### Abstract

We study the ground state energy of a gas of spin 1/2 fermions with repulsive short-range interactions. We derive an upper bound that agrees, at low density  $\rho$ , with the Huang–Yang conjecture. The latter captures the first three terms in an asymptotic low-density expansion, and in particular the Huang–Yang correction term of order  $\varrho^{7/3}$ . Our trial state is constructed using an adaptation of the bosonic Bogoliubov theory to the Fermi system, where the correlation structure of fermionic particles is incorporated by quasi-bosonic Bogoliubov transformations. In the latter, it is important to consider a modified zero-energy scattering equation that takes into account the presence of the Fermi sea, in the spirit of the Bethe–Goldstone equation.

# <span id="page-1-0"></span>1 Introduction and main result

Establishing asymptotic formulas for the ground state energy of dilute gases has been an active area in Mathematical Physics in recent years, partly motivated by the advances in the physics of cold atoms and molecules. In the bosonic case, the validity of the Lee–Huang–Yang formula [\[33\]](#page-46-0) for the first two terms in a low-density expansion was recently established [\[1,](#page-45-1) [19,](#page-46-1) [20,](#page-46-2) [47\]](#page-47-0), following earlier work on the first term in [\[16,](#page-45-2) [36\]](#page-46-3). In this work, we are concerned with the analogous question for fermions, for which the Huang–Yang formula [\[28\]](#page-46-4) gives the first three terms in an asymptotic expansion at low density. We shall establish the validity of this formula, at least as an upper bound.

We consider a system of N fermions with spin  $1/2$  in a box  $\Lambda := [-L/2, L/2]^3 \subset \mathbb{R}^3$  with periodic boundary conditions. The interaction between particles is described by the periodization  $V : \Lambda \to \mathbb{R}$  of a potential  $V_{\infty} : \mathbb{R}^3 \to \mathbb{R}$ , i.e.,  $V(x) = \sum_{z \in \mathbb{Z}^3} V_{\infty}(x + Lz)$ , where we assume that  $V_{\infty}$  is nonnegative, radial and compactly supported. The Hamiltonian describing the system is given by

<span id="page-1-4"></span>
$$
H_N := -\sum_{j=1}^N \Delta_{x_j} + \sum_{1 \le i < j \le N} V(x_i - x_j),\tag{1.1}
$$

acting on  $\bigwedge^N L^2(\Lambda, \mathbb{C}^2)$ , the Hilbert space of antisymmetric square-integrable functions of N space-spin variables  $(x_i, \sigma_i)$ , with  $x_i \in \Lambda$  and  $\sigma_i \in \{\uparrow, \downarrow\}$ . Since  $H_N$  is spin-independent, if  $N = N_{\uparrow} + N_{\downarrow}$ , then  $H_N$ leaves invariant the subspace  $\mathfrak{h}(N_{\uparrow}, N_{\downarrow}) \subset \bigwedge^N L^2(\Lambda, \mathbb{C}^2)$  consisting of N-body wave functions with exactly  $N_{\sigma}$  particles of spin  $\sigma \in \{\uparrow, \downarrow\}.$ 

The Hamiltonian  $H_N$  is bounded from below and can be defined as a self-adjoint operator by Friedrichs' method. The ground state energy in the subspace  $\mathfrak{h}(N_{\uparrow}, N_{\downarrow})$  is given by

<span id="page-1-5"></span>
$$
E_L(N_\uparrow, N_\downarrow) = \inf_{\psi \in \mathfrak{h}(N_\uparrow, N_\downarrow)} \frac{\langle \psi, H_N \psi \rangle}{\langle \psi, \psi \rangle},\tag{1.2}
$$

and the ground state energy density in the thermodynamic limit is

<span id="page-1-2"></span>
$$
e(\varrho_{\uparrow}, \varrho_{\downarrow}) = \lim_{\substack{L \to \infty \\ N_{\sigma}/L^3 \to \varrho_{\sigma}, \sigma \in \{\uparrow, \downarrow\}}} \frac{E_L(N_{\uparrow}, N_{\downarrow})}{L^3}.
$$
\n(1.3)

It is well-known that the thermodynamic limit exists and is independent of the boundary conditions [\[41,](#page-46-5) [42\]](#page-46-6).

By using a pseudopotential method, Huang and Yang [\[28\]](#page-46-4) predicted that in the low-density limit  $\rho_{\uparrow}$  $\varrho_{\downarrow} = \varrho/2 \rightarrow 0,$ 

<span id="page-1-1"></span>
$$
e(\varrho/2,\varrho/2) = \frac{3}{5}(3\pi^2)^{\frac{2}{3}}\varrho^{\frac{5}{3}} + 2\pi a\varrho^2 + \frac{4}{35}(11 - 2\log 2)(9\pi)^{\frac{2}{3}}a^2\varrho^{7/3} + o(\varrho^{\frac{7}{3}})_{\varrho \to 0}
$$
(1.4)

where  $a > 0$  is the s-wave scattering length of the interaction potential  $V_{\infty}$ , defined by  $8\pi a = \int_{\mathbb{R}^3} V_{\infty} (1 - \varphi_{\infty})$ with  $\varphi_{\infty} : \mathbb{R}^3 \to \mathbb{R}$  the solution of the zero-scattering equation

<span id="page-1-3"></span>
$$
2\Delta\varphi_{\infty} + V_{\infty}(1 - \varphi_{\infty}) = 0, \qquad \varphi_{\infty}(x) \to 0 \quad \text{as} \quad |x| \to \infty. \tag{1.5}
$$

The Huang–Yang conjecture was derived from a consideration of hard-sphere interactions, but it is expected that the formula extends to a large class of repulsive and short-range interaction potentials. The formula [\(1.4\)](#page-1-1) is of great interest in the theory of dilute quantum gases, since it exhibits a remarkable universality, with the energy depending on the interaction potential only via its scattering length, at least to the order considered. We refer to [\[38\]](#page-46-7) for an experimental verification.

On the mathematical side, for a large class of repulsive interactions, including hard spheres, the validity of the first two terms of [\(1.4\)](#page-1-1) was proved in [\[34\]](#page-46-8); more precisely, [\[34,](#page-46-8) Thm. 1] states that

<span id="page-2-1"></span>
$$
e(\varrho_{\uparrow}, \varrho_{\downarrow}) = \frac{3}{5} (6\pi^2)^{\frac{2}{3}} \left( \varrho_{\uparrow}^{5/3} + \varrho_{\downarrow}^{5/3} \right) + 8\pi a \varrho_{\uparrow} \varrho_{\downarrow} + o(\varrho^2)_{\varrho \to 0}.
$$
 (1.6)

The leading order term comes from the kinetic energy of a non-interacting Fermi gas, while the second-order term provides an effective description of the interaction between components of different spins. (In the case of fermions without spin, this second term vanishes; see [\[31,](#page-46-9) [32\]](#page-46-10) for the corresponding result in this case.) An analogue of [\(1.6\)](#page-2-1) for the thermodynamic pressure at positive temperature was derived in [\[45\]](#page-47-1).

An alternative proof of [\(1.6\)](#page-2-1) was recently given in [\[17\]](#page-45-3), by applying elements of bosonic Bogoliubov theory to Fermi systems. The method in [\[17\]](#page-45-3) was later extended in [\[21\]](#page-46-11) to derive an optimal error estimate  $O(\varrho^{7/3})$  in the upper bound, and will also be of crucial importance in our analysis here. (See also [\[30\]](#page-46-12) for an alternative approach.) In fact, in the present paper we shall prove an upper bound containing the precise Huang–Yang correction of order  $\varrho^{7/3}$ . We impose the following conditions on the interaction potential.

<span id="page-2-2"></span>**Assumption 1.1.** The interaction potential  $V_{\infty} \in L^2(\mathbb{R}^3)$  is nonnegative, radial and compactly supported.

In order to state our main result, we shall need the function  $F : \mathbb{R}_+ \to \mathbb{R}_+$  defined as

$$
F(x) = \frac{(6\pi^2)^{1/3}}{35} \left( 16x^{7/3} \ln x - 48 \left( x^{7/3} + 1 \right) \ln(1 + x^{1/3}) + 6 \left( 15x^{1/3} - 4x^{2/3} + 33x + 33x^{4/3} - 4x^{5/3} + 15x^2 \right) + 21 \left( 1 - 6x^{2/3} + 5x + 5x^{4/3} - 6x^{5/3} + x^{7/3} \right) \ln \frac{|1 - x^{1/3}|}{1 + x^{1/3}} \right). \tag{1.7}
$$

<span id="page-2-0"></span>It is a continuous, increasing function, with  $F(1) = \frac{48}{35}(11 - 2 \log 2)(6\pi^2)^{\frac{1}{3}}$ .

**Theorem 1.2** (Upper bound). Let  $V_{\infty}$  be as in Assumption [1.1,](#page-2-2) and let  $a > 0$  be its scattering length. In the low-density limit  $\rho_+ + \rho_+ = \rho \to 0$ , the ground state energy density defined in [\(1.3\)](#page-1-2) satisfies

<span id="page-2-4"></span><span id="page-2-3"></span>
$$
e(\varrho_{\uparrow},\varrho_{\downarrow}) \leq \frac{3}{5} (6\pi^2)^{\frac{2}{3}} \left( \varrho_{\uparrow}^{\frac{5}{3}} + \varrho_{\downarrow}^{\frac{5}{3}} \right) + 8\pi a \varrho_{\uparrow} \varrho_{\downarrow} + a^2 \varrho_{\uparrow}^{\frac{7}{3}} F \left( \frac{\varrho_{\downarrow}}{\varrho_{\uparrow}} \right) + O(\varrho^{\frac{7}{3} + \frac{1}{9}}), \tag{1.8}
$$

where F is defined in [\(1.7\)](#page-2-3). In particular, if  $\varrho_{\uparrow} = \varrho_{\downarrow} = \varrho/2 \rightarrow 0$ , we have

$$
e(\varrho/2,\varrho/2) \le \frac{3}{5}(3\pi^2)^{\frac{2}{3}}\varrho^{\frac{5}{3}} + 2\pi a\varrho^2 + \frac{4}{35}(11 - 2\log 2)(9\pi)^{\frac{2}{3}}a^2\varrho^{7/3} + O(\varrho^{\frac{7}{3} + \frac{1}{9}}). \tag{1.9}
$$

As we will see in the proof, the contribution  $a^2 \varrho_1^{\frac{7}{3}} F(\varrho_1/\varrho_1)$  in [\(1.8\)](#page-2-4) comes from the expression

<span id="page-2-5"></span>
$$
\frac{a^2}{8\pi^7} \int_{\mathbb{R}^3} dp \int_{|r| \le k_F^{\uparrow}} dr \int_{|r'| \le k_F^{\downarrow}} dr' \left( \frac{1}{2|p|^2} - \frac{\mathbb{1}_{\{|r+p| > k_F^{\uparrow}\}} \mathbb{1}_{\{|r'-p| > k_F^{\downarrow}\}}}{|r+p|^2 - |r|^2 + |r'-p|^2 - |r'|^2} \right) \tag{1.10}
$$

with  $k_F^{\sigma} = (6\pi^2)^{\frac{1}{3}} \varrho_{\sigma}^{1/3}$  the Fermi momenta of the two spin components. In particular, the roles of  $\varrho_{\uparrow}$  and  $\varrho_{\downarrow}$ are symmetric. In fact,  $\varrho_{\uparrow}^{\frac{7}{3}}F(\varrho_{\downarrow}/\varrho_{\uparrow}) = \varrho_{\downarrow}^{\frac{7}{3}}F(\varrho_{\uparrow}/\varrho_{\downarrow})$  since  $F(x^{-1}) = x^{-7/3}F(x)$  for  $x > 0$ . The explicit form of F in  $(1.7)$  has appeared in the physics literature in  $[29]$  (see also  $[12, 39]$  $[12, 39]$ ).

The Huang–Yang correction in [\(1.4\)](#page-1-1) can be interpreted as the fermionic analogue of the Lee–Huang– Yang correction for the energy of a dilute Bose gas, whose validity was proved in [\[19,](#page-46-1) [20\]](#page-46-2) (lower bound) and [\[47,](#page-47-0) [1\]](#page-45-1) (upper bound) (see also [\[25,](#page-46-15) [24,](#page-46-16) [18\]](#page-46-17) for extensions to the free energy at positive temperature). In the analysis of the Bose gas, an important role is played by Bogoliubov's theory [\[8\]](#page-45-5), where the correlation between particles is captured by unitary transformations containing quadratic expressions in the creation and annihilation operators on Fock space. The solution of the zero-energy scattering equation [\(1.5\)](#page-1-3) naturally enters in these transformations.

Our proof of Theorem [1.2](#page-2-0) is based on an adaptation of the bosonic Bogoliubov theory to Fermi systems. We will interpret suitable pairs of fermions as bosons, and then construct a trial state using the corresponding quasi-bosonic Bogoliubov transformations. This bosonization method goes back to heuristic arguments in [\[43,](#page-46-18) [44\]](#page-46-19) in the attempt to explain the random phase approximation proposed in the 1950s [\[9,](#page-45-6) [10,](#page-45-7) [11,](#page-45-8) [40\]](#page-46-20). In the context of the high-density Fermi gas, the bosonization method has been recently made rigorous to study the correlation energy in the mean-field regime [\[3,](#page-45-9) [4,](#page-45-10) [5,](#page-45-11) [13,](#page-45-12) [14,](#page-45-13) [15\]](#page-45-14).

For the low-density Fermi gas, the bosonization method was used in [\[17\]](#page-45-3) to give a new proof of [\(1.6\)](#page-2-1), and was improved further in [\[21\]](#page-46-11) to obtain an optimal error estimate  $O(\varrho^{7/3})$  in the upper bound. However, to obtain the precise Huang–Yang correction of order  $\varrho^{7/3}$ , we need to go substantially beyond the existing analysis. We will in fact introduce two quasi-bosonic Bogoliubov transformations to extract the correlation contribution of the particles. The first Bogoliubov transformation is closely related to the construction in [\[21\]](#page-46-11), and involves the solution to the zero-energy scattering equation in [\(1.5\)](#page-1-3). In the present paper, this transformation carries an additional momentum cut-off to ensure that all relevant error terms are of order  $o(\varrho^{7/3})$ . The main new tool is the second Bogoliubov transformation, which contains the solution of a modified scattering equation taking into account the presence of the Fermi sea at low momentum. The main ingredients of the proof will be explained in the next section.

Our analysis can be extended in a straightforward way to higher spin fermions or, equivalently, more than two species of spinless fermions. For simplicity, we stick to the case of spin 1/2 here.

Finally, we remark that the method of the present paper can be used to derive a lower bound with the optimal error  $O(\varrho^{7/3})$ ; see [\[22\]](#page-46-21) for details. The matching lower bound for [\(1.8\)](#page-2-4) remains open, however.

Organization of the paper. In the next section, we shall explain the main structure of the proof. In Sections [2.1](#page-3-1) and [2.2](#page-4-0) we introduce the fermionic Fock space and the particle-hole transformation, which gives a convenient representation of the correlation Hamiltonian in Proposition [2.3.](#page-5-0) In Section [2.3](#page-6-0) we construct the trial state in terms of two quasi-bosonic unitary transformations  $T_1$  and  $T_2$ , defined in Definition [2.7.](#page-7-0) A heuristic discussion of the effect of the unitary transformations on the correlation Hamiltonian, and a sketch of the key estimates required, is then given in Section [2.4.](#page-8-0) Section [3](#page-10-0) contains some preliminary bounds that in particular will allow to reduce the correlation Hamiltonian to a simpler, effective one, as formulated in Proposition [3.6.](#page-14-3) The main technical analysis needed in the proof of Theorem [1.2](#page-2-0) is done in Sections [4](#page-14-0) and [5,](#page-28-0) respectively, where the effect of the two unitary transformations  $T_1$  and  $T_2$  on the various operators of relevance is investigated. The main results of these two sections are summarized in Propositions [4.1](#page-14-2) and [5.1,](#page-29-2) respectively. Finally, in Section [6](#page-39-1) we combine the results of the previous sections, and complete the proof of Theorem [1.2.](#page-2-0) The appendix contains various auxiliary results needed in the proof.

# <span id="page-3-0"></span>2 Main ingredients in the proof

In this section we shall explain in detail the construction of the trial state and the main strategy of the proof of Theorem [1.2.](#page-2-0) We will briefly recall the Fock space formalism and the particle-hole transformation, which will be convenient in order to focus on the excitations around the Fermi sea. Then we will introduce quasi-bosonic transformations, which are our main tool to impose the precise correlations among particles needed to capture the energy to the desired order. Finally we will explain heuristically some key estimates in the computation of the energy, leading to the upper bound in Theorem [1.2.](#page-2-0)

### <span id="page-3-1"></span>2.1 The fermionic Fock space

It will be convenient to work in second quantization. The fermionic Fock space is given by

$$
\mathcal{F}_{f} = \bigoplus_{n \geq 0} \mathcal{F}_{f}^{(n)}, \quad \mathcal{F}_{f}^{(n)} = \bigwedge^{n} L^{2}(\Lambda, \mathbb{C}^{2}).
$$

Any  $\psi \in \mathcal{F}_{f}$  is of the form  $\psi = (\psi^{(0)}, \psi^{(1)}, \dots, \psi^{(n)}, \dots)$  with  $\psi^{(n)} = \psi^{(n)}((x_1, \sigma_1), \dots, (x_n, \sigma_n)) \in \mathcal{F}_{f}^{(n)}$ . The vacuum state will be denoted by  $\Omega = (1, 0, 0, \ldots)$ .

For any  $f \in L^2(\Lambda, \mathbb{C}^2)$ , we denote by  $a^*(f)$  and  $a(f)$  the creation and annihilation operators, respectively. These operators satisfy the canonical commutation relations

$$
\{a(f), a^*(g)\} = \langle f, g \rangle_{L^2(\Lambda; \mathbb{C}^2)}, \quad \{a(f), a(g)\} = \{a^*(f), a^*(g)\} = 0
$$

for any  $f, g \in L^2(\Lambda; \mathbb{C}^2)$ , where  $\{A, B\} = AB + BA$ . As a consequence, these operators are bounded, with

<span id="page-3-2"></span>
$$
||a(f)|| = ||a^*(f)|| = ||f||_{L^2(\Lambda, \mathbb{C}^2)}.
$$
\n(2.1)

For  $\sigma \in \{\uparrow, \downarrow\}$  and  $k \in \Lambda^* := (2\pi/L)\mathbb{Z}^3$ , we denote  $(\delta_{\sigma} f_k)(x, \sigma') = \delta_{\sigma, \sigma'} L^{-3/2} e^{ik \cdot x}$  and

$$
\hat{a}_{k,\sigma} = a(\delta_{\sigma} f_k) = \frac{1}{L^{3/2}} \int_{\Lambda} dx \, a_{x,\sigma} e^{-ikx}
$$
\n(2.2)

where we introduced the operator-valued distributions  $a_{x,\sigma} = a(\delta_{x,\sigma})$  with  $\delta_{x,\sigma}(y,\sigma') = \delta_{\sigma,\sigma'}\delta(x-y)$ . Furthermore, we denote by  $\mathcal{N}_{\sigma}$ ,  $\sigma \in \{\uparrow,\downarrow\}$ , the number operators counting the number of particles of spin  $\sigma$ , which can be written as

$$
\mathcal{N}_{\sigma} = \sum_{k \in \Lambda^*} \hat{a}_{k,\sigma}^* \hat{a}_{k,\sigma} = \int_{\Lambda} dx \, a_{x,\sigma}^* a_{x,\sigma},
$$

and the total number operator  $\mathcal{N} = \sum_{\sigma \in \{\uparrow, \downarrow\}} \mathcal{N}_{\sigma}$ .

The Hamiltonian  $H_N$  in [\(1.1\)](#page-1-4) can be extended to the operator on Fock space

$$
\mathcal{H} = \sum_{\sigma \in \{\uparrow, \downarrow\}} \int_{\Lambda} dx \, \nabla_x a_{x,\sigma}^* \nabla_x a_{x,\sigma} + \frac{1}{2} \sum_{\sigma,\sigma' \in \{\uparrow, \downarrow\}} \int_{\Lambda \times \Lambda} dx dy \, V(x - y) a_{x,\sigma}^* a_{y,\sigma'} a_{y,\sigma'} a_{x,\sigma}.
$$

That is,  $H_N$  is the restriction of  $\mathcal{H}$  to  $\mathcal{F}_{f}^{(n)} \subset \mathcal{F}_{f}$ . Equivalently, we can write

$$
\mathcal{H} = \sum_{\sigma \in \{\uparrow,\downarrow\}} \sum_{k \in \Lambda^*} |k|^2 \hat{a}_{k,\sigma}^* \hat{a}_{k,\sigma} + \frac{1}{2L^3} \sum_{\sigma,\sigma' \in \{\uparrow,\downarrow\}} \sum_{k,p,q \in \Lambda^*} \hat{V}(k) \hat{a}_{p+k,\sigma}^* \hat{a}_{q-k,\sigma'}^* \hat{a}_{q,\sigma'} \hat{a}_{p,\sigma}
$$

where  $\hat{V}$  are the Fourier coefficients of V. Here and in the following, we use the convention

$$
\hat{f}(p) = \int_{\Lambda} dx f(x)e^{-ip\cdot x}, \qquad f(x) = \frac{1}{L^3} \sum_{p \in \Lambda^*} \hat{f}(p)e^{ip\cdot x}
$$

for the Fourier transform in a box  $\Lambda$ . (The Fourier transform in  $\mathbb{R}^3$  will instead be denoted by  $\mathcal F$  in the following.)

Finally, we can identity  $\mathfrak{h}(N_{\uparrow}, N_{\downarrow})$  with the subspace  $\mathcal{F}_{f}(N_{\uparrow}, N_{\downarrow}) \subset \mathcal{F}_{f}$  where  $\mathcal{N}_{\sigma} = N_{\sigma}$  for  $\sigma \in \{\uparrow, \downarrow\}$ (which is left invariant by  $\mathcal{H}$ ), and write the ground state energy in [\(1.2\)](#page-1-5) as

$$
E_L(N_{\uparrow}, N_{\downarrow}) = \inf_{\psi \in \mathcal{F}_t(N_{\uparrow}, N_{\downarrow})} \frac{\langle \psi, \mathcal{H}\psi \rangle}{\langle \psi, \psi \rangle}.
$$

### <span id="page-4-0"></span>2.2 The particle-hole transformation

For a non-interacting system, the ground state is given by the free Fermi gas state  $\psi_{\text{FFG}}$ , which is simply the Slater determinant of the plane waves with momentum inside the Fermi sphere $(s)$ , namely

$$
\psi_{\text{FFG}} = \prod_{\sigma \in \{\uparrow,\downarrow\}} \prod_{k \in \mathcal{B}_F^{\sigma}} \hat{a}_{k,\sigma}^* \Omega
$$

where  $\mathcal{B}_{F}^{\sigma} := \left\{ k \in (2\pi/L)\mathbb{Z}^3 \mid |k| \leq k_F^{\sigma} \right\}$  is the Fermi ball of spin  $\sigma$ , with  $k_F^{\sigma} = (6\pi^2)^{\frac{1}{3}} \varrho_{\sigma}^{\frac{1}{3}} + o(1)_{L\to\infty}$ . As in [\[17,](#page-45-3) [21\]](#page-46-11), we can suppose the Fermi ball(s) to be completely filled, i.e.,  $N_{\sigma} = |\mathcal{B}_{F}^{\sigma}|$ . A simple computation (see e.g. [\[17,](#page-45-3) [21\]](#page-46-11)) shows that the energy per unit volume of the free Fermi gas state  $\psi_{\text{FFG}}, E_{\text{FFG}} = \langle \psi_{\text{FFG}}, H_N \psi_{\text{FFG}} \rangle$ , satisfies

<span id="page-4-3"></span>
$$
\lim_{L \to \infty} \frac{E_{\text{FFG}}}{L^3} = \frac{3}{5} (6\pi^2)^{\frac{2}{3}} \left( \varrho_1^{\frac{5}{3}} + \varrho_1^{\frac{5}{3}} \right) + \hat{V}(0) \varrho_1 \varrho_1 + O(\varrho^{\frac{8}{3}})
$$
\n(2.3)

for small  $\varrho$ , where the shorthand notation  $\lim_{L\to\infty}$  stands for the thermodynamic limit.

We will denote by v the one-particle reduced density matrix of  $\psi_{\text{FFG}}$ , which is an orthogonal projection with integral kernel given by

<span id="page-4-1"></span>
$$
v_{\sigma,\sigma'}(x;y) = \frac{\delta_{\sigma,\sigma'}}{L^3} \sum_{k \in \mathcal{B}_F^{\sigma}} e^{ik \cdot (x-y)}.
$$
\n(2.4)

Note that  $v_{\sigma,\sigma'}(x; y)$  is real-valued. We shall also define  $u = 1 - v$ , with integral kernel

<span id="page-4-2"></span>
$$
u_{\sigma,\sigma'}(x;y) = \frac{\delta_{\sigma,\sigma'}}{L^3} \sum_{k \notin \mathcal{B}_F^{\sigma}} e^{ik \cdot (x-y)}, \qquad (2.5)
$$

satisfying  $uv = vu = 0$ . We will write  $u_{\sigma} = u_{\sigma,\sigma}$  and  $v_{\sigma} = v_{\sigma,\sigma}$  for simplicity. Furthermore, we define  $u_{x,\sigma}(\cdot) := u_{\sigma}(\cdot; x)$  and  $v_{x,\sigma}(\cdot) := v_{\sigma}(\cdot; x)$ .

<span id="page-5-2"></span>As in [\[17,](#page-45-3) [21\]](#page-46-11) we factor out  $E_{\text{FFG}}$  by a unitary particle-hole transformation.

**Definition 2.1** (Particle-hole transformation). Let  $u, v : L^2(\Lambda; \mathbb{C}^2) \to L^2(\Lambda; \mathbb{C}^2)$  be given in [\(2.4\)](#page-4-1)–[\(2.5\)](#page-4-2). The particle-hole transformation  $R : \mathcal{F}_{f} \to \mathcal{F}_{f}$  is a unitary operator such that the following properties hold:

(i) The state RQ is such that  $(R\Omega)^{(n)} = 0$  whenever  $n \neq N$  and  $(R\Omega)^{(N)} = \Psi_{\text{FFG}}$ .

 $(ii)$ 

<span id="page-5-1"></span>
$$
R^* a_{x,\sigma}^* R = a_{\sigma}^*(u_x) + a_{\sigma}(v_x), \qquad (2.6)
$$

where

<span id="page-5-4"></span>
$$
a^*_{\sigma}(u_x) = \int_{\Lambda} dy \, u_{\sigma}(y; x) a^*_{y, \sigma}, \qquad a_{\sigma}(v_x) = \int_{\Lambda} dy \, v_{\sigma}(y; x) a_{y, \sigma}.
$$
 (2.7)

**Remark 2.2.** As explained in [\[6\]](#page-45-15), the particle-hole transformation R is a particular example of a fermionic Bogoliubov transformation, which allows to focus on the excitations around the free Fermi gas. Equivalently, the transformation  $R$  can be defined by

$$
R^*\hat{a}_{k,\sigma}R = \begin{cases} \hat{a}_{k,\sigma} & \text{if } k \notin \mathcal{B}_F^{\sigma}, \\ \hat{a}_{-k,\sigma}^* & \text{if } k \in \mathcal{B}_F^{\sigma}, \end{cases}
$$
 (2.8)

which justifies the name *particle-hole transformation*.

Note that we define the particle-hole transformation slightly differently from the one used in the previous work [\[17,](#page-45-3) [21\]](#page-46-11), in order to preserve translation-invariance. Since  $R\Omega = \psi_{\text{FFG}}$  we have  $E_{\text{FFG}} = \langle R\Omega, \mathcal{H}R\Omega \rangle$ . With the aid of [\(2.6\)](#page-5-1) we can compute  $R^*H$ R explicitly. Proceeding as in [\[17\]](#page-45-3) (using (2.6) and normal-ordering all the terms), we obtain

<span id="page-5-0"></span>**Proposition 2.3** (Conjugation of H by R). Let  $V_{\infty}$  be as in Assumption [1.1.](#page-2-2) Let  $\psi \in \mathcal{F}_{f}$  be a normalized state satisfying  $\mathcal{N}_{\sigma}\psi = N_{\sigma}\psi$  for  $\sigma \in \{\uparrow, \downarrow\}$ . Then

$$
\langle \psi, \mathcal{H}\psi \rangle = E_{\text{FFG}} + \langle R^* \psi, \mathcal{H}_{\text{corr}} R^* \psi \rangle \tag{2.9}
$$

where  $E_{\text{FFG}}$  is the energy of the free Fermi gas introduced above [\(2.3\)](#page-4-3) and  $\mathcal{H}_{\text{corr}} = \mathbb{H}_0 + \mathbb{X} + \sum_{i=1}^4 \mathbb{Q}_i$  is the correlation Hamiltonian given by

<span id="page-5-3"></span>
$$
\mathbb{H}_{0} = \sum_{\sigma} \sum_{k} ||k|^{2} - (k_{F}^{\sigma})^{2} |\hat{a}_{k,\sigma}^{*} \hat{a}_{k,\sigma},
$$
\n
$$
\mathbb{X} = \sum_{\sigma} \int_{\Lambda^{2}} dxdy V(x - y)v_{\sigma}(x - y) (a_{\sigma}^{*}(u_{x})a_{\sigma}(u_{y}) - a_{\sigma}^{*}(v_{y})a_{\sigma}(v_{x}))
$$
\n
$$
\mathbb{Q}_{1} = \sum_{\sigma,\sigma'} \int_{\Lambda^{2}} dxdy V(x - y)a_{\sigma}^{*}(u_{x})a_{\sigma}^{*}(v_{x})a_{\sigma'}(v_{y})a_{\sigma'}(u_{y})
$$
\n
$$
+ \frac{1}{2} \sum_{\sigma,\sigma'} \int_{\Lambda^{2}} dxdy V(x - y) (a_{\sigma}^{*}(v_{x})a_{\sigma'}^{*}(v_{y})a_{\sigma'}(v_{y})a_{\sigma}(v_{x}) - 2a_{\sigma}^{*}(u_{x})a_{\sigma'}^{*}(v_{y})a_{\sigma'}(v_{y})a_{\sigma}(u_{x})),
$$
\n
$$
\mathbb{Q}_{2} = \frac{1}{2} \sum_{\sigma,\sigma'} \int_{\Lambda^{2}} dxdy V(x - y)a_{\sigma}^{*}(u_{x})a_{\sigma'}^{*}(u_{y})a_{\sigma'}^{*}(v_{y})a_{\sigma}^{*}(v_{x}) + \text{h.c.}
$$
\n
$$
\mathbb{Q}_{3} = \sum_{\sigma,\sigma'} \int_{\Lambda^{2}} dxdy V(x - y) (a_{\sigma}^{*}(u_{x})a_{\sigma'}^{*}(v_{y})a_{\sigma'}^{*}(v_{x})a_{\sigma'}(v_{y}) - a_{\sigma}^{*}(u_{x})a_{\sigma'}^{*}(u_{y})a_{\sigma'}^{*}(u_{y})) + \text{h.c.,}
$$
\n
$$
\mathbb{Q}_{4} = \frac{1}{2} \sum_{\sigma,\sigma'} \int_{\Lambda^{2}} dxdy V(x - y) a_{\sigma}^{*}(u_{x})a_{\sigma'}^{*}(u_{y})a_{\sigma'}(u_{y})a_{\sigma}(u_{x}). \tag{2.10}
$$

In the following, it will be convenient to further decompose  $\mathbb{Q}_2 = \mathbb{Q}_2^{\parallel} + \mathbb{Q}_2^{\uparrow\downarrow}$  into a part  $\mathbb{Q}_2^{\parallel}$  involving interactions of particles with the same spin, and  $\mathbb{Q}_2^{\uparrow\downarrow}$  involving interactions of particles of opposite spin, i.e.,

<span id="page-5-5"></span>
$$
\mathbb{Q}_2^{\parallel} = \frac{1}{2} \sum_{\sigma} \int_{\Lambda^2} dx dy V(x - y) a_{\sigma}^*(u_x) a_{\sigma}^*(v_y) a_{\sigma}^*(v_y) a_{\sigma}^*(v_x) + \text{h.c.}
$$
\n
$$
\mathbb{Q}_2^{\uparrow\downarrow} = \frac{1}{2} \sum_{\sigma \neq \sigma'} \int_{\Lambda^2} dx dy V(x - y) a_{\sigma}^*(u_x) a_{\sigma'}^*(u_y) a_{\sigma'}^*(v_y) a_{\sigma}^*(v_x) + \text{h.c.}
$$
\n(2.11)

For our trial state, the main contribution to the energy will come from the effective correlation Hamiltonian

<span id="page-6-5"></span>
$$
\mathcal{H}_{\text{corr}}^{\text{eff}} := \mathbb{H}_0 + \mathbb{Q}_2^{\uparrow\downarrow} + \mathbb{Q}_4 \tag{2.12}
$$

(see Section [3.2](#page-13-0) for more details).

### <span id="page-6-0"></span>2.3 Trial state and quasi-bosonic Bogoliubov transformations

The trial state we are going to use in order to prove Theorem [1.2](#page-2-0) is of the form

<span id="page-6-4"></span>
$$
\psi_{\text{trial}} := RT_1 T_2 \Omega,\tag{2.13}
$$

where R is the particle hole transformation defined in Definition [2.1,](#page-5-2)  $\Omega \in \mathcal{F}_{f}$  is the vacuum state, and  $T_1, T_2$ are certain unitary transformations that will be defined below.

The main idea of our approach is to describe the low energy excitations around the Fermi ball by pairs of fermionic particles that display an approximate bosonic behavior. To do that we introduce the quasi-bosonic annihilation operators

<span id="page-6-2"></span>
$$
b_{p,k,\sigma} = \hat{u}_{\sigma}(p+k)\hat{v}_{\sigma}(k)\hat{a}_{p+k,\sigma}\hat{a}_{-k,\sigma} \quad \text{and} \quad b_{p,\sigma} = \sum_{k \in \Lambda^*} b_{p,k,\sigma} \quad (2.14)
$$

and their adjoints, the corresponding creation operators, where  $\hat{u}_{\sigma}$ ,  $\hat{v}_{\sigma}$  are the Fourier coefficients of the kernels introduced in [\(2.5\)](#page-4-2). In particular,

<span id="page-6-6"></span>
$$
\hat{u}_{\sigma}(k) = \begin{cases}\n0 & \text{if } |k| \le k_F^{\sigma}, \\
1 & \text{if } |k| > k_F^{\sigma},\n\end{cases} \qquad \hat{v}_{\sigma}(k) = \begin{cases}\n1 & \text{if } |k| \le k_F^{\sigma}, \\
0 & \text{if } |k| > k_F^{\sigma}.\n\end{cases}
$$
\n(2.15)

**Remark 2.4.** Unlike in [\[17,](#page-45-3) [21\]](#page-46-11), we use here the sharp projections  $\hat{u}, \hat{v}$  (instead of regularized ones), which will help to simplify and improve many error terms.

The unitary transformations  $T_1$  and  $T_2$  are defined as exponentials of expressions quadratic in the  $b, b^*$ operators. The two transformations correspond to two different regimes of the momentum  $p$  of the bosonic quasi-particle: for high-momenta (with respect to  $k_F^{\sigma}$ ) we use a "less refined" expression which helps to extract the leading term  $8\pi a\rho_{\uparrow}\rho_{\downarrow}$  of the interaction energy, and at the same time renormalizes the interaction potential, while for low momenta we use a "more refined" expression which allows to extract the correct energy of order  $\varrho^{7/3}$ . In order to introduce the momentum splitting, we choose two smooth functions  $\mathbb{R}^3 \to \mathbb{R}$ , denoted by  $\mathcal{F}(\chi_{<,\infty})$  and  $\mathcal{F}(\chi_{>,\infty})$ , respectively, satisfying

<span id="page-6-7"></span>
$$
\mathcal{F}(\chi_{<,\infty}) + \mathcal{F}(\chi_{>,\infty}) = 1, \quad \mathcal{F}(\chi_{<,\infty})(p) = \begin{cases} 1 & \text{if } |p| < 4\varrho^{\frac{1}{3}-\gamma}, \\ 0 & \text{if } |p| > 5\varrho^{\frac{1}{3}-\gamma}. \end{cases}
$$
(2.16)

Here  $0 \le \gamma \le 1/3$  is a parameter which will be optimized over at the end; we shall in fact choose  $\gamma = 1/9$ . From  $\mathcal{F}(\chi_{\leq,\infty})$  we can construct the periodic function  $\chi_{\leq} : \Lambda \to \mathbb{C}$  using the Fourier coefficients  $\{\mathcal{F}(\chi_{\leq,\infty}(p)\}_{p\in\Lambda^*},$ which satisfies the uniform bound  $\|\chi_{\leq}\|_{L^1(\Lambda)} \leq C$  (see Lemma [A.5\)](#page-42-2). In the following we will also use the notation  $\widehat{\chi}_{>}(p) = 1 - \widehat{\chi}_{<}(p).$ 

The operators  $T_1$  and  $T_2$  will implement the desired correlation structure between particles by using two different expressions both related to the zero-energy scattering equation [\(1.5\)](#page-1-3).

<span id="page-6-1"></span>**Definition 2.5** (Scattering solutions). We define the periodic function  $\varphi : \Lambda \to \mathbb{C}$  by  $\hat{\varphi}(p) = \mathcal{F}(\varphi_{\infty})(p)$  for  $0 \neq p \in \Lambda^*, \ \hat{\varphi}(0) = 0$ , where  $\varphi_{\infty}: \mathbb{R}^3 \to \mathbb{R}$  is the solution of the zero-scattering equation [\(1.5\)](#page-1-3). Moreover, for  $\varepsilon = \varrho^{2/3 + \delta}$  with a parameter  $\delta > 0$ , we define

<span id="page-6-3"></span>
$$
\hat{\eta}_{r,r'}^{\varepsilon}(p) := \frac{8\pi a}{\lambda_{r,p} + \lambda_{r',-p} + 2\varepsilon}, \quad \lambda_{r,p} := |r+p|^2 - |r|^2 \tag{2.17}
$$

where a denotes the scattering length of  $V_{\infty}$ .

**Remark 2.6.** We will see in [A](#page-40-0)ppendix A that  $\varphi$  is well-defined. In fact  $\|\varphi\|_{L^{\infty}(\Lambda)} \leq C$  uniformly in L but  $\|\varphi\|_{L^2(\Lambda)}$  diverges as  $L \to \infty$  (see Remark [A.3\)](#page-41-0).

