0} \right| \\
& \quad \text{(since } \max\{a, b\} = \frac{1}{2}(a + b + |a - b|) \text{ for real scalars } a, b) \\
& = \frac{1}{2} \left(\left\langle \left(S^{\sharp A}S + (S^{\sharp A}S)^2 \right) z, z \right\rangle_{A_0} + \left| \left\langle \left(S^{\sharp A}S - (S^{\sharp A}S)^2 \right) z, z \right\rangle_{A_0} \right| \right) + \left| \langle S^{\sharp A}S^2z, z \rangle_{A_0} \right| \\
& \leq \frac{1}{2} \left[\omega_{A_0} \left(S^{\sharp A}S + (S^{\sharp A}S)^2 \right) + \omega_{A_0} \left(S^{\sharp A}S - (S^{\sharp A}S)^2 \right) \right] + \omega_{A_0} (S^{\sharp A}S^2) \\
& = \frac{1}{2} \omega_{A_0} \left(\begin{bmatrix} (C^{\sharp A}C)^2 + C^{\sharp A}C & 0 \\ 0 & B^{\sharp A}B + (B^{\sharp A}B)^2 \end{bmatrix} \right) \\
& \quad + \frac{1}{2} \omega_{A_0} \left(\begin{bmatrix} (C^{\sharp A}C)^2 - C^{\sharp A}C & 0 \\ 0 & (B^{\sharp A}B)^2 - B^{\sharp A}B \end{bmatrix} \right) + \omega_{A_0} \left(\begin{bmatrix} 0 & C^{\sharp A}CB \\ B^{\sharp A}BC & 0 \end{bmatrix} \right) \\
& = \frac{1}{2} \max \left\{ \omega_A \left((C^{\sharp A}C)^2 + C^{\sharp A}C \right), \omega_A \left(B^{\sharp A}B + (B^{\sharp A}B)^2 \right) \right\} \\
& \quad + \frac{1}{2} \max \left\{ \omega_A \left((C^{\sharp A}C)^2 - C^{\sharp A}C \right), \omega_A \left(B^{\sharp A}B - (B^{\sharp A}B)^2 \right) \right\} \\
& \quad + \omega_{A_0} \left(\begin{bmatrix} 0 & C^{\sharp A}CB \\ B^{\sharp A}BC & 0 \end{bmatrix} \right) \quad \text{(by Lemma 3.2).}
\end{aligned}$$

This implies the inequality as desired. \square

Remark 3.9. Considering $B = C$ in Theorem 3.8, and using (3.1) and Lemma 3.3, we derive the existing inequality (see [13, Corollary 2.10])

$$d\omega_A^2(B) \leq \frac{1}{2} \left[\omega_A \left(B^{\sharp A}B + (B^{\sharp A}B)^2 \right) + \omega_A \left(B^{\sharp A}B - (B^{\sharp A}B)^2 \right) \right] + \omega_A (B^{\sharp A}B^2)$$

and so the inequality in Theorem 3.8 is a generalization of [13, Corollary 2.10].

To develop our final result we need the lemma.

Lemma 3.10. *If $x, u, v \in \mathcal{H}$ then*

$$|\langle x, u \rangle_A|^2 + |\langle x, v \rangle_A|^2 \leq \|x\|_A^2 \sqrt{|\langle u, u \rangle_A|^2 + 2|\langle u, v \rangle_A|^2 + |\langle v, v \rangle_A|^2}.$$

Theorem 3.11. *If $C, B \in \mathcal{B}_A(\mathcal{H})$ then*

$$d\omega_{A_0}^4 \left(\begin{bmatrix} 0 & B \\ C & 0 \end{bmatrix} \right) \leq \max \left\{ \omega_A \left((C^{\sharp_A} C)^2 + (C^{\sharp_A} C)^4 \right), \omega_A \left((B^{\sharp_A} B)^2 + (B^{\sharp_A} B)^4 \right) \right\} \\ + 2\omega_{A_0}^2 \left(\begin{bmatrix} 0 & C^{\sharp_A} C B \\ B^{\sharp_A} B C & 0 \end{bmatrix} \right).$$

Proof. Let $S = \begin{bmatrix} 0 & B \\ C & 0 \end{bmatrix}$ and $z \in \mathcal{H} \oplus \mathcal{H}$ with $\|z\|_{A_0} = 1$, then

$$\begin{aligned} & \left(|\langle Sz, z \rangle_{A_0}|^2 + \|Sz\|_{A_0}^4 \right)^2 = \left(|\langle z, Sz \rangle_{A_0}|^2 + |\langle z, S^{\sharp_A} Sz \rangle_{A_0}|^2 \right)^2 \\ & \leq \|z\|_{A_0}^4 \left(|\langle Sz, Sz \rangle_{A_0}|^2 + 2 |\langle Sz, S^{\sharp_A} Sz \rangle_{A_0}|^2 + |\langle S^{\sharp_A} Sz, S^{\sharp_A} Sz \rangle_{A_0}|^2 \right) \text{ (by Lemma 3.10)} \\ & = |\langle S^{\sharp_A} Sz, z \rangle_{A_0}|^2 + 2 |\langle S^{\sharp_A} S^2 z, z \rangle_{A_0}|^2 + \left| \langle (S^{\sharp_A} S)^2 z, z \rangle_{A_0} \right|^2 \\ & \leq \langle (S^{\sharp_A} S)^2 z, z \rangle_{A_0} + \langle (S^{\sharp_A} S)^4 z, z \rangle_{A_0} + 2 |\langle S^{\sharp_A} S^2 z, z \rangle_{A_0}|^2 \text{ (by Lemma 2.17)} \\ & \leq \omega_{A_0} \left((S^{\sharp_A} S)^2 + (S^{\sharp_A} S)^4 \right) + 2\omega_{A_0}^2 (S^{\sharp_A} S^2) \\ & = \omega_{A_0} \left(\begin{bmatrix} (C^{\sharp_A} C)^2 + (C^{\sharp_A} C)^4 & 0 \\ 0 & (B^{\sharp_A} B)^2 + (B^{\sharp_A} B)^4 \end{bmatrix} \right) + 2\omega_{A_0}^2 \left(\begin{bmatrix} 0 & C^{\sharp_A} C B \\ B^{\sharp_A} B C & 0 \end{bmatrix} \right) \\ & = \max \left\{ \omega_A \left((C^{\sharp_A} C)^2 + (C^{\sharp_A} C)^4 \right), \omega_A \left((B^{\sharp_A} B)^4 + (B^{\sharp_A} B)^2 \right) \right\} \\ & \quad + 2\omega_{A_0}^2 \left(\begin{bmatrix} 0 & C^{\sharp_A} C B \\ B^{\sharp_A} B C & 0 \end{bmatrix} \right) \text{ (by Lemma 3.2)}. \end{aligned}$$

Therefore, this gives the inequality as desired. \square

Remark 3.12. Considering $B = C$ in Theorem 3.11, and using (3.1) and Lemma 3.3, we derive the existing inequality (see [13, Corollary 2.7])

$$d\omega_A^4(B) \leq \omega_A \left((B^{\sharp_A} B)^2 + (B^{\sharp_A} B)^4 \right) + 2\omega_A^2 (B^{\sharp_A} B^2)$$

and so Theorem 3.11 is a generalization of [13, Corollary 2.7].