<span id="page-7-0"></span>**Definition 2.7** (Quasi-bosonic transformations). For a parameter  $\lambda \in \mathbb{R}$ , we define

<span id="page-7-4"></span>
$$
T_{1;\lambda} = \exp\left(\lambda (B_1 - B_1^*)\right), \quad B_1 = \frac{1}{L^3} \sum_{p \in \Lambda^*} \hat{\varphi}(p) \hat{\chi}_> (p) \, b_{p,\uparrow} b_{-p,\downarrow},\tag{2.18}
$$

$$
T_{2;\lambda} = \exp\left(\lambda (B_2 - B_2^*)\right), \quad B_2 = \frac{1}{L^3} \sum_{p,r,r' \in \Lambda^*} \hat{\eta}_{r,r'}^{\varepsilon}(p) \hat{\chi}_{\leq}(p) b_{p,r,\uparrow} b_{-p,r',\downarrow},\tag{2.19}
$$

where  $\hat{\varphi}$  and  $\hat{\eta}_{r,r'}^{\varepsilon}$  are given in Definition [2.5.](#page-6-1) We also write  $T_1$  and  $T_2$  in place of  $T_{1,1}$  and  $T_{2,1}$ , respectively.

The cut-off  $\hat{\chi}_{>}(p)$  helps to regularize  $B_1$  since the function  $\tilde{\varphi} : \Lambda \to \mathbb{R}$  with  $\hat{\tilde{\varphi}}(p) = \hat{\varphi}(p)\hat{\chi}_{>}(p)$  is uniformly bounded in  $L^1(\Lambda) \cap L^{\infty}(\Lambda)$  (see Lemma [A.2\)](#page-40-3) as  $L \to \infty$ . In the expression for  $B_2$  in [\(2.19\)](#page-7-1), we only use  $\hat{\eta}_{r,r'}^{\varepsilon}(p)$  for momenta  $r \in \mathcal{B}_F^{\uparrow}$ ,  $r' \in \mathcal{B}_F^{\downarrow}$ ,  $r + p \notin \mathcal{B}_F^{\uparrow}$ ,  $r' - p \notin \mathcal{B}_F^{\downarrow}$ , where  $\lambda_{r,p} = |r + p|^2 - |r|^2 > 0$  and  $\lambda_{r',-p} = |r'-p|^2 - |r'|^2 > 0.$  The parameter  $\varepsilon = \varrho^{2/3+\delta}$  in the denominator of  $\hat{\eta}_{r,r'}^{\varepsilon}(p)$  is introduced for technical reasons to avoid logarithmic divergences otherwise encountered in integrals. At the end we shall choose  $\delta$  to satisfy  $16/63 \leq \delta \leq 8/9$ .

Remark 2.8 (Relation to Bethe–Goldstone equation). From our analysis, it may seem more natural to consider a trial state of the form  $\tilde{\psi}_{\text{trial}} := RT\Omega$ , with the unitary T given by

<span id="page-7-3"></span><span id="page-7-1"></span>
$$
T = \exp\left(\frac{1}{L^3} \sum_{p,r,r'} \hat{\varphi}_{r,r'}(p) b_{p,r,\uparrow} b_{-p,r',\downarrow} - \text{h.c.}\right),\tag{2.20}
$$

where  $\hat{\varphi}_{r,r'}$  is chosen to satisfy the equation

<span id="page-7-2"></span>
$$
2(|p|^2 + p \cdot (r - r'))\hat{\varphi}_{r,r'}(p) = \mathcal{F}(V_{\infty}(1 - \varphi_{r,r'}))(p)
$$
\n(2.21)

(in the infinity volume limit). Note that  $(2.21)$  reduces to  $(1.5)$  for  $r = r' = 0$ . Equation  $(2.21)$  can be interpreted as describing the scattering (at zero energy) of two particles at relative momentum  $p$ , with initial momenta r, r' within the Fermi sphere which is fully occupied. From the definition of  $b_{p,r,\uparrow}$  and  $b_{-p,r',\downarrow}$ , the function  $\varphi_{r,r'}(p)$  appearing in [\(2.20\)](#page-7-3) is naturally supported on the set where  $|r+p| \geq k_F^{\uparrow}, |r'-p| \geq k_F^{\downarrow}$ . Note that the effective kinetic energy

$$
2|p|^2 + 2p \cdot (r - r') = \lambda_{r,p} + \lambda_{r',-p}
$$

describes the difference between the kinetic energy of the two particles with initial momenta  $r, r'$  and excited momenta  $r + p$ ,  $r' - p$ , and is positive. Equation [\(2.21\)](#page-7-2) plays a prominent role in the physics literature. With the help of  $G_{r,r'}(p) := (\lambda_{r,p} + \lambda_{r',-p})\hat{\varphi}_{r,r'}(p)$ , it can be rewritten in the form

$$
G_{r,r'}(p) = \mathcal{F}(V_{\infty})(p) - \int_{|r+q| \ge k_F^{\uparrow}, |r'-q| \ge k_F^{\downarrow}} dq \frac{\mathcal{F}(V_{\infty})(p-q)}{\lambda_{r,q} + \lambda_{r',-q}} G_{r,r'}(q), \tag{2.22}
$$

which is known as the Bethe–Goldstone equation, see [\[7,](#page-45-16) Equation 2.2].

For technical reasons, we find it simpler not to work with  $\tilde{\psi}_{\text{trial}} = RT\Omega$ , but rather split the unitary into two parts,  $T_1$  and  $T_2$ . Note that the  $\hat{\varphi}$  in the definition of  $T_1$  depends only on the momentum p; in this sense  $T_1$  is "less refined" but it is sufficient to renormalize the interaction in  $\mathbb{Q}_2^{\uparrow\downarrow}$  into a softer one with integral given by  $8\pi a$ . On the other hand, the transformation  $T_2$  is "more refined" since the  $\hat{\eta}_{r,r'}^{\varepsilon}$  in  $T_2$  depends on  $p, r, r'$ , but it is also simpler than T since the function  $\hat{\eta}_{r,r'}^{\varepsilon}$  is explicit.

Note that on the support of  $\chi_{>}(p)$ , the term  $p \cdot (r - r')$  is subleading compared to  $p^2$ , hence it is natural to replace  $\varphi_{r,r'}$  by the usual scattering solution  $\varphi$  in  $T_1$ . On the other hand, on the support of  $\chi<$  and for  $r \in \mathcal{B}_F^{\uparrow}, r' \in \mathcal{B}_F^{\downarrow}, \mathcal{F}(V_{\infty}(1-\varphi_{r,r'}))(p)$  on the right-hand side of  $(2.21)$  can be replaced by  $8\pi a$  to leading order, naturally reducing  $\hat{\varphi}_{r,r'}$  to  $\hat{\eta}_{r,r'}^{\varepsilon}$  in this regime.

<span id="page-7-7"></span>Remark 2.9 (Configuration space representation). In the calculation below it will be convenient to estimate the error terms in configuration space. For this reason, we will often write

<span id="page-7-6"></span>
$$
B_1 = \int dz dz' \tilde{\varphi}(z - z') a_{\uparrow}(u_z) a_{\uparrow}(v_z) a_{\downarrow}(u_{z'}) a_{\downarrow}(v_{z'}) \tag{2.23}
$$

where

<span id="page-7-5"></span>
$$
\widetilde{\varphi}(p) = \mathcal{F}(\varphi_{\infty})(p)\widehat{\chi}_{>}(p). \tag{2.24}
$$

Useful bounds on the function  $\tilde{\varphi}$  will be given in Lemma [A.2.](#page-40-3)

Writing the unitary  $T_2$  in configuration space is a bit more complicated, since  $\hat{\eta}_{r,r'}^{\varepsilon}(p)$  depends on all the momenta involved in the definition of the transformation. First of all we notice that in the definition of  $B_2$  in [\(2.19\)](#page-7-1), the coefficients  $\hat{u}_{\uparrow}(r+p)$  and  $\hat{u}_{\downarrow}(r'-p)$  appearing in [\(2.14\)](#page-6-2) can be replaced by  $\hat{u}_{\uparrow}^{\leq}(r+p)$  and  $\hat{u}_{\downarrow}^{\leq}(r'-p)$ with

<span id="page-8-1"></span>
$$
\hat{u}_{\sigma}^{<}(k) := \begin{cases} 1 & \text{if } k_{F}^{\sigma} < |k| \le 6\varrho^{\frac{1}{3}-\gamma}, \\ 0 & \text{if } |k| < k_{F}^{\sigma}, \text{ or } |k| > 6\varrho^{\frac{1}{3}-\gamma}, \end{cases}
$$
(2.25)

since  $|p| \le 5\varrho^{1/3-\gamma}$  and both r and r' are bounded by (a constant times)  $\varrho^{1/3}$ , hence  $|r+p|, |r'-p| < 6\varrho^{1/3-\gamma}$ for  $\varrho$  small. Moreover, since both  $\lambda_{r,p}$  and  $\lambda_{r',-p}$  appearing in the denominator in the definition of  $\hat{\eta}_{r,r'}^{\varepsilon}$  in [\(2.17\)](#page-6-3) are positive, we can write

$$
\hat{\eta}_{r,r'}^{\varepsilon}(p) = 8\pi a \int_0^{\infty} dt \, e^{-(|r+p|^2 - |r|^2 + |r'-p|^2 - |r'|^2 + 2\varepsilon)t}
$$

for  $r + p \notin \mathcal{B}_F^{\uparrow}$ ,  $r' - p \notin \mathcal{B}_F^{\downarrow}$ ,  $r \in \mathcal{B}_F^{\uparrow}$  and  $r' \in \mathcal{B}_F^{\downarrow}$ . Therefore, introducing the functions

<span id="page-8-3"></span>
$$
\hat{v}^t_\sigma(\cdot) := e^{t|\cdot|^2} \hat{v}_\sigma(\cdot), \qquad \hat{u}^t_\sigma(\cdot) := e^{-t|\cdot|^2} \hat{u}^<\sigma(\cdot), \tag{2.26}
$$

with  $\hat{u}_{\sigma}^{\le}$  and  $\hat{v}_{\sigma}$  defined in [\(2.25\)](#page-8-1) and [\(2.4\)](#page-4-1), respectively, we can write  $B_2$  in configuration space as

<span id="page-8-4"></span>
$$
B_2 = 8\pi a \int_0^\infty dt \, e^{-2t\varepsilon} \int dz dz' \chi_<(z-z') a_\uparrow(u_z^t) a_\uparrow(v_z^t) a_\downarrow(u_{z'}^t) a_\downarrow(v_{z'}^t). \tag{2.27}
$$

A big advantage of choosing the explicit function [\(2.17\)](#page-6-3) (as opposed to the solution of [\(2.21\)](#page-7-2)) is to allow for this representation in configuration space.

**Remark 2.10.** The transformation  $T_1$  is related to the unitary transformation used in [\[21,](#page-46-11) Definition 4.3] (see also Remark 4.4 and Remark 4.5 in [\[21\]](#page-46-11)). In [\[21,](#page-46-11) Definition 4.3],  $T_1$  contains a cut-off around  $|x| \simeq \varrho^{-1/3}$ in configuration space, which is essentially equivalent to a cut-off around  $|p| \simeq \varrho^{1/3}$  in momentum space. In the present paper we choose a weaker localization with a momentum cut-off around  $|p| \simeq \varrho^{1/3-\gamma}$  in order to obtain better error estimates of order  $o(\varrho^{7/3})$ .

We conclude this section by showing that the trial state introduced in  $(2.13)$  is admissible, i.e., is a state with  $N_{\uparrow}$  particles with spin  $\uparrow$  and  $N_{\downarrow}$  particles with spin  $\downarrow$ . To see this, note that  $R\Omega$  is clearly admissible, and  $RB_jR$  commutes with  $\mathcal{N}_{\sigma}$  for  $j \in \{1,2\}$  and  $\sigma \in \{\uparrow,\downarrow\}$ , which can be deduced from the definitions in a straightforward way. Hence

$$
\mathcal{N}_{\sigma}\psi_{\text{trial}} = \mathcal{N}_{\sigma}RT_1T_2\Omega = RT_1T_2R\mathcal{N}_{\sigma}R\Omega = N_{\sigma}\psi_{\text{trial}}.
$$

### <span id="page-8-0"></span>2.4 Key estimates

Using the trial state [\(2.13\)](#page-6-4) and Proposition [2.3,](#page-5-0) we obtain as an upper bound to the ground state energy

$$
E_L(N_\uparrow, N_\downarrow) \le E_{\rm FFG} + \langle \Omega, T_2^* T_1^* \mathcal{H}_{\rm corr} T_1 T_2 \Omega \rangle \simeq E_{\rm FFG} + \langle \Omega, T_2^* T_1^* \mathcal{H}_{\rm corr}^{\rm eff} T_1 T_2 \Omega \rangle
$$

where  $\mathcal{H}_{\text{corr}}^{\text{eff}} = \mathbb{H}_0 + \mathbb{Q}_2^{\uparrow\downarrow} + \mathbb{Q}_4$  was defined in [\(2.12\)](#page-6-5). We shall now explain some key estimates in the computation of  $\langle \Omega, T_2^* T_1^* \mathcal{H}_{\text{corr}}^{\text{eff}} T_1 T_2 \Omega \rangle$ . In the first step, the unitary operator  $T_1$  introduced in [\(2.18\)](#page-7-4) is responsible for extracting the leading order of the interaction energy given by  $8\pi a \varrho_{\uparrow}\varrho_{\downarrow}$ . Moreover, via  $T_1$  we also renormalize the interaction, effectively replacing  $\mathbb{Q}_2^{\uparrow\downarrow} + \mathbb{Q}_4$  by the softer interaction

<span id="page-8-2"></span>
$$
\mathbb{Q}_{2;<} = \frac{8\pi a}{L^3} \sum_{p} \widehat{\chi}_{<}(p) b_{p,\uparrow} b_{-p,\downarrow} + \text{h.c.}.
$$
\n(2.28)

At this point the correlation operator to leading order reduces to  $\mathbb{H}_0 + \mathbb{Q}_{2;<}$ . To extract the next order correction to the correlation energy we then conjugate  $\mathbb{H}_0 + \mathbb{Q}_{2,\leq}$  by the unitary operator  $T_2$  in the second step.

**Step 1:** We conjugate the effective correlation operator with the unitary  $T_1$  by writing

$$
T_1^* \mathcal{H}_{\text{corr}}^{\text{eff}} T_1 = \mathcal{H}_{\text{corr}}^{\text{eff}} + \int_0^1 d\lambda \, \partial_\lambda T_{1;\lambda}^* \mathcal{H}_{\text{corr}}^{\text{eff}} T_{1;\lambda}
$$
  
=  $\mathcal{H}_{\text{corr}}^{\text{eff}} + \int_0^1 d\lambda T_{1;\lambda}^* [\mathcal{H}_{\text{corr}}^{\text{eff}}, B_1 - B_1^*] T_{1;\lambda},$ 

recalling the notation  $T_{1;\lambda} = \exp(\lambda(B_1 - B_1^*))$  introduced in [\(2.18\)](#page-7-4). To leading order, we shall see that

$$
[\mathbb{H}_0 + \mathbb{Q}_4, B_1 - B_1^*] \simeq -\frac{1}{L^3} \sum_p (2|p|^2 \hat{\varphi}(p)\hat{\chi}_> (p) + \hat{V} \ast_{\sum} (\hat{\varphi}\hat{\chi}_>)(p)) b_{p,\uparrow} b_{-p,\downarrow} + \text{h.c.}
$$

where  $*_{\Sigma}$  denotes the "discrete convolution" for functions defined on momentum space, namely

$$
(\hat{f} *_{\Sigma} \hat{g})(p) = \frac{1}{L^3} \sum_{q \in \Lambda^*} \hat{f}(p-q)\hat{g}(q) = (\widehat{fg})(p).
$$

This explains the choice of the function  $\hat{\varphi}\hat{\chi}$  appearing in  $B_1$ : From the zero-energy scattering equation [\(1.5\)](#page-1-3) we deduce that  $\hat{V} *_{\sum} \hat{\varphi}(p) \simeq \hat{V}(p) - 2|p|^2 \hat{\varphi}(p)$ . The operator  $\mathbb{Q}_2^{\uparrow\downarrow}$  in [\(2.10\)](#page-5-3) can equivalently be written as

$$
\mathbb{Q}_2^{\uparrow\downarrow} = \frac{1}{L^3} \sum_p \hat{V}(p) b_{p,\uparrow} b_{-p,\downarrow} + \text{h.c.}
$$

Since  $2|p|^2\hat{\varphi}(p) \simeq 8\pi a$  for small p, we conclude that

<span id="page-9-0"></span>
$$
\mathbb{Q}_2^{\uparrow\downarrow} + [\mathbb{H}_0 + \mathbb{Q}_4, B_1 - B_1^*] \simeq \mathbb{Q}_{2; <} + \widetilde{\mathbb{Q}}_{2; <} \tag{2.29}
$$

where  $\mathbb{Q}_{2;<}$  is defined in [\(2.28\)](#page-8-2) and

<span id="page-9-2"></span>
$$
\widetilde{\mathbb{Q}}_{2;<} = \frac{1}{L^3} \sum_{p} \widehat{V} *_{\Sigma} (\widehat{\varphi}\widehat{\chi}_{<}) (p) b_{p,\uparrow} b_{-p,\downarrow} + \text{h.c.}.
$$
\n(2.30)

We emphasize that  $\mathbb{Q}_{2;<}$  is a renormalized version of  $\mathbb{Q}_2^{\uparrow\downarrow}$ , where after taking the 2-body scattering process into account, we have the softer interaction potential  $8\pi a\hat{\chi}$  instead of  $\hat{V}$ . The operator  $\tilde{Q}_{2,<}$  will be important only in the next order of the Duhamel expansion, where it leads via a commutator to a term relevant for the correct Huang–Yang correction of order  $\varrho^{7/3}$ , as will be demonstrated below. In fact, applying [\(2.29\)](#page-9-0) we can extend the above Duhamel expansion as

$$
T_1^*(\mathbb{H}_0 + \mathbb{Q}_4 + \mathbb{Q}_2^{\uparrow\downarrow})T_1 = \mathbb{H}_0 + \mathbb{Q}_4 + \mathbb{Q}_2^{\uparrow\downarrow} + [\mathbb{H}_0 + \mathbb{Q}_4, B_1 - B_1^*]
$$
  
+  $\int_0^1 d\lambda (1 - \lambda) T_{1;\lambda}^* [(\mathbb{H}_0 + \mathbb{Q}_4, B_1 - B_1^*], B_1 - B_1^*] T_{1;\lambda} + \int_0^1 d\lambda T_{1;\lambda}^* [\mathbb{Q}_2^{\uparrow\downarrow}, B_1 - B_1^*] T_{1;\lambda}$   
 $\simeq \mathbb{H}_0 + \mathbb{Q}_4 + \mathbb{Q}_{2;\lt} + \tilde{\mathbb{Q}}_{2;\lt} + \int_0^1 d\lambda T_{1;\lambda}^* [\lambda \mathbb{Q}_2^{\uparrow\downarrow} + (1 - \lambda) (\mathbb{Q}_{2;\lt} + \tilde{\mathbb{Q}}_{2;\lt}), B_1 - B_1^*] T_{1;\lambda}. \tag{2.31}$ 

Computing the commutator in the last integrand and normal-ordering the expression leads to constant term, which is the leading contribution. The integration over  $\lambda$  then just gives a factor 1/2. We shall see that

$$
\frac{1}{2}[\mathbb{Q}_2^{\uparrow\downarrow} + \mathbb{Q}_{2,<} + \widetilde{\mathbb{Q}}_{2,<}, B_1 - B_1^*] \simeq -\varrho_{\uparrow}\varrho_{\downarrow} \sum_{p \in \Lambda^*} \hat{V}(p)\hat{\varphi}(p) + (8\pi a)^2 \varrho_{\uparrow}\varrho_{\downarrow} \sum_{0 \neq p \in \Lambda^*} \frac{\hat{\chi}_{<}(p)}{2|p|^2}.
$$

The first term on the right-hand side naturally combines with  $\hat{V}(0)\hat{q}\uparrow\hat{q}\downarrow$  from [\(2.3\)](#page-4-3) to yield the scattering length, since

<span id="page-9-1"></span>
$$
\hat{V}(0) - \frac{1}{L^3} \sum_{p \in \Lambda^*} \hat{V}(p)\hat{\varphi}(p) = (\hat{V} - \hat{V} *_{\sum} \hat{\varphi})(0) \simeq \int_{\mathbb{R}^3} V_{\infty}(1 - \varphi_{\infty}) = 8\pi a.
$$

Therefore, we obtain the upper bound

$$
\frac{E_L(N_\uparrow, N_\downarrow)}{L^3} \le \frac{3}{5} (6\pi^2)^{\frac{2}{3}} \left( \varrho_\uparrow^{\frac{5}{3}} + \varrho_\downarrow^{\frac{5}{3}} \right) + 8\pi a \varrho_\uparrow \varrho_\downarrow + \frac{(8\pi a)^2 \varrho_\uparrow \varrho_\downarrow}{L^3} \sum_{0 \ne p \in \Lambda^*} \frac{(\widehat{\chi}_< (p))^2}{2|p|^2} + \frac{1}{L^3} \langle T_2 \Omega, (\mathbb{H}_0 + \mathbb{Q}_4 + \mathbb{Q}_{2;<}) T_2 \Omega \rangle + o(\varrho^{\frac{7}{3}}). \tag{2.32}
$$

The rigorous justification of this statement is the content of Proposition [4.1.](#page-14-2)

**Step 2:** To complete the proof, we still have to compute the last term in  $(2.32)$ . We will see that  $\mathbb{Q}_4$  is negligible, i.e., that  $L^{-3}\langle T_2\Omega,\mathbb{Q}_4T_2\Omega\rangle = o(\varrho^{7/3})$  (see Proposition [5.3\)](#page-29-3). It therefore remains to conjugate the final effective correlation Hamiltonian  $\mathbb{H}_0 + \mathbb{Q}_{2,<}$  under  $T_2$ . As above we can write

$$
T_2^*(\mathbb{H}_0 + \mathbb{Q}_{2;<})T_2 = T_2^*\mathbb{Q}_{2;<}T_2 + \int_0^1 d\lambda T_{2;\lambda}^*[\mathbb{H}_0, B_2 - B_2^*]T_{2;\lambda}
$$

where  $T_{2,\lambda} = \exp(\lambda(B_2 - B_2^*))$ . From the definition of the unitary operator  $T_2$  (see [\(2.19\)](#page-7-1) and [\(2.17\)](#page-6-3)), we find that

<span id="page-10-5"></span><span id="page-10-4"></span>
$$
[\mathbb{H}_0, B_2 - B_2^*] \simeq -\mathbb{Q}_{2;<}.
$$
\n(2.33)

As a consequence, we obtain

$$
T_2^*(\mathbb{H}_0 + \mathbb{Q}_{2;<})T_2 \simeq T_2^*\mathbb{Q}_{2;<}T_2 - \int_0^1 d\lambda T_{2;\lambda}^*\mathbb{Q}_{2;<}T_{2;\lambda} = \int_0^1 d\lambda \lambda T_{2;\lambda}^*[\mathbb{Q}_{2;<},B_2 - B_2^*]T_{2;\lambda}.
$$

Computing the commutator and normal-ordering leads to a constant contribution in the last expression, which is the leading term and given by

$$
\frac{1}{2}[\mathbb{Q}_{2,<},B_2 - B_2^*] \simeq -\frac{(8\pi a)^2}{L^6} \sum_{p,r,r' \in \Lambda^*} \frac{\hat{u}_{\uparrow}(r+p)\hat{u}_{\downarrow}(r'-p)\hat{v}_{\uparrow}(r)\hat{v}_{\downarrow}(r')}{|r+p|^2 - |r|^2 + |r'-p|^2 - |r'|^2 + 2\varepsilon} (\hat{x}_{<}(p))^2, \tag{2.34}
$$

where  $\hat{u}_{\sigma}$  and  $\hat{v}_{\sigma}$  are given in [\(2.15\)](#page-6-6). The rigorous justification of this formula is contained in Proposition [5.5.](#page-36-1) Combining both transformations we find that the energy per unit volume satisfies

$$
\begin{aligned} \frac{E_L(N_\uparrow,N_\downarrow)}{L^3} &\leq \frac{3}{5} (6\pi^2)^{\frac{2}{3}} \left( \varrho_\uparrow^{\frac{5}{3}} + \varrho_\downarrow^{\frac{5}{3}} \right) + 8\pi a \varrho_\uparrow \varrho_\downarrow \\ &\quad - \frac{(8\pi a)^2}{L^9} \sum_{p,r,r'\in \Lambda^*} \left( \frac{\hat{u}_\uparrow (r+p) \hat{u}_\downarrow (r'-p) \hat{v}_\uparrow (r) \hat{v}_\downarrow (r')}{|r+p|^2 - |r|^2 + |r'-p|^2 - |r'|^2 + 2\varepsilon} - \frac{1}{2|p|^2} \right) (\hat{\chi}_< (p))^2 + o(\varrho^{\frac{7}{3}}). \end{aligned}
$$

To conclude we can remove the  $\varepsilon$  and the momentum cut-off in the third term (see Lemma [6.1\)](#page-39-2) to get, in the thermodynamic limit,

$$
e(\varrho_{\uparrow},\varrho_{\downarrow}) \leq \frac{3}{5} (6\pi^2)^{\frac{2}{3}} \left( \varrho_{\uparrow}^{\frac{5}{3}} + \varrho_{\downarrow}^{\frac{5}{3}} \right) + 8\pi a \varrho_{\uparrow} \varrho_{\downarrow}
$$
  

$$
- \frac{(8\pi a)^2}{(2\pi)^9} \int_{\mathbb{R}^3} dp \int_{\mathcal{B}_F^{\uparrow}} dr \int_{\mathcal{B}_F^{\downarrow}} dr' \left( \frac{\chi_{\mathcal{B}_F^{\uparrow}}^c (r+p) \chi_{\mathcal{B}_F^{\downarrow}}^c (r'-p)}{|r+p|^2 - |r'|^2 + |r'-p|^2 - |r'|^2} - \frac{1}{2|p|^2} \right) + o(\varrho^{\frac{7}{3}}).
$$

The evaluation of the last integral yields the expression  $a^2 \varrho_1^{\frac{7}{3}} F(\varrho_1/\varrho_1)$  in Theorem [1.2,](#page-2-0) as will be demonstrated in Appendix [B.](#page-42-1)

# <span id="page-10-0"></span>3 Preliminary bounds and effective correlation operator

In this section, we collect some useful preliminary bounds that we will use frequently in our analysis. We also identify the effective correlation operator from which we will extract the desired expression for the energy in the upper bound in Theorem [1.2.](#page-2-0) As usual, we will denote by  $C$  generic constants in the following, which may have different values at different occurrences.

### <span id="page-10-1"></span>3.1 Some operator bounds

In this subsection we collect some general operator inequalities. For  $g \in L^1(\Lambda)$ , define

<span id="page-10-2"></span>
$$
b_{\sigma}(g) := \int_{\Lambda} dz \, g(z) a_{\sigma}(u_z) a_{\sigma}(v_z)
$$
\n(3.1)

where we recall the notation [\(2.7\)](#page-5-4). Similarly, we define

<span id="page-10-3"></span>
$$
b_{j,\sigma}(g) = \int_{\Lambda} dz \, g(z) a_{\sigma}(u_z) a_{\sigma}(\partial_j v_z), \qquad j = 1, 2, 3.
$$
 (3.2)

<span id="page-11-3"></span>**Lemma 3.1** (Bounds for  $b_{\sigma}(\tilde{\varphi}_z)$ ,  $b_{j,\sigma}(\tilde{\varphi}_z)$ ). For  $\tilde{\varphi}$  defined in [\(2.24\)](#page-7-5) let  $\tilde{\varphi}_z(z') = \varphi(z - z')$ . Then

<span id="page-11-1"></span>
$$
||b_{\sigma}(\widetilde{\varphi}_z)|| \le C\varrho^{\frac{1}{3} + \frac{\gamma}{2}}, \qquad ||b_{j,\sigma}(\widetilde{\varphi}_z)|| \le C\varrho^{\frac{2}{3} + \frac{\gamma}{2}}, \qquad j = 1, 2, 3 \tag{3.3}
$$

uniformly in  $z \in \Lambda$ .

Proof. The proof is analogous to the one of [\[21,](#page-46-11) Lemma 4.8]. We have

<span id="page-11-0"></span>
$$
b_{\sigma}(\tilde{\varphi}_z) = \int_{\Lambda} dz' \, \tilde{\varphi}(z - z') a_{\sigma}(u_{z'}) a_{\sigma}(v_{z'}) = \frac{1}{L^3} \sum_{p,k} \hat{\varphi}(p) \hat{\chi}_{>}(p) e^{ip \cdot z} \hat{u}_{\sigma}(k+p) \hat{v}_{\sigma}(k) \hat{a}_{k+p,\sigma} \hat{a}_{-k,\sigma}
$$
  

$$
= \frac{1}{L^3} \sum_{p,k} \hat{\varphi}(p) \hat{\chi}_{>}(p) e^{ip \cdot z} \hat{v}_{\sigma}(k) \mathbb{1}_{\{|k+p| \ge 3\varrho^{1/3-\gamma}\}} \hat{a}_{k+p,\sigma} \hat{a}_{-k,\sigma}, \tag{3.4}
$$

where we used that the conditions  $|p| \ge 4\varrho^{1/3-\gamma}$  and  $|k| < k_F^{\sigma}$  imply that  $|k+p| \ge 3\varrho^{1/3-\gamma}$  for small  $\varrho$ , and hence  $\hat{u}_{\sigma}(k+p) = 1$ . We multiply and divide the expression on the right hand side of [\(3.4\)](#page-11-0) by  $|k+p|^2$  and decompose  $b_{\sigma}(\tilde{\varphi}_z)$  as a sum of three terms. Writing them in configuration space, we obtain

$$
b_{\sigma}(\widetilde{\varphi}_z) = -\int dz' \Delta \widetilde{\varphi}(z - z') a_{\sigma}(\widetilde{u}_{z'}) a_{\sigma}(v_{z'}) + 2 \sum_{j=1}^3 \int dz' \partial_j \widetilde{\varphi}(z - z') a_{\sigma}(\widetilde{u}_{z'}) a_{\sigma}(\partial_j v_{z'})
$$

$$
- \int dz' \widetilde{\varphi}(z - z') a_{\sigma}(\widetilde{u}_{z'}) a_{\sigma}(\Delta v_{z'}),
$$

where

$$
\widetilde{u}_x(y) := \frac{1}{L^3} \sum_{p \in \Lambda^*} \frac{1}{|p|^2} \mathbb{1}_{\{|p| \ge 3e^{1/3 - \gamma}\}} e^{ip \cdot (y - x)}.
$$
\n(3.5)

Using  $(2.1)$  we thus obtain

$$
||b_{\sigma}(\widetilde{\varphi}_z)|| \leq ||v_{\sigma}||_2 ||\widetilde{u}||_2 ||\Delta \widetilde{\varphi}||_1 + 2||\nabla v_{\sigma}||_2 ||\widetilde{u}||_2 ||\nabla \widetilde{\varphi}||_1 + ||\Delta v_{\sigma}||_2 ||\widetilde{u}||_2 ||\widetilde{\varphi}||_1 \leq C \varrho^{\frac{1}{3} + \frac{\gamma}{2}},
$$

where in last step we used [\(A.3\)](#page-41-1) to bound the various norms involving  $\tilde{\varphi}$ , as well as  $\|\tilde{u}\|_2 \leq C\varrho^{\gamma/2-1/6}$  and  $\|\partial^n v_\sigma\|_2 \leq C\varrho^{1/2+n/3}.$ 

For the proof of the second estimate in [\(3.3\)](#page-11-1) we can proceed in the same way. The extra factor  $\varrho^{1/3}$  arises from the additional derivative hitting  $v_{\sigma}$ .  $\Box$ 

<span id="page-11-6"></span>**Lemma 3.2.** For any  $g \in L^1(\Lambda) \cap L^2(\Lambda)$ , we have

<span id="page-11-2"></span>
$$
||b^*_{\sigma}(g)\psi||^2 \le ||b_{\sigma}(g)\psi||^2 + C\varrho||g||_2^2 \qquad \forall \psi \in \mathcal{F}, \ \|\psi\| = 1. \tag{3.6}
$$

*Proof.* The proof of  $(3.6)$  can be done as in [\[17,](#page-45-3) Proposition 5.1, Eq.  $(5.10)$ ]. The idea is to write

$$
||b^*_{\sigma}(g)\psi||^2 = ||b_{\sigma}(g)\psi||^2 - \langle \psi, [b^*_{\sigma}(g), b_{\sigma}(g)]\psi \rangle,
$$

and to use the positivity of the (normal-ordered) quadratic terms in the commutator above, obtaining

$$
-[b^*_{\sigma}(g_z), b_{\sigma}(g_z)] \leq \frac{1}{L^6} \sum_{k,r} |\hat{g}(k)|^2 \hat{v}_{\sigma}(r) \hat{u}_{\sigma}(r+k).
$$

Bounding  $\hat{u}_{\sigma}$  by 1, the result follows.

Next, we turn to the number operator  $N$  on Fock space, which, after the particle-hole transformation R, measures the number of excitations above the Fermi sea. We have the following estimates concerning its behavior under the quasi-bosonic transformations  $T_{1;\lambda}$  and  $T_{2;\lambda}$  defined in Section [2.3.](#page-6-0)

<span id="page-11-5"></span>**Proposition 3.3** (Estimate for  $\mathcal{N}$  – Part I). Let  $\lambda \in [0,1]$  and  $0 < \gamma < 1/3$ . For any normalized  $\psi \in \mathcal{F}_f$ , we have

<span id="page-11-4"></span>
$$
\langle T_{1,\lambda}\psi, \mathcal{N}T_{1,\lambda}\psi \rangle \le C \langle \psi, \mathcal{N}\psi \rangle + C L^3 \varrho^{\frac{5}{3}+\gamma}.
$$
 (3.7)

Proof. The proof is very similar to the one in [\[21,](#page-46-11) Proposition 4.11]. We compute

$$
\partial_{\lambda} T_{1;\lambda}^{*} \mathcal{N} T_{1;\lambda} = T_{1;\lambda}^{*} [\mathcal{N}, B_{1} - B_{1}^{*}] T_{1;\lambda} = -4 T_{1;\lambda}^{*} (B_{1} + B_{1}^{*}) T_{1;\lambda}
$$
  
= 
$$
4 T_{1;\lambda}^{*} \left( \int dz \, b_{\downarrow} (\tilde{\varphi}_{z}) a_{\uparrow} (v_{z}) a_{\uparrow} (u_{z}) + \text{h.c.} \right) T_{1;\lambda},
$$

where we used the definition [3.1](#page-10-2) and the form of  $B_1$  in [\(2.23\)](#page-7-6). Using that  $||a_{\uparrow}(v_z)|| = ||v_{\uparrow}||_2 \le \varrho^{1/2}$  as well as the bound [\(3.3\)](#page-11-1) from Lemma [3.1,](#page-11-3) we obtain with the help of the Cauchy–Schwarz inequality

$$
|\partial_{\lambda}\langle T_{1;\lambda}\psi,\mathcal{N}T_{1;\lambda}\psi\rangle|\leq C\varrho^{\frac{5}{6}+\frac{\gamma}{2}}\int dz\,\|a_{\uparrow}(u_{z})T_{1;\lambda}\psi\|\leq CL^{\frac{3}{2}}\varrho^{\frac{5}{6}+\frac{\gamma}{2}}\|\mathcal{N}^{\frac{1}{2}}T_{1;\lambda}\psi\|.
$$

The bound  $(3.7)$  then follows from Grönwall's Lemma.

<span id="page-12-0"></span>Before considering the analogous problem for  $T_{2;\lambda}$  we shall prove the following Lemma. **Lemma 3.4** (Integration over t). Let  $0 < \gamma < 1/3$  and  $0 < \delta \le 8\gamma$ . For  $v^t_\sigma$  and  $u^t_\sigma$  defined in [\(2.26\)](#page-8-3), we have

<span id="page-12-1"></span>
$$
\int_0^\infty dt \, e^{-2t\varepsilon} e^{2t(k_F^\sigma)^2} \|u_\sigma^t\|_2^2 \le C \varrho^{\frac{1}{3}-\gamma}
$$
\n(3.8)

and

<span id="page-12-2"></span>
$$
\int_0^\infty dt \, e^{-2t\varepsilon} e^{-2t(k_F^\sigma)^2} \|v_\sigma^t\|_2^2 \le C\varrho^{\frac{1}{3} - \frac{\delta}{8}}.
$$
\n(3.9)

The proof shows that the factor 8 can be replaced by any other number. The choice 8 guarantees that the final error bound is independent of it. In the following we will often use

<span id="page-12-3"></span>
$$
\int dt \, e^{-2t\varepsilon} \|u_{\sigma}^{t}\|_{2} \|v_{\sigma}^{t}\|_{2} \leq C \varrho^{\frac{1}{3} - \frac{\gamma}{2} - \frac{\delta}{16}} \tag{3.10}
$$

which follows from Lemma [3.4](#page-12-0) by the Cauchy–Schwarz inequality.

*Proof.* We start with proving  $(3.8)$ . Writing the  $L^2$ -norm as a sum in momentum space, we have

$$
\int_0^\infty dt \, e^{-2t\varepsilon} e^{2t(k_F^\sigma)^2} \|u_\sigma^t\|_2^2 = \frac{1}{2L^3} \sum_k \frac{|\hat{u}_\sigma^< (k)|^2}{|k|^2 - (k_F^\sigma)^2 + \varepsilon}.
$$

Since  $\hat{u}_{\sigma}^{(k)}(k)$  is supported on  $k_F^{\sigma} < |k| \leq 6\varrho^{\frac{1}{3}-\gamma}$  (see [\(2.25\)](#page-8-1)), the contribution to the sum from  $|k| \geq 2k_F^{\sigma}$  is bounded by  $C\varrho^{1/3-\gamma}$ . For the remaining part, we bound the sum by the corresponding integral and obtain

$$
\frac{1}{2L^3} \sum_{k_F^{\uparrow} < |k| < 2k_F^{\sigma}} \frac{1}{(|k| - k_F^{\sigma})(|k| + k_F^{\sigma}) + \varepsilon} \leq C \int_{k_F^{\sigma} \leq |k| \leq 2k_F^{\sigma}} dk \frac{1}{(|k| - k_F^{\sigma})(|k| + k_F^{\sigma}) + \varepsilon} \\
\leq C k_F^{\sigma} \log \left( 1 + \frac{(k_F^{\sigma})^2}{\varepsilon} \right).
$$

The last factor grows only logarithmically with  $(k_F^{\sigma})^2/\varepsilon \lesssim \varrho^{-\delta}$ , hence we can bound it by  $C\varrho^{-\delta/8}$ . This term is negligible compared to the one of order  $\varrho^{1/3-\gamma}$  above, and we arrive at [\(3.8\)](#page-12-1). For [\(3.9\)](#page-12-2) we have analogously

$$
\int_0^\infty dt \, e^{-2t\varepsilon} e^{-2t(k_F^\uparrow)^2} \|v_\uparrow^t\|_2^2 = \frac{1}{2L^3} \sum_k \frac{|\hat{v}_\uparrow(k)|^2}{(k_F^\uparrow)^2 - |k|^2 + \varepsilon}.
$$

The sum can be bounded very similarly as above, with the result that

$$
\frac{1}{2L^3}\sum_k \frac{|\hat{v}_\sigma(k)|^2}{(k_F^\sigma)^2-|k|^2+\varepsilon}\leq C\int_{0\leq |k|\leq k_F^\sigma}dk\frac{1}{(k_F^\sigma-|k|)(k_F^\sigma+|k|)+\varepsilon}\leq Ck_F^\sigma\log\left(1+\frac{(k_F^\sigma)^2}{\varepsilon}\right)\leq C\varrho^{\frac{1}{3}-\frac{\delta}{8}}.
$$

 $\Box$ 

<span id="page-13-3"></span>**Proposition 3.5** (Estimate for  $\mathcal{N}$  – Part II). Let  $0 < \delta \leq 8\gamma$  for some  $0 < \gamma < 1/3$ , and  $\lambda \in [0,1]$ . For any normalized  $\psi \in \mathcal{F}_{f}$ , we have

<span id="page-13-1"></span>
$$
|\partial_{\lambda} \langle T_{2,\lambda} \psi, \mathcal{N} T_{2,\lambda} \psi \rangle| \leq C L^{\frac{3}{2}} \varrho^{\frac{5}{6} - \frac{\gamma}{2} - \frac{\delta}{16}} \|\mathcal{N}^{\frac{1}{2}} T_{2,\lambda} \psi\|.
$$
 (3.11)

Furthermore,

<span id="page-13-2"></span>
$$
\langle T_{1,\lambda} T_2 \Omega, \mathcal{N} T_{1,\lambda} T_2 \Omega \rangle \leq C L^3 \varrho^{\frac{5}{3} - \gamma - \frac{\delta}{8}}.
$$
\n(3.12)

Proof. As in Proposition [3.3,](#page-11-5) we compute

$$
\partial_{\lambda} T_{2,\lambda}^{*} \mathcal{N} T_{2,\lambda} = T_{2,\lambda}^{*} [\mathcal{N}, B_2 - B_2^{*}] T_{2,\lambda} = -4 T_{2,\lambda}^{*} (B_2 + B_2^{*}) T_{2,\lambda}.
$$

In particular, inserting the expression  $(2.27)$  for  $B_2$ , we have

$$
\partial_{\lambda}T_{2;\lambda}^{\ast}\mathcal{N}T_{2;\lambda} = 4T_{2;\lambda}^{\ast}\left(8\pi a \int_0^{\infty} dt \, e^{-2t\varepsilon} \int dx dy \, \chi_<(x-y)\langle a_{\uparrow}(u_x^t)a_{\uparrow}(v_x^t)a_{\downarrow}(v_y^t)a_{\downarrow}(u_y^t) + \text{h.c.}\right) T_{2;\lambda},
$$

where  $u^t_{\sigma}$  and  $v^t_{\sigma}$  are defined in [\(2.26\)](#page-8-3). We can then estimate

$$
\begin{array}{rcl}\n|\partial_{\lambda}\langle T_{2;\lambda}\psi,\mathcal{N}T_{2;\lambda}\psi\rangle| & \leq & C\int dt \, e^{-2t\varepsilon} \|u_{\uparrow}^{t}\|_{2} \|v_{\uparrow}^{t}\|_{2} \|v_{\downarrow}^{t}\|_{2} \int dx dy \, |\chi_{<}(x-y)| \|a_{\downarrow}(u_{y}^{t})T_{2;\lambda}\psi\| \\
& \leq & CL^{\frac{3}{2}} \varrho^{\frac{1}{2}} \|\mathcal{N}^{\frac{1}{2}}T_{2;\lambda}\psi\| \int dt \, e^{-2t\varepsilon} \|u_{\uparrow}^{t}\|_{2} \|\hat{v}_{\uparrow}^{t}\|_{2},\n\end{array} \tag{3.13}
$$

where we used that  $||\chi_{\leq}||_1 \leq C, ||v_{\downarrow}^t||_2 \leq C \varrho^{1/2} e^{t(k_F^{\downarrow})^2}$ , and that

<span id="page-13-4"></span>
$$
\int dy \, \|a_{\sigma}(u_y^t)\psi\|^2 = \sum_k |\hat{u}_{\sigma}^t(k)|^2 \langle \psi, \hat{a}_{k,\sigma}^* \hat{a}_{k,\sigma} \psi \rangle \le \sum_{|k| > k_F^{\sigma}} e^{-2t|k|^2} \langle \psi, \hat{a}_{k,\downarrow}^* \hat{a}_{k,\downarrow} \psi \rangle \le e^{-2t(k_F^{\sigma})^2} \langle \psi, \mathcal{N}\psi \rangle, \tag{3.14}
$$

along with the Cauchy–Schwarz inequality. The desired bound [\(3.11\)](#page-13-1) then follows from [\(3.10\)](#page-12-3).

Grönwall's Lemma readily implies [\(3.12\)](#page-13-2) for  $\lambda = 0$ . The general case then follows directly from [\(3.7\)](#page-11-4).  $\Box$ 

### <span id="page-13-0"></span>3.2 Simplified correlation operator

In this section, we collect some bounds already discussed in [\[17,](#page-45-3) [21\]](#page-46-11), which allow to reduce the correlation operator  $\mathcal{H}_{\text{corr}} = \mathbb{H}_0 + \mathbb{X} + \sum_{i=1}^4 \mathbb{Q}_i$  defined in [\(2.10\)](#page-5-3) to a simplified one as far as the energy of our trial state  $\psi_{\text{trial}} = RT_1T_2\Omega$  is concerned. We shall see that we can ignore the contributions of  $\mathbb{X}, \mathbb{Q}_1, \mathbb{Q}_2^{\parallel}$  and  $\mathbb{Q}_3$ .

### Estimates for  $\mathbb{X}$  and  $\mathbb{Q}_1$

Proceeding as in the proof of [\[17,](#page-45-3) Proposition 3.3], it is easy to see that

$$
|\langle \psi, \mathbb{X} \psi \rangle| \le C_{\mathcal{Q}} \langle \psi, \mathcal{N} \psi \rangle, \qquad |\langle \psi, \mathbb{Q}_1 \psi \rangle| \le C_{\mathcal{Q}} \langle \psi, \mathcal{N} \psi \rangle, \qquad \forall \psi \in \mathcal{F}_{f}.\tag{3.15}
$$

This estimate guarantees that  $\langle T_1 T_2 \Omega, (\mathbb{X} + \mathbb{Q}_1) T_1 T_2 \Omega \rangle = L^3 o(\varrho^{7/3})$ , as a direct consequence of the bound for the number operator in [\(3.12\)](#page-13-2), as long as  $\gamma + \delta/8 < 1/3$ .

### Estimate for  $\mathbb{Q}_3$

We note that the state  $T_1T_2\Omega$  is such that in the *n*-particle sector of the Fock space  $(T_1T_2\Omega)^{(n)} = 0$  unless  $n = 4k$  for  $k \in \mathbb{N}$ . This is a consequence of the fact that both  $B_1$  and  $B_2$  either create or annihilate 4 particles. Since  $\mathbb{Q}_3$  changes the particle number by  $\pm 2$ , we immediately conclude that  $\langle T_1T_2\Omega, \mathbb{Q}_3T_1T_2\Omega \rangle = 0$ .

#### $\text{Estimate for } \mathbb{Q}_2^\parallel$ 2

We shall now argue, similarly as above, that also  $\langle T_1T_2\Omega, \mathbb{Q}_2^{\parallel}T_1T_2\Omega\rangle = 0$ . This follows from the fact that  $T_1T_2\Omega$  and  $\mathbb{Q}_2^{\parallel}T_1T_2\Omega$  are orthogonal, since  $\mathbb{Q}_2^{\parallel}$  creates or annihilates 4 particles of the same spin, while in the state  $T_1T_2\Omega$  the number of particles in each spin component is the same, since both  $T_1$  and  $T_2$  create particle (and annihilate) pairs of opposite spin simultaneously.

In summary, we obtain the following simplification of the correlation Hamiltonian.

<span id="page-14-3"></span>Proposition 3.6 (Effective correlation operator). We have

$$
\langle T_1 T_2 \Omega, \mathcal{H}_{\text{corr}} T_1 T_2 \Omega \rangle \le \langle T_1 T_2 \Omega, \mathcal{H}_{\text{corr}}^{\text{eff}} T_1 T_2 \Omega \rangle + C L^3 \varrho^{\frac{8}{3} - \gamma - \frac{\delta}{8}}
$$

where  $\mathcal{H}_{\text{corr}}^{\text{eff}} = \mathbb{H}_0 + \mathbb{Q}_2^{\uparrow\downarrow} + \mathbb{Q}_4$  (with the various terms defined in [\(2.10\)](#page-5-3)).

# <span id="page-14-0"></span>4 First quasi-bosonic Bogoliubov transformation  $T_1$

In this section we perform the first step discussed in Section [2.4,](#page-8-0) i.e., we conjugate the effective correlation operator  $\mathcal{H}_{\text{corr}}^{\text{eff}} = \mathbb{H}_0 + \mathbb{Q}_2^{\uparrow\downarrow} + \mathbb{Q}_4$  in Proposition [3.6](#page-14-3) with the unitary  $T_1$  introduced in [\(2.18\)](#page-7-4). The main result of this section is the following rigorous version of [\(2.32\)](#page-9-1). Throughout this section, we shall denote by  $o(1)_{L\to\infty}$ terms that vanish in the thermodynamic limit (and likewise  $o(L^{\alpha})_{L\to\infty}$  for those that vanish after dividing by  $L^{\alpha}$ ). We shall not specify their  $\varrho$ -dependence since we take  $L \to \infty$  before considering the low density limit.

<span id="page-14-2"></span>**Proposition 4.1** (Conjugation by T<sub>1</sub>). For any  $\gamma \in (0, \frac{1}{6})$ ,  $\delta \in (0, 8\gamma]$  with  $2\gamma + \frac{\delta}{16} \leq \frac{1}{3}$  we have

$$
\frac{1}{L^3} \langle T_1 T_2 \Omega, \mathcal{H}_{\text{corr}}^{\text{eff}} T_1 T_2 \Omega \rangle \leq \varrho_{\uparrow} \varrho_{\downarrow} \left( 8\pi a - \hat{V}(0) + \frac{1}{L^3} \sum_{0 \neq p \in \Lambda^*} \frac{(8\pi a)^2 (\hat{\chi}_{<}(p))^2}{2|p|^2} \right) \n+ \frac{1}{L^3} \langle T_2 \Omega, (\mathbb{H}_0 + \mathbb{Q}_{2;<} + \mathcal{E}_{\mathbb{H}_0} + C \varrho^{\frac{2}{3} + 2\gamma - \frac{2}{3}} \mathbb{H}_0 + C \mathbb{Q}_4) T_2 \Omega \rangle + C \varrho^{\frac{8}{3} - 2\gamma} + o(1)_{L \to \infty}
$$
\n(4.1)

with  $\mathbb{Q}_{2;<}$  defined in [\(2.28\)](#page-8-2) and

<span id="page-14-9"></span><span id="page-14-4"></span>
$$
\mathcal{E}_{\mathbb{H}_0} = -\frac{2}{L^3} \sum_{k,s,s' \in \Lambda^*} k \cdot (s - s') \hat{\varphi}(k) \hat{\chi}_>(k) b_{k,s,\uparrow} b_{-k,s',\downarrow} + \text{h.c.}.
$$
 (4.2)

The operator  $\mathbb{Q}_{2;<}$  can be interpreted as a renormalized version of  $\mathbb{Q}_2^{\uparrow\downarrow}$ , where the effect of the 2-body scattering process have been taken into account, leading to the softer interaction potential  $8\pi a\hat{\chi}_\text{c}$  instead of  $\hat{V}$ . This operator, together with the kinetic energy operator  $\mathbb{H}_0$ , allows us to extract the full constant term of order  $\varrho^{7/3}$  after conjugation with  $T_2$ . The error term  $\langle T_2\Omega, (\mathcal{E}_{\mathbb{H}_0}+C\varrho^{\frac{2}{3}+2\gamma-\frac{\delta}{8}}\mathbb{H}_0+C\mathbb{Q}_4)T_2\Omega\rangle$  will be estimated in the next section.

To prove Proposition [4.1,](#page-14-2) we first consider the conjugation of the operators  $\mathbb{H}_0$ ,  $\mathbb{Q}_4$  and  $\mathbb{Q}_2^{\uparrow\downarrow}$  with respect to the unitary  $T_1$  separately in Sections [4.1–](#page-14-1)[4.3.](#page-19-0) Then in Section [4.4](#page-21-0) we use the zero-energy scattering equation [\(1.5\)](#page-1-3) to justify [\(2.29\)](#page-9-0), effectively leading to  $\mathbb{Q}_{2,<}$  as a renormalization of  $\mathbb{Q}_2^{\uparrow\downarrow}$ . In Section [4.5](#page-25-0) we prove propagation bounds for the operators  $\mathbb{H}_0$  and  $\mathbb{Q}_4$ , which help to control some of the error terms. Finally, in Section [4.6](#page-26-0) we collect all the estimates and complete the proof of Proposition [4.1.](#page-14-2)

In the following we will often use the expression  $(2.23)$  for  $T_1$  in configuration space, together with several estimates on  $\tilde{\varphi}$  from Lemma [A.2.](#page-40-3)

### <span id="page-14-1"></span>4.1 Conjugation of  $\mathbb{H}_0$

First, let us consider the conjugation of  $\mathbb{H}_0$  by  $T_1$ . Our goal is to extract a (quasi-bosonic) quadratic term which helps to renormalize the interaction potential in  $\mathbb{Q}_2^{\uparrow\downarrow}$ .

<span id="page-14-6"></span>**Proposition 4.2** (Conjugation of  $\mathbb{H}_0$  by  $T_1$ ). Let  $\lambda \in [0, 1]$  and  $\gamma \in (0, 1/3)$ . Under the same assumptions as in Theorem [1.2](#page-2-0)

<span id="page-14-7"></span>
$$
\partial_{\lambda} T_{1;\lambda}^* \mathbb{H}_0 T_{1;\lambda} = T_{1;\lambda}^* (\mathbb{T}_1 + \mathcal{E}_{\mathbb{H}_0}) T_{1;\lambda}, \tag{4.3}
$$

where  $\mathcal{E}_{\mathbb{H}_0}$  is given in [\(4.2\)](#page-14-4), and

<span id="page-14-8"></span>
$$
\mathbb{T}_1 = -\frac{2}{L^3} \sum_{k \in \Lambda^*} |k|^2 \hat{\varphi}(k) \hat{\chi}_> (k) b_{k,\uparrow} b_{-k,\downarrow} + \text{h.c.} \tag{4.4}
$$

Furthermore, for any  $\psi \in \mathcal{F}_f$ 

<span id="page-14-5"></span>
$$
|\partial_{\lambda}\langle T_{1,\lambda}\psi,\mathcal{E}_{\mathbb{H}_0}T_{1,\lambda}\psi\rangle|\leq C\varrho^{1+\gamma}\|\mathbb{H}_0^{\frac{1}{2}}T_{1,\lambda}\psi\|\|\mathcal{N}^{\frac{1}{2}}T_{1,\lambda}\psi\|+C\varrho^{\frac{4}{3}+\gamma}\langle T_{1,\lambda}\psi,\mathcal{N}T_{1,\lambda}\psi\rangle.
$$
(4.5)

<span id="page-15-6"></span>Remark 4.3. In our analysis,  $\mathcal{E}_{\mathbb{H}_0}$  gives rise to an error term. In order to estimate it, in Section [4.6](#page-26-0) (see  $(4.71)$ – $(4.72)$ , we shall apply Duhamel's formula again, in the form

$$
T_{1;\lambda}^*\mathcal{E}_{\mathbb{H}_0}T_{1;\lambda}=\mathcal{E}_{\mathbb{H}_0}+\int_0^\lambda d\lambda'\,\partial_{\lambda'}T_{1;\lambda'}^*\mathcal{E}_{\mathbb{H}_0}T_{1;\lambda'},
$$

and use [\(4.5\)](#page-14-5) to estimate the last term above.

Remark 4.4 (Comparison with [\[21\]](#page-46-11)). The proof of Proposition [4.2](#page-14-6) is similar to that in [\[21,](#page-46-11) Proposition 5.1 and Lemma 5.2]. However, here we do not need to insert a smooth cut-off in the projection inside or outside the Fermi ball, which simplifies and improves many estimates.

*Proof of Proposition [4.2.](#page-14-6)* The equality in  $(4.3)$  is a straightforward consequence of

<span id="page-15-0"></span>
$$
\partial_{\lambda}T_{1;\lambda}^*\mathbb{H}_0T_{1;\lambda}=T_{1;\lambda}^*[\mathbb{H}_0,B_1-B_1^*]T_{1;\lambda},
$$

inserting the definitions of  $\mathbb{H}_0$  and  $B_1$  in [\(2.10\)](#page-5-3) and [\(2.18\)](#page-7-4), respectively, and computing the commutator. We shall skip the details. To prove [\(4.5\)](#page-14-5), we compute

$$
\partial_\lambda T_{1;\lambda}^*\mathcal{E}_{\mathbb{H}_0}T_{1;\lambda}=T_{1;\lambda}^*[\mathcal{E}_{\mathbb{H}_0},B_1-B_1^*]T_{1;\lambda}=T_{1;\lambda}^*[\mathcal{E}_{\mathbb{H}_0},B_1]T_{1;\lambda}+\text{h.c.}
$$

For simplicity, we only consider the first term involving  $k \cdot s$  in the definition [\(4.2\)](#page-14-4) of  $\mathcal{E}_{\mathbb{H}_0}$ , i.e.,

<span id="page-15-5"></span><span id="page-15-2"></span><span id="page-15-1"></span>
$$
\mathcal{E}_{\mathbb{H}_0;1} := -\frac{2}{L^3} \sum_{k,s,s' \in \Lambda^*} k \cdot s \,\hat{\varphi}(k) \hat{\chi}_>(k) \, b_{k,s,\uparrow} b_{-k,s',\downarrow} + \text{h.c.},\tag{4.6}
$$

the estimate for the other term involving  $k \cdot s'$  is analogous. For the calculation of the commutator  $[\mathcal{E}_{\mathbb{H}_0;1}, B_1]$ , we need to compute

$$
\begin{split} &\left[\hat{a}_{-s',\downarrow}^{*}\hat{a}_{s'-k,\downarrow}^{*}\hat{a}_{-s,\uparrow}^{*}\hat{a}_{s+k,\uparrow}^{*},\hat{a}_{r+p,\uparrow}\hat{a}_{-r,\uparrow}\hat{a}_{r'-p,\downarrow}\hat{a}_{-r',\downarrow}\right] \\ & = \hat{a}_{s+k,\uparrow}^{*}\hat{a}_{s'-k,\downarrow}^{*}\hat{a}_{r+p,\uparrow}\hat{a}_{r'-p,\downarrow}(\delta_{s,r}\delta_{s',r'}-\delta_{s,r}\hat{a}_{-s',\downarrow}^{*}\hat{a}_{-r',\downarrow}-\delta_{s',r'}\hat{a}_{-s,\uparrow}^{*}\hat{a}_{-r,\uparrow}) \\ &\quad + (\delta_{s+k,r+p}\hat{a}_{s'-k,\sigma'}^{*}\hat{a}_{r'-p,\downarrow}+\delta_{s'-k,r'-p}\hat{a}_{s+k,\uparrow}^{*}\hat{a}_{r+p,\uparrow}-\delta_{s'-k,r'-p}\delta_{r+p,s+k})\hat{a}_{-r,\uparrow}\hat{a}_{-r',\downarrow}\hat{a}_{-s',\downarrow}^{*}\hat{a}_{-s,\uparrow}^{*} \end{split} \tag{4.7}
$$

Correspondingly, we have  $[\mathcal{E}_{\mathbb{H}_0;1}, B_1] = \sum_{j=1}^6 I_j$ , with

$$
I_1 = \frac{1}{L^6} \sum_{k,p,r,r'} k \cdot r\hat{\varphi}(k)\hat{\chi}_{>}(k)\hat{v}_{\uparrow}(r)\hat{\varphi}(p)\hat{\chi}_{>}(p)\hat{v}_{\downarrow}(r')\hat{u}_{\uparrow}(r+k)\hat{u}_{\downarrow}(r'-k)\hat{u}_{\uparrow}(r+p)\hat{u}_{\downarrow}(r'-p) \times \hat{a}^*_{r+k,\uparrow}\hat{a}^*_{r'-k,\downarrow}\hat{a}_{r+p,\uparrow}\hat{a}_{r'-p,\downarrow}, \quad (4.8)
$$

$$
I_2 = -\frac{1}{L^6} \sum_{k,p,r,r',s} k \cdot r\hat{\varphi}(k)\hat{\chi}_{>}(k)\hat{v}_{\uparrow}(r)\hat{\varphi}(p)\hat{\chi}_{>}(p)\hat{v}_{\downarrow}(r')\hat{v}_{\downarrow}(s)\hat{u}_{\uparrow}(r+k)\hat{u}_{\downarrow}(s-k)\hat{u}_{\uparrow}(r+p)\hat{u}_{\downarrow}(r'-p) \times \hat{a}^*_{r+k,\uparrow}\hat{a}^*_{s-k,\downarrow}\hat{a}^*_{-s,\downarrow}\hat{a}_{-r',\downarrow}\hat{a}_{r+p,\uparrow}\hat{a}_{r'-p,\downarrow}, \quad (4.9)
$$

$$
I_3 = -\frac{1}{L^6} \sum_{k,p,r,r',s} k \cdot s\hat{\varphi}(k)\hat{\chi}_{>}(k)\hat{v}_{\uparrow}(s)\hat{\varphi}(p)\hat{\chi}_{>}(p)\hat{v}_{\downarrow}(r')\hat{v}_{\uparrow}(r)\hat{u}_{\uparrow}(s+k)\hat{u}_{\downarrow}(r'-k)\hat{u}_{\uparrow}(p+r)\hat{u}_{\downarrow}(r'-p) \times \hat{a}_{s+k,\uparrow}^* \hat{a}_{r'-k,\downarrow}^* \hat{a}_{-s,\uparrow}^* \hat{a}_{-r,\uparrow} \hat{a}_{r+p,\uparrow} \hat{a}_{r'-p,\downarrow}, \quad (4.10)
$$

<span id="page-15-4"></span><span id="page-15-3"></span>
$$
I_{4} = \frac{1}{L^{6}} \sum_{k,p,r,r',s} k \cdot (r+p-k)\hat{\varphi}(k)\hat{\chi}_{>}(k)\hat{\varphi}(p)\hat{\chi}_{>}(p)\hat{u}_{\uparrow}(r+p)\hat{u}_{\downarrow}(s-k)\hat{u}_{\downarrow}(r'-p) \times \hat{v}_{\uparrow}(r+p-k)\hat{v}_{\downarrow}(s)\hat{v}_{\uparrow}(r)\hat{v}_{\downarrow}(r')\hat{a}_{s-k,\downarrow}^{*}\hat{a}_{r'-p,\downarrow}\hat{a}_{-r,\uparrow}\hat{a}_{-r',\downarrow}\hat{a}_{-s,\downarrow}^{*}\hat{a}_{-r-p+k,\uparrow}^{*}, \quad (4.11)
$$

$$
I_5 = \frac{1}{L^6} \sum_{k,p,r,r',s} k \cdot s\hat{\varphi}(k)\hat{\chi}_{>}(k)\hat{\varphi}(p)\hat{\chi}_{>}(p)\hat{u}_{\uparrow}(r+p)\hat{u}_{\uparrow}(s+k)\hat{u}_{\downarrow}(r'-p) \times \hat{v}_{\uparrow}(s)\hat{v}_{\downarrow}(r')\hat{v}_{\uparrow}(r)\hat{v}_{\downarrow}(r'+k-p)\hat{a}_{s+k,\uparrow}^*\hat{a}_{r+p,\uparrow}\hat{a}_{-r',\downarrow}\hat{a}_{-r'-k+p,\downarrow}^*\hat{a}_{-s,\uparrow}^*,
$$
(4.12)

$$
I_6 = -\frac{1}{L^6} \sum_{k,p,r,r'} k \cdot (r+p-k)\hat{\varphi}(k)\hat{\chi}_{>}(k)\hat{\varphi}(p)\hat{\chi}_{>}(p)\hat{u}_{\uparrow}(r+p)\hat{u}_{\downarrow}(r'-p)\hat{v}_{\uparrow}(r+p-k)\hat{v}_{\downarrow}(r'-p+k) \times \hat{v}_{\uparrow}(r)\hat{v}_{\downarrow}(r')\hat{a}_{-r,\uparrow}\hat{a}_{-r',\downarrow}\hat{a}_{-r'+p-k,\downarrow}^* \hat{a}_{-r'-p+k,\uparrow}^*.
$$
 (4.13)

In the following, we shall estimate all these terms. We shall repeatedly use the bound

<span id="page-16-2"></span><span id="page-16-0"></span>
$$
||a_{\sigma}(\partial^{n} v_{x})|| \le ||| \cdot |^{n} \hat{v}_{\sigma}||_{2} \le C \varrho^{\frac{1}{2} + \frac{n}{3}} \tag{4.14}
$$

for the fermionic creation and annihilation operators. Moreover, we shall employ the bounds in Lemma [3.1](#page-11-3) in Lemma [A.2.](#page-40-3) We will estimate the expectation value of all the terms in a general state  $\psi \in \mathcal{F}_{f}$ . We first consider the error terms coming from the second line on the right hand side in  $(4.7)$ , i.e.,  $I_1$ ,  $I_2$  and  $I_3$ . It is convenient to divide them all into two parts, which corresponds to an integration by parts in configuration space: this allows us to get a factor  $\varrho^{1/3}$  when the derivative hits a  $v_{\sigma}$ , and to use  $\mathbb{H}_0$  instead of N to estimate the error terms when the derivative hits a  $u_{\sigma}$ . We start by estimating the term I<sub>1</sub> in [\(4.8\)](#page-15-1). Writing  $k \cdot r = -r^2 + r \cdot (r + k)$ , we split  $I_1$  into two terms, which we denote by  $I_{1,a}$  and  $I_{1,b}$ , respectively. In  $I_{1,b}$  it is convenient to replace  $\hat{u}_{\uparrow}(r+k)$  by  $\hat{\nu}_{\uparrow}^>(r+k)$  with  $\hat{\nu}^>$  defined as

<span id="page-16-3"></span>
$$
\hat{\nu}^{>}(k) = \begin{cases} 1 & \text{if } |k| > 3\varrho^{\frac{1}{3}-\gamma}, \\ 0 & \text{if } |k| \le 3\varrho^{\frac{1}{3}-\gamma}. \end{cases}
$$
(4.15)

This can be done since  $|k| \ge 4\varrho^{1/3-\gamma}$  and  $|r| \le k_F^{\uparrow}$  for all the terms in the sum. The same argument applies to  $I_2$  and  $I_3$ .

To estimate  $I_1$ , we rewrite both  $I_{1,a}$  and  $I_{1,b}$  in configuration space. We have

$$
I_{1;a} = \int dx dy dz dz' \widetilde{\varphi}(x-y) \widetilde{\varphi}(z-z') (\Delta v_{\uparrow}) (x;z) v_{\downarrow}(y;z') a_{\uparrow}^*(u_x) a_{\downarrow}^*(u_y) a_{\uparrow}(u_z) a_{\downarrow}(u_{z'}).
$$

For fixed y and z, we can use [\(4.14\)](#page-16-0) and  $0 \leq \hat{u}_\uparrow \leq 1$  to bound

$$
\left\| \int dx \,\widetilde{\varphi}(x-y) \left( \Delta v_{\uparrow} \right)(x;z) a_{\uparrow}(u_x) \right\| \leq \|\widetilde{\varphi}_y \Delta v_{z,\uparrow}\|_2,
$$

where we used the notation  $\tilde{\varphi}_y(\cdot) = \tilde{\varphi}(y - \cdot)$ ,  $\Delta v_{z,\uparrow}(\cdot) = \Delta v_{\uparrow}(\cdot; z)$ , as in Lemma [3.1](#page-11-3) and the discussion after [\(2.5\)](#page-4-2). Similarly,

<span id="page-16-1"></span>
$$
\left\| \int dz' \widetilde{\varphi}(z - z') v_{\downarrow}(y; z') a_{\downarrow}(u_{z'}) \right\| \leq \|\widetilde{\varphi}_z v_{y,\downarrow}\|_2.
$$
\n(4.16)

With the aid of the Cauchy–Schwarz's inequality, we hence find that

$$
\begin{aligned} |\langle \psi, I_{1;a} \psi \rangle| &\leq \int dy dz \, \|\widetilde{\varphi}_y \Delta v_{z,\uparrow}\|_2 \|\widetilde{\varphi}_z v_{y,\downarrow}\|_2 \|a_\downarrow(u_y)\psi\| \|a_\uparrow(u_z)\psi\| \\ &\leq \left(\int dy dz dw \, |\widetilde{\varphi}(w-y)|^2 |\Delta v_\uparrow(z;w)|^2 \|a_\downarrow(u_y)\psi\|^2\right)^{\frac{1}{2}} \left(\int dy dz dw \, |\widetilde{\varphi}(z-w)|^2 |v_\downarrow(y;w)|^2 \|a_\uparrow(u_z)\psi\|^2\right)^{\frac{1}{2}}. \end{aligned}
$$

Thus, using also Lemma [A.2,](#page-40-3) we obtain

$$
|\langle \psi, I_{1,a}\psi \rangle| \le ||\widetilde{\varphi}||_2^2 \|\Delta v_\uparrow\|_2 \|v_\downarrow\|_2 \langle \psi, \mathcal{N}\psi \rangle \le C \varrho^{\frac{4}{3}+\gamma} \langle \psi, \mathcal{N}\psi \rangle. \tag{4.17}
$$

The estimate of the term  $I_{1:b}$  is similar. We have

$$
I_{1;b} = \sum_{\ell=1}^{3} \int dx dy dz dz' \widetilde{\varphi}(x-y) \widetilde{\varphi}(z-z') \partial_{\ell}v_{\uparrow}(x;z) v_{\downarrow}(y;z') a_{\uparrow}^{*}(\partial_{\ell}v_{x}^{>}) a_{\downarrow}^{*}(u_{y}) a_{\uparrow}(u_{z}) a_{\downarrow}(u_{z'})
$$

where  $\nu_x^>(\cdot) = \nu^>(\cdot - x)$ . Proceeding as above, we can bound

<span id="page-16-4"></span>
$$
\left\| \int dz \,\widetilde{\varphi}(z-z') \partial_{\ell} v_{\uparrow}(x;z) a_{\uparrow}(u_z) \right\| \leq \|\widetilde{\varphi}_{z'} \partial_{\ell} v_{x,\uparrow}\|_2.
$$
\n(4.18)

Using also [\(4.16\)](#page-16-1) and that

<span id="page-17-0"></span>
$$
\sum_{\ell=1}^{3} \int dx \, \|a_{\uparrow}(\partial_{\ell} \nu_{x}^{>})\psi\|^{2} = \sum_{k} |k|^{2} |\hat{\nu}_{\uparrow}^{>}(k)|^{2} \|\hat{a}_{k,\uparrow}\psi\|^{2} \le C\langle\psi, \mathbb{H}_{0}\psi\rangle, \tag{4.19}
$$

we obtain the bound

$$
|\langle \psi, I_{1;b}\psi \rangle| \le C \|\tilde{\varphi}\|_{2}^{2} \|\nabla v_{\uparrow}\|_{2} \|v_{\downarrow}\|_{2} \|\mathbb{H}_{0}^{\frac{1}{2}} \psi\| \|\mathcal{N}^{\frac{1}{2}} \psi\| \le C \varrho^{1+\gamma} \|\mathbb{H}_{0}^{\frac{1}{2}} \psi\| \|\mathcal{N}^{\frac{1}{2}} \psi\|.
$$
 (4.20)

We now estimate the term I<sub>2</sub> defined in [\(4.9\)](#page-15-2). Similarly as above, we write  $k \cdot r = -r^2 + r \cdot (r + k)$  and correspondingly we split  $I_2$  as a sum of two different terms,  $I_{2;a}$  and  $I_{2;b}$ . In order to bound  $I_{2;a}$ , we rewrite it partially in configuration space. Recalling the definition of  $b_{\sigma}$  in [\(3.1\)](#page-10-2)), we find

$$
\langle \psi, I_{2;a} \psi \rangle = \frac{1}{L^3} \sum_r |r|^2 \hat{v}_{\uparrow}(r) \left\| \int dx \, e^{-ir \cdot x} b_{\downarrow}(\widetilde{\varphi}_x) a_{\uparrow}(u_x) \psi \right\|^2.
$$

We can bound  $|r|^2 \hat{v}_{\uparrow}(r) \leq C \varrho^{2/3}$  for all  $r \in \Lambda^*$ . From the bounds in Lemma [3.1,](#page-11-3) we find

$$
\frac{1}{L^3} \sum_{r} \left\| \int dx \, e^{-ir \cdot x} b_{\downarrow}(\widetilde{\varphi}_x) a_{\uparrow}(u_x) \psi \right\|^2 = \int dx \, \|b_{\downarrow}(\widetilde{\varphi}_x) a_{\uparrow}(u_x) \psi\|^2
$$
  

$$
\leq \int dx \, \|b_{\downarrow}(\widetilde{\varphi}_x)\|^2 \|a_{\uparrow}(u_x) \psi\|^2 \leq C \varrho^{\frac{2}{3}+\gamma} \langle \psi, \mathcal{N} \psi \rangle,
$$

and hence we obtain

$$
|\langle \psi, I_{2,a}\psi \rangle| \le C \varrho^{\frac{4}{3} + \gamma} \langle \psi, \mathcal{N}\psi \rangle. \tag{4.21}
$$

The estimate of  $I_{2,b}$  can be done analogously as the one of  $I_{2,a}$ , using in addition [\(4.19\)](#page-17-0). We omit the details, and directly write the final estimate as

$$
|\langle \psi, I_{2;b} \psi \rangle| \le C \varrho^{1+\gamma} \| \mathbb{H}_0^{\frac{1}{2}} \psi \| \| \mathcal{N}^{\frac{1}{2}} \psi \|.
$$
\n(4.22)

Next we consider I<sub>3</sub> in [\(4.10\)](#page-15-3). Again we split the term in two, I<sub>3;a</sub> and I<sub>3;b</sub>, by writing  $k = r' - (r' - k)$ . The term  $I_{3;a}$  can then be written as

$$
I_{3;a} = -\sum_{\ell=1}^3 \sum_{r'} r'_\ell \hat{v}_\downarrow(r') \int dydz' e^{ir'\cdot(y-z')} a^*_\downarrow(u_y) b^*_{\ell,\uparrow}(\widetilde{\varphi}_y) b_\uparrow(\widetilde{\varphi}_{z'}) a_\downarrow(u_{z'})
$$

where we used the operators introduced in [\(3.1\)](#page-10-2) and [\(3.2\)](#page-10-3). Using the bounds in Lemma [3.1](#page-11-3) and that  $|r'_{\ell}\hat{v}_{\downarrow}(r')| \leq C\varrho^{1/3}$ , we get with the aid of the Cauchy–Schwarz inequality

$$
\begin{split}\n&\|\langle\psi,\mathrm{I}_{3;a}\psi\rangle| \\
&\leq C\varrho^{\frac{1}{3}}\sum_{\ell=1}^{3}\left(\frac{1}{L^{3}}\sum_{r'}\left\|\int dy\,e^{-ir'\cdot y}\,b_{\ell,\uparrow}(\widetilde{\varphi}_{y})a_{\downarrow}(u_{y})\psi\right\|^{2}\right)^{\frac{1}{2}}\left(\frac{1}{L^{3}}\sum_{r'}\left\|\int dz'\,e^{-ir'\cdot z'}\,b_{\uparrow}(\widetilde{\varphi}_{z'})a_{\downarrow}(u_{z'})\psi\right\|^{2}\right)^{\frac{1}{2}} \\
&= C\varrho^{\frac{1}{3}}\sum_{\ell=1}^{3}\left(\int dy\,\|b_{\ell,\uparrow}(\widetilde{\varphi}_{y})a_{\downarrow}(u_{y})\psi\|^{2}\right)^{\frac{1}{2}}\left(\int dz'\,\|b_{\uparrow}(\widetilde{\varphi}_{z'})a_{\downarrow}(u_{z'})\psi\|^{2}\right)^{\frac{1}{2}} \leq C\varrho^{\frac{4}{3}+\gamma}\langle\psi,\mathcal{N}\psi\rangle.\n\end{split} \tag{4.23}
$$

The analysis of  $I_{3,b}$  can be done similarly as the one for  $I_{3,a}$ , using also the inequality in [\(4.19\)](#page-17-0). The result is

$$
|\langle \psi, I_{3,b}\psi \rangle| \le C\varrho^{1+\gamma} \|\mathbb{H}_0^{\frac{1}{2}}\psi\| \|\mathcal{N}^{\frac{1}{2}}\psi\|.
$$
\n(4.24)

The next error term we estimate is  $I_4$  in [\(4.11\)](#page-15-4). As above, it is convenient to rewrite it in configuration space. Since the constraints  $|p| \ge 4\varrho^{1/3-\gamma}$  and  $|r| \le k_F^{\uparrow}$  imply that  $|r+p| > 3\varrho^{1/3-\gamma}$ , we have that  $\hat{u}_{\uparrow}(r+p) = 1$ in  $(4.11)$ , and hence

$$
I_4 = \sum_{\ell=1}^3 \int dx dy dz \, \partial_\ell \widetilde{\varphi}(x-y) \widetilde{\varphi}(x-z) a_\downarrow^*(u_y) a_\uparrow(v_x) a_\downarrow^*(v_z) a_\downarrow(v_y) a_\uparrow^*(\partial_\ell v_x) a_\downarrow(u_z).
$$

Using Lemma [A.2](#page-40-3) and [\(4.14\)](#page-16-0), we can bound

$$
|\langle \psi, I_4 \psi \rangle| \le C \varrho^{2+\frac{1}{3}} \sum_{\ell=1}^3 \int dx dy dz \, |\partial_\ell \widetilde{\varphi}(x-y)| |\widetilde{\varphi}(x-z)| \|a_\downarrow(u_y)\psi\| \|a_\downarrow(u_z)\psi\|
$$
  

$$
\le C \varrho^{2+\frac{1}{3}} \sum_{\ell=1}^3 \|\partial_\ell \widetilde{\varphi}\|_1 \|\widetilde{\varphi}\|_1 \langle \psi, \mathcal{N}\psi \rangle \le C \varrho^{\frac{4}{3}+3\gamma} \langle \psi, \mathcal{N}\psi \rangle.
$$
 (4.25)

The estimate for I<sub>5</sub> can be done similarly, we omit the details. Also for this term we obtain

$$
|\langle \psi, I_5 \psi \rangle| \le C \varrho^{\frac{4}{3} + 3\gamma} \langle \psi, \mathcal{N} \psi \rangle. \tag{4.26}
$$

Finally we consider the last term I<sub>6</sub> in [\(4.13\)](#page-16-2). Similarly as above, we have  $\hat{u}_{\uparrow}(r+p) = \hat{u}_{\downarrow}(r'-p) = 1$  for all the terms in the sum. To estimate it, we shall write

$$
-\hat{a}_{-r,\uparrow}\hat{a}_{-r',\downarrow}\hat{a}_{-r'+p-k,\downarrow}^*\hat{a}_{-r-p+k,\uparrow}^* = \hat{a}_{-r'+p-k,\downarrow}^*\hat{a}_{-r,\uparrow}\hat{a}_{-r-p+k,\uparrow}^*\hat{a}_{-r',\downarrow} - \delta_{p,k}\hat{a}_{-r,\uparrow}\hat{a}_{-r,\uparrow}^*
$$

and correspondingly split  $I_6$  in two terms, denoted by  $I_{6,a}$  and  $I_{6,b}$ . The last one vanishes,

$$
\mathcal{I}_{6;b} = -\frac{1}{L^6} \sum_{p,r,r'} p \cdot r \left| \hat{\varphi}(p)\hat{\chi}_>(p) \right|^2 \hat{v}_\downarrow(r')\hat{v}_\uparrow(r)\hat{a}_{-r,\uparrow}\hat{a}_{-r,\uparrow}^* = 0
$$

since the sum over p is zero by symmetry. The term  $I_{6,a}$  we can write in configuration space as

$$
I_{6;a} = \sum_{\ell=1}^3 \int dx dy \,\tilde{\varphi}(x-y) \partial_\ell \tilde{\varphi}(x-y) \tilde{\varphi}(x-y) a_\downarrow^*(v_y) a_\uparrow(v_x) a_\uparrow^*(\partial_\ell v_x) a_\downarrow(v_y). \tag{4.27}
$$

We use  $\widetilde{\varphi} \partial_\ell \widetilde{\varphi} = \frac{1}{2} \partial_\ell \widetilde{\varphi}^2$  and integrate by parts in x. The derivate then hits either  $a_\uparrow(v_x)$  or  $a^*_\uparrow(\partial_\ell v_x)$ , and using [\(4.14\)](#page-16-0) we can bound

$$
|\langle \psi, I_{6,a}\psi \rangle| \le C\varrho^{1+\frac{2}{3}} \int dx dy \, |\widetilde{\varphi}(x-y)|^2 \|a_\downarrow(v_y)\psi\|^2 \le C\varrho^{\frac{4}{3}+\gamma}\langle \psi, \mathcal{N}\psi \rangle,\tag{4.28}
$$

where we used Lemma [A.2](#page-40-3) in the last step.

## <span id="page-18-0"></span>4.2 Conjugation of  $\mathbb{Q}_4$

<span id="page-18-3"></span>We now conjugate  $\mathbb{Q}_4$  by  $T_1$  (see [\(2.10\)](#page-5-3) and [\(2.18\)](#page-7-4) for their definition).

**Proposition 4.5** (Conjugation of  $\mathbb{Q}_4$  by  $T_1$ ). Let  $\lambda \in [0,1]$  and  $\gamma \in (0,1/3)$ . Under the same assumptions of Theorem [1.2](#page-2-0)

<span id="page-18-4"></span>
$$
\partial_{\lambda} T_{1,\lambda}^* \mathbb{Q}_4 T_{1,\lambda} = T_{1,\lambda}^* (\mathbb{T}_2 + \mathcal{E}_{\mathbb{Q}_4}) T_{1,\lambda},\tag{4.29}
$$

where

<span id="page-18-1"></span>
$$
\mathbb{T}_2 := -\frac{1}{L^3} \sum_{k \in \Lambda^*} \hat{V} *_{\Sigma} (\hat{\varphi} \hat{\chi}_{>})(k) b_{k,\uparrow} b_{-k,\downarrow} + \text{h.c.}
$$
\n(4.30)

and  $\mathcal{E}_{\mathbb{Q}_4}$  is such that for any  $\psi \in \mathcal{F}_{f}$ 

<span id="page-18-2"></span>
$$
|\langle \psi, \mathcal{E}_{\mathbb{Q}_4} \psi \rangle| \le C \varrho^{\frac{5}{6} + \frac{\gamma}{2}} \| \mathcal{N}^{\frac{1}{2}} \psi \| \| \mathbb{Q}_4^{\frac{1}{2}} \psi \|.
$$
\n(4.31)

Proof. We start by computing

$$
\partial_{\lambda}T_{1;\lambda}^*\mathbb{Q}_4T_{1;\lambda}=T_{1;\lambda}^*[\mathbb{Q}_4, B_1]T_{1;\lambda}+\text{h.c.}
$$

with

$$
[\mathbb{Q}_4, B_1] = \frac{1}{2L^6} \sum_{\sigma,\sigma'} \sum_{k,p,s,s'} \hat{V}(k)\hat{\varphi}(p)\hat{\chi}_{>}(p)\hat{u}_{\sigma}(s+k)\hat{u}_{\sigma'}(s'-k)\hat{u}_{\sigma}(s)\hat{u}_{\sigma'}(s') [\hat{a}_{s+k,\sigma}^* \hat{a}_{s'-k,\sigma'}^* \hat{a}_{s',\sigma'}\hat{a}_{s,\sigma}, b_{p,\uparrow}b_{-p,\downarrow}].
$$

Recall from [\(2.14\)](#page-6-2) that  $b_{p,\sigma} = \sum_r \hat{u}_{\sigma}(p+r)\hat{v}_{\sigma}(r)\hat{a}_{p+r,\sigma}\hat{a}_{-r,\sigma}$ . Hence we need to compute

$$
\begin{split} &[\hat{a}^*_{s+k,\sigma}\hat{a}^*_{s'-k,\sigma'}\hat{a}_{s',\sigma'}\hat{a}_{s,\sigma},\hat{a}_{p+r,\uparrow}\hat{a}_{-r,\uparrow}\hat{a}_{-p+r',\downarrow}\hat{a}_{-r',\downarrow}] = -\delta_{s+k,r+p}\delta_{\sigma,\uparrow}\hat{a}^*_{s'-k,\sigma'}\hat{a}_{r'-p,\downarrow}\hat{a}_{-r',\downarrow}\hat{a}_{-r,\uparrow}\hat{a}_{s',\sigma'}\hat{a}_{s,\sigma} \\ &+ \delta_{s'-k,r+p}\delta_{\sigma',\uparrow}\hat{a}^*_{s+k,\sigma}\hat{a}_{r'-p,\downarrow}\hat{a}_{-r',\downarrow}\hat{a}_{-r,\uparrow}\hat{a}_{s',\sigma'}\hat{a}_{s,\sigma} - \delta_{s'-k,r'-p}\delta_{\sigma',\downarrow}\hat{a}^*_{s+k,\sigma}\hat{a}_{r+p,\uparrow}\hat{a}_{-r',\downarrow}\hat{a}_{-r,\uparrow}\hat{a}_{s',\sigma'}\hat{a}_{s,\sigma} \\ &+ \delta_{s+k,r'-p}\delta_{\sigma,\downarrow}\hat{a}^*_{s'-k,\sigma'}\hat{a}_{r+p,\uparrow}\hat{a}_{-r',\downarrow}\hat{a}_{-r,\uparrow}\hat{a}_{s',\sigma'}\hat{a}_{s,\sigma} + \delta_{s+k,r+p}\delta_{s'-k,r'-p}\delta_{\sigma,\uparrow}\delta_{\sigma',\downarrow}\hat{a}_{-r',\downarrow}\hat{a}_{-r,\uparrow}\hat{a}_{s',\sigma'}\hat{a}_{s,\sigma} \\ &- \delta_{s+k,r'-p}\delta_{s'-k,r+p}\delta_{\sigma,\downarrow}\delta_{\sigma',\uparrow}\hat{a}_{-r',\downarrow}\hat{a}_{-r,\uparrow}\hat{a}_{s',\sigma'}\hat{a}_{s,\sigma}. \end{split}
$$

Using that  $\hat{V}(k) = \hat{V}(-k)$ ,  $\hat{\varphi}(p)\hat{\chi}_{>}(p) = \hat{\varphi}(-p)\hat{\chi}_{>}(-p)$  and performing a suitable change of variables, we can combine the first two terms in the commutator above, as well as the third and the forth and the last two. Therefore, we find that

<span id="page-19-1"></span>
$$
[Q_4, B_1] = I_1 + I_2 + I_3,
$$

with

$$
I_1 = \frac{1}{L^6} \sum_{\sigma} \sum_{k, p, r, r', s} \hat{V}(k)\hat{\varphi}(p)\hat{\chi}_{>}(p)\hat{u}_{\uparrow}(r+p)\hat{u}_{\downarrow}(r'-p)\hat{u}_{\uparrow}(r+p-k)\hat{u}_{\sigma}(s-k)\hat{u}_{\sigma}(s)\hat{v}_{\uparrow}(r)\hat{v}_{\downarrow}(r')
$$
  

$$
\times \hat{a}_{s-k,\sigma}^{*}\hat{a}_{r'-p,\downarrow}\hat{a}_{-r,\uparrow}\hat{a}_{-r',\downarrow}\hat{a}_{s,\sigma}\hat{a}_{r+p-k,\uparrow}, \quad (4.32)
$$

$$
I_2 = \frac{1}{L^6} \sum_{\sigma} \sum_{k, p, r, r', s} \hat{V}(k)\hat{\varphi}(p)\hat{\chi}_{>}(p)\hat{u}_{\uparrow}(r+p)\hat{u}_{\downarrow}(r'-p)\hat{u}_{\downarrow}(r'-p-k)\hat{u}_{\sigma}(s-k)\hat{u}_{\sigma}(s)\hat{v}_{\uparrow}(r)\hat{v}_{\downarrow}(r')
$$
  

$$
\times \hat{a}_{s-k,\sigma}^{*}\hat{a}_{r+p,\uparrow}\hat{a}_{-r',\downarrow}\hat{a}_{-r,\uparrow}\hat{a}_{s,\sigma}\hat{a}_{r'-p-k,\downarrow},
$$

$$
I_3 = -\frac{1}{L^6} \sum_{k,q,r,r'} \hat{V}(k)\hat{\varphi}(p)\hat{\chi}_{>}(p)\hat{u}_{\uparrow}(r+p)\hat{u}_{\downarrow}(r'-p)\hat{u}_{\uparrow}(r+p+k)\hat{u}_{\downarrow}(r'-p-k)\hat{v}_{\uparrow}(r)\hat{v}_{\downarrow}(r')\times \hat{a}_{r+p+k,\uparrow}\hat{a}_{-r,\uparrow}\hat{a}_{r'-p-k,\downarrow}\hat{a}_{-r',\downarrow}.
$$

In I<sub>3</sub> we have  $\hat{u}_{\uparrow}(r+p) = \hat{u}_{\downarrow}(r'-p) = 1$  due to the constraints on p, r, r' and, with another change of variables, we find that  $I_3 + I_3^* = \mathbb{T}_2$  defined in [\(4.30\)](#page-18-1). In other words,  $\mathcal{E}_{\mathbb{Q}_4} = I_1 + I_2 + \text{h.c.}$ .

In the following we only consider  $I_1$ , the bound on  $I_2$  works in exactly the same way. Using again that  $\hat{u}_{\uparrow}(r+p) = 1$  in [\(4.32\)](#page-19-1), we can write in configuration space

$$
I_1 = -\sum_{\sigma} \int dx dy V(x - y) a_{\sigma}^*(u_y) b_{\downarrow}(\tilde{\varphi}_x) a_{\uparrow}(v_x) a_{\sigma}(u_y) a_{\uparrow}(u_x), \tag{4.33}
$$

where we recall the definition of the operator  $b_{\sigma}$  in [\(3.1\)](#page-10-2). Using  $||a_{\downarrow}(v_x)|| = ||v||_2 \leq \varrho^{1/2}$ , Lemma [3.1](#page-11-3) as well as the Cauchy–Schwarz inequality, we obtain

$$
|\langle \psi, I_1 \psi \rangle| \le C \varrho^{\frac{5}{6} + \frac{\gamma}{2}} \sum_{\sigma} \int dx dy V(x - y) \|a_{\sigma}(u_y)\psi\| \|a_{\sigma}(u_y)a_{\uparrow}(u_x)\psi\| \le C \varrho^{\frac{5}{6} + \frac{\gamma}{2}} \|\mathcal{N}^{\frac{1}{2}}\psi\| \|\mathbb{Q}_4^{\frac{1}{2}}\psi\|.
$$
 (4.34)

This yields [\(4.31\)](#page-18-2).

#### <span id="page-19-0"></span>4.3 Conjugation of  $\mathbb{Q}_2^{\uparrow\downarrow}$ 2

In the next proposition we conjugate the operator  $\mathbb{Q}_2^{\uparrow\downarrow}$  introduced in  $(2.11)$  with respect to the unitary operator  $T_1$  defined in  $(2.18)$ .

<span id="page-19-2"></span>**Proposition 4.6** (Conjugation of  $\mathbb{Q}_2^{\uparrow\downarrow}$  by  $T_1$ ). Let  $\lambda \in [0,1]$  and  $\gamma \in (0,1/3)$ . Under the same assumptions of Theorem [1.2](#page-2-0)

$$
\partial_{\lambda}T_{1;\lambda}^*\mathbb{Q}_2^{\uparrow\downarrow}T_{1;\lambda} = -2\varrho_{\uparrow}\varrho_{\downarrow}\sum_{p\in\Lambda^*}\hat{V}(p)\hat{\varphi}(p)\hat{\chi}_>(p) + T_{1;\lambda}^*\mathcal{E}_{\mathbb{Q}_2^{\uparrow\downarrow}}T_{1;\lambda},
$$

with  $\mathcal{E}_{\mathbb{Q}_2^{ \uparrow \downarrow}}$  such that for any  $\psi \in \mathcal{F}_{\mathsf{f}}$ 

$$
|\langle \psi, \mathcal{E}_{\mathbb{Q}_2^{d\downarrow}} \psi \rangle| \le C \varrho^{\frac{5}{6} + \frac{\gamma}{2}} \|\mathbb{Q}_4^{\frac{1}{2}} \psi\| \|\mathcal{N}^{\frac{1}{2}} \psi\| + C \varrho \langle \psi, \mathcal{N} \psi \rangle. \tag{4.35}
$$

$$
\Box
$$

Proof. As in the previous propositions, we have

<span id="page-20-2"></span>
$$
\partial_{\lambda} T_{1;\lambda}^* \mathbb{Q}_2^{\uparrow\downarrow} T_{1;\lambda} = T_{1;\lambda}^* [\mathbb{Q}_2^{\uparrow\downarrow}, B_1] T_{1;\lambda} + \text{h.c.}.
$$
\n(4.36)

For the computation of  $[\mathbb{Q}_2^{\uparrow\downarrow}, B_1]$  we shall use that

$$
\mathbb{Q}_2^{\uparrow\downarrow} = \frac{1}{L^3} \sum_{k,s,s'} \hat{V}(k)\hat{v}_{\uparrow}(s')\hat{u}_{\uparrow}(s'-k)\hat{v}_{\downarrow}(s)\hat{u}_{\downarrow}(s+k)\hat{a}_{-s',\uparrow}^*\hat{a}_{s'-k,\uparrow}^*\hat{a}_{-s,\downarrow}^*\hat{a}_{s+k,\downarrow}^* + \text{h.c.}
$$

and hence we need

$$
\begin{split}\n&\left[\hat{a}_{-s',\uparrow}^{*}\hat{a}_{s'-k,\uparrow}^{*}\hat{a}_{-s,\downarrow}^{*}\hat{a}_{s+k,\downarrow}^{*},\hat{a}_{r+p,\uparrow}\hat{a}_{-r,\uparrow}\hat{a}_{r'-p,\downarrow}\hat{a}_{-r',\downarrow}\right] \\
&=\hat{a}_{s'-k,\uparrow}^{*}\hat{a}_{s+k,\downarrow}^{*}\hat{a}_{r+p,\uparrow}\hat{a}_{r'-p,\downarrow}\left(\delta_{s',r}\hat{a}_{-s,\downarrow}^{*}\hat{a}_{-r',\downarrow}+\delta_{s,r'}\hat{a}_{-s',\uparrow}\hat{a}_{-r,\uparrow}-\delta_{s',r}\delta_{s,r'}\right) \\
&\quad-\left(\delta_{s'-k,r+p}\hat{a}_{s+k,\downarrow}^{*}\hat{a}_{r'-p,\downarrow}+\delta_{s+k,r'-p}\hat{a}_{s'-k,\uparrow}^{*}\hat{a}_{r+p,\uparrow}-\delta_{s'-k,r+p}\delta_{s+k,r'-p}\right)\hat{a}_{-r,\uparrow}\hat{a}_{-r',\downarrow}\hat{a}_{-s',\uparrow}^{*}\hat{a}_{-s,\downarrow}^{*}.\n\end{split} \tag{4.37}
$$

Correspondingly, from the six terms on the right-hand side we obtain  $[\mathbb{Q}_2^{\uparrow\downarrow}, B_1] = \sum_{j=1}^6 I_j$ , and we shall now estimate these terms. The main term comes from normal-ordering of  $I_6$ . As in the previous proofs, in our estimates we often use that  $||V||_1 \leq C$ , together with the bounds proved in Lemma [3.1,](#page-11-3) Lemma [A.2](#page-40-3) and  $(4.14)$  with  $n = 0$ . We start by considering I<sub>1</sub>. It is convenient to rewrite the term partially in configuration space, as

<span id="page-20-0"></span>
$$
I_1 = -\frac{1}{L^3} \sum_r \hat{v}_\uparrow(r) \int dx dy dz \, e^{ir \cdot (x-z)} V(x-y) a_\downarrow^*(u_y) a_\uparrow^*(u_x) a_\downarrow^*(v_y) b_\downarrow(\widetilde{\varphi}_z) a_\uparrow(u_z),\tag{4.38}
$$

where we used again the operator  $b_{\sigma}$  introduced in [\(3.1\)](#page-10-2). Using that  $0 \leq \hat{v}_{\uparrow}(r) \leq 1$  and the Cauchy–Schwarz inequality, we get

$$
\begin{split} &|\langle \psi, \mathbf{I}_1 \psi \rangle| \\ &\leq \left( \frac{1}{L^3} \sum_r \left\| \int dx dy \, V(x-y) e^{-ir\cdot x} a_\downarrow(v_y) a_\uparrow(u_x) a_\downarrow(u_y) \psi \right\|^2 \right)^{\frac{1}{2}} \left( \frac{1}{L^3} \sum_r \left\| \int dz \, e^{-ir\cdot z} b_\downarrow(\widetilde{\varphi}_z) a_\uparrow(u_z) \psi \right\|^2 \right)^{\frac{1}{2}}. \\ &\text{We can further bound} \end{split}
$$

We can further bound

$$
\frac{1}{L^3} \sum_{r} \left\| \int dx dy V(x - y) e^{-ir \cdot x} a_{\downarrow}(v_y) a_{\uparrow}(u_x) a_{\downarrow}(u_y) \psi \right\|^2
$$
\n
$$
\leq \int dx dy dy' V(x - y) V(x - y') \|a_{\downarrow}(v_y) a_{\uparrow}(u_x) a_{\downarrow}(u_y) \psi\| \|a_{\downarrow}(v_{y'}) a_{\uparrow}(u_x) a_{\downarrow}(u_{y'}) \psi\|
$$
\n
$$
\leq C \varrho \int dx dy dy' V(x - y) V(x - y') \|a_{\uparrow}(u_x) a_{\downarrow}(u_y) \psi\|^2 \leq C \varrho \langle \psi, \mathbb{Q}_4 \psi \rangle,
$$

where we used [\(4.14\)](#page-16-0) and  $||V||_1 \leq C$ . Using Lemma [3.1](#page-11-3) we can also estimate

$$
\frac{1}{L^3} \sum_{r} \left\| \int dz \, e^{-ir \cdot z} b_{\downarrow}(\widetilde{\varphi}_z) a_{\uparrow}(u_z) \psi \right\|^2 = \int dz \, \left\| b_{\downarrow}(\widetilde{\varphi}_z) a_{\uparrow}(u_z) \psi \right\|^2 \leq C \varrho^{\frac{2}{3} + \gamma} \langle \psi, \mathcal{N} \psi \rangle.
$$

In combination, we thus obtain

$$
|\langle \psi, I_1 \psi \rangle| \le C \varrho^{\frac{5}{6} + \frac{\gamma}{2}} \|\mathbb{Q}_4^{\frac{1}{2}} \psi\| \|\mathcal{N}^{\frac{1}{2}} \psi\|.
$$
\n(4.39)

The term  $I_2$  in can be estimated similarly, with the same outcome, and we omit the details.

Next we consider  $I_3$ . Similarly as for the other terms, we rewrite it in configuration space as

<span id="page-20-1"></span>
$$
\langle \psi, I_3 \psi \rangle = \int dx dy dz' V(x - y) v_{\downarrow}(y; z') \left\langle a_{\uparrow}(u_x) a_{\downarrow}(u_y) \psi, \left( \int dz \, \widetilde{\varphi}(z - z') v_{\uparrow}(x; z) a_{\uparrow}(u_z) \right) a_{\downarrow}(u_{z'}) \psi \right\rangle. \tag{4.40}
$$

By the Cauchy–Schwarz's inequality, we have

$$
\begin{aligned} |\langle \psi, \mathbf{I}_3 \psi \rangle| &\leq \left( \int dx dy dz' \, V(x-y) |v_{\downarrow}(y;z')|^2 \|a_{\uparrow}(u_x) a_{\downarrow}(u_y) \psi\|^2 \right)^{\frac{1}{2}} \\ &\times \left( \int dx dy dz' \, V(x-y) \left\| \int dz \, \widetilde{\varphi}(z-z') v_{\uparrow}(x;z) a_{\uparrow}(u_z) \right\|^2 \|a_{\downarrow}(u_{z'}) \psi\|^2 \right)^{\frac{1}{2}} . \end{aligned}
$$

The first factor is bounded by  $||v_\downarrow||_2 ||\mathbb{Q}_4^{\frac{1}{2}} \psi||$ . To bound the second, we proceed as in [\(4.16\)](#page-16-1), i.e., using [\(4.14\)](#page-16-0) and  $0 \leq \hat{u}_{\sigma} \leq 1$ , to obtain

$$
|\langle \psi, I_3 \psi \rangle| \le ||v_\downarrow||_2 ||\mathbb{Q}_4^{\frac{1}{2}} \psi|| \left( \int dx dy dz' dw \, V(x-y) |\widetilde{\varphi}(z'-w)|^2 |v_\uparrow(x;w)|^2 ||a_\downarrow(u_{z'})\psi||^2 \right)^{\frac{1}{2}}
$$
  

$$
\le ||V||_1^{\frac{1}{2}} ||v_\uparrow||_2 ||v_\downarrow||_2 ||\widetilde{\varphi}||_2 ||\mathbb{Q}_4^{\frac{1}{2}} \psi|| ||\mathcal{N}^{\frac{1}{2}} \psi|| \le C \varrho^{\frac{5}{6} + \frac{\gamma}{2}} ||\mathbb{Q}_4^{\frac{1}{2}} \psi|| ||\mathcal{N}^{\frac{1}{2}} \psi||.
$$

Here we have used Lemma [A.2](#page-40-3) in the last step.

The next term we consider is I<sub>4</sub>. Before estimating it, we note that from the constraint  $|p| \ge 4\varrho^{1/3-\gamma}$  and  $|r| \leq k_F^{\uparrow}$ , we get that  $|r+p| > 3\varrho^{1/3-\gamma}$ . Hence  $\hat{u}_{\uparrow}(r+p) = 1$ . Rewriting  $I_4$  in configuration space, we then get

<span id="page-21-2"></span>
$$
I_4 = \int dx dy dz V(x - y)\widetilde{\varphi}(y - z)a_{\downarrow}^*(u_x)a_{\downarrow}(u_z)a_{\uparrow}(v_y)a_{\downarrow}(v_z)a_{\downarrow}^*(v_x)a_{\uparrow}^*(v_y).
$$
 (4.41)

Hence, using again Lemma [A.2](#page-40-3) and the fact that  $a_\downarrow(u_z)$  commutes with  $a_\uparrow(v_y)a_\downarrow(v_z)a_\downarrow^*(v_x)a_\uparrow^*(v_y)$ ,

$$
|\langle \psi, I_4 \psi \rangle| \le C \varrho^2 \int dx dy dz V(x - y) |\widetilde{\varphi}(y - z)| \|a_\downarrow(u_x) \psi\| \|a_\downarrow(u_z) \psi\|
$$
  

$$
\le C \varrho^2 \|V\|_1 \|\widetilde{\varphi}\|_1 \langle \psi, \mathcal{N} \psi \rangle \le C \varrho^{\frac{4}{3} + 2\gamma} \langle \psi, \mathcal{N} \psi \rangle. \tag{4.42}
$$

The term  $I_5$  can be estimated in the same way, obtaining the same bound.

Finally we consider the term  $I_6$ , from which we extract the leading contribution. We start by normalordering the terms, using

<span id="page-21-4"></span>
$$
\hat{a}_{-r,\uparrow}\hat{a}_{-r',\downarrow}\hat{a}_{-s',\uparrow}^*\hat{a}_{-s,\downarrow}^* = -\left(\hat{a}_{-s',\uparrow}^*\hat{a}_{-r,\uparrow} - \delta_{r,s'}\right)\left(\hat{a}_{-s,\downarrow}^*\hat{a}_{-r',\downarrow} - \delta_{s,r'}\right) \tag{4.43}
$$

This way, we obtain

$$
I_{6} = -\varrho_{\uparrow}\varrho_{\downarrow}\sum_{p}\hat{V}(p)\hat{\varphi}(p)\hat{\chi}_{>}(p)
$$
  
+ 
$$
\frac{1}{L^{3}}\sum_{p,r}\hat{V}(p)\hat{\varphi}(p)\hat{\chi}_{>}(p)\left(\varrho_{\downarrow}\hat{v}_{\uparrow}(r)\hat{a}_{r,\uparrow}^{*}\hat{a}_{r,\uparrow} + \varrho_{\uparrow}\hat{v}_{\downarrow}(r)\hat{a}_{r,\downarrow}^{*}\hat{a}_{r,\downarrow}\right)
$$
  
+ 
$$
\frac{1}{L^{6}}\sum_{k,p,r,r'}\hat{V}(k)\hat{\varphi}(p)\hat{\chi}_{>}(p)\hat{v}_{\uparrow}(k+r+p)\hat{v}_{\downarrow}(r'-p-k)\hat{v}_{\uparrow}(r)\hat{v}_{\downarrow}(r')\hat{a}_{-k-r-p,\uparrow}^{*}\hat{a}_{p+k-r',\downarrow}^{*}\hat{a}_{-r,\uparrow}\hat{a}_{-r',\downarrow}
$$
(4.44)

where we have used again that  $\hat{u}_{\uparrow}(r+p) = \hat{u}_{\downarrow}(r'-p) = 1$  in all the summands. The main contribution is the constant first term. Since

$$
\left|\frac{1}{L^3}\sum_{p}\hat{V}(p)\hat{\varphi}(p)\hat{\chi}_{>}(p)\right| = \left|\int_{\Lambda}dx\,V(x)\tilde{\varphi}(x)\right| \leq \|V\|_{L^1(\Lambda)}\|\tilde{\varphi}\|_{L^{\infty}(\Lambda)} \leq C,
$$

the term in the second line is bounded by  $C_{\ell}N$ . To bound the term in the last line in [\(4.44\)](#page-21-1), we rewrite it in configuration space as

<span id="page-21-3"></span>
$$
-\int dxdy V(x-y)\widetilde{\varphi}(x-y)a_{\downarrow}^*(v_x)a_{\uparrow}(v_y)a_{\downarrow}(v_y)a_{\downarrow}(v_x). \tag{4.45}
$$

Hence also this term is bounded by  $C\varrho\mathcal{N}$ , using that  $||V\widetilde{\varphi}||_1 \leq ||V||_1 ||\widetilde{\varphi}||_{\infty} \leq C$  because of [\(A.2\)](#page-40-4).

Combining all the bounds the proof of Proposition [4.6](#page-19-2) is complete.

### <span id="page-21-1"></span> $\Box$

# <span id="page-21-0"></span>4.4 Renormalization of  $\mathbb{Q}_2^{\uparrow\downarrow}$  by scattering equation

In this subsection we will combine the " $bb + b^*b^*$  operators" from Propositions [4.2](#page-14-6) and [4.5](#page-18-3) with  $\mathbb{Q}_2^{\uparrow\downarrow}$  in order to obtain a renormalized interaction. Recall the definitions of  $\mathbb{T}_1$  and  $\mathbb{T}_2$  in [\(4.4\)](#page-14-8) and in [\(4.30\)](#page-18-1), as well as the ones of  $\mathbb{Q}_{2,<}$  and  $\widetilde{\mathbb{Q}}_{2,<}$  in [\(2.28\)](#page-8-2) and [\(2.30\)](#page-9-2). Note also that, as all these operators,  $\mathbb{Q}_{2}^{\uparrow\downarrow}$  in [\(2.11\)](#page-5-5) is quadratic in the b's, namely,

$$
\mathbb{Q}_2^{\uparrow\downarrow} = \frac{1}{L^3} \sum_p \hat{V}(p) b_{p,\uparrow} b_{-p,\downarrow} + \text{h.c.}
$$

<span id="page-22-0"></span>**Proposition 4.7** (Scattering equation cancellation). Let  $\gamma \in (0, 1/3)$ . Under the same assumptions of Theorem [1.2,](#page-2-0)

$$
\mathbb{T}_1 + \mathbb{T}_2 + \mathbb{Q}_2^{\uparrow\downarrow} = \mathbb{Q}_{2;<} + \widetilde{\mathbb{Q}}_{2;<} + \mathcal{E}_{\text{scatt}},\tag{4.46}
$$

where  $\mathcal{E}_{\text{scatt}}$  is such that for any normalized  $\psi \in \mathcal{F}_{f}$ 

<span id="page-22-1"></span>
$$
|\langle \psi, \mathcal{E}_{\text{scatt}} \psi \rangle| \le C \left( \varrho^{\frac{5}{3} - 2\gamma} + o(1)_{L \to \infty} \right) \langle \psi, \mathcal{N}\psi \rangle + C L^{\frac{3}{2}} \left( \varrho^{\frac{13}{6} - \frac{7}{2}\gamma} + o(1)_{L \to \infty} \right) ||\mathcal{N}^{\frac{1}{2}}\psi||. \tag{4.47}
$$

*Proof.* Using  $\hat{\chi}$   $+ \hat{\chi}$   $= 1$ , a simple computation yields

$$
\mathcal{E}_{\text{scatt}} = \frac{1}{L^3} \sum_{p} \hat{h}(p) b_{p,\uparrow} b_{-p,\downarrow} + \text{h.c}
$$

with

$$
\hat{h}(p) = \hat{V}(p) - (\hat{V} *_{\Sigma} \hat{\varphi})(p) - 8\pi a \hat{\chi} < (p) - 2p^2 \hat{\varphi}(p)\hat{\chi} > (p).
$$
\n(4.48)

In the following we will show that, as a consequence of the zero-energy scattering equation [\(1.5\)](#page-1-3),  $\hat{h}$  is suitably small (for large L and small  $\varrho$ ). We shall write  $\hat{h} = \hat{h}_1 + \hat{h}_2$ , with

<span id="page-22-3"></span>
$$
\hat{h}_1(p) = \left(\hat{V}(p) - (\hat{V} *_{\Sigma} \hat{\varphi})(p) - 2p^2 \hat{\varphi}(p)\right) \hat{\chi}_> (p).
$$
\n(4.49)

According to [\(1.5\)](#page-1-3),  $\hat{V}(p) - 2p^2 \hat{\varphi}(p) = (\mathcal{F}(V_{\infty} \varphi_{\infty})(p))$ , hence  $\hat{h}_1$  takes into account the finite-size effect of the periodic box, and vanishes in the thermodynamic limit. In Lemma [A.4,](#page-42-3) we shall in fact show that the periodic function  $h_1$  with Fourier coefficients  $\hat{h}_1$  satisfies  $||h_1||_{L^1(\Lambda)} \to 0$  and  $||h_1||_{L^2(\Lambda)} \to 0$  as  $L \to \infty$ .

In configuration space we can write

$$
I := \frac{1}{L^3} \sum_{p} \hat{h}_1(p) b_{p,\uparrow} b_{-p,\downarrow} = \int dx dy h_1(x-y) a_{\uparrow}(u_x) a_{\uparrow}(v_x) a_{\downarrow}(u_y) a_{\downarrow}(v_y) = \int dy b_{\uparrow}((h_1)_y) a_{\downarrow}(u_y) a_{\downarrow}(v_y),
$$

where we used the notation  $b_{\sigma}$  introduced in [\(3.1\)](#page-10-2). With the aid of Lemma [3.2](#page-11-6) and the Cauchy–Schwarz inequality, we can estimate

$$
|\langle \psi, I\psi \rangle| \le ||\hat{v}_{\downarrow}||_2 \left( \int dy \, \|b_{\uparrow}((h_1)_y)\psi\| \|a_{\downarrow}(u_y)\psi\| + CL^{\frac{3}{2}} \varrho^{\frac{1}{2}} \|h_1\|_2 \|\mathcal{N}^{\frac{1}{2}} \psi\| \right) \le ||\hat{v}_{\downarrow}||_2 \|\hat{v}_{\uparrow}\|_2 \int dx dy \, |h_1(x-y)| \|a_{\uparrow}(u_x)\psi\| \|a_{\downarrow}(u_y)\psi\| + CL^{\frac{3}{2}} \varrho \|h_1\|_2 \|\mathcal{N}^{\frac{1}{2}} \psi\| \le C \varrho \|h_1\|_1 \langle \psi, \mathcal{N}\psi \rangle + CL^{\frac{3}{2}} \varrho \|h_1\|_2 \|\mathcal{N}^{\frac{1}{2}} \psi\|.
$$
\n(4.50)

This term is thus  $o(L^3)_{L\to\infty}$  in the thermodynamic limit.

We now consider the remaining term

<span id="page-22-2"></span>
$$
\Pi := \frac{1}{L^3} \sum_{p} \hat{h}_2(p) b_{p,\uparrow} b_{-p,\downarrow} , \qquad \hat{h}_2(p) = (\hat{V}(p) - (\hat{V} *_{\Sigma} \hat{\varphi})(p) - 8\pi a) \hat{\chi}_<(p).
$$
 (4.51)

To start, we note that

$$
\frac{1}{L^3} \sum_p \hat{h}_2(p) b_{p,\uparrow} b_{-p,\downarrow} = \frac{1}{L^3} \sum_{p,r,r'} \hat{h}_2(p) \hat{u}_{\uparrow}^<(r+p) \hat{u}_{\downarrow}^<(r'-p) \hat{v}_{\uparrow}(r) \hat{v}_{\downarrow}(r') \hat{a}_{r+p,\uparrow} \hat{a}_{-r,\uparrow} \hat{a}_{r'-p,\downarrow} \hat{a}_{-r',\downarrow},
$$

i.e., we can replace  $\hat{u}_{\uparrow}(r+p)$  and  $\hat{u}_{\downarrow}(r'-p)$  by  $\hat{u}_{\uparrow}^<(r+p)$  and  $\hat{u}_{\downarrow}^<(r'-p)$ , with  $\hat{u}_{\sigma}^<$  defined in [\(2.25\)](#page-8-1), due to the support properties of  $\hat{\chi}_\text{\tiny <}$  and  $\hat{v}_\sigma$ . Using also that

$$
\sum_{r} \hat{u}_{\sigma}^{<}(r+p)\hat{v}_{\sigma}(r)\hat{a}_{r+p,\sigma}\hat{a}_{-r,\sigma} = \int dx \, e^{-ip\cdot x} a_{\sigma}(u_{x}^{<}) a_{\sigma}(v_{x}),
$$

we can write

$$
\langle \psi, \Pi \psi \rangle = \frac{1}{L^3} \sum_p \hat{h}_2(p) \left\langle \left( \int dx \, e^{-ip \cdot x} a^*_\uparrow(u^<_x) a^*_\uparrow(v_x) \psi \right), \left( \int dy \, e^{-ip \cdot y} a_\downarrow(v_y) a_\downarrow(u^<_y) \psi \right) \right\rangle
$$

<span id="page-23-1"></span>.

and hence, by the Cauchy–Schwarz inequality,

$$
|\langle \psi, \Pi \psi \rangle| \leq \|\hat{h}_2\|_{\infty} \left( \int dx \, \|a_1^*(u_x^{\leq}) a_1^*(v_x) \psi\|^2 \right)^{1/2} \left( \int dy \, \|a_1(v_y) a_1(u_y^{\leq}) \psi\|^2 \right)^{1/2}
$$

The last factor can simply be bounded by  $\varrho^{\frac{1}{2}} \langle \psi, \mathcal{N} \psi \rangle^{1/2}$ . In the first factor, we first normal and write  $a_{\uparrow}(u_x^{\le})a_{\uparrow}^*(u_x^{\le}) = -a_{\uparrow}^*(u_x^{\le})a_{\uparrow}(u_x^{\le}) + ||u^{\le}||_2^2$ , leading to the bound  $\varrho^{\frac{1}{2}} \langle \psi, \mathcal{N}\psi \rangle^{1/2} + \varrho^{\frac{1}{2}} ||u^{\le}||_2 L^{3/2}$ . Since  $||u^{\le}||_2^2 \le$  $C\varrho^{1-3\gamma}$ , this yields

$$
|\langle \psi, \Pi \psi \rangle| \leq C \|\hat{h}_2\|_{\infty} \left( \varrho \langle \psi, \mathcal{N} \psi \rangle + \varrho^{\frac{3}{2}(1-\gamma)} L^{3/2} \langle \psi, \mathcal{N} \psi \rangle^{1/2} \right).
$$

We are left with bounding  $\sup_p |\hat{h}_2(p)|$ . Note that  $8\pi a = \int_{\mathbb{R}^3} V_{\infty}(1 - \varphi_{\infty}) = \hat{V}(0) - \int_{\mathbb{R}^3} V_{\infty} \varphi_{\infty}$ . Since  $V_{\infty}$  is assumed to have compact support,  $|\hat{V}(p) - \hat{V}(0)| \le C|p|^2$ . Using also [\(A.4\)](#page-41-2), we see that

<span id="page-23-4"></span>
$$
(\hat{V} *_{\Sigma} \hat{\varphi})(p) = \int_{\Lambda} dx \, V(x)\varphi(x)e^{ip \cdot x} = \int_{\mathbb{R}^3} V_{\infty}(x)\varphi_{\infty}(x)e^{ip \cdot x} + o(1)_{L \to \infty}
$$
\n(4.52)

and hence  $|(\hat{V} *_{\Sigma} \hat{\varphi})(p) - \int_{\mathbb{R}^3} V_{\infty} \varphi_{\infty}| \leq C|p|^2 + o(1)_{L \to \infty}$  (using that  $\varphi_{\infty}$  is bounded, see Lemma [A.1\)](#page-40-5). Altogether, this shows that  $|\hat{h}_2(p)| \leq C|p|^2|\hat{\chi}_<(p)| + o(1)_{L\to\infty} \leq C\varrho^{2/3-2\gamma} + o(1)_{L\to\infty}$ , and thus completes the proof.

<span id="page-23-0"></span>**Proposition 4.8** (Propagation estimates for  $\mathbb{Q}_{2;<}$  and  $\widetilde{\mathbb{Q}}_{2;<}$ ). Let  $\lambda \in [0,1]$  and  $\gamma \in (0,1/3)$ . Under the same assumptions as in Theorem [1.2](#page-2-0)

$$
T_{1;\lambda}^*(\mathbb{Q}_{2;<} + \widetilde{\mathbb{Q}}_{2;<})T_{1;\lambda} = \mathbb{Q}_{2;<} + \widetilde{\mathbb{Q}}_{2;<} - 2\lambda \varrho_{\uparrow} \varrho_{\downarrow} \sum_{p \in \Lambda^*} \left( 8\pi a \widehat{\chi}_{<}(p) + \widehat{V} *_{\Sigma} (\widehat{\chi}_{<}\widehat{\varphi})(p) \right) \widehat{\varphi}(p)\widehat{\chi}_{>}(p) \tag{4.53}
$$

$$
+\int_0^\lambda d\lambda' T_{1;\lambda'}^* \mathcal{E}_{\mathbb{Q}_{2;<}+\widetilde{\mathbb{Q}}_{2;<}} T_{1;\lambda'},\tag{4.54}
$$

where the error term  $\mathcal{E}_{\mathbb{Q}_{2;} < \tilde{+}\widetilde{\mathbb{Q}}_{2;} <}$  is such that for any  $\psi \in \mathcal{F}_{\mathrm{f}}$ 

$$
|\langle \psi, \mathcal{E}_{\mathbb{Q}_{2;<} + \widetilde{\mathbb{Q}}_{2;<}} \psi \rangle| \leq C \varrho^{\frac{4}{3}-\gamma} \langle \psi, \mathcal{N}\psi \rangle + C \varrho^{\frac{7}{6}-\frac{\gamma}{2}} \|\mathbb{Q}_{4}^{\frac{1}{2}}\psi\| \|\mathcal{N}^{\frac{1}{2}}\psi\|.
$$

Furthermore, for any normalized  $\psi \in \mathcal{F}_f$ , we have

<span id="page-23-2"></span>
$$
|\langle \psi, \widetilde{\mathbb{Q}}_{2;} \langle \psi \rangle| \leq CL^{3/2} \varrho^{\frac{4}{3}-\gamma} \|\mathbb{Q}_4^{\frac{1}{2}}\psi\|,\tag{4.55}
$$

<span id="page-23-3"></span>
$$
|\langle \psi, \mathbb{Q}_{2;} \langle \psi \rangle| \leq CL^{\frac{3}{2}} \varrho^{\frac{3}{2}(1-\gamma)} \|\mathcal{N}^{\frac{1}{2}}\psi\|.
$$
\n
$$
(4.56)
$$

Proof of Proposition [4.8.](#page-23-0) By Duhamel's formula,

$$
T_{1;\lambda}^*(\mathbb{Q}_{2;<}+\widetilde{\mathbb{Q}}_{2;<})T_{1;\lambda}=\mathbb{Q}_{2;<}+\widetilde{\mathbb{Q}}_{2;<}+\int_0^\lambda d\lambda' T_{1;\lambda'}^*[\mathbb{Q}_{2;<}+\widetilde{\mathbb{Q}}_{2;<},B_1-B_1^*]T_{1;\lambda'}.
$$
 (4.57)

We start by computing  $[Q_{2,<}, B_1 - B_1^*]$ . The terms have the same structure as in Proposition [4.6,](#page-19-2) the only difference is that  $V(k)$  has to be replaced by  $8\pi a\hat{\chi}(k)$  everywhere. We again write them as

$$
[\mathbb{Q}_{2,<}, B_1 - B_1^*] = \sum_{j=1}^6 I_j + \text{h.c.}.
$$

As in Proposition [4.6,](#page-19-2) putting  $I_6$  in normal order, we get the constant term. All the other terms are error terms, which we estimate in expectation in a state  $\psi \in \mathcal{F}_f$ . In some error terms it will again be convenient to replace  $\hat{u}_{\sigma}$  by  $\hat{u}_{\sigma}^{\le}$ , with  $\hat{u}_{\sigma}^{\le}$  defined in [\(2.25\)](#page-8-1), which is possible by the compact support of  $\hat{\chi}_{\le}$ . In the estimates below, we often use the bounds in Lemma [3.1,](#page-11-3) Lemma [A.2](#page-40-3) and Lemma [A.5](#page-42-2) together with [\(2.1\)](#page-3-2) and [\(4.14\)](#page-16-0).

For  $I_1$ , we have, analogously to  $(4.38)$ ,

$$
I_1 = -\frac{8\pi a}{L^3} \sum_r \hat{v}_\uparrow(r) \int dx dy dz \, e^{ir \cdot (x-z)} \chi_<(x-y) a_\downarrow^*(u_y^-) a_\uparrow^*(u_x^-) a_\downarrow^*(v_y) b_\downarrow(\tilde{\varphi}_z) a_\uparrow(u_z). \tag{4.58}
$$

Using  $0 \le v_{\uparrow}(r) \le 1$  and the Cauchy–Schwarz inequality, we can bound

$$
|\langle \psi, I_1 \psi \rangle| \leq 8\pi a \left( \int dx \left\| \int dy \chi_{<}(x-y) a_{\downarrow}(v_y) a_{\uparrow}(u_x^{\le}) a_{\downarrow}(u_y^{\le}) \psi \right\|^2 \right)^{1/2} \left( \int dz \left\| b_{\downarrow}(\widetilde{\varphi}_z) a_{\uparrow}(u_z) \psi \right\|^2 \right)^{1/2} \leq 8\pi a \|\hat{v}_{\downarrow}\|_2 \|\hat{u}_{\downarrow}^{\le}\|_2 \|\chi_{<}\|_1 \varrho^{\frac{1}{3} + \frac{\gamma}{2}} \langle \psi, \mathcal{N}\psi \rangle \leq C \varrho^{\frac{4}{3} - \gamma} \langle \psi, \mathcal{N}\psi \rangle. \tag{4.59}
$$

The term  $I_2$  can be estimated in the same way, with the same result.

Next we consider  $I_3$ . In analogy with  $(4.40)$ , it is given by

$$
\langle \psi, I_3 \psi \rangle = 8\pi a \int dx dy dz' \chi_{<}(x-y) v_{\downarrow}(y;z') \left\langle a_{\uparrow}(u_x^{\leq}) a_{\downarrow}(u_y^{\leq}) \psi, \left( \int dz \, \widetilde{\varphi}(z-z') v_{\uparrow}(x;z) a_{\uparrow}(u_z) \right) a_{\downarrow}(u_{z'}) \psi \right\rangle.
$$

Using [\(4.16\)](#page-16-1) and the Cauchy–Schwarz inequality, we obtain the bound

$$
|\langle \psi, I_3 \psi \rangle| \leq 8\pi a \left( \int dx dy dz' |\chi_{<}(x-y)||v_{\downarrow}(y;z')|^2 \|a_{\uparrow}(u_x^{\le})a_{\downarrow}(u_y^{\le})\psi\|^2 \right)^{\frac{1}{2}}
$$
  
\$\times \left( \int dx dy dz' dw |\chi\_{<}(x-y)||\widetilde{\varphi}(z'-w)|^2 |v\_{\uparrow}(x;w)|^2 \|a\_{\downarrow}(u\_{z'})\psi\|^2 \right)^{\frac{1}{2}}\$  
\$\leq 8\pi a ||\chi\_{<}\|\_1 \|v\_{\uparrow}\|\_2 \|v\_{\downarrow}\|\_2 \|u\_{\uparrow}^{\le}\|\_2 \|\widetilde{\varphi}\|\_2 \langle \psi, \mathcal{N}\psi \rangle \leq C \varrho^{\frac{4}{3}-\gamma} \langle \psi, \mathcal{N}\psi \rangle, \quad (4.60)\$

where we used the bounds mentioned at the beginning of the proof.

The term  $I_4$  can be written, similarly to  $(4.41)$ , as

$$
I_4 = 8\pi a \int dx dy dz \ \chi_<(x-y)\widetilde{\varphi}(y-z)a_{\downarrow}^*(u_x)a_{\downarrow}(u_z)a_{\uparrow}(v_y)a_{\downarrow}(v_z)a_{\downarrow}^*(v_x)a_{\uparrow}^*(v_y).
$$

Hence

$$
|\langle \psi, I_4 \psi \rangle| \le C \varrho^2 \| \chi_{\lt} \|_1 \| \widetilde{\varphi} \|_1 \langle \psi, \mathcal{N} \psi \rangle = C \varrho^{\frac{4}{3} + 2\gamma} \langle \psi, \mathcal{N} \psi \rangle, \tag{4.61}
$$

where used that  $a_\downarrow(u_x)$  commutes with  $a_\uparrow(v_y)a_\downarrow(v_z)a_\downarrow^*(v_x)a_\uparrow^*(v_y)$ , as well as Lemmas [A.2](#page-40-3) and [A.5](#page-42-2) in the last step. The term  $I_5$  can be estimated in the same way, with the same result.

Finally we consider the last term I<sub>6</sub> coming from the commutator  $[Q_{2,<}B_1 - B_1]$ , which equals [\(4.44\)](#page-21-1) with  $\hat{V}$  replaced by  $8\pi a \hat{\chi}$ . The term in the first line is the desired constant. For the term in the second line, we use

<span id="page-24-0"></span>
$$
\left|\frac{1}{L^3}\sum_{p}\widehat{\chi}_{<}(p)\widehat{\varphi}(p)\widehat{\chi}_{>}(p)\right| \leq \frac{C}{L^3}\sum_{p\neq 0} \frac{\widehat{\chi}_{<}(p)}{|p|^2} \leq C\varrho^{\frac{1}{3}-\gamma},\tag{4.62}
$$

which follows from the fact that  $p^2\hat{\varphi}(p)$  is bounded, as a consequence of [\(1.5\)](#page-1-3). Hence the expectation value of this term is bounded by  $C\varrho^{\frac{4}{3}-\gamma}\langle\psi,\mathcal{N}\psi\rangle$ . In the last term corresponding to the third line of [\(4.44\)](#page-21-1), we observe that the summation over p is restricted to  $|p| \leq 7\varrho^{1/3-\gamma}$ , due to the constraints on  $k, r, r'$  and  $r+p+k, r'-p-k$ in the summands. In other words, we can add for free the cut-off function  $\tilde{\chi}$  given by

$$
\widetilde{\chi}(p) = \begin{cases} 1 & \text{if } |p| \le 7\varrho^{\frac{1}{3}-\gamma}, \\ 0 & \text{if } |p| > 7\varrho^{\frac{1}{3}-\gamma}, \end{cases}
$$

arriving at

$$
\frac{8\pi a}{L^6}\sum_{k,p,r,r'}\widehat{\chi}_{<}(k)\hat{\varphi}(p)\widehat{\chi}_{>}(p)\widehat{\chi}(p)\hat{v}_{\uparrow}(r)\hat{v}_{\downarrow}(r')\hat{v}_{\uparrow}(k+r+p)\hat{v}_{\downarrow}(r'-p-k)\hat{a}_{-k-r-p,\uparrow}^*\hat{a}_{p+k-r',\downarrow}^*\hat{a}_{-r,\uparrow}\hat{a}_{-r',\downarrow}.
$$

Introducing the function  $\tilde{\varphi}_{<$  with Fourier coefficients  $\hat{\chi}_{>} (p) \hat{\varphi}(p) \tilde{\chi}(p)$  and rewriting the term in configuration space as in [\(4.45\)](#page-21-3), we obtain the bound  $C\varrho\|\chi_{\leq \varphi\leq \|_1}N$ . We have  $\|\chi_{\leq \varphi\leq \|_1} \leq \|\chi_{\leq} \|_1 \|\widetilde{\varphi}_{\leq} \|_{\infty} \leq C\varrho^{\frac{1}{3}-\gamma}$  using the same bound as in [\(4.62\)](#page-24-0). Altogether, we have thus shown that

$$
[\mathbb{Q}_{2,<},B_1-B_1^*]=-16\pi a\varrho_1\varrho_\downarrow\sum_p\widehat{\chi}_<(p)\widehat{\varphi}(p)\widehat{\chi}_>(p)+\mathcal{E}_{\mathbb{Q}_{2,<}},
$$

with  $\mathcal{E}_{\mathbb{Q}_{2;\epsilon}}$  such that

$$
|\langle \psi, \mathcal{E}_{\mathbb{Q}_{2;<}} \psi \rangle| \leq C \varrho^{\frac{4}{3}-\gamma} \langle \psi, \mathcal{N} \psi \rangle.
$$

We now consider  $[\tilde{\mathbb{Q}}_{2,<}, B_1 - B_1^*]$ . Again all the terms in the commutator are of the same type as the ones in  $[Q_2, B_1 - B_1^*]$  in Proposition [4.6,](#page-19-2) now with  $\hat{V}$  replaced by  $\hat{V} *_{\sum_{i} (\hat{X} < \hat{\varphi})^i}$ . They can then be treated exactly in the same way as the corresponding error terms in Proposition  $4.6$ , using that

<span id="page-25-1"></span>
$$
\sup_{x \in \Lambda} \left| \frac{1}{L^3} \sum_{p} \hat{\varphi}(p) \hat{\chi}_{\leq}(p) e^{ip \cdot x} \right| \leq C \varrho^{\frac{1}{3} - \gamma} \tag{4.63}
$$

as in [\(4.62\)](#page-24-0). We thus get that

$$
[\widetilde{\mathbb{Q}}_{2,<},B_1-B_1^*]=-2\varrho_{\uparrow}\varrho_{\downarrow}\sum_{p\in\Lambda^*}\hat{V} *_{\Sigma}(\widehat{\chi}<\hat{\varphi})(p)\hat{\varphi}(p)\widehat{\chi}_{>}(p)+\mathcal{E}_{\widetilde{\mathbb{Q}}_{2,<}},
$$

with  $\mathcal{E}_{\widetilde{\mathbb{Q}}_{2;\leq}}$  such that

$$
|\langle \psi, \mathcal{E}_{\tilde{\mathbb{Q}}_{2};<} \psi \rangle| \leq C \varrho^{\frac{7}{6}-\frac{\gamma}{2}} \|\mathbb{Q}_{4}^{\frac{1}{2}}\psi\| \|\mathcal{N}^{\frac{1}{2}}\psi\| + C \varrho^{\frac{4}{3}-\gamma}\langle \psi, \mathcal{N}\psi \rangle.
$$

This proves [\(4.54\)](#page-23-1).

Finally we discuss the bounds in [\(4.55\)](#page-23-2) and [\(4.56\)](#page-23-3). Rewriting  $\tilde{\mathbb{Q}}_{2,<}$  in configuration space, we have

$$
\widetilde{\mathbb{Q}}_{2;<} = \int dx dy V(x - y)\varphi_<(x - y)a_{\uparrow}(u_x)a_{\uparrow}(v_x)a_{\downarrow}(u_y)a_{\downarrow}(v_y) + \text{h.c.},
$$

where  $\varphi_{\leq}$  is the function with Fourier coefficients  $\hat{\varphi}(p)\hat{\chi}_{\leq}(p)$ . The bound in [\(4.55\)](#page-23-2) is then a consequence of  $\|\varphi_{<} \|_{\infty} \leq C \varrho^{1/3-\gamma}$  as shown in [\(4.63\)](#page-25-1). Indeed, via the Cauchy–Schwarz inequality, we get

$$
|\langle \psi, \widetilde{\mathbb{Q}}_{2;} \langle \psi \rangle| \leq C \varrho^{\frac{4}{3}-\gamma} \int dx dy V(x-y) \|a_{\uparrow}(u_x) a_{\downarrow}(u_y) \psi\| \leq CL^{3/2} \varrho^{\frac{4}{3}-\gamma} \|\mathbb{Q}_4^{\frac{1}{2}} \psi\|.
$$

Similarly, we can write  $\mathbb{Q}_{2;<}$  in configuration space as

$$
\mathbb{Q}_{2,<} = 8\pi a \int dx dy \ \chi_<(x-y)a_{\uparrow}(u_x^<)a_{\downarrow}(u_y^<)a_{\downarrow}(v_y)a_{\uparrow}(v_x) + \text{h.c.}
$$

where we again could replace  $\hat{u}_{\sigma}$  by  $\hat{u}_{\sigma}^{\lt}$  defined in [\(2.25\)](#page-8-1). We then find

$$
|\langle \psi, \mathbb{Q}_{2;} \langle \psi \rangle| \le 16\pi a \|u_{\uparrow}^{\le} \|_{2} \|v_{\uparrow}\|_{2} \|v_{\downarrow}\|_{2} \int dx dy \, |\chi_{<}(x-y)| \|a_{\downarrow}(u_{y}^{<})\psi\| \le CL^{\frac{3}{2}} \varrho^{\frac{3}{2}(1-\gamma)} \|\mathcal{N}^{\frac{1}{2}}\psi\|.
$$
 (4.64)

This completes the proof of Proposition [4.8.](#page-23-0)

## <span id="page-25-0"></span>4.5 Propagation of the estimates for  $\mathbb{H}_0$  and  $\mathbb{Q}_4$

In this subsection we obtain propagation estimates for  $\mathbb{H}_0$  and  $\mathbb{Q}_4$ , which will be useful to estimate some of the error terms.

<span id="page-25-3"></span>**Proposition 4.9** (Propagation of the estimates for  $\mathbb{H}_0$  and  $\mathbb{Q}_4$ ). Let  $\lambda \in [0,1]$ ,  $\gamma \in (0,1/6)$ ,  $\delta \in (0,8\gamma]$  with  $2\gamma + \frac{\delta}{16} \leq \frac{1}{3}$ . Under the same assumptions as in Theorem [1.2](#page-2-0)

$$
\langle T_{1;\lambda}T_2\Omega, (\mathbb{H}_0 + \mathbb{Q}_4)T_{1;\lambda}T_2\Omega\rangle \leq C\langle T_2\Omega, (\mathbb{H}_0 + \mathbb{Q}_4)T_2\Omega\rangle + CL^3 \varrho^2 + o(L^3)_{L\to\infty}.
$$

Note that since  $\mathbb{H}_0$  and  $\mathbb{Q}_4$  are nonnegative, the above estimate gives two separate bounds for  $\langle T_{1, \lambda}T_2\Omega, \mathbb{H}_0T_{1, \lambda}T_2\Omega\rangle$  and  $\langle T_{1, \lambda}T_2\Omega, \mathbb{Q}_4T_{1, \lambda}T_2\Omega\rangle$ . The term  $\langle T_2\Omega, (\mathbb{H}_0 + \mathbb{Q}_4)T_2\Omega\rangle$  on the right-hand side is actually small compared to  $L^3 \varrho^2$ , as will be proved later in Propositions [5.2](#page-29-4) and [5.3.](#page-29-3)

Proof. Let  $\xi_{\lambda} = T_{1,\lambda}T_2\Omega$ . We prove the propagation estimate by Grönwall's Lemma. By Propositions [4.2](#page-14-6) and [4.5,](#page-18-3) we have

<span id="page-25-2"></span>
$$
\partial_{\lambda}\langle \xi_{\lambda}, (\mathbb{H}_0 + \mathbb{Q}_4)\xi_{\lambda}\rangle = \langle \xi_{\lambda}, (\mathbb{T}_1 + \mathbb{T}_2 + \mathcal{E}_{\mathbb{H}_0} + \mathcal{E}_{\mathbb{Q}_4})\xi_{\lambda}\rangle, \tag{4.65}
$$

where the four terms on the right-hand side are defined in  $(4.4)$ ,  $(4.30)$ ,  $(4.2)$  and  $(4.29)$ , respectively. Eq.  $(4.31)$ in Proposition [4.5](#page-18-3) gives a bound on  $\mathcal{E}_{\mathbb{Q}_4}$ . For the term  $\mathcal{E}_{\mathbb{H}_0}$  in [\(4.2\)](#page-14-4), we first consider the terms involving  $k \cdot s$ 

in [\(4.6\)](#page-15-5) and write, as in the proof of Proposition [4.2,](#page-14-6)  $k = (k + s) - s$ . Correspondingly, writing the resulting expression in configuration space and recalling the definition of  $b_{\sigma}$  in [\(3.1\)](#page-10-2), we find

<span id="page-26-2"></span>
$$
-\frac{2}{L^3} \sum_{k,s,s' \in \Lambda^*} k \cdot s\hat{\varphi}(k)\hat{\chi}_{>}(k) b_{k,s,\uparrow} b_{-k,s',\downarrow} = 2 \sum_{\ell=1}^3 \int dx \, b_{\downarrow}(\tilde{\varphi}_x) \left( a_{\uparrow}(\partial_{\ell}v_x) a_{\uparrow}(\partial_{\ell}v_x^>) - a_{\uparrow}(\partial_{\ell}^2 v_x) a_{\uparrow}(u_x) \right) \tag{4.66}
$$

where in the first term we again replaced  $u_{\uparrow}$  by  $\nu^{\geq}$  defined in [\(4.15\)](#page-16-3), which is possible due the presence of the cutoff  $\chi$ . Using Lemma [3.1](#page-11-3) together with the bounds in [\(4.14\)](#page-16-0), we can estimate via the Cauchy–Schwarz inequality

<span id="page-26-3"></span>
$$
\int dx \, \|b_{\downarrow}(\widetilde{\varphi}_x)a_{\uparrow}(\partial_j^2 v_x)a_{\uparrow}(u_x)\xi_{\lambda}\| \leq CL^{\frac{3}{2}}\varrho^{\frac{3}{2}+\frac{\gamma}{2}}\|\mathcal{N}^{\frac{1}{2}}\xi_{\lambda}\|.
$$
\n(4.67)

For the first term on the right-hand side of [\(4.66\)](#page-26-2), we can proceed as in [\(4.19\)](#page-17-0) to bound

<span id="page-26-4"></span>
$$
\int dx \, \|b_{\downarrow}(\tilde{\varphi}_x)a_{\uparrow}(\partial_\ell v_x)a_{\uparrow}(\partial_\ell v_x^>)\xi_{\lambda}\| \leq CL^{\frac{3}{2}}\varrho^{\frac{7}{6}+\frac{\gamma}{2}}\langle\xi_{\lambda},\mathbb{H}_0\xi_{\lambda}\rangle^{1/2}.
$$
\n(4.68)

For the terms involving  $k \cdot s'$  in  $\mathcal{E}_{\mathbb{H}_0}$  in [\(4.2\)](#page-14-4) we can proceed in the same way, obtaining the same bound.

We now consider the expectation of  $T_1 + T_2$  in [\(4.65\)](#page-25-2). From Proposition [4.7,](#page-22-0) we know that  $T_1 + T_2$  $-\mathbb{Q}_2^{\uparrow\downarrow}+\mathbb{Q}_{2;<}+\widetilde{\mathbb{Q}}_{2;<}+\mathcal{E}_{\text{scatt}}$ , with  $\mathcal{E}_{\text{scatt}}$  bounded as in [\(4.47\)](#page-22-1), and Eqs. [\(4.55\)](#page-23-2) and [\(4.56\)](#page-23-3) from Proposition [4.8](#page-23-0) give a bound on  $\mathbb{Q}_{2,<} + \widetilde{\mathbb{Q}}_{2,<}$  It thus remains to give a bound on  $\mathbb{Q}_2^{\uparrow\downarrow}$ . By the Cauchy–Schwarz inequality and [\(4.14\)](#page-16-0),

$$
|\langle \xi_{\lambda}, \mathbb{Q}_{2}^{\uparrow\downarrow} \xi_{\lambda} \rangle| \leq C \varrho \int dx dy V(x - y) \|a_{\uparrow}(u_{x}) a_{\downarrow}(u_{y}) \xi_{\lambda} \| \leq CL^{\frac{3}{2}} \varrho \|\mathbb{Q}_{4}^{\frac{1}{2}} \xi_{\lambda} \| \leq CL^{3} \varrho^{2} + \langle \xi_{\lambda}, \mathbb{Q}_{4} \xi_{\lambda} \rangle
$$

where we used  $V \geq 0$  and  $||V||_{L^1(\Lambda)} \leq C$ . Therefore,

$$
|\langle \xi_{\lambda}, (\mathbb{T}_1 + \mathbb{T}_2) \xi_{\lambda} \rangle| \leq CL^3 \varrho^2 + C \langle \xi_{\lambda}, \mathbb{Q}_4 \xi_{\lambda} \rangle + C \left( \varrho^{\frac{5}{3} - 2\gamma} + o(1)_{L \to \infty} \right) \langle \xi_{\lambda}, \mathcal{N} \xi_{\lambda} \rangle
$$
  
+  $CL^{\frac{3}{2}} \left( \varrho^{\frac{3}{2}(1-\gamma)} + \varrho^{\frac{13}{6} - \frac{7}{2}\gamma} + o(1)_{L \to \infty} \right) ||\mathcal{N}^{\frac{1}{2}} \xi_{\lambda}||.$  (4.69)

Inserting the bounds [\(4.31\)](#page-18-2), [\(4.67\)](#page-26-3), [\(4.68\)](#page-26-4) and [\(4.69\)](#page-26-5) in [\(4.65\)](#page-25-2), we find

$$
|\partial_{\lambda}\langle \xi_{\lambda}, (\mathbb{H}_0 + \mathbb{Q}_4)\xi_{\lambda}\rangle| \leq C\langle \xi_{\lambda}, (\mathbb{H}_0 + \mathbb{Q}_4)\xi_{\lambda}\rangle + CL^3 \varrho^2 + C\left(\varrho^{\frac{5}{3}-2\gamma} + o(1)_{L\to\infty}\right) \langle \xi_{\lambda}, \mathcal{N}\xi_{\lambda}\rangle
$$

$$
+ CL^{\frac{3}{2}}\left(\varrho^{\frac{3}{2}(1-\gamma)} + \varrho^{\frac{13}{6}-\frac{7}{2}\gamma} + o(1)_{L\to\infty}\right) \|\mathcal{N}^{\frac{1}{2}}\xi_{\lambda}\|.
$$

Using the estimate for the number operator in [\(3.12\)](#page-13-2) together with the constraints on the parameters  $\gamma < 1/3$ ,  $\delta \leq 8\gamma$  and  $2\gamma + \frac{\delta}{16} \leq \frac{1}{3}$ , we conclude that

<span id="page-26-5"></span><span id="page-26-1"></span>
$$
|\partial_{\lambda}\langle \xi_{\lambda}, (\mathbb{H}_0 + \mathbb{Q}_4)\xi_{\lambda}\rangle| \leq C\langle \xi_{\lambda}, (\mathbb{H}_0 + \mathbb{Q}_4)\xi_{\lambda}\rangle + CL^3 \varrho^2 + o(L^3)_{L\to\infty}.
$$

<span id="page-26-0"></span>The desired result then follows from Grönwall's Lemma.

## 4.6 Conclusion of Proposition [4.1](#page-14-2)

Now we have all the necessary ingredients in order to give the proof of Proposition [4.1.](#page-14-2) Recall the definition of  $\mathcal{H}_{\text{corr}}^{\text{eff}} = \mathbb{H}_0 + \mathbb{Q}_2^{\uparrow\downarrow} + \mathbb{Q}_4$  in [\(2.12\)](#page-6-5). We start by writing

<span id="page-26-6"></span>
$$
\langle T_1 T_2 \Omega, (\mathbb{H}_0 + \mathbb{Q}_4) T_1 T_2 \Omega \rangle = \langle T_2 \Omega, (\mathbb{H}_0 + \mathbb{Q}_4) T_2 \Omega \rangle + \int_0^1 d\lambda \, \partial_\lambda \langle T_{1,\lambda} T_2 \Omega, (\mathbb{H}_0 + \mathbb{Q}_4) T_{1,\lambda} T_2 \Omega \rangle. \tag{4.70}
$$

From Proposition [4.2](#page-14-6) and Remark [4.3,](#page-15-6)

$$
\int_0^1 d\lambda \, \partial_\lambda \langle T_{1;\lambda} T_2 \Omega, \mathbb{H}_0 T_{1;\lambda} T_2 \Omega \rangle
$$
\n
$$
= \int_0^1 d\lambda \, \langle T_{1;\lambda} T_2 \Omega, \mathbb{T}_1 T_{1;\lambda} T_2 \Omega \rangle + \langle T_2 \Omega, \mathcal{E}_{\mathbb{H}_0} T_2 \Omega \rangle + \int_0^1 d\lambda \, (1 - \lambda) \partial_\lambda \langle T_{1;\lambda} T_2 \Omega, \mathcal{E}_{\mathbb{H}_0} T_{1;\lambda} T_2 \Omega \rangle, \quad (4.71)
$$

<span id="page-27-0"></span>28

where  $\mathbb{T}_1$  is defined in [\(4.4\)](#page-14-8), and the last error term can be controlled by combining the bound [\(4.5\)](#page-14-5) from Proposition [4.2](#page-14-6) with Propositions [3.5](#page-13-3) and [4.9](#page-25-3) as

$$
\begin{split} |\partial_{\lambda} \langle T_{1;\lambda} T_{2}\Omega, \mathcal{E}_{\mathbb{H}_{0}} T_{1;\lambda} T_{2}\Omega \rangle| &\leq C \varrho^{1+\gamma} \|\mathbb{H}_{0}^{\frac{1}{2}} T_{1;\lambda} T_{2}\Omega\| \|\mathcal{N}^{\frac{1}{2}} T_{1;\lambda} T_{2}\Omega\| + C \varrho^{\frac{4}{3}+\gamma} \langle T_{1;\lambda} T_{2}\Omega, \mathcal{N} T_{1;\lambda} T_{2}\Omega \rangle \\ &\leq C L^{3/2} \varrho^{\frac{17}{6}+\frac{\gamma}{2}-\frac{\delta}{16}} \|(\mathbb{H}_{0} + \mathbb{Q}_{4})^{\frac{1}{2}} T_{2}\Omega\| + C L^{3} \left(\varrho^{\frac{17}{6}+\frac{\gamma}{2}-\frac{\delta}{16}} + \varrho^{3-\frac{\delta}{8}}\right) + o(L^{3})_{L \to \infty} . \end{split} \tag{4.72}
$$

From Proposition [4.5](#page-18-3) we get

$$
\int_0^1 d\lambda \, \partial_\lambda \langle T_{1;\lambda} T_2 \Omega, \mathbb{Q}_4 T_{1;\lambda} T_2 \Omega \rangle = \int_0^1 d\lambda \, \langle T_{1;\lambda} T_2 \Omega, (\mathbb{T}_2 + \mathcal{E}_{\mathbb{Q}_4}) T_{1;\lambda} T_2 \Omega \rangle \tag{4.73}
$$

where  $\mathbb{T}_2$  is defined in [\(4.30\)](#page-18-1) and the error term  $\mathcal{E}_{\mathbb{Q}_4}$  can be controlled, again with Proposition [3.5](#page-13-3) and [4.9,](#page-25-3) as

$$
|\langle T_{1,\lambda}T_2\Omega, \mathcal{E}_{\mathbb{Q}_4}T_{1,\lambda}T_2\Omega\rangle| \leq C\varrho^{\frac{5}{6}+\frac{\gamma}{2}}\|\mathcal{N}^{\frac{1}{2}}T_{1,\lambda}T_2\Omega\|\|\mathbb{Q}_4^{\frac{1}{2}}T_{1,\lambda}T_2\Omega\| \leq C\varrho^{\frac{5}{3}-\frac{\delta}{16}}L^{3/2}\left(\|(\mathbb{H}_0+\mathbb{Q}_4)^{\frac{1}{2}}T_2\Omega\|+L^{3/2}\varrho+o(L^{3/2})_{L\to\infty}\right).
$$
\n(4.74)

The terms  $\mathbb{T}_1$  and  $\mathbb{T}_2$  can be combined as in Proposition [4.7](#page-22-0) to  $\mathbb{T}_1 + \mathbb{T}_2 = -\mathbb{Q}_2^{\uparrow\downarrow} + \mathbb{Q}_{2;<} + \widetilde{\mathbb{Q}}_{2;<} + \mathcal{E}_{scatt}$  with  $\mathbb{Q}_{2;<}$  and  $\widetilde{\mathbb{Q}}_{2;<}$  defined in [\(2.28\)](#page-8-2) and [\(2.30\)](#page-9-2), and  $\mathcal{E}_{scatt}$  satisfying

<span id="page-27-2"></span><span id="page-27-1"></span>
$$
|\langle T_{1,\lambda}T_2\Omega, \mathcal{E}_{\text{scatt}}T_{1,\lambda}T_2\Omega\rangle| \leq CL^3 \varrho^{3-4\gamma - \frac{\delta}{16}} + o(L^3)_{L \to \infty},\tag{4.75}
$$

where we used the estimate in  $(4.47)$  together with Proposition [3.5.](#page-13-3) Therefore, combining  $(4.70)$ – $(4.75)$ , we obtain

$$
\langle T_1 T_2 \Omega, \mathcal{H}_{\text{corr}}^{\text{eff}} T_1 T_2 \Omega \rangle = \langle T_2 \Omega, (\mathbb{H}_0 + \mathbb{Q}_4 + \mathcal{E}_{\mathbb{H}_0}) T_2 \Omega \rangle + \int_0^1 d\lambda \langle T_{1,\lambda} T_2 \Omega, (\mathbb{Q}_{2;<} + \widetilde{\mathbb{Q}}_{2;<}) T_{1,\lambda} T_2 \Omega \rangle
$$
  
+ \langle T\_1 T\_2 \Omega, \mathbb{Q}\_2^{\uparrow \downarrow} T\_1 T\_2 \Omega \rangle - \int\_0^1 d\lambda \langle T\_{1,\lambda} T\_2 \Omega, \mathbb{Q}\_2^{\uparrow \downarrow} T\_{1,\lambda} T\_2 \Omega \rangle + \mathcal{E}(4.76)

with

$$
|\mathcal{E}| \leq C \varrho^{\frac{5}{3} - \frac{\delta}{16}} L^{3/2} \| (\mathbb{H}_0 + \mathbb{Q}_4)^{\frac{1}{2}} T_2 \Omega \| + C L^3 \varrho^{\frac{8}{3} - \frac{\delta}{16}} + C L^3 \varrho^{3 - 4\gamma - \frac{\delta}{16}} + o(L^3)_{L \to \infty}.
$$
 (4.77)

The terms involving  $\mathbb{Q}_2^{\uparrow\downarrow}$  in the second line on the right-hand of [\(4.76\)](#page-27-2) above can be written as

$$
\langle T_1 T_2 \Omega, \mathbb{Q}_2^{\uparrow \downarrow} T_1 T_2 \Omega \rangle - \int_0^1 d\lambda \, \langle T_{1;\lambda} T_2 \Omega, \mathbb{Q}_2^{\uparrow \downarrow} T_{1;\lambda} T_2 \Omega \rangle = \int_0^1 d\lambda \, \lambda \, \partial_\lambda \langle T_{1;\lambda} T_2 \Omega, \mathbb{Q}_2^{\uparrow \downarrow} T_{1;\lambda} T_2 \Omega \rangle,
$$

which, according to Proposition [4.6,](#page-19-2) equals

$$
-\varrho_{\uparrow}\varrho_{\downarrow}\sum_{p\in\Lambda^*}\hat{V}(p)\hat{\varphi}(p)\hat{\chi}_{>}(p)+\int_0^1d\lambda\,\lambda\,\langle T_{1;\lambda}T_2\Omega,\mathcal{E}_{\mathbb{Q}_2^{\uparrow\downarrow}}T_{1;\lambda}T_2\Omega\rangle\tag{4.78}
$$

with

$$
|\langle T_{1;\lambda}T_2\Omega, \mathcal{E}_{\mathbb{Q}_2^{\uparrow\downarrow}} T_{1;\lambda}T_2\Omega\rangle| \leq CL^3 \varrho^{\frac{8}{3}-\gamma-\frac{\delta}{8}} + C\varrho^{\frac{5}{3}-\frac{\delta}{16}} L^{3/2} \|(\mathbb{H}_0 + \mathbb{Q}_4)^{\frac{1}{2}} T_2\Omega\| + o(L^3)_{L\to\infty}
$$
(4.79)

for all  $\lambda \in [0, 1]$ , where we used again Proposition [3.5](#page-13-3) and Proposition [4.9.](#page-25-3) Next we consider the contribution coming from  $\mathbb{Q}_{2,<} + \widetilde{\mathbb{Q}}_{2,<}$  in the first line on the right-hand side of [\(4.76\)](#page-27-2). By Proposition [4.8,](#page-23-0)

$$
\int_0^1 d\lambda \langle T_{1,\lambda} T_2 \Omega, (\mathbb{Q}_{2,<} + \widetilde{\mathbb{Q}}_{2,<}) T_{1,\lambda} T_2 \Omega \rangle = \langle T_2 \Omega, (\mathbb{Q}_{2,<} + \widetilde{\mathbb{Q}}_{2,<}) T_2 \Omega \rangle - 8\pi a \varrho_{\uparrow} \varrho_{\downarrow} \sum_{p \in \Lambda^*} \widehat{\chi}_{<}(p) \widehat{\varphi}(p) \widehat{\chi}_{>}(p)
$$

$$
- \varrho_{\uparrow} \varrho_{\downarrow} \sum_{p \in \Lambda^*} \widehat{V} *_{\Sigma} (\widehat{\chi}_{<}\widehat{\varphi})(p) \widehat{\varphi}(p) \widehat{\chi}_{>}(p) + \int_0^1 d\lambda (1 - \lambda) \langle T_{1,\lambda} T_2 \Omega, \mathcal{E}_{\mathbb{Q}_{2,<} + \widetilde{\mathbb{Q}}_{2,<}} T_{1,\lambda} T_2 \Omega \rangle
$$

with

$$
|\langle T_{1;\lambda}T_2\Omega, \mathcal{E}_{\mathbb{Q}_{2;<}+\widetilde{\mathbb{Q}}_{2;<}}T_{1;\lambda}T_2\Omega\rangle|\leq CL^3\varrho^{3-2\gamma-\frac{\delta}{8}}+CL^{3/2}\varrho^{2-\gamma-\frac{\delta}{16}}\|(\mathbb{H}_0+\mathbb{Q}_4)^{\frac{1}{2}}T_2\Omega\|+o(L^3)_{L\to\infty},
$$

where we used again the bounds in Propositions [3.5](#page-13-3) and [4.9.](#page-25-3) We can further bound the term  $\tilde{\mathbb{Q}}_{2;<}$  on the right hand side above using [\(4.55\)](#page-23-2). Therefore, combining all the estimates, we proved that

$$
\langle T_1 T_2 \Omega, \mathcal{H}_{\text{corr}}^{\text{eff}} T_1 T_2 \Omega \rangle \le -\varrho_{\uparrow} \varrho_{\downarrow} \sum_{p \in \Lambda^*} \left( \hat{V}(p) + \hat{V} \ast_{\Sigma} (\hat{\chi} < \hat{\varphi})(p) + 8\pi a \hat{\chi} < (p) \right) \hat{\varphi}(p) \hat{\chi}_{>}(p) + \langle T_2 \Omega, (\mathbb{H}_0 + \mathbb{Q}_4 + \mathbb{Q}_{2;\lt} + \mathcal{E}_{\mathbb{H}_0}) T_2 \Omega \rangle + C \varrho^{\frac{5}{3} - \frac{\delta}{16}} L^{3/2} \| (\mathbb{H}_0 + \mathbb{Q}_4)^{\frac{1}{2}} T_2 \Omega \| + C L^{3/2} \varrho^{\frac{4}{3} - \gamma} \| \mathbb{Q}_4^{\frac{1}{2}} T_2 \Omega \| + C L^3 \varrho^{\frac{8}{3} - \gamma - \frac{\delta}{8}} + C L^3 \varrho^{3 - 4\gamma - \frac{\delta}{16}} + o(L^3)_{L \to \infty}.
$$
 (4.80)

To complete the proof of Proposition [4.1,](#page-14-2) we need the following Lemma, evaluating the constant contribution in the first line on the right-hand side of [\(4.80\)](#page-28-1).

**Lemma 4.10** (Constant contribution to  $8\pi a \varrho_{\uparrow} \varrho_{\downarrow}$ ). Let V be as in Assumption [1.1.](#page-2-2) Let  $\hat{\chi}_{\leq}, \hat{\chi}_{>}\hat{\chi}_{\geq}$  be defined as in [\(2.16\)](#page-6-7), with  $0 < \gamma < 1/3$ , and let  $\varphi$  be as in Definition [\(2.5\)](#page-6-1). Then

<span id="page-28-2"></span><span id="page-28-1"></span>
$$
\frac{1}{L^3} \sum_{p \in \Lambda^*} \left( \hat{V}(p) + \hat{V} *_{\Sigma} (\hat{\chi} < \hat{\varphi})(p) + 8\pi a \hat{\chi} < (p) \right) \hat{\varphi}(p) \hat{\chi}_{>}(p)
$$
  
=  $\hat{V}(0) - 8\pi a - \frac{1}{L^3} \sum_{0 \neq p \in \Lambda^*} \frac{(8\pi a)^2 (\hat{\chi} < (p))^2}{2|p|^2} + \mathcal{E}_{\text{const}}$  (4.81)

with  $|\mathcal{E}_{\text{const}}| \leq C \varrho^{\frac{2}{3}-2\gamma} + o(1)_{L \to \infty}$ .

*Proof.* Using  $\hat{\chi}$   $+ \hat{\chi}$   $= 1$ , we can rewrite the left-hand side of [\(4.81\)](#page-28-2) (multiplied by  $L^3$ ) as

<span id="page-28-3"></span>
$$
\sum_{p} \hat{V}(p)\hat{\varphi}(p) - \sum_{p} \hat{h}_2(p)\hat{\varphi}(p) - \sum_{p} \hat{V} *_{\Sigma} (\hat{\chi} < \hat{\varphi})(p)\hat{\varphi}(p)\hat{\chi}< (p) - 8\pi a \sum_{p} \hat{\varphi}(p)(\hat{\chi}< (p))^{2}
$$
(4.82)

where we used the definition of  $\hat{h}_2(p) = (\hat{V}(p) - (\hat{V} *_{\Sigma} \hat{\varphi})(p) - 8\pi a)\hat{\chi}_<(p)$  in [\(4.51\)](#page-22-2). As in [\(4.52\)](#page-23-4), we have  $L^{-3} \sum_{p} \hat{V}(p)\hat{\varphi}(p) = \int_{\mathbb{R}^3} V_{\infty} \varphi_{\infty} + o(1)_{L \to \infty} = \hat{V}(0) - 8\pi a + o(1)_{L \to \infty}$ . At the end of the proof of Proposition [4.7,](#page-22-0) we also showed that  $|\hat{h}_2(p)| \leq C|p|^2 |\hat{\chi}_<(p)| + o(1)_{L\to\infty}$ . The zero-energy scattering equation [\(1.5\)](#page-1-3) implies that  $p^2\hat{\varphi}(p)$  is bounded, hence

$$
\left|\frac{1}{L^3}\sum_p \hat{h}_2(p)\hat{\varphi}(p)\right|\leq \frac{C}{L^3}\sum_p \hat{\chi}_{<}(p)+o(1)_{L\to\infty}\frac{1}{L^3}\sum_{0\neq |p|\leq 5\varrho^{1/3-\gamma}}\frac{1}{p^2}\leq C\varrho^{1-3\gamma}+o(1)_{L\to\infty}.
$$

Using that  $\|\hat{V}\|_{\infty} \leq C$ , the third term in [\(4.82\)](#page-28-3) is bounded as

$$
\left| \frac{1}{L^6} \sum_{q,p} \hat{V}(p-q) \hat{\chi}_{<}(q) \hat{\varphi}(q) \hat{\chi}_{<}(p) \hat{\varphi}(p) \right| \le C \left( \frac{1}{L^3} \sum_{p \neq 0} \frac{\hat{\chi}_{<}(p)}{|p|^2} \right)^2 \le C \varrho^{\frac{2}{3}-2\gamma}.
$$
\n(4.83)

Finally, an argument as at the end of the proof of Proposition [4.7](#page-22-0) shows at  $|p^2\hat{\varphi}(p) - 4\pi a| \leq Cp^2$ , hence

$$
\sum_{p} \hat{\varphi}(p)(\widehat{\chi}_{<}(p))^{2} = 4\pi a \sum_{p \neq 0} \frac{(\widehat{\chi}_{<}(p))^{2}}{2|p|^{2}} + \mathcal{E}
$$

with  $|\mathcal{E}| \le C \sum_{p} \chi_{\lt}(p)^2 \le CL^3 \varrho^{1-3\gamma}$ . This completes the proof.

Proposition [4.1](#page-14-2) follows from combining [\(4.80\)](#page-28-1) with [\(4.81\)](#page-28-2) and a simple Cauchy–Schwarz inequality.

# <span id="page-28-0"></span>5 Second quasi-bosonic Bogoliubov transformation  $T_2$

In this section we complete the second step discussed in Section [2.4.](#page-8-0) After the conjugation with  $T_1$ , the new effective correlation operator is  $\mathbb{H}_0 + \mathbb{Q}_{2,<}$ . By conjugating this operator with  $T_2$ , we will extract the full constant of order  $\varrho^{7/3}$ . The main result of this section is a rigorous version of [\(2.34\)](#page-10-4), plus estimates on the conjugations of  $\mathbb{H}_0$ ,  $\mathbb{Q}_4$  and  $\mathcal{E}_{\mathbb{H}_0}$ , which are needed to control the error terms in [\(4.1\)](#page-14-9) from Proposition [4.1.](#page-14-2)

Recall that  $\mathbb{H}_0$  and  $\mathbb{Q}_4$  are defined in [\(2.10\)](#page-5-3), while  $\mathbb{Q}_{2;<}$  and  $\mathcal{E}_{\mathbb{H}_0}$  are given in [\(2.28\)](#page-8-2) and [\(4.2\)](#page-14-4), respectively.

<span id="page-29-2"></span>**Proposition 5.1** (Conjugation by  $T_2$ ). Let  $0 < \gamma < \frac{1}{6}$ ,  $0 < \delta \le 8\gamma$  with  $2\gamma + \frac{\delta}{16} \le \frac{1}{3}$ . Then

$$
\langle T_2\Omega, (\mathbb{H}_0 + \mathbb{Q}_{2;<})T_2\Omega \rangle = -\frac{(8\pi a)^2}{L^6} \sum_{p,r,r' \in \Lambda^*} \frac{\hat{u}_\uparrow(r+p)\hat{u}_\downarrow(r'-p)\hat{v}_\uparrow(r)\hat{v}_\downarrow(r')}{|r+p|^2 - |r|^2 + |r'-p|^2 - |r'|^2 + 2\varepsilon} (\hat{\chi}_(5.1)
$$

with.

<span id="page-29-12"></span><span id="page-29-10"></span><span id="page-29-9"></span>
$$
|\mathcal{E}_{T_2}|\leq CL^3\left(\varrho^{\frac{7}{3}-\gamma+\frac{7}{8}\delta}+\varrho^{3-3\gamma-\frac{3}{16}\delta}\right).
$$

Moreover,

$$
\langle T_{2,\lambda}\Omega, \mathbb{H}_0 T_{2,\lambda}\Omega \rangle \leq C L^3 \varrho^{\frac{7}{3}-2\gamma-\frac{\delta}{16}},\tag{5.2}
$$

$$
\langle T_{2,\lambda}\Omega, \mathbb{Q}_4 T_{2,\lambda}\Omega \rangle \leq C L^3 \varrho^{\frac{8}{3}-2\gamma},\tag{5.3}
$$

<span id="page-29-11"></span>
$$
|\langle T_2\Omega, \mathcal{E}_{\mathbb{H}_0} T_2\Omega\rangle| \leq CL^3 \left(\varrho^{\frac{7}{3}+\gamma} + \varrho^{3-2\gamma-\frac{\delta}{4}}\right). \tag{5.4}
$$

We will study the individual terms  $\langle T_{2i}\rangle_{\Omega_1} \mathbb{H}_0 T_{2i}\rangle_{\Omega_2}$ ,  $\langle T_{2i}\rangle_{\Omega_2} \mathbb{Q}_4 T_{2i}\rangle_{\Omega_2}$ ,  $\langle T_2\Omega_2 \mathbb{E}_{\mathbb{H}_0} T_2\Omega_2 \rangle$  and  $\langle T_{2i}\rangle \Omega$ ,  $\mathbb{Q}_{2i} \langle T_{2i}\rangle \Omega$  in Sections [5.1–](#page-29-0)[5.4,](#page-36-0) and then complete the proof of Proposition [5.1](#page-29-2) in Section [5.5.](#page-39-0) In the proof, it will be very helpful to use the configuration space representation of  $B_2$  in [\(2.27\)](#page-8-4).

### <span id="page-29-0"></span>5.1 Conjugation of  $\mathbb{H}_0$

In this subsection we investigate  $T_2^* \mathbb{H}_0 T_2$ , and in particular validate [\(2.33\)](#page-10-5). Moreover, we also prove a rough estimate for  $\langle T_2\Omega, \mathbb{H}_0T_2\Omega\rangle$ , which is helpful to control the corresponding error term in Proposition [4.1.](#page-14-2)

<span id="page-29-4"></span>**Proposition 5.2** (Conjugation of  $\mathbb{H}_0$  by  $T_2$ ). Let  $\lambda \in [0,1]$ ,  $0 < \gamma < \frac{1}{6}$ ,  $0 < \delta \le 8\gamma$  with  $2\gamma + \frac{\delta}{16} \le \frac{1}{3}$ . Under the same assumptions as in Theorem [1.2,](#page-2-0)

$$
\partial_{\lambda} T_{2;\lambda}^* \mathbb{H}_0 T_{2;\lambda} = -T_{2;\lambda}^* (\mathbb{Q}_{2;<} + \mathfrak{e}_{\mathbb{H}_0}) T_{2;\lambda}
$$
\n(5.5)

where  $\mathfrak{e}_{\mathbb{H}_0}$  is such that for any normalized  $\psi \in \mathcal{F}_f$ 

<span id="page-29-5"></span>
$$
|\langle \psi, \mathbf{e}_{\mathbb{H}_0} \psi \rangle| \leq CL^{\frac{3}{2}} \varrho^{\frac{3}{2} - \frac{\gamma}{2} + \frac{15}{16} \delta} \|\mathcal{N}^{\frac{1}{2}} \psi\|.
$$
\n
$$
(5.6)
$$

Moreover, for any normalized  $\psi \in \mathcal{F}_{f}$ 

<span id="page-29-6"></span>
$$
\langle T_{2,\lambda}\psi, \mathbb{H}_0 T_{2,\lambda}\psi \rangle \le \langle \psi, \mathbb{H}_0 \psi \rangle + C L^{\frac{3}{2}} \varrho^{\frac{3}{2}(1-\gamma)} \|\mathcal{N}^{\frac{1}{2}}\psi\|.
$$
 (5.7)

Applying the bounds to  $\psi = T_{2,\lambda}\Omega$  and  $\psi = \Omega$ , respectively, we obtain from [\(3.12\)](#page-13-2) (with  $\lambda = 0$ )

<span id="page-29-8"></span>
$$
|\langle T_{2,\lambda}\Omega, \mathfrak{e}_{\mathbb{H}_0} T_{2,\lambda}\Omega\rangle| \leq CL^3 \varrho^{\frac{7}{3}-\gamma+\frac{7}{8}\delta}, \qquad \langle T_{2,\lambda}\Omega, \mathbb{H}_0 T_{2,\lambda}\Omega\rangle \leq CL^3 \varrho^{\frac{7}{3}-2\gamma-\frac{\delta}{16}}.
$$
 (5.8)

Proof. We have

 $\partial_{\lambda} T_{2;\lambda}^{*} \mathbb{H}_{0} T_{2;\lambda} = T_{2;\lambda}^{*} [\mathbb{H}_{0}, B_{2} - B_{2}^{*}] T_{2;\lambda'}.$  (5.9)

An explicit computation, using that for  $s + k \notin \mathcal{B}_F^{\uparrow}$ ,  $s' - k \notin \mathcal{B}_F^{\downarrow}$ ,  $s \in \mathcal{B}_F^{\uparrow}$ ,  $s' \in \mathcal{B}_F^{\downarrow}$ ,

$$
-(|s+k|^2 - |s|^2 + |s'-k|^2 - |s'|^2)\hat{\eta}_{s,s'}^{\varepsilon}(k) = -8\pi a + 2\varepsilon \hat{\eta}_{s,s'}^{\varepsilon}(k)
$$

by the definition of  $\hat{\eta}_{s,s'}^{\varepsilon}$  in [\(2.17\)](#page-6-3), gives  $[\mathbb{H}_0, B_2 - B_2^*] = -\mathbb{Q}_{2,\lt} + 2\varepsilon(B_2 + B_2^*)$ . We have already estimated the expectation value of  $B_2 + B_2^*$  in the proof of Proposition [3.5.](#page-13-3) Recalling that  $\varepsilon = \varrho^{\frac{2}{3}+\delta}$  and applying this bound, we directly obtain [\(5.6\)](#page-29-5). To prove [\(5.7\)](#page-29-6) we use Grönwall's Lemma together with the bound [\(4.56\)](#page-23-3) on  $\mathbb{Q}_{2;<}.$  $\Box$ 

## <span id="page-29-1"></span>5.2 Conjugation of  $\mathbb{Q}_4$

In this subsection we conjugate  $\mathbb{Q}_4$  with respect to  $T_{2;\lambda}$ . We will show that  $\langle T_{2;\lambda}\Omega,\mathbb{Q}_4T_{2;\lambda}\Omega\rangle$  does not contribute to the energy to order  $\varrho^{7/3}$ .

<span id="page-29-3"></span>**Proposition 5.3** (Conjugation of  $\mathbb{Q}_4$  by  $T_2$ ). Let  $\lambda \in [0,1]$ ,  $0 < \gamma < \frac{1}{6}$ ,  $0 < \delta \le 8\gamma$  with  $2\gamma + \frac{\delta}{16} \le \frac{1}{3}$ . Under the same assumptions as in Theorem [1.2](#page-2-0)

<span id="page-29-7"></span>
$$
\langle T_{2,\lambda}\Omega, \mathbb{Q}_4 T_{2,\lambda}\Omega \rangle \leq C L^3 \varrho^{\frac{8}{3}-2\gamma}.
$$
\n(5.10)

*Proof.* For the proof we find it convenient to split the operator  $\mathbb{Q}_4$  according to the support of the momenta of each of the  $\hat{u}_{\sigma}$ . To make this precise, we introduce smooth functions  $\hat{\zeta} < \hat{\zeta} > \hat{\zeta} > \infty$   $[0, 1]$  with  $\hat{\zeta} < +\hat{\zeta} > 1$ such that

<span id="page-30-6"></span>
$$
\hat{\zeta}^{<}(k) := \begin{cases} 1 & \text{if } |k| \le 5 \max\{k_F^{\uparrow}, k_F^{\downarrow}\}, \\ 0 & \text{if } |k| > 6 \max\{k_F^{\uparrow}, k_F^{\downarrow}\}. \end{cases} \tag{5.11}
$$

We denote we define  $\zeta^{\leq} : \Lambda \to \mathbb{R}$  the periodic function with Fourier coefficients  $\hat{\zeta}^{\leq}(k)$  for  $k \in (2\pi/L)\mathbb{Z}^3$ , and also  $\hat{u}_{\sigma}^{<}(k) = \hat{u}_{\sigma}(k)\hat{\zeta}_{\uparrow}^{<}(k), \ \hat{u}_{\sigma}^{>}(k) = \hat{u}_{\sigma}(k)\hat{\zeta}_{\uparrow}^{>}(k)$ . Accordingly, we split

$$
\mathbb{Q}_4=\mathbb{Q}_4^>+ \mathbb{Q}_4^< ,
$$

where

$$
\mathbb{Q}^{\geqslant}_4=\sum_{\sigma,\sigma'}\int dxdy\,V(x-y)a^{\ast}_{\sigma}(u^{\geqslant}_x)a^{\ast}_{\sigma'}(u^{\geqslant}_y)a_{\sigma'}(u^{\geqslant}_y)a_{\sigma}(u^{\geqslant}_x)
$$

and  $\mathbb{Q}_4^{\le}$  contains all the other possible terms. Specifically,  $\mathbb{Q}_4^{\le} = \sum_{j=0}^3 \mathbb{Q}_{4;j}^{\le}$ , where  $\mathbb{Q}_{4;j}^{\le}$  contains all the terms that have j functions  $u_{\sigma}^{\ge}$  and  $4-j$  functions  $u_{\sigma}^{\le}$ .

Let  $\xi_{\lambda} = T_{2,\lambda}\Omega$ . Using that  $||a_{\sigma}(u_x^{\le})|| \le C\varrho^{1/2}$ , it is easy to see that

<span id="page-30-0"></span>
$$
|\langle \xi_{\lambda}, (\mathbb{Q}_{4;0}^{\leq} + \mathbb{Q}_{4;1}^{\leq} + \mathbb{Q}_{4;2}^{\leq, a}) \xi_{\lambda} \rangle| \leq C_{\mathcal{Q}} \langle \xi_{\lambda}, \mathcal{N} \xi_{\lambda} \rangle \tag{5.12}
$$

where  $\mathbb{Q}_{4;2}^{\leq a}$  denotes the part of  $\mathbb{Q}_{4;2}^{\leq}$  with one  $a_{\sigma}(u^{\geq})$  and one  $a_{\sigma}^{*}(u^{\geq})$ . The other contributions to  $\mathbb{Q}_{4}^{\leq}$  can be bounded via the Cauchy–Schwarz inequality as

<span id="page-30-1"></span>
$$
|\langle \xi_{\lambda}, (\mathbb{Q}_{4;2}^{<,b} + \mathbb{Q}_{4;3}^{<}) \xi_{\lambda} \rangle| \le C \varrho^{\frac{1}{2}} \| \mathcal{N}^{\frac{1}{2}} \xi_{\lambda} \| \| (\mathbb{Q}_{4}^{>})^{\frac{1}{2}} \xi_{\lambda} \|.
$$
 (5.13)

In particular, from  $(5.12)$  and  $(5.13)$  we find that

<span id="page-30-5"></span>
$$
|\langle \xi_{\lambda}, \mathbb{Q}_{4}^{\leq} \xi_{\lambda} \rangle| \leq C \varrho \langle \xi_{\lambda}, \mathcal{N} \xi_{\lambda} \rangle + C \langle \xi_{\lambda}, \mathbb{Q}_{4}^{\geq} \xi_{\lambda} \rangle. \tag{5.14}
$$

We are thus left with estimating  $\mathbb{Q}_4^>$ , and we will use Grönwall's Lemma. We start by computing

<span id="page-30-2"></span>
$$
\partial_\lambda T^*_{2;\lambda}\mathbb{Q}^{\geq 0}_4 T_{2;\lambda}=T^*_{2;\lambda}[\mathbb{Q}^{\geq 0}_4,B_2-B^*_2]T_{2;\lambda}.
$$

The terms we find from the commutator above are of the same type as the ones in Proposition [4.5.](#page-18-3) Explicitly,  $[Q_4^>, B_2 - B_2^*] = I_1 + I_2 + I_3 + h.c.$  with

$$
I_1 = \frac{8\pi a}{L^6} \sum_{\sigma} \sum_{k, p, r, r', s} \hat{V}(k)\hat{\chi}_{<}(p)\hat{\eta}_{r, r'}^{\varepsilon}(p)\hat{u}_{\uparrow}^{\varepsilon}(r+p)\hat{u}_{\downarrow}(r'-p)\hat{u}_{\uparrow}^{\varepsilon}(r+p-k)\hat{u}_{\sigma}^{\varepsilon}(s-k)\hat{u}_{\sigma}^{\varepsilon}(s)\hat{v}_{\uparrow}(r)\hat{v}_{\downarrow}(r') \times
$$
  

$$
\times \hat{a}_{s-k,\sigma}^{*}\hat{a}_{r'-p,\downarrow}\hat{a}_{-r,\uparrow}\hat{a}_{-r',\downarrow}\hat{a}_{s,\sigma}\hat{a}_{r+p-k,\uparrow}, \quad (5.15)
$$

$$
I_2 = \frac{1}{L^6} \sum_{\sigma} \sum_{k, p, r, r', s} \hat{V}(k) \hat{\chi}_{<}(p) \hat{\eta}_{r, r'}^{\varepsilon}(p) \hat{u}_{\uparrow}(r+p) \hat{u}_{\downarrow}^{\geq}(r'-p) \hat{u}_{\downarrow}^{\geq}(r'-p-k) \hat{u}_{\sigma}^{\geq}(s-k) \hat{u}_{\sigma}^{\geq}(s) \hat{v}_{\uparrow}(r) \hat{v}_{\downarrow}(r') \times \hat{a}_{s-k, \sigma}^{\ast} \hat{a}_{r+p, \uparrow} \hat{a}_{-r', \downarrow} \hat{a}_{-r, \uparrow} \hat{a}_{s, \sigma} \hat{a}_{r'-p-k, \downarrow},
$$

$$
I_3 = -\frac{1}{L^6} \sum_{k,q,r,r'} \hat{V}(k)\hat{\chi}_{<}(p)\hat{\eta}_{r,r'}^{\epsilon}(p)\hat{u}_{\uparrow}^>(r+p)\hat{u}_{\downarrow}^>(r'-p)\hat{u}_{\uparrow}^>(r+p+k)\hat{u}_{\downarrow}^>(r'-p-k)\hat{v}_{\uparrow}(r)\hat{v}_{\downarrow}(r') \times
$$
  

$$
\times \hat{a}_{r+p+k,\uparrow}\hat{a}_{-r,\uparrow}\hat{a}_{r'-p-k,\downarrow}\hat{a}_{-r',\downarrow}. \quad (5.16)
$$

In what follows we will often use that  $||V||_1 \leq C$ , the bounds in Lemma [A.5](#page-42-2) and Lemma [A.6](#page-42-4) and that

<span id="page-30-4"></span><span id="page-30-3"></span>
$$
||a_{\sigma}(v_x^t)|| = ||v_{\sigma}^t||_2 \leq \varrho^{\frac{1}{2}} e^{t(k_F^{\sigma})^2}
$$
\n(5.17)

with  $v^t_{\sigma}$  defined in [\(2.26\)](#page-8-3).

We start by considering  $I_1$ . Since  $\hat{u}^{\geq} = \hat{\zeta}^{\geq} \hat{u}^{\perp} = \hat{\zeta}^{\geq}$ , the definition of  $\hat{\zeta}^{\geq}$  implies that  $|r + p| \geq$  $\{5\max\{k_F^{\uparrow}, k_F^{\downarrow}\}\}\$ , and hence  $|p - r'| \geq 3\max\{k_F^{\downarrow}, k_F^{\uparrow}\}\$  since  $|r| \leq k_F^{\uparrow}$  and  $|r'| \leq k_F^{\downarrow}$ . Moreover, also

 $|r'-p| \leq 6\varrho^{1/3-\gamma}$  and hence we can replace  $\hat{u}_{\downarrow}(r'-p)$  in [\(5.15\)](#page-30-2) by  $\hat{\eta}(r'-p)$  with  $\hat{\eta}$  the characteristic function of the set  $3 \max\{k_F^{\uparrow}, k_F^{\downarrow}\} \leq |k| \leq 6\varrho^{1/3-\gamma}$ . Proceeding then as in Remark [2.9](#page-7-7) we can rewrite  $I_1$  in configuration space as

<span id="page-31-0"></span>
$$
I_1 = 8\pi a \sum_{\sigma} \int_0^{\infty} dt \, e^{-2t\epsilon} \int dx dy dz dz' V(x - y) \chi_{\leq}(z - z') \zeta^t(z; y) a_{\sigma}^*(u_y^>) a_{\uparrow}(v_z^t) a_{\downarrow}(\eta_{z'}^t) a_{\downarrow}(v_{z'}^t) a_{\downarrow}(u_x^>) a_{\sigma}(u_y^>)
$$
\n
$$
(5.18)
$$

with

<span id="page-31-1"></span>
$$
\zeta^{t}(z; y) := \frac{1}{L^{3}} \sum_{k} \zeta^{>}(k) e^{-t|k|^{2}} e^{ik \cdot (z-y)}, \qquad \eta^{t}(x; y) = \frac{1}{L^{3}} \sum_{k} \hat{\eta}(k) e^{-t|k|^{2}} e^{ik \cdot (x-y)}.
$$
 (5.19)

We shall write the right-hand side of [\(5.18\)](#page-31-0) as  $8\pi a \int_0^\infty dt e^{-2t\varepsilon} I_1^t$ . With the aid of [\(5.17\)](#page-30-3), Lemma [A.6](#page-42-4) and the Cauchy–Schwarz inequality, we find

$$
|\langle \xi_{\lambda}, \mathbf{I}_1^t \xi_{\lambda} \rangle| \leq C \sum_{\sigma} \int dx dy dz dz' V(x - y) |\chi_{<}(z - z')||\zeta^t(z; y)||\hat{v}_{\downarrow}^t||_2 \|\hat{v}_{\uparrow}^t||_2 \|\hat{v}_{\uparrow}^t||_2 \|\hat{a}_{\sigma}(u_y^>)\xi_{\lambda}\| \|a_{\downarrow}(u_x^>) a_{\sigma}(u_y^>)\xi_{\lambda}\|
$$
  
\n
$$
\leq C \|\chi_{<}\|_1 \|\zeta^t\|_1 \|\hat{v}_{\uparrow}^t||_2 \|\hat{v}_{\downarrow}^t||_2 \|\hat{v}_{\downarrow}^t||_2 \|\hat{v}_{\downarrow}^t||_2 \|\hat{v}_{\perp}^t\|_2 \sum_{\sigma} \int dx dy V(x - y) \|a_{\sigma}(u_y^>)\xi_{\lambda}\| \|a_{\downarrow}(u_x^>) a_{\sigma}(u_y^>)\xi_{\lambda}\|
$$
  
\n
$$
\leq C \varrho^{\frac{1}{2}} e^{t(k_F^{\uparrow})^2} \|\hat{v}_{\downarrow}^t||_2 \|\hat{v}_{\perp}^t||_2 \|\mathcal{N}^{\frac{1}{2}}\xi_{\lambda}\| \|(\mathbb{Q}_4^{\geq})^{\frac{1}{2}}\xi_{\lambda}\|.
$$

For the integration over  $t$ , we can use the Cauchy–Schwarz's inequality to get

$$
\int_0^\infty dt \, e^{-2t\varepsilon} e^{t(k_F^{\uparrow})^2} \|\hat{\eta}^t\|_2 \|\hat{v}^t_\downarrow\|_2 \leq \left(\int_0^\infty dt \, e^{-2t\varepsilon} e^{2t(k_F^{\uparrow})^2} e^{2t(k_F^{\downarrow})^2} \|\hat{\eta}^t_\downarrow\|_2^2\right)^{\frac{1}{2}} \left(\int_0^\infty dt \, e^{-2t\varepsilon} e^{-2t(k_F^{\downarrow})^2} \|\hat{v}^t_\downarrow\|_2^2\right)^{\frac{1}{2}}.
$$

The second integral above is bounded in [\(3.9\)](#page-12-2). The first equals

<span id="page-31-2"></span>
$$
\frac{1}{2}\frac{1}{L^3} \sum_{3 \max\{k_F^{\uparrow}, k_F^{\downarrow}\} \le |k| \le 6\varrho^{1/3 - \gamma}} \frac{1}{|k|^2 - (k_F^{\downarrow})^2 - (k_F^{\uparrow})^2 + \varepsilon} \le C\varrho^{\frac{1}{3} - \gamma}.
$$
 (5.20)

In combination, we have thus shown that

<span id="page-31-3"></span>
$$
|\langle \xi_{\lambda}, I_1 \xi_{\lambda} \rangle| \leq C \varrho^{\frac{5}{6} - \frac{\gamma}{2} - \frac{\delta}{16}} \|\mathcal{N}^{\frac{1}{2}} \xi_{\lambda}\| \|\mathbb{Q}_{4}^{\gamma}\right)^{\frac{1}{2}} \xi_{\lambda} \| \leq C \varrho^{\frac{5}{3} - \gamma - \frac{\delta}{8}} \langle \xi_{\lambda}, \mathcal{N}\xi_{\lambda} \rangle + C \langle \xi_{\lambda}, \mathbb{Q}_{4}^{\gamma} \xi_{\lambda} \rangle. \tag{5.21}
$$

The term  $I_2$  can be bounded in the same way.

To conclude the analysis of  $\mathbb{Q}_4^>$ , we now consider I<sub>3</sub> in [\(5.16\)](#page-30-4). Arguing as above, we can replace  $\hat{u}_{\uparrow}^>(r+1)$  $p\hat{u}^{\geq}(r'-p)$  by  $\hat{\eta}(r+p)\hat{\eta}(r'-p)$ . In configuration space, we then obtain

$$
I_3 = 8\pi a \int_0^\infty dt \, e^{-2t\varepsilon} \int dx dy dz dz' V(x - y) \chi_<(z - z')\eta^t(z; x)\eta^t(z'; y) a_\uparrow(u_x^>) a_\uparrow(v_z^t) a_\downarrow(u_y^>) a_\downarrow(v_{z'}^t)
$$

with  $\eta^t$  as in [\(5.19\)](#page-31-1). Writing  $I_3 = \int_0^\infty dt \, e^{-2t\varepsilon} I_3^t$  and using [\(5.17\)](#page-30-3), we can estimate

$$
|\langle \xi_{\lambda},\mathbf{I}_3^t\xi_{\lambda}\rangle| \leq C\varrho e^{t(k_F^+)^2}e^{t(k_F^+)^2}\int dxdydzdz'V(x-y)|\chi_{\leq}(z-z')||\eta^t(z;x)||\eta^t(z';y)||a_{\uparrow}(u_x^>)a_{\downarrow}(u_y^>)\xi_{\lambda}||.
$$

With

$$
\left| \int dz dz' \chi_{\leq}(z-z') \eta^t(z;x) \eta^t(z';y) \right| \leq C \| \chi_{\leq} \|_{1} \| \eta^t \|_2^2 \leq C \| \eta^t \|_2^2
$$

and the Cauchy–Schwarz inequality we then get

$$
|\langle \xi_\lambda, I_3 \xi_\lambda \rangle| \leq CL^{\frac{3}{2}} \varrho \left( \int_0^\infty dt \, e^{-2t\varepsilon} e^{t(k_F^\uparrow)^2} e^{t(k_F^\downarrow)^2} \|\hat{\eta}^t\|_2^2 \right) \|(\mathbb{Q}_4^{\gt})^{\frac{1}{2}} \xi_\lambda\|.
$$

The integral is again bounded as in [\(5.20\)](#page-31-2). Inserting this bound, we obtain

<span id="page-31-4"></span>
$$
|\langle \xi_{\lambda}, I_3 \xi_{\lambda} \rangle| \leq CL^{\frac{3}{2}} \varrho^{\frac{4}{3}-\gamma} \| (\mathbb{Q}_4^>)^{\frac{1}{2}} \xi_{\lambda} \| \leq CL^3 \varrho^{\frac{8}{3}-2\gamma} + \langle \xi_{\lambda}, \mathbb{Q}_4^> \xi_{\lambda} \rangle. \tag{5.22}
$$

Combining  $(5.21)$  and  $(5.22)$ , we get

$$
\begin{split} |\partial_{\lambda} \langle T_{2;\lambda}\Omega, \mathbb{Q}_{4}^{\geq} T_{2;\lambda}\Omega \rangle| &\leq CL^{3} \varrho^{\frac{8}{3}-2\gamma} + C\varrho^{\frac{5}{3}-\gamma-\frac{\delta}{8}} \langle T_{2;\lambda}\Omega, \mathcal{N} T_{2;\lambda}\Omega \rangle + C \langle T_{2;\lambda}\Omega, \mathbb{Q}_{4}^{\geq} T_{2;\lambda}\Omega \rangle \\ &\leq CL^{3} \varrho^{\frac{8}{3}-2\gamma} + C \langle T_{2;\lambda}\Omega, \mathbb{Q}_{4}^{\geq} T_{2;\lambda}\Omega \rangle, \end{split}
$$

where we used the bound on the number operator N from Proposition [3.5](#page-13-3) (Eq.  $(3.12)$  for  $\lambda = 0$ ) and the constraints  $0 < \gamma < 1/3$  and  $\delta < 8\gamma$  in the last estimate. Therefore, by Grönwall's Lemma, for any  $\lambda \in [0, 1]$ , we have,

$$
|\langle T_{2;\lambda}\Omega,\mathbb{Q}_4^{\geq}T_{2;\lambda}\Omega\rangle| \leq CL^3\varrho^{\frac{8}{3}-2\gamma}
$$

Inserting this estimate in [\(5.14\)](#page-30-5) and using again the bound for the number operator from Proposition [3.5,](#page-13-3) we find [\(5.10\)](#page-29-7).  $\Box$ 

## <span id="page-32-0"></span>5.3 Conjugation of  $\mathcal{E}_{H_0}$

The purpose of this subsection is to show that  $\langle T_2 \Omega, \mathcal{E}_{\mathbb{H}_0} T_2 \Omega \rangle = L^3 o(\varrho^{\frac{7}{3}})$ , with  $\mathcal{E}_{\mathbb{H}_0}$  defined in [\(4.2\)](#page-14-4) the kinetic error term coming from Proposition [4.2](#page-14-6) from the conjugation of  $\mathbb{H}_0$  by  $T_1$ .

<span id="page-32-4"></span>**Proposition 5.4** (Final estimate for  $\mathcal{E}_{\mathbb{H}_0}$ ). Let  $0 < \gamma < \frac{1}{6}$ ,  $0 < \delta \leq 8\gamma$  with  $2\gamma + \frac{\delta}{16} \leq \frac{1}{3}$ . Under the same assumptions of Theorem [1.2](#page-2-0)

<span id="page-32-1"></span>
$$
|\langle T_2\Omega, \mathcal{E}_{\mathbb{H}_0} T_2\Omega\rangle| \leq CL^3 \left(\varrho^{\frac{7}{3}+\gamma} + \varrho^{3-2\gamma-\frac{\delta}{4}}\right). \tag{5.23}
$$

.

Proof. Again we use Grönwall's Lemma, and compute

$$
\partial_{\lambda}T_{2;\lambda}^*\mathcal{E}_{\mathbb{H}_0}T_{2;\lambda}=T_{2;\lambda}[\mathcal{E}_{\mathbb{H}_0},B_2-B_2^*]T_{2;\lambda}.
$$

The terms in  $[\mathcal{E}_{\mathbb{H}_0}, B_2 - B_2^*]$  are of the same type as those in Proposition [4.2,](#page-14-6) see [\(4.8\)](#page-15-1)–[\(4.13\)](#page-16-2). The only difference is that each of them has  $\hat{\eta}_{r,r'}^{\varepsilon}(p)\hat{\chi}_{<}(p)$  in place of  $\hat{\varphi}(p)\hat{\chi}_{>}(p)$ , which distinguishes  $B_1$  from  $B_2$ . As in the proof of Proposition [4.2,](#page-14-6) it is enough to prove the bound in  $(5.23)$  with  $\mathcal{E}_{\mathbb{H}_0}$  replaced by  $\mathcal{E}_{\mathbb{H}_0,1}$ , defined in [4.6.](#page-15-5) We shall again write  $[\mathcal{E}_{\mathbb{H}_0,1}, B_2] = \sum_{j=1}^6 I_j$  and consider the terms individually. We will estimate the expectation value of all the terms in the state  $\xi_{\lambda} = T_{2,\lambda}\Omega$ . In the estimates we will often use the bounds in Lemma [A.2,](#page-40-3) Lemma [3.1,](#page-11-3) Lemma [A.5](#page-42-2) as well as [\(4.14\)](#page-16-0) and [\(5.17\)](#page-30-3). Similarly to [\(3.14\)](#page-13-4), we shall also need that

<span id="page-32-3"></span>
$$
\int dx \, \|a_{\sigma}(v_{x}^{t})\xi_{\lambda}\|^{2} \leq e^{2t(k_{F}^{\sigma})^{2}} \langle \xi_{\lambda}, \mathcal{N}\xi_{\lambda} \rangle. \tag{5.24}
$$

Moreover, we will often use the constraints on  $p, r, r'$  to replace  $\hat{u}_{\uparrow}(r+p)$  and  $\hat{u}_{\downarrow}(r'-p)$  by  $\hat{u}_{\uparrow}^{\leq}(r+p)$  and  $\hat{u}_{\downarrow}^{\le}(r'-p)$ , respectively, with  $\hat{u}_{\sigma}^{\le}$  defined as in [\(2.25\)](#page-8-1). Similarly as in Proposition [4.2,](#page-14-6) it is convenient to split  $I_1$ ,  $I_2$  and  $I_3$  into a sum of two terms each.

Proceeding as in the proof of Proposition [4.2,](#page-14-6) taking into account Remark [2.9,](#page-7-7) we have for the analogue of [\(4.8\)](#page-15-1)

<span id="page-32-2"></span>
$$
I_1 = 8\pi a \int_0^\infty dt \, e^{-2t\varepsilon} \left( I_{1;a}^t + I_{1;b}^t \right) \tag{5.25}
$$

with

$$
\mathcal{I}_{1;a}^t = \int dx dy dz dz' \widetilde{\varphi}(x-y) \chi_{\leq}(z-z') v_{\downarrow}^t(y;z') \Delta v_{\uparrow}^t(x;z) a_{\uparrow}^*(u_x) a_{\downarrow}^*(u_y) a_{\downarrow}(u_{z'}^t) a_{\uparrow}(u_z^t)
$$

and

$$
I_{1;b}^{t} = \sum_{\ell=1}^{3} \int dx dy dz dz' \widetilde{\varphi}(x-y) \chi_{<}(z-z') v_{\downarrow}^{t}(y;z') \partial_{\ell} v_{\uparrow}^{t}(x;z) a_{\uparrow}^{*} (\partial_{\ell} v_{x}^{>}) a_{\downarrow}^{*}(u_{y}) a_{\downarrow}(u_{z}') a_{\uparrow}(u_{z}^{t})
$$

with  $\nu$  defined in [\(4.15\)](#page-16-3). With the aid of Cauchy–Schwarz inequality, together with bounds as in [\(4.16\)](#page-16-1) and

[\(4.18\)](#page-16-4), using that  $0 \leq \hat{u}^t_{\downarrow} \leq e^{-t(k_F^{\downarrow})^2}$  and  $0 \leq \hat{u}_{\uparrow} \leq 1$ , we obtain for the first term

$$
\begin{split}\n|\langle \xi_{\lambda}, \mathbf{I}_{1,a}^{t} \xi_{\lambda} \rangle| &\leq \left( \int dy dz \, \left\| \int dx \, \widetilde{\varphi}(x-y) \Delta v_{\uparrow}^{t}(x;z) a_{\uparrow}(u_{x}) \right\|^{2} \|a_{\downarrow}(u_{y}) \xi_{\lambda}\|^{2} \right)^{\frac{1}{2}} \\
&\times \left( \int dy dz \, \left\| \int dz' \, \chi_{<}(z-z') v_{\downarrow}^{t}(y;z') a_{\downarrow}(u_{z'}) \right\|^{2} \|a_{\uparrow}(u_{z}') \xi_{\lambda}\|^{2} \right)^{\frac{1}{2}} \\
&\leq e^{-t(k_{F}^{+})^{2}} \left( \int dy dz dz' \, |\widetilde{\varphi}(z'-y)|^{2} |\Delta v_{\uparrow}^{t}(z;z')|^{2} \|a_{\downarrow}(u_{y}) \xi_{\lambda}\|^{2} \right)^{\frac{1}{2}} \\
&\times \left( \int dy dz dz' \, |\chi_{<}(z-z')|^{2} |v_{\downarrow}^{t}(y;z')|^{2} \|a_{\uparrow}(u_{z}') \xi_{\lambda}\|^{2} \right)^{\frac{1}{2}}.\n\end{split}
$$

To bound the terms, we shall use Lemma [A.2](#page-40-3) and  $\|\chi_{<}\|_2 \leq C\varrho^{1/2-(3/2)\gamma}$ , as well as [\(3.14\)](#page-13-4). This way, we obtain

$$
|\langle \xi_{\lambda}, \mathcal{I}_{1;a}^t \xi_{\lambda} \rangle| \leq e^{-t \sum_{\sigma} (k_F^{\sigma})^2} \|\widetilde{\varphi}\|_2 \|\chi_{\langle \xi \rangle} \|_2 \|\Delta v_{\uparrow}^t\|_2 \|v_{\downarrow}^t\|_2 \langle \xi_{\lambda}, \mathcal{N}\xi_{\lambda} \rangle \leq C \varrho^{1-\gamma} e^{-t \sum_{\sigma} (k_F^{\sigma})^2} \|v_{\uparrow}^t\|_2 \|v_{\downarrow}^t\|_2 \langle \xi_{\lambda}, \mathcal{N}\xi_{\lambda} \rangle.
$$

The Cauchy–Schwarz inequality and [\(3.9\)](#page-12-2) for the integral with respect to t then yields

$$
\int_0^\infty dt \, e^{-2t\varepsilon} |\langle \xi_\lambda, I_{1;a}^t \xi_\lambda \rangle| \le C \varrho^{\frac{4}{3} - \gamma - \frac{\delta}{8}} \langle \xi_\lambda, \mathcal{N}\xi_\lambda \rangle. \tag{5.26}
$$

The term  $I_{1;b}$  can be bounded very similarly, using in addition [\(4.19\)](#page-17-0). We obtain

$$
\int_0^\infty dt \, e^{-2t\varepsilon} |\langle \xi_\lambda, \mathbf{I}_{1;b}^t \xi_\lambda \rangle| \le C \varrho^{1-\gamma-\frac{\delta}{8}} \|\mathbb{H}_0^{\frac{1}{2}} \xi_\lambda\| \|\mathcal{N}^{\frac{1}{2}} \xi_\lambda\|.
$$
 (5.27)

Next we consider the term  $I_2$ . Proceeding as above, we find again [\(5.25\)](#page-32-2) with  $I_1$  replaced by  $I_2$  everywhere, and

$$
\mathrm{I}_{2;a}^t = \frac{1}{L^3} \sum_r |r|^2 \hat{v}_{\uparrow}^t(r) \left( \int dx \, e^{ir \cdot x} a_{\uparrow}^*(u_x) b_{\downarrow}^*(\tilde{\varphi}_x) \right) \left( \int dz \, e^{-ir \cdot z} b_{\downarrow}^t(\chi_{\leq z}) a_{\uparrow}(u_z^t) \right),
$$

where we used the notation in [\(3.1\)](#page-10-2) and introduced in addition

<span id="page-33-0"></span>
$$
b^t_{\sigma}(\chi_{\leq z}) := \int dz' \,\chi_{\leq}(z-z') a_{\sigma}(u^t_{z'}) a_{\sigma}(v^t_{z'}).
$$
 (5.28)

Using  $|r|^2 \hat{v}^t_\uparrow(r) \leq C \varrho^{2/3} e^{t(k_F^{\uparrow})^2}$  and the Cauchy–Schwarz inequality, we obtain

$$
|\langle \xi_{\lambda},\mathrm{I}^t_{2;a}\xi_{\lambda}\rangle|\leq C\varrho^{\frac{2}{3}}e^{t(k_F^\uparrow)^2}\sqrt{\int dx\left\|b_{\downarrow}(\widetilde{\varphi}_x)a_{\uparrow}(u_x)\xi_{\lambda}\right\|^2}\sqrt{\int dz\left\|b_{\downarrow}^t(\chi_{
$$

Using the bound from Lemma [3.1](#page-11-3) for  $||b_{\downarrow}(\widetilde{\varphi}_x)||$ , we find

$$
\int dx \, \|b_{\downarrow}(\widetilde{\varphi}_x)a_{\uparrow}(u_x)\xi_{\lambda}\|^2 \leq C\varrho^{\frac{2}{3}+\gamma}\langle \xi_{\lambda}, \mathcal{N}\xi_{\lambda}\rangle.
$$

Similarly, from

<span id="page-33-1"></span>
$$
||b_{\downarrow}^{t}(\chi_{\leq z})|| \leq \int dz' |\chi_{\leq}(z-z')| ||a_{\downarrow}(u_{z'}^{t})|| ||a_{\downarrow}(v_{z'}^{t})|| \leq ||\chi_{\leq}||_{1} ||u_{\downarrow}^{t}||_{2} ||v_{\downarrow}^{t}||_{2} \leq C ||u_{\downarrow}^{t}||_{2} ||v_{\downarrow}^{t}||_{2}
$$
(5.29)

together with [\(5.24\)](#page-32-3), we find that

$$
\int dz \left\|b_{\downarrow}^{t}(\chi_{\leq z})a_{\uparrow}(u_{z}^{t})\xi_{\lambda}\right\|^{2} \leq Ce^{-2t(k_{F}^{\uparrow})^{2}}\|u_{\downarrow}^{t}\|_{2}^{2}\|v_{\downarrow}^{t}\|_{2}^{2}\langle\xi_{\lambda},\mathcal{N}\xi_{\lambda}\rangle.
$$

Using  $(3.10)$  for the integral with respect to t, we obtain

$$
\int_0^\infty dt \, e^{-2t\varepsilon} |\langle \xi_\lambda, I_{2;a}^t \xi_\lambda \rangle| \le C \varrho^{1+\frac{\gamma}{2}} \left( \int_0^\infty dt \, e^{-2t\varepsilon} \| \hat{u}_\downarrow^t \|_2 \| \hat{v}_\downarrow^t \|_2 \right) \langle \xi_\lambda, \mathcal{N}\xi_\lambda \rangle = C \varrho^{\frac{4}{3} - \frac{\delta}{16}} \langle \xi_\lambda, \mathcal{N}\xi_\lambda \rangle.
$$

$$
\mathcal{I}^t_{2;b} = \frac{1}{L^3} \sum_{\ell=1}^3 \sum_r r_\ell \hat{v}^t_\uparrow(r) \int dx dz \, e^{ir \cdot (x-z)} a^*_\uparrow(\partial_\ell \nu^>_x) b^*_\downarrow(\widetilde{\varphi}_x) b^t_\downarrow(\chi_{
$$

Using [\(4.19\)](#page-17-0) and proceeding as above, we obtain

<span id="page-34-1"></span>
$$
\int_0^\infty dt \, e^{-2t\varepsilon} |\langle \xi_\lambda, I_{2;b}^\tagger \xi_\lambda \rangle| \leq C \varrho^{1-\frac{\delta}{16}} \|\mathcal{N}^\frac{1}{2} \xi_\lambda\| \|\mathbb{H}_0^{\frac{1}{2}} \xi_\lambda\|.
$$

The term  $I_3$  can be estimated in the same way as  $I_2$ , obtaining the same final bound. We omit the details. We now consider the term  $I_4$ . In contrast to the corresponding one in Proposition [4.2](#page-14-6) in [\(4.11\)](#page-15-4), to estimate this term we rewrite it in normal order using that

$$
\hat{a}_{s-k,\downarrow}^{*}\hat{a}_{r'-p,\downarrow}\hat{a}_{-r,\uparrow}\hat{a}_{-r',\downarrow}\hat{a}_{-s,\downarrow}^{*}\hat{a}_{-r-p+k,\uparrow}^{*} = \hat{a}_{s-k,\downarrow}^{*}\hat{a}_{-s,\downarrow}^{*}\hat{a}_{-r-p+k,\uparrow}^{*}\hat{a}_{-r,\uparrow}\hat{a}_{-r',\downarrow}\hat{a}_{r'-p,\downarrow}^{*}
$$
\n
$$
+ \delta_{p,k}\hat{a}_{s-k,\downarrow}^{*}\hat{a}_{-s,\downarrow}^{*}\hat{a}_{-r',\downarrow}\hat{a}_{r'-p,\downarrow} - \delta_{r',s}\hat{a}_{s-k,\downarrow}^{*}\hat{a}_{-r-p+k,\uparrow}^{*}\hat{a}_{-r,\uparrow}\hat{a}_{r'-p,\downarrow} + \delta_{r',s}\delta_{p,k}\hat{a}_{s-k,\downarrow}^{*}\hat{a}_{r'-p,\downarrow}.
$$
\n(5.30)

Correspondingly, we have  $I_4 = 8\pi a \int_0^\infty dt \, e^{-2t\varepsilon} (\mathbf{I}_{4;a}^t + \mathbf{I}_{4;b}^t + \mathbf{I}_{4;c}^t + \mathbf{I}_{4;d}^t)$ . The first term equals

$$
\mathcal{I}_{4;a}^t = \sum_{\ell=1}^3 \frac{1}{L^3} \sum_k \hat{u}_{\uparrow}^t(k) \int dydz \, e^{ik \cdot (z-y)} a_{\uparrow}^*(\partial_{\ell}v_y) b_{\downarrow}^*(\partial_{\ell} \widetilde{\varphi}_y) b_{\downarrow}^t(\chi_{\leq z}) a_{\uparrow}(v_z^t)
$$

where we used again the notations introduced in [\(3.1\)](#page-10-2) and [\(5.28\)](#page-33-0). Since  $0 \leq \hat{u}_{\uparrow}^{t}(k) \leq e^{-t(k_{F}^{\uparrow})^{2}}$ , the Cauchy-Schwarz inequality yields

$$
|\langle \xi_\lambda, \mathcal{I}_{4;a}^t \xi_\lambda \rangle| \leq e^{-t(k_F^{\uparrow})^2} \sum_{\ell=1}^3 \sqrt{\int dy \left\| b_{\downarrow} (\partial_\ell \widetilde{\varphi}_y) a_{\uparrow} (\partial_\ell v_y) \xi_\lambda \right\|^2} \sqrt{\int dz \left\| b_{\downarrow}^t (\chi_{\leq z}) a_{\uparrow} (v_z^t) \xi_\lambda \right\|^2}.
$$

The last factor can be bounded with the aid of [\(5.29\)](#page-33-1) and [\(5.24\)](#page-32-3). For the first factor, we use

$$
||b_{\downarrow}(\partial_{\ell}\widetilde{\varphi}_{y})a_{\uparrow}(\partial_{\ell}v_{y})\xi_{\lambda}|| \leq \int dx \, |\partial_{\ell}\widetilde{\varphi}(x-y)|| ||a_{\downarrow}(u_{x})a_{\downarrow}(v_{x})a_{\uparrow}(\partial_{\ell}v_{y})\xi_{\lambda}||
$$
  

$$
\leq ||v_{\downarrow}||_{2}|| ||\partial_{\ell}v_{\uparrow}||_{2} \int dx \, |\partial_{\ell}\widetilde{\varphi}(x-y)|| ||a_{\downarrow}(u_{x})\xi_{\lambda}||
$$

and hence

$$
\int dy \|b_{\downarrow}(\partial_{\ell}\tilde{\varphi}_{y})a_{\uparrow}(\partial_{\ell}v_{y})\xi_{\lambda}\|^{2}
$$
\n
$$
\leq C\varrho^{\frac{8}{3}}\int dydxdx'\ |\partial_{\ell}\tilde{\varphi}(y-x)||\partial_{\ell}\tilde{\varphi}(y-x')|\|a_{\downarrow}(u_{x})\xi_{\lambda}\|\|a_{\downarrow}(u_{x'})\xi_{\lambda}\| \leq C\varrho^{\frac{8}{3}}\|\partial_{\ell}\tilde{\varphi}\|_{1}^{2}\langle\xi_{\lambda},\mathcal{N}\xi_{\lambda}\rangle.
$$

In combination with Lemma [A.2](#page-40-3) and [\(3.10\)](#page-12-3), this yields

<span id="page-34-0"></span>
$$
\int_0^\infty dt \, e^{-2t\varepsilon} |\langle \xi_\lambda, I_{4;a}^t \xi_\lambda \rangle| \le C \varrho^{\frac{4}{3} + \frac{\gamma}{2} - \frac{\delta}{16}} \langle \xi_\lambda, \mathcal{N}\xi_\lambda \rangle. \tag{5.31}
$$

Next we consider  $I_{4,b}^t$ , which is given by

$$
I_{4;b}^{t} = \sum_{\ell=1}^{3} \int dydz \, u_{\uparrow}^{t}(y;z) \partial_{\ell}v_{\uparrow}^{t}(y;z) b_{\downarrow}^{*} (\partial_{\ell} \widetilde{\varphi}_{y}) b_{\downarrow}^{t}(\chi_{\leq z})
$$

and can be bounded as

$$
\begin{aligned} |\langle \xi_{\lambda},\mathrm{I}_{4;b}^{t}\xi_{\lambda}\rangle| \\ &\leq \|v_{\downarrow}\|_{2} \|v_{\downarrow}^{t}\|_{2} \sum_{\ell=1}^{3} \int dxdydzdz' \, |\partial_{\ell}\widetilde{\varphi}(x-y)||\chi_{<}(z-z')||u_{\uparrow}^{t}(y;z)||\partial_{\ell}v_{\uparrow}^{t}(y;z)||u_{\downarrow}(u_{x})\xi_{\lambda}|| \, ||a_{\downarrow}(u_{z}')\xi_{\lambda}||. \end{aligned}
$$

With  $(3.14)$ ,  $\|\partial_{\ell}^{n}v_{\sigma}^{t}\|_{2} \leq C\varrho^{n/3}\|v_{\sigma}^{t}\|_{2}$ ,  $\|v_{\sigma}^{t}\|_{2} \leq C\varrho^{1/2}e^{t(k_{F}^{\sigma})^{2}}$ , Lemma [A.2](#page-40-3) and Cauchy–Schwarz we thus obtain

$$
|\langle \xi_\lambda, \mathcal{I}_{4; b}^t \xi_\lambda \rangle| \leq e^{-t (k_F^+)^2} \sum_{\ell=1}^3 \|v_\downarrow\|_2 \|v_\downarrow^t\|_2 \|\partial_\ell \widetilde{\varphi}\|_1 \|\chi_\leqslant \|_1 \|u_\uparrow^t\|_2 \|\partial_\ell v_\uparrow^t\|_2 \langle \xi_\lambda, \mathcal{N}\xi_\lambda \rangle \leq C \varrho^{1+\gamma} \|v_\uparrow^t\|_2 \|u_\uparrow^t\|_2 \langle \xi_\lambda, \mathcal{N}\xi_\lambda \rangle.
$$

In combination with  $(3.10)$  this yields the same bound as in  $(5.31)$  after integration over t. The same applies to  $I_{4;c}^{t}$  and we omit the details. The last term in  $I_{4}$  is

$$
\mathcal{I}_{4;d}^t = \frac{1}{L^6} \sum_{\ell=1}^3 \sum_{p,r,r'} p_\ell \hat{\varphi}(p) \hat{\chi}_> (p) \hat{\chi}_< (p) \hat{u}_\uparrow^t(r+p) r_\ell \hat{v}_\uparrow^t(r) \hat{u}_\downarrow^t(r') \hat{v}_\downarrow^t(r'+p) \hat{a}_{r',\downarrow}^* \hat{a}_{r',\downarrow}.
$$

Since  $|p_{\ell}\hat{\varphi}(p)\hat{\chi}_{>}(p)\hat{\chi}_{<}(p)| \leq ||\partial_{\ell}\tilde{\varphi}||_1||\chi_{<}||_1$  and

$$
\frac{1}{L^6} \sum_{p,r} \hat{u}_{\uparrow}^t(r+p) |r_{\ell}| \hat{v}_{\uparrow}^t(r) \hat{u}_{\downarrow}^t(r') \hat{v}_{\downarrow}^t(r'+p) \leq C \varrho^{4/3} \|u_{\uparrow}^t\|_2 \|v_{\uparrow}^t\|_2
$$

for all  $r' \in \Lambda^*$ , we can again obtain a bound of the same kind. Altogether, we have thus shown that

$$
|\langle \xi_{\lambda}, I_4 \xi_{\lambda} \rangle| \le C \varrho^{\frac{4}{3} + \frac{\gamma}{2} - \frac{\delta}{16}} \langle \xi_{\lambda}, \mathcal{N}\xi_{\lambda} \rangle. \tag{5.32}
$$

The term  $I_5$  can be estimated very similarly, obtaining the same result.

To conclude, we consider the last error term  $I_6$ , which corresponds to [\(4.13\)](#page-16-2) in Proposition [4.2.](#page-14-6) We shall again start by writing it in normal order, using

$$
\hat{a}_{-r,\uparrow}\hat{a}_{-r',\downarrow}\hat{a}_{-r'+p-k,\downarrow}^*\hat{a}_{-r-p+k,\uparrow}^*=\delta_{p,k}\left(1-\hat{a}_{-r,\uparrow}^*\hat{a}_{-r,\uparrow}-\hat{a}_{-r',\downarrow}^*\hat{a}_{-r',\downarrow}\right)+\hat{a}_{-r'+p-k,\downarrow}^*\hat{a}_{-r-p+k,\uparrow}^*\hat{a}_{-r,\uparrow}\hat{a}_{-r',\downarrow}
$$

and correspondingly obtain 4 terms, which we write as  $I_6 = I_{6;a} + 8\pi a \int_0^\infty dt \, e^{-2t\varepsilon} (I_{6;b}^t + I_{6;c}^t + I_{6;d}^t)$ . The term  $I_{6;a}$  is a constant, given by

$$
I_{6;a} = \frac{1}{L^6} \sum_{p,r,r'} \widehat{\chi}_{\leq}(p)\widehat{\eta}_{r,r'}^{\varepsilon}(p)\widehat{\chi}_{>}(p)\widehat{\varphi}(p)p \cdot r\widehat{v}_{\uparrow}(r)\widehat{v}_{\downarrow}(r').
$$

To arrive at this expression, we used that support properties of the various functions imply that  $\hat{u}_\uparrow(r +$  $p\hat{u}_{\downarrow}(r'-p) = 1$ . If we replace  $\hat{\eta}_{r,r'}^{\varepsilon}(p)$  by  $1/(2|p|^2)$ , the resulting sum over p is zero by symmetry. Hence we can also write

$$
I_{6;a} = \frac{1}{L^6} \sum_{p,r,r'} \widehat{\chi}_{\leq}(p) \left( \widehat{\eta}_{r,r'}^{\varepsilon}(p) - \frac{1}{2|p|^2} \right) \widehat{\chi}_{>}(p) \widehat{\varphi}(p) p \cdot r \widehat{v}_{\uparrow}(r) \widehat{v}_{\downarrow}(r').
$$

On the support of  $\hat{\chi}_{\leq}(p)\hat{\chi}_{>}(p)$ , i.e., for  $4\varrho^{1/3-\gamma} \leq |p| \leq 5\varrho^{1/3-\gamma}$ , one readily checks that  $|\hat{\eta}^{\varepsilon}_{r,r'}(p)-1/(2|p|^2)| \leq$  $C\varrho^{1/3}/|p|^3$  for  $r \in \mathcal{B}_F^{\uparrow}$  and  $r' \in \mathcal{B}_F^{\downarrow}$  (and  $\varepsilon \lesssim \varrho^{2/3}$ ). Moreover, as already used earlier,  $|\hat{\varphi}(p)| \le C/|p|^2$  as a consequence of [\(1.5\)](#page-1-3). Hence

$$
|I_{6;a}| \leq C\varrho^{\frac{1}{3}} \frac{1}{L^6} \sum_{p,r,r'} \widehat{\chi}_{\leq}(p) \frac{1}{|p|^4} \widehat{\chi}_{>}(p) |r|\widehat{v}_{\uparrow}(r) \widehat{v}_{\downarrow}(r') \leq CL^3 \varrho^{\frac{8}{3}} \int_{4\varrho^{1/3-\gamma} \leq |p| \leq 5\varrho^{1/3-\gamma}} \frac{dp}{|p|^4} = CL^3 \varrho^{7/3+\gamma}.
$$
 (5.33)

The term  $I_{6;b}^{t}$  is given by

$$
\mathcal{I}_{6;b}^t = -\frac{1}{L^6} \sum_{p,r,r'} p \cdot r\hat{\varphi}(p)\hat{\chi}_>(p)\hat{\chi}_<(p)\hat{u}_\uparrow^t(r+p)\hat{u}_\downarrow^t(r'-p)\hat{v}_\uparrow^t(r)\hat{v}_\downarrow^t(r')\hat{a}_{-r,\uparrow}^* \hat{a}_{-r,\uparrow}.
$$

Proceeding as with  $I_{4;d}$  above, we obtain

$$
|\langle \xi_{\lambda}, \mathbf{I}_{6;b}^{t} \xi_{\lambda} \rangle| \leq C \varrho^{1+\gamma} \|u_{\uparrow}^{t}\|_{2} \|u_{\downarrow}^{t}\|_{2} e^{t(k_{F}^{\uparrow})^{2}} e^{t(k_{F}^{\downarrow})^{2}} \langle \xi_{\lambda}, \mathcal{N}\xi_{\lambda} \rangle.
$$

The integral over  $t$  can then be bounded with the aid of  $(3.8)$ , with the result that

<span id="page-35-0"></span>
$$
\int_0^\infty dt \, e^{-2t\varepsilon} |\langle \xi_\lambda, I_{6;b}^t \xi_\lambda \rangle| \le C \varrho^{\frac{4}{3}} \langle \xi_\lambda, \mathcal{N} \xi_\lambda \rangle. \tag{5.34}
$$

The same bounds holds for  $I_{6;c}^t$ .

The last term to study is  $I_{6;d}^t$ , which in configuration space can be written as

$$
\mathcal{I}_{6;d}^t = \sum_{\ell=1}^3 \int dx dy dz dz' \, \partial_\ell \widetilde{\varphi}(x-y) \chi_<(z-z') u_\uparrow^t(y;z) u_\downarrow^t(x;z') a_\downarrow^*(v_x) a_\uparrow^*(\partial_\ell v_y) a_\downarrow(v_z^t) a_\uparrow(v_z^t)
$$

Using [\(4.14\)](#page-16-0), [\(5.17\)](#page-30-3) and [\(5.24\)](#page-32-3) together with the Cauchy–Schwarz inequality we can bound

$$
\begin{split}\n&\langle \xi_{\lambda},\mathrm{I}_{6;d}\xi_{\lambda}\rangle| \\
&\leq \sum_{\ell=1}^{3}\|\partial_{\ell}v_{\uparrow}\|_{2}\|v_{\downarrow}^{t}\|_{2}\int dxdydzdz'\,|\partial_{\ell}\widetilde{\varphi}(x-y)||\chi_{<}(z-z')||u_{\uparrow}^{t}(y;z)||u_{\downarrow}^{t}(x;z')||a_{\downarrow}(v_{x})\xi_{\lambda}|\|a_{\uparrow}(v_{z}^{t})\xi_{\lambda}|\n\end{split}
$$
\n
$$
\leq Ce^{t(k_{F}^{\uparrow})^{2}}\sum_{\ell=1}^{3}\|\partial_{\ell}v_{\uparrow}\|_{2}\|v_{\downarrow}^{t}\|_{2}\|\partial_{\ell}\widetilde{\varphi}\|_{1}\|\chi_{<}\|_{1}\|\hat{u}_{\uparrow}^{t}\|_{2}\|\hat{u}_{\downarrow}^{t}\|_{2}\langle\xi_{\lambda},\mathcal{N}\xi_{\lambda}\rangle
$$
\n
$$
\leq C\varrho^{1+\gamma}e^{t(k_{F}^{\downarrow})^{2}}e^{t(k_{F}^{\uparrow})^{2}}\|\hat{u}_{\uparrow}^{t}\|_{2}\|\hat{u}_{\downarrow}^{t}\|_{2}\langle\xi_{\lambda},\mathcal{N}\xi_{\lambda}\rangle,
$$

where we also used the bounds from Lemma [A.2](#page-40-3) and Lemma [A.5](#page-42-2) in the last step. Again we can bound the integral over t using [\(3.8\)](#page-12-1) to conclude that [\(5.34\)](#page-35-0) also holds for  $I_{6;d}^t$ . Combining all the bounds above, we obtain

$$
|\langle \xi_{\lambda}, I_6 \xi_{\lambda} \rangle| \leq CL^3 \varrho^{\frac{7}{3}+\gamma} + C \varrho^{\frac{4}{3}} \langle \xi_{\lambda}, \mathcal{N}\xi_{\lambda} \rangle.
$$
 (5.35)

Combining all these bounds with [\(3.12\)](#page-13-2) (for  $\lambda = 0$ ) and the second bound in [\(5.8\)](#page-29-8), and using Grönwall's Lemma, we obtain [\(5.23\)](#page-32-1).  $\Box$ 

## <span id="page-36-0"></span>5.4 Conjugation of  $\mathbb{Q}_{2,\leq}$

In the next proposition we finally take into account the conjugation of  $\mathbb{Q}_{2\cdotlt}$  by  $T_2$ . The contribution from  $\langle T_2\Omega, \mathbb{Q}_{2;}$ ,  $T_2\Omega$ , when combined with the main contribution of  $\langle T_2\Omega, \mathbb{H}_0 T_2\Omega \rangle$  in Proposition [5.2,](#page-29-4) will give the correct energy of order  $\varrho^{7/3}$ .

<span id="page-36-1"></span>**Proposition 5.5** (Conjugation of  $\mathbb{Q}_{2,<}$  by  $T_2$ ). Let  $0 < \gamma < \frac{1}{6}$ ,  $\delta \leq 8\gamma$ ,  $2\gamma + \frac{\delta}{16} \leq \frac{1}{3}$ . Under the same assumptions as in Theorem [1.2](#page-2-0)

$$
\partial_{\lambda} T_{2;\lambda}^{*} \mathbb{Q}_{2;\leq} T_{2;\lambda} = -\frac{16\pi a}{L^{6}} \sum_{p,r,r' \in \frac{2\pi}{L} \mathbb{Z}^{3}} (\widehat{\chi}_{<}(p))^{2} \widehat{\eta}_{r,r'}^{c}(p) \widehat{u}_{\uparrow}(r+p) \widehat{u}_{\downarrow}(r'-p) \widehat{v}_{\uparrow}(r) \widehat{v}_{\downarrow}(r') + T_{2;\lambda}^{*} \mathcal{E}_{\mathbb{Q}_{2;\leq}} T_{2;\lambda}, \quad (5.36)
$$

where  $\mathcal{E}_{\mathbb{Q}_{2;\leq}}$  is such that for any  $\psi \in \mathcal{F}_{f}$ 

<span id="page-36-2"></span>
$$
|\langle \psi, \mathcal{E}_{\mathbb{Q}_2, \langle \psi \rangle}| \le C \varrho^{\frac{4}{3} - 2\gamma - \frac{\delta}{16}} \langle \psi, \mathcal{N}\psi \rangle.
$$
 (5.37)

Combining [\(5.37\)](#page-36-2) for  $\psi = T_{2,\lambda}\Omega$  with [\(3.12\)](#page-13-2) (for  $\lambda = 0$ ), we get for any  $\lambda \in [0,1]$ 

<span id="page-36-3"></span>
$$
|\langle T_{2;\lambda}\Omega, \mathcal{E}_{\mathbb{Q}_{2;<}}T_{2;\lambda}\Omega\rangle| \leq CL^3 \varrho^{3(1-\gamma)-\frac{3}{16}\delta}.
$$
\n(5.38)

Proof. Since  $\partial_{\lambda} T_{2;\lambda}^* \mathbb{Q}_{2;<} T_{2;\lambda} = T_{2;\lambda}^* [\mathbb{Q}_{2;<}, B_2 - B_2^*] T_{2;\lambda}$ , we have to compute the commutator  $[\mathbb{Q}_{2;<}, B_2 - B_2^*]$ . The structure of the various terms is the same as those in the commutator in [\(4.36\)](#page-20-2) in Proposition [4.6.](#page-19-2) Following the same strategy, we have

$$
[\mathbb{Q}_{2,<}, B_2 - B_2^*] = (8\pi a)^2 \sum_{j=1}^6 \int_0^\infty dt \, e^{-2t\varepsilon} \, \mathcal{I}_j^t + \text{h.c.}.
$$

The leading order constant term comes from normal ordering  $I_6^t$ , all the other terms are error terms, which we now estimate individually. In all the error terms, we can replace each  $\hat{u}_{\sigma}$  by  $\hat{u}_{\sigma}^{\le}$  defined in [\(2.25\)](#page-8-1) as a consequence of the constraints on  $p, k, r, r'$ , which will be convenient for the estimates.

The first term to consider is the analogue of [\(4.38\)](#page-20-0),

$$
I_1^t = \frac{1}{L^3} \sum_k \hat{v}_{\uparrow}^t(k) \int dx dz \, e^{ik \cdot (x-z)} a_{\uparrow}^*(u_x) b_{\downarrow}^{<*}(\chi_{\leq x}) b_{\downarrow}^t(\chi_{\leq z}) a_{\uparrow}(u_z^t)
$$

where we used the definition [\(5.28\)](#page-33-0) and introduced

<span id="page-37-1"></span>
$$
b_{\sigma}^{<}(\chi_{
$$

By the Cauchy–Schwarz inequality and  $0 \leq \hat{v}_{\uparrow}^t(k) \leq e^{t(k_F^{\uparrow})^2}$ ,

$$
|\langle \psi, \mathbf{I}_1^t \psi \rangle| \leq e^{t(k_F^{\dagger})^2} \left( \int dx \, \left\| b_{\downarrow}^<( \chi_{\lt x} ) a_{\uparrow}(u_x) \psi \right\|^2 \right)^{1/2} \left( \int dz \, \left\| b_{\downarrow}^t(\chi_{\lt z} ) a_{\uparrow}(u_z^t) \psi \right\|^2 \right)^{1/2}.
$$

From the bounds [\(5.29\)](#page-33-1) and  $||b_{\downarrow}^{<}(\chi_{\leq y})|| \leq ||\chi_{\leq}||_1 ||v_{\downarrow}||_2 ||u_{\downarrow}^{<}||_2 \leq C \varrho^{1-\frac{3}{2}\gamma}$ , we find with [\(3.14\)](#page-13-4) that

$$
|\langle \psi, I_1^t \psi \rangle| \le C \varrho^{1 - \frac{3}{2}\gamma} \|u_\downarrow^t\|_2 \|v_\downarrow^t\|_2 \langle \psi, \mathcal{N}\psi \rangle. \tag{5.40}
$$

The integral over  $t$  is bounded in  $(3.10)$ , resulting in

<span id="page-37-0"></span>
$$
\int_0^\infty dt \, e^{-2t\varepsilon} |\langle \psi, I_1^t \psi \rangle| \le C \varrho^{\frac{4}{3} - 2\gamma - \frac{\delta}{16}} \langle \psi, \mathcal{N}\psi \rangle. \tag{5.41}
$$

The estimate of  $I_2$  works in the same way, with the same result.

Next we consider the analogue of [\(4.40\)](#page-20-1), given by

$$
\mathcal{I}_3^t = \int dx dy dz dz' \chi_<(x-y)\chi_<(z-z')v_\downarrow^t(y;z')v_\uparrow^t(x;z)a_\uparrow^*(u_x^<)a_\downarrow^*(u_y^<)a_\downarrow(u_{z'}^t)a_\uparrow(u_z^t).
$$

Using the Cauchy–Schwarz inequality together with the bound [\(3.14\)](#page-13-4), we can estimate

$$
\begin{aligned} |\langle \psi, \mathbf{I}_3 \psi \rangle| &\leq \|u^t_{\downarrow}\|_2 \|u^<_{\downarrow}\|_2 \int dxdydzdz' \, |\chi_{<}(x-y)| |\chi_{<}(z-z')||v^t_{\downarrow}(y;z')||v^t_{\uparrow}(x;z)||\|a_{\uparrow}(u^<_{x})\psi\| \|a_{\uparrow}(u^t_{z})\psi\| \\ &\leq e^{-t(k_F^{\uparrow})^2} \|u^t_{\downarrow}\|_2 \|u^<_{\downarrow}\|_2 \|\chi_{<}\|_1^2 \|v^t_{\downarrow}\|_2 \|v^t_{\uparrow}\|_2 \langle \psi, \mathcal{N}\psi \rangle \leq C \varrho^{1-\frac{3}{2}\gamma} \|u^t_{\downarrow}\|_2 \|v^t_{\downarrow}\|_2 \langle \psi, \mathcal{N}\psi \rangle, \end{aligned}
$$

where we also used Lemma [A.5](#page-42-2) in the last step. Applying again  $(3.10)$  for the integration over t shows that  $(5.41)$  also holds for  $I_3^t$ .

The term  $I_4^t$  is the analogue of [\(4.41\)](#page-21-2). Similarly as for the term  $I_4$  in the proof of Proposition [5.4,](#page-32-4) it is convenient to write  $I_4^t$  in normal order. Using [\(5.30\)](#page-34-1), we can write  $I_4^t = I_{4;a}^t + I_{4;b}^t + I_{4;c}^t + I_{4;d}^t$ , and the individual terms can be analyzed in a similar way as the corresponding terms in Proposition [5.4.](#page-32-4) The first term equals

$$
I_{4;a}^t = \frac{1}{L^3} \sum_{k} \hat{u}_{\uparrow}^t(k) \int dydz \, e^{ik \cdot (y-z)} a_{\uparrow}^*(v_y) b_{\downarrow}^{<*}(\chi_{
$$

where we used again the operators introduced in [\(5.28\)](#page-33-0) and [\(5.39\)](#page-37-1). Using  $0 \leq \hat{u}_{\uparrow}^{t}(k) \leq e^{-t(k_{F}^{\uparrow})^{2}}$  and the Cauchy–Schwarz inequality, we find

$$
|\langle \psi, I_{4;a} \psi \rangle| \leq e^{-t(k_F^{\uparrow})^2} \left( \int dy \left\| b_{\downarrow}^{<}(\chi_{\leq y}) a_{\uparrow}(v_y) \psi \right\|^2 \right)^{\frac{1}{2}} \left( \int dz \left\| b_{\downarrow}^{t}(\chi_{\leq z}) a_{\uparrow}(v_z^{t}) \psi \right\|^2 \right)^{\frac{1}{2}}.
$$

We can further bound  $||b_{\downarrow}^{\lt}( \chi_{\lt y}) a_{\uparrow}(v_y) \psi|| \leq ||v_{\uparrow}||_2 ||v_{\downarrow}||_2 \int dx \, |\chi_{\lt}(x - y)| ||a_{\downarrow}(u_x^{\lt}) \psi||$  and similarly for  $||b_{\downarrow}^{t}(\chi_{\lt z})a_{\uparrow}(v_{z}^{t})\psi||$ , with the result that

$$
|\langle \psi, I_{4,a}\psi \rangle| \leq \varrho \| \chi_{\leq} \|_1^2 e^{-t(k_F^{\uparrow})^2 - t(k_F^{\downarrow})^2} \| v_{\uparrow}^t \|_2 \| v_{\downarrow}^t \|_2 \langle \psi, \mathcal{N}\psi \rangle.
$$

where we also used again  $(3.14)$ . Applying now  $(3.9)$  for the integration over t, we arrive at

$$
\int_0^\infty dt \, e^{-2t\varepsilon} |\langle \psi, \mathcal{I}_{4;a}^t \psi \rangle| \leq C \varrho^{\frac{4}{3} - \frac{\delta}{8}} \langle \psi, \mathcal{N} \psi \rangle.
$$

The term  $I_{4;b}^{t}$  is given by

$$
\mathcal{I}_{4;b}^t = \int dxdydzdz' \, \chi_<(x-y)\chi_<(z-z')u_\uparrow^t(z;y)v_\downarrow^t(z';x)a_\downarrow^*(u_x^>)a_\uparrow^*(v_y)a_\downarrow(u_{z'}^t)a_\uparrow(v_z^t).
$$

Similarly as above, we can bound it with the aid of the Cauchy–Schwarz inequality as

$$
|\langle \psi, I_{4,b}\psi \rangle| \le ||v_{\uparrow}^{t}||_{2}||v_{\downarrow}||_{2} \int dxdydzdz' | \chi_{<}(x-y)||\chi_{<}(z-z')||u_{\uparrow}^{t}(z;y)||v_{\downarrow}^{t}(z';x)||a_{\downarrow}(u_{x}^{<})\psi|| ||a_{\downarrow}(u_{z}^{t})\psi||
$$
  

$$
\le e^{-t(k_{F}^{+})^{2}}||v_{\uparrow}^{t}||_{2}||v_{\downarrow}||_{2}||v_{\downarrow}^{t}||_{2}||u_{\uparrow}^{t}||_{2}||\chi_{<}||_{1}^{2}\langle \psi, \mathcal{N}\psi \rangle \le C\varrho||u_{\uparrow}^{t}||_{2}||v_{\uparrow}^{t}||_{2}\langle \psi, \mathcal{N}\psi \rangle.
$$

With  $(3.10)$  to bound the integral over t we therefore obtain

<span id="page-38-0"></span>
$$
\int_0^\infty dt \, e^{-2t\varepsilon} |\langle \psi, I_{4;b}^t \psi \rangle| \le C \varrho^{\frac{4}{3} - \frac{\gamma}{2} - \frac{\delta}{16}} \langle \psi, \mathcal{N}\psi \rangle. \tag{5.42}
$$

The estimate for the term  $I_{4;c}^t$ , which is given by

$$
\mathcal{I}_{4;c}^t = \int dx dy dz dz' \chi_<(x-y)\chi_<(z-z')u_\uparrow^t(z;y)v_\uparrow^t(z;y)a_\downarrow^*(u_x^-)a_\downarrow^*(v_x)a_\downarrow(u_{z'}^t)a_\downarrow(v_{z'}^t),
$$

can be done in a similar way, obtaining the same result. Finally, the term

$$
\mathcal{I}^t_{4;d}=\int dxdydzdz'\,\chi_<(x-y)\chi_<(z-z')u^t_\uparrow(z;y)v^t_\downarrow(z';x)v^t_\uparrow(z;y)a^*_\downarrow(u^<_x)a_\downarrow(u^t_{z'})
$$

can be estimated similarly as  $I_{4;a}^t$  above, using also that  $|v_\downarrow^t(z';x)| \le \varrho e^{t(k_F^t)^2}$ , with the result that

$$
|\langle \psi, \mathbf{I}_{4;d}^t \psi \rangle| \leq \varrho \| \chi_{<} \|^2_1 \| u^t_{\uparrow} \|_2 \| v^t_{\uparrow} \|_2 \langle \psi, \mathcal{N} \psi \rangle.
$$

Again [\(3.10\)](#page-12-3) then yields the validity of the bound [\(5.42\)](#page-38-0) also for  $I_{4;d}^t$ . Combining the bounds, we conclude that for  $\delta < 8\gamma$ ,

$$
\int_0^\infty dt \, e^{-2t\varepsilon} |\langle \psi, I_4^t \psi \rangle| \le C \varrho^{\frac{4}{3} - \frac{\gamma}{2} - \frac{\delta}{16}} \langle \psi, \mathcal{N}\psi \rangle. \tag{5.43}
$$

The estimate for the term  $I_5^t$  can be done in the same way, obtaining the same result.

Finally we analyze  $I_6^t$ , which is the analogue of [\(4.44\)](#page-21-1). As already mentioned at the beginning of the proof, we shall put it in normal order in order to extract the constant contribution. Using [\(4.43\)](#page-21-4), we obtain  $I_6^t = I_{6;a}^t + I_{6;b}^t + I_{6;c}^t$ , where the first is the desired constant,

$$
(8\pi a)^2 \int_0^{\infty} dt \, e^{-2t\varepsilon} I_{6;a}^t = -\frac{8\pi a}{L^6} \sum_{p,r,r'} (\widehat{\chi}_<(p))^2 \hat{\eta}_{r,r'}^{\varepsilon}(p) \hat{u}_{\uparrow}(r+p) \hat{u}_{\downarrow}(r'-p) \hat{v}_{\uparrow}(r) \hat{v}_{\downarrow}(r').
$$

The second term equals

$$
\mathcal{I}_{6;b}^{t} = \frac{1}{L^{6}} \sum_{p,r,r'} \widehat{\chi}_{<}(p)^{2} \widehat{u}_{\uparrow}^{t}(r+p) \widehat{u}_{\downarrow}^{t}(r'-p) \widehat{v}_{\uparrow}^{t}(r) \widehat{v}_{\downarrow}^{t}(r') \left(\widehat{a}_{-r,\uparrow}^{*} \widehat{a}_{-r,\uparrow} + \widehat{a}_{-r',\downarrow}^{*} \widehat{a}_{-r',\downarrow}\right)
$$

and is thus bounded by  $\varrho \|u_{\uparrow}^t\|_2 \|u_{\downarrow}^t\|_2 e^{t(k_F^{\uparrow})^2 + t(k_F^{\downarrow})^2} \mathcal{N}$ , using  $0 \leq \hat{\chi}(\rho) \leq 1$ . The third term we can write in configuration space as

$$
\mathcal{I}_{6;c}^t = \int dx dy dz dz' \chi_<(x-y)\chi_<(z-z')u_\uparrow^t(z;x)u_\downarrow^t(z';y) a_\uparrow^*(v_x) a_\downarrow^*(v_y) a_\uparrow(v_z^t) a_\downarrow(v_{z'}^t).
$$

Proceeding similarly as for  $I_{4;b}^{t}$  above, we can bound it as

$$
|\langle \psi, I_{6;c}^t \psi \rangle| \leq ||\chi_{\leq}||_1^2 ||v_{\downarrow}||_2 ||v_{\uparrow}^t||_2 ||u_{\uparrow}^t||_2 ||u_{\downarrow}^t||_2 e^{t(k_F^{\downarrow})^2} \langle \psi, \mathcal{N}\psi \rangle \leq C\varrho ||u_{\uparrow}^t||_2 ||u_{\downarrow}^t||_2 e^{t(k_F^{\uparrow})^2 + t(k_F^{\downarrow})^2} \langle \psi, \mathcal{N}\psi \rangle.
$$

For the integration over  $t$ , we can again use Lemma [3.4](#page-12-0) to conclude that

$$
\int_0^\infty dt \, e^{-2t\varepsilon} |\langle \psi, (\mathcal{I}_{6;b}^t + \mathcal{I}_{6;c}^t) \psi \rangle| \le C \varrho^{\frac{4}{3} - \gamma} \langle \psi, \mathcal{N}\psi \rangle. \tag{5.44}
$$

Combining all the estimates we proved [\(5.37\)](#page-36-2).

### <span id="page-39-0"></span>5.5 Conclusion of Proposition [5.1](#page-29-2)

Proof of Proposition [5.1.](#page-29-2) We shall now combine the results of Propositions [5.2–](#page-29-4)[5.5](#page-36-1) in order to prove Proposition [5.1.](#page-29-2) The bounds [\(5.2\)](#page-29-9), [\(5.3\)](#page-29-10) and [\(5.4\)](#page-29-11) were already proved in Proposition [5.2,](#page-29-4) Proposition [5.3](#page-29-3) and Proposition [5.4,](#page-32-4) respectively. Moreover, combining Proposition [5.2](#page-29-4) and Proposition [5.5](#page-36-1) we obtain

$$
\langle T_2\Omega, (\mathbb{H}_0 + \mathbb{Q}_{2;<})T_2\Omega \rangle = \int_0^1 d\lambda \lambda \partial_{\lambda} \langle T_{2;\lambda}\Omega, \mathbb{Q}_{2;<} T_{2;\lambda}\Omega \rangle + \int_0^1 d\lambda \langle T_{2,\lambda}\Omega \mathbf{e}_{\mathbb{H}_0} T_{2;\lambda}\Omega \rangle
$$
  
= 
$$
-\frac{8\pi a}{L^6} \sum_{p,r,r'} (\hat{\chi}_<(p))^2 \hat{\eta}^{\varepsilon}_{r,r'}(p) \hat{u}_{\uparrow}(r+p) \hat{u}_{\downarrow}(r'-p) \hat{v}_{\uparrow}(r) \hat{v}_{\downarrow}(r')
$$
  
+ 
$$
\int_0^1 d\lambda \langle T_{2,\lambda}\Omega, (\mathbf{e}_{\mathbb{H}_0} + \lambda \mathcal{E}_{\mathbb{Q}_{2;<}}) T_{2;\lambda}\Omega \rangle.
$$

Inserting the definition of  $\hat{\eta}_{r,r'}^{\varepsilon}$  in [\(2.17\)](#page-6-3), the desired estimate [\(5.1\)](#page-29-12) follows from [\(5.8\)](#page-29-8) and [\(5.38\)](#page-36-3).

# <span id="page-39-1"></span>6 Conclusion of Theorem [1.2](#page-2-0)

We shall now complete the proof of Theorem [1.2.](#page-2-0) As already explained in Section [2.4,](#page-8-0) the starting point is the bound

$$
E_L(N_\uparrow, N_\downarrow) \le E_{\rm FFG} + \langle \Omega, T_2^* T_1^* \mathcal{H}_{\rm corr} T_1 T_2 \Omega \rangle
$$

using the trial state  $(2.13)$  and Proposition [2.3.](#page-5-0) From Proposition [3.6](#page-14-3) we further obtain

$$
\langle T_1 T_2 \Omega, \mathcal{H}_{\text{corr}} T_1 T_2 \Omega \rangle \le \langle T_1 T_2 \Omega, \mathcal{H}_{\text{corr}}^{\text{eff}} T_1 T_2 \Omega \rangle + C L^3 \varrho^{\frac{8}{3} - \gamma - \frac{\delta}{8}}.
$$

Combining now Propositions [4.1](#page-14-2) and [5.1](#page-29-2) and taking the thermodynamic limit we find that

$$
e(\varrho_{\uparrow}, \varrho_{\downarrow}) \leq \frac{3}{5} (6\pi^2)^{\frac{2}{3}} \left( \varrho_{\uparrow}^{\frac{5}{3}} + \varrho_{\downarrow}^{\frac{5}{3}} \right) + 8\pi a \varrho_{\uparrow} \varrho_{\downarrow}
$$
  
+ 
$$
\frac{(8\pi a)^2}{(2\pi)^9} \int dp dr dr' \left( \frac{1}{2|p|^2} - \frac{\hat{u}_{\uparrow}(r+p)\hat{u}_{\downarrow}(r'-p)}{|r+p|^2 - |r|^2 + |r'-p|^2 - |r'|^2 + 2\varepsilon} \right) (\hat{\chi}_{  
+ 
$$
\mathcal{E}_{T_1+T_2}
$$
 (6.1)
$$

with

<span id="page-39-5"></span><span id="page-39-4"></span><span id="page-39-3"></span>
$$
|\mathcal{E}_{T_1+T_2}| \leq C \left( \varrho^{\frac{7}{3}+\gamma} + \varrho^{\frac{8}{3}-2\gamma} + \varrho^{\frac{7}{3}-\gamma+\frac{7}{8}\delta} + \varrho^{3-3\gamma-\frac{3}{16}\delta} \right).
$$

To obtain [\(6.1\)](#page-39-3), we also used [\(2.3\)](#page-4-3) and that  $(2\pi)^{-3} \int dr \,\hat{v}_{\sigma}(r) = \varrho_{\sigma}$ . Recall the conditions on the parameters,  $0 < \gamma < \frac{1}{3}$ ,  $0 < \delta \le 8\gamma$ , and  $2\gamma + \frac{\delta}{16} \le \frac{1}{3}$ . By choosing  $\gamma = 1/9$  and  $16/63 \le \delta \le 8/9$ , we fulfill these conditions and find that  $|\mathcal{E}_{T_1+T_2}| \leq C \varrho^{\frac{7}{3} + \frac{1}{9}}$ .

To complete the proof of Theorem [1.2,](#page-2-0) we still have to remove the parameter  $2\varepsilon = 2\varrho^{2/3+\delta}$  in [\(6.1\)](#page-39-3), which was used to have strictly positive lower bound on the relevant denominator, and the cut-off  $(\widehat{\chi}_{\leq}(p))^2$  which restricts the integration to  $|p| \lesssim \varrho^{1/3-\gamma}$ . This is the content of the following lemma.

<span id="page-39-2"></span>**Lemma 6.1** (Removing the gap and the cut-off). We have

$$
\int dp dr dr' \left( \frac{\hat{u}_{\uparrow}(r+p)\hat{u}_{\downarrow}(r'-p)}{|r+p|^2 - |r|^2 + |r'-p|^2 - |r'|^2 + 2\varrho^{\frac{2}{3}+\delta}} - \frac{1}{2|p|^2} \right) (\hat{\chi}_{<}(p))^2 \hat{v}_{\uparrow}(r)\hat{v}_{\downarrow}(r')
$$
\n
$$
= \int dp dr dr' \left( \frac{\hat{u}_{\uparrow}(r+p)\hat{u}_{\downarrow}(r'-p)}{|r+p|^2 - |r|^2 + |r'-p|^2 - |r'|^2} - \frac{1}{2|p|^2} \right) \hat{v}_{\uparrow}(r)\hat{v}_{\downarrow}(r') + O(\varrho^{\frac{7}{3}+\delta}) + O(\varrho^{\frac{7}{3}+\gamma}). \quad (6.2)
$$

*Proof.* Recall the notation  $\lambda_{r,p} = |r+p|^2 - |r|^2$ . We split the proof in two parts. We first prove that

$$
\int dp dr dr' \frac{\hat{u}_{\uparrow}(r+p)\hat{u}_{\downarrow}(r'-p)\hat{v}_{\uparrow}(r)\hat{v}_{\downarrow}(r')}{\lambda_{r,p} + \lambda_{r',-p} + 2\varrho^{\frac{2}{3}+\delta}} (\hat{\chi}_{<}(p))^{2}
$$
\n
$$
= \int dp dr dr' \frac{\hat{u}_{\uparrow}(r+p)\hat{u}_{\downarrow}(r'-p)\hat{v}_{\uparrow}(r)\hat{v}_{\downarrow}(r')}{\lambda_{r,p} + \lambda_{r',-p}} (\hat{\chi}_{<}(p))^{2} + O(\varrho^{\frac{7}{3}+\delta}). \quad (6.3)
$$

The difference between the two terms in [\(6.3\)](#page-39-4) is given by

$$
I := 2\varrho^{\frac{2}{3}+\delta} \int dp dr dr' \frac{\hat{u}_{\uparrow}(r+p)\hat{u}_{\downarrow}(r'-p)\hat{v}_{\uparrow}(r)\hat{v}_{\downarrow}(r')}{(\lambda_{r,p} + \lambda_{r',-p})(\lambda_{r,p} + \lambda_{r',-p} + 2\varrho^{\frac{2}{3}+\delta})} (\hat{\chi}_{<}(p))^{2}.
$$
\n(6.4)

Without loss of generality let us assume that  $k_F^{\uparrow} \geq k_F^{\downarrow}$ . Rescaling the variables respect to  $k_F^{\uparrow}$ , we get

<span id="page-40-2"></span>
$$
|\mathcal{I}| \leq C \varrho^{\frac{7}{3}+\delta} \int_{\substack{|r| < 1 < |r+p| \\ |r'| < k_F^{\downarrow}/k_F^{\uparrow} < |r'-p|}} dp dr dr' \frac{1}{(\lambda_{r,p} + \lambda_{r',-p})^2} \leq C \varrho^{\frac{7}{3}+\delta} \tag{6.5}
$$

where the boundedness of the integral follows from Lemma [C.1](#page-44-1) in Appendix [C.](#page-44-0) To conclude it remains to show that

$$
\text{II} := \int dp dr dr' \left( \frac{\hat{u}_{\uparrow}(r+p)\hat{u}_{\downarrow}(r'-p)}{\lambda_{r,p} + \lambda_{r',-p}} - \frac{1}{2|p|^2} \right) \hat{v}_{\uparrow}(r)\hat{v}_{\downarrow}(r') \left(1 - \hat{\chi}_{<}(p)^2\right) = O(\varrho^{\frac{7}{3}+\gamma}).
$$

The integration over p runs over  $|p| \ge 4\varrho^{1/3-\gamma}$  only, hence we have  $\hat{u}_{\uparrow}(r+p)\hat{u}_{\downarrow}(r'-p) = 1$ . Moreover, using that

<span id="page-40-6"></span>
$$
\frac{1}{\lambda_{r,p} + \lambda_{r',-p}} - \frac{1}{2|p|^2} = \frac{p \cdot (r'-r)}{2|p|^4} + \frac{\left(p \cdot (r'-r)\right)^2}{|p|^4(\lambda_{r,p} + \lambda_{r',-p})}
$$
(6.6)

we can write

$$
II = \int dp dr dr' \frac{\left(p \cdot \left(r' - r\right)\right)^2}{|p|^4 (\lambda_{r,p} + \lambda_{r',-p})} \hat{v}_{\uparrow}(r) \hat{v}_{\downarrow}(r') \left(1 - \hat{\chi}_{
$$

since the first term in [\(6.6\)](#page-40-6) integrates to zero by symmetry. On the support of  $1 - \chi_{\leq}(p)^2$ ,  $\lambda_{r,p} + \lambda_{r',-p}$  is bounded from below by  $Cp^2$ , hence

$$
II \leq C \varrho^{\frac{8}{3}} \int_{|p| > 4\varrho^{\frac{1}{3}-\gamma}} \frac{dp}{|p|^4} = C \varrho^{\frac{7}{3}+\gamma}.
$$

This completes the proof of the lemma.

Applying Lemma [6.1](#page-39-2) to the bound in [\(6.1\)](#page-39-3) completes the proof of Theorem [1.2.](#page-2-0) To get the explicit form [\(1.7\)](#page-2-3) of the Huang–Yang correction one has to compute the integral on the right-hand side of [\(6.2\)](#page-39-5). This will be carried out in Appendix [B.](#page-42-1)

# <span id="page-40-0"></span>A Useful bounds on scattering solution and cut-off functions

In this section we prove bounds on the solution of the zero-energy scattering equation [\(1.5\)](#page-1-3), and on the cut-off functions we use in our analysis.

### <span id="page-40-1"></span>A.1 Bounds on scattering solution

<span id="page-40-5"></span>Let us start this section by collecting some well-known estimates for the scattering solution  $\varphi_{\infty}$ .

**Lemma A.1** (Properties of  $\varphi_{\infty}$ ). Let  $V_{\infty}$  be as in Assumption [1.1,](#page-2-2) and  $\varphi_{\infty}$  the solution of [\(1.5\)](#page-1-3). Then

$$
0 \le \varphi_{\infty}(x) \le \min\left\{1, \frac{a}{|x|}\right\} \quad \forall x \in \mathbb{R}^3 \;, \qquad \varphi_{\infty}(x) = \frac{a}{|x|} \quad \forall x \in \mathbb{R}^3 \setminus (\text{supp}V_{\infty}), \tag{A.1}
$$

where  $a = (8\pi)^{-1} \int_{\mathbb{R}^3} V_{\infty}(1 - \varphi_{\infty})$  is the scattering length of  $V_{\infty}$ .

For the proof of Lemma [A.1](#page-40-5) we refer to [\[37\]](#page-46-22) or [\[35\]](#page-46-23). Next we investigate  $\tilde{\varphi}$  defined in [\(2.24\)](#page-7-5), a periodized version of  $\varphi_{\infty}$  regularized by a momentum cut-off. Recall also the definition of  $\varphi$  in Definition [2.5.](#page-6-1)

<span id="page-40-3"></span>**Lemma A.2** (Bounds for  $\tilde{\varphi}$ ). Let  $0 < \gamma < 1/3$ . Let  $V_{\infty}$  as in Assumption [1.1](#page-2-2) and let  $\tilde{\varphi}$  be as in [\(2.24\)](#page-7-5). Then the following bounds hold uniformly for L large,

<span id="page-40-4"></span>
$$
\|\tilde{\varphi}\|_{L^{\infty}(\Lambda)} \le C, \qquad \|\tilde{\varphi}\|_{L^{2}(\Lambda)} \le C\varrho^{-\frac{1}{6} + \frac{\gamma}{2}}, \tag{A.2}
$$

and

<span id="page-41-1"></span>
$$
\|\tilde{\varphi}\|_{L^{1}(\Lambda)} \leq C\varrho^{-\frac{2}{3}+2\gamma}, \qquad \|\nabla\tilde{\varphi}\|_{L^{1}(\Lambda)} \leq C\varrho^{-\frac{1}{3}+\gamma}, \qquad \|\Delta\tilde{\varphi}\|_{L^{1}(\Lambda)} \leq C. \tag{A.3}
$$

Furthermore, with  $\varphi$  as in Definition [2.5,](#page-6-1) for any  $R > 0$ 

<span id="page-41-2"></span>
$$
\lim_{L \to \infty} \sup_{|x| \le R} |\varphi_\infty(x) - \varphi(x)| = 0.
$$
\n(A.4)

*Proof.* We start by proving [\(A.2\)](#page-40-4). Let  $f_{\infty} := 1 - \varphi_{\infty}$ . By the definition [\(2.24\)](#page-7-5) and the zero-energy scattering equation [\(1.5\)](#page-1-3) we have that

$$
|\widetilde{\varphi}(x)| \le \frac{1}{L^3} \sum_{p} |\hat{\varphi}(p)| \le \frac{C}{L^3} \sum_{p \neq 0} \frac{|\mathcal{F}(V_{\infty}f_{\infty})(p)|}{|p|^2} \le \frac{C}{L^3} \sum_{0 \neq |p| \le 1} \frac{1}{|p|^2} + \frac{C}{L^3} \sum_{|p| > 1} \frac{|\mathcal{F}(V_{\infty}f_{\infty})(p)|}{|p|^2},
$$

where we used that  $V_{\infty} f_{\infty} \in L^{1}(\mathbb{R}^{3})$  because of Lemma [A.1.](#page-40-5) Assumption [1.1](#page-2-2) implies that also  $V_{\infty} f_{\infty} \in L^{2}(\mathbb{R}^{3})$ and the function has compact support. Hence, for large enough L, the  $L^2(\Lambda)$ -norm of its periodization equals the  $L^2(\mathbb{R}^3)$  norm, and in particular,

$$
\frac{1}{L^3} \sum_{p \in \Lambda^*} |\mathcal{F}(V_{\infty} f_{\infty})(p)|^2 = \int_{\mathbb{R}^3} dx \, |V_{\infty}(x) f_{\infty}(x)|^2 \le C \|V_{\infty}\|_{L^2(\mathbb{R}^3)}^2 \le C. \tag{A.5}
$$

Therefore, by Cauchy–Schwarz and using that  $\frac{1}{L^3} \sum_{|p|>1} \frac{1}{|p|^4} \leq C$ , we can conclude that  $|\widetilde{\varphi}(x)| \leq C$ . For the  $L^2$ -norm, we have

$$
\|\tilde{\varphi}\|_{L^2(\Lambda)}^2 = \frac{1}{L^3} \sum_p |\hat{\varphi}(p)|^2 |\hat{\chi}_>p)|^2 \le \frac{C}{L^3} \sum_{|p| \ge 4\varrho^{1/3 - \gamma}} \frac{1}{|p|^4} \le C\varrho^{-\frac{1}{3} + \gamma},
$$

<span id="page-41-0"></span>where we used again that  $|\hat{\varphi}(p)| \le C/p^2$ .

**Remark A.3.** The proof above actually shows that  $\varphi$  in Definition [2.5](#page-6-1) is uniformly bounded, i.e.,  $\|\varphi\|_{L^{\infty}(\Lambda)} \leq$ C. However,  $\|\varphi\|_{L^2(\Lambda)}$  diverges as  $L \to \infty$ .

In the following, we bound the  $L^1$  norms of  $\tilde{\varphi}$  and its derivatives. With the aid of [\(1.5\)](#page-1-3) and [\(2.16\)](#page-6-7) we can write

$$
\hat{\widetilde{\varphi}}(p) = \mathcal{F}(V_{\infty}f_{\infty} * g),
$$

where  $g : \mathbb{R}^3 \to \mathbb{C}$  has Fourier transform  $\mathcal{F}(g)(p) = \mathcal{F}(\chi_{>,\infty})(p)/(2|p|^2)$ . The function  $\widetilde{\varphi}$  is thus the periodization of  $V_{\infty} f_{\infty} * g$ , and hence

$$
\|\widetilde{\varphi}\|_{L^1(\Lambda)} \le \|V_{\infty} f_{\infty} * g\|_{L^1(\mathbb{R}^3)} \le \|V_{\infty} f_{\infty}\|_{L^1(\mathbb{R}^3)} \|g\|_{L^1(\mathbb{R}^3)}.
$$

It is a simple exercise, using the smoothness and support properties of  $\chi_{>\infty}$ , to check that  $||g||_{L^1(\mathbb{R}^3)} \leq$  $C\varrho^{-2/3+2\gamma}$ , yielding the first bound in [\(A.3\)](#page-41-1). The second bound on  $\nabla \widetilde{\varphi}$  follows in the same way, using  $\|\nabla g\|_{L^1(\mathbb{R}^3)} \leq C\varrho^{-1/3+\gamma}$ . We omit the details. For the last bound in  $(A.3)$ , we can directly use that  $\Delta \varphi(x) =$  $\sum_{n\in\mathbb{Z}^3} \Delta\varphi_\infty(x+nL)$  with at most one non-vanishing term in the sum, due to the compact support of V. This implies that  $\Delta \varphi = \Delta \varphi_{\infty}$  on  $\Lambda$ . Using that  $\hat{\chi}_{>} = 1 - \hat{\chi}_{<}$ , it then follows that

$$
\Delta \widetilde{\varphi}(x) = \Delta \varphi(x) - \int_{\Lambda} dy \, \Delta \varphi(y) \chi_{<}(x - y).
$$

Hence

$$
\|\Delta \widetilde{\varphi}\|_{L^1(\Lambda)} \leq C \|V_{\infty}\|_{L^1(\mathbb{R}^3)} \left(1 + \|\chi_{\lt}\|_{L^1(\Lambda)}\right) \leq C,
$$

where we used again Assumption [1.1,](#page-2-2) [\(1.5\)](#page-1-3), Lemma [A.1](#page-40-5) and the fact that  $\|\chi_{\leq}\|_{L^1(\Lambda)} \leq C$  by Lemma [A.5](#page-42-2) below.

It remains to prove [\(A.4\)](#page-41-2). We have

$$
\varphi(x)-\varphi_\infty(x)=\frac{1}{L^3}\sum_{p\neq 0}\frac{\mathcal{F}(V_\infty f_\infty)(p)}{|p|^2}e^{ip\cdot x}-\frac{1}{(2\pi)^3}\int_{\mathbb{R}^3}dp\,\frac{\mathcal{F}(V_\infty f_\infty)(p)}{|p|^2}e^{ip\cdot x}.
$$

The function  $p \mapsto \mathcal{F}(V_{\infty}f_{\infty})(p)e^{ip\cdot x}$  is square integrable and smooth, uniformly in x for bounded x. Approximating the integral by a Riemann sum, it is then a simple exercise to show that the right-hand side is  $O(1/L)$ for large  $L$ , uniformly in  $x$  for bounded  $x$ . We leave the details to the reader.  $\Box$ 

<span id="page-42-3"></span>**Lemma A.4** (Estimates of the  $L^1, L^2$  norms of  $h_1$ ). Let  $h_1 : \Lambda \to \mathbb{R}$  be the periodic function with the Fourier coefficients defined in [\(4.49\)](#page-22-3). Then  $||h_1||_{L^1(\Lambda)} \to 0$  and  $||h_2||_{L^2(\Lambda)} \to 0$  as  $L \to \infty$ .

*Proof.* Using [\(1.5\)](#page-1-3) and  $\hat{\chi}$  +  $\hat{\chi}$  = 1, we can write

$$
\hat{h}_1(p) = \hat{g}(p) (1 - \hat{\chi}_{<}(p)) \quad \text{with } \hat{g}(p) = \mathcal{F}(V_{\infty} \varphi_{\infty})(p) - \widehat{V \varphi}(p).
$$

The function  $g : \Lambda \to \mathbb{R}$  with Fourier coefficients  $\hat{g}(p)$  is thus the periodization of  $V_{\infty}(\varphi_{\infty} - \varphi)$ , and because of the compact support of V, we have for  $x \in \Lambda = [-L/2, L/2]^3$  (and L large enough)

$$
g(x) = V_{\infty}(x) (\varphi_{\infty}(x) - \varphi(x)).
$$

From Assumption [1.1](#page-2-2) and [A.4,](#page-41-2) it readily follows that  $||g||_{L^1(\Lambda)} \to 0$  and  $||g||_{L^2(\Lambda)} \to 0$  as  $L \to \infty$ . Now

$$
h_1(x) = g(x) - \int_{\Lambda} dy g(x - y) \chi_{<} (y),
$$

hence the same holds for  $h_1$  since  $\|\chi_{<} \|_{L^1(\Lambda)} \leq C$ , as will be shown in Lemma [A.5](#page-42-2) below. This completes the proof. proof.

### <span id="page-42-0"></span>A.2 Bounds on the cut-off functions

<span id="page-42-2"></span>The following Lemma is an easy exercise that we leave to the reader. (Compare with [\[17,](#page-45-3) Prop. 4.2].)

**Lemma A.5** ( $L^1$  norm of the cut-off functions  $\chi_<$ ,  $\zeta^<$ ). Let  $\chi_<$  :  $\Lambda \to \mathbb{R}$  and  $\zeta^<$  :  $\Lambda \to \mathbb{R}$  be the cut-off functions with Fourier coefficients introduced in [\(2.16\)](#page-6-7) and [\(5.11\)](#page-30-6), respectively. Then

$$
\|\chi_{<} \|_{L^1(\Lambda)} \le C, \qquad \|\zeta^{\le}\|_{L^1(\Lambda)} \le C
$$

The next lemma is somewhat more subtle, as it requires uniformity in t.

<span id="page-42-4"></span>**Lemma A.6** ( $L^1$  norm of the function  $\zeta^t$ ). Let  $\zeta^t$  be as in [\(5.19\)](#page-31-1) for  $t \in (0, \infty)$ . Then

<span id="page-42-5"></span>
$$
\|\zeta^t\|_{L^1(\Lambda)} \le C. \tag{A.6}
$$

Proof. We start by writing

$$
\zeta^t(x) = \frac{1}{L^3} \sum_k e^{-t|k|^2} e^{ik \cdot x} - \frac{1}{L^3} \sum_k \zeta^{\leq}(k) e^{-t|k|^2} e^{ik \cdot x} = \zeta_1^t(x) + \zeta_2^t(x),
$$

with  $\zeta^<$  as in [\(5.11\)](#page-30-6). The function  $\zeta_1^t$  is the periodization of  $\zeta_\infty^t(x) := (2\pi)^{-3} \int_{\mathbb{R}^3} dp e^{-tp^2} e^{ip \cdot x} =$  $(4\pi t)^{-3/2}e^{-x^2/(4t)},$  hence  $\|\zeta_1^t\|_{L^1(\Lambda)} \leq \|\zeta_\infty^t\|_{L^1(\mathbb{R}^3)} = 1$ . To estimate the  $L^1$  norm of  $\zeta_2^t$  it is enough to notice that

$$
\zeta_2^t(x) = \int_{\Lambda} dy \, \zeta_1^t(x - y) \zeta^< (y),
$$

which implies that  $\|\zeta_2^t\|_{L^1(\Lambda)} \le \|\zeta_1^t\|_{L^1(\Lambda)} \|\zeta^{\lt}\|_{L^1(\Lambda)} \le C$ , using Lemma [A.5.](#page-42-2) This yields [\(A.6\)](#page-42-5).

### $\Box$

# <span id="page-42-1"></span>**B** Evaluation of  $F(x)$

In this section we explicitly evaluate the integral in [\(1.10\)](#page-2-5), and show that it equals  $a^2 \varrho^{\frac{7}{3}}_\uparrow F(\varrho_1/\varrho_1)$  with F given in [\(1.7\)](#page-2-3). In fact, rescaling the integrations over p, r, r' in [\(1.10\)](#page-2-5) by  $k_F^{\uparrow} = (6\pi^2)^{\frac{1}{3}} \varrho_{\uparrow}^{1/3}$  $\uparrow^{\scriptscriptstyle 1/\mathfrak{d}},$  we find

$$
F(x) = \frac{4}{\pi} (6\pi^2)^{1/3} \int_{\mathbb{R}^3} dp \left( \frac{x}{p^2} - g(x, p) \right)
$$
 (B.1)

and

$$
g(x,p) = \frac{9}{8\pi^2} \int_{|k+p|>1>|k|} dk \int_{|q-p|>x^{1/3}>|q|} dq \frac{1}{(k+p)^2 - k^2 + (q-p)^2 - q^2}.
$$
 (B.2)

**Lemma B.1.** For every  $x > 0$ ,  $F(x)$  can be written explicitly as in [\(1.7\)](#page-2-3).

*Proof.* Let us rewrite  $g$  as

$$
g(x,p) = \frac{9}{8\pi^2} \lim_{\varepsilon \to 0} \int dk \,\chi(k) \int dq \,\chi(x^{-1/3}q) \frac{\chi^c(k+p)\chi^c(x^{-1/3}(q-p))}{(k+p)^2 - k^2 + (q-p)^2 - q^2 + i\varepsilon}
$$
  
= 
$$
\frac{9}{8\pi^2} \lim_{\varepsilon \to 0} \Re \int dk \,\chi(k) \int dq \,\chi(x^{-1/3}q) \frac{1 - \chi(k+p) - \chi(x^{-1/3}(q-p))}{(k+p)^2 - k^2 + (q-p)^2 - q^2 + i\varepsilon}
$$

where  $\chi$  stands for the characteristic function of the unit ball,  $\chi^c = 1 - \chi$  and we have used that

$$
\Re \int dk \,\chi(k) \int dq \,\chi(x^{-1/3}q) \frac{\chi(k+p)\chi(x^{-1/3}(q-p))}{(k+p)^2 - k^2 + (q-p)^2 - q^2 + i\varepsilon} = 0
$$

because of symmetry. In particular,  $g = g_0 - g_1 - g_2$  with

$$
g_0(x,p) = \frac{9}{8\pi^2} \lim_{\varepsilon \to 0} \Re \int dk \,\chi(k) \int dq \,\chi(x^{-1/3}q) \frac{1}{(k+p)^2 - k^2 + (q-p)^2 - q^2 + i\varepsilon},
$$
  
\n
$$
g_1(x,p) = \frac{9}{8\pi^2} \lim_{\varepsilon \to 0} \Re \int dk \,\chi(k) \int dq \,\chi(x^{-1/3}q) \frac{\chi(k+p)}{(k+p)^2 - k^2 + (q-p)^2 - q^2 + i\varepsilon},
$$
  
\n
$$
g_2(x,p) = \frac{9}{8\pi^2} \lim_{\varepsilon \to 0} \Re \int dk \,\chi(k) \int dq \,\chi(x^{-1/3}q) \frac{\chi(x^{-1/3}(q-p))}{(k+p)^2 - k^2 + (q-p)^2 - q^2 + i\varepsilon}.
$$

We claim that

$$
\int_{\mathbb{R}^3} dp \left( \frac{x}{p^2} - g_0(x, p) \right) = 0
$$

which follows from

$$
\lim_{\varepsilon \to 0} \Re \int_{\mathbb{R}^3} dp \left( \frac{1}{2p^2} - \frac{1}{(k+p)^2 - k^2 + (q-p)^2 - q^2 + i\varepsilon} \right) = 0
$$

for fixed  $k$  and  $q$ . In fact, the Fourier transform of the integrand above is proportional to

$$
\frac{1}{|y|}\left(1-e^{iy(k-q)/2}e^{-\sqrt{-(k-q)^2/4+ i\varepsilon}|y|}\right).
$$

Taking the real part and  $\varepsilon \to 0$ , this evaluates to 0 at  $y = 0$ .

We conclude that

<span id="page-43-0"></span>
$$
F(x) = \frac{4}{\pi} (6\pi^2)^{1/3} \int_{\mathbb{R}^3} dp (g_1(x, p) + g_2(x, p)).
$$

By simple scaling,  $g_2(x, p) = x^{4/3} g_1(x^{-1}, x^{-1/3}p)$ , hence also

$$
F(x) = \frac{4}{\pi} (6\pi^2)^{1/3} \left( f(x) + x^{7/3} f(x^{-1}) \right) \quad \text{with} \quad f(x) = \int_{\mathbb{R}^3} dp \, g_1(x, p). \tag{B.3}
$$

We have

$$
f(x) = \frac{9}{8\pi^2} \lim_{\varepsilon \to 0} \Re \int dp \int dk \,\chi(k) \int dq \,\chi(x^{-1/3}q) \frac{\chi(k+p)}{(k+p)^2 - k^2 + (q-p)^2 - q^2 + i\varepsilon}
$$
  
= 
$$
\frac{9}{8\pi^2} \lim_{\varepsilon \to 0} \Re \int dk \,\chi(k) \int dq \,\chi(x^{-1/3}q) \int dp \,\frac{\chi(p)}{p^2 - k^2 + (q+k-p)^2 - q^2 + i\varepsilon} dp dq dk.
$$

Let us compute

$$
f'(x) = \frac{3}{8\pi^2} \lim_{\varepsilon \to 0} \Re \int_{\mathbb{R}^3} dk \,\chi(k) \int_{\mathbb{S}^2} d\omega \int_{\mathbb{R}^3} dp \, \frac{\chi(p)}{p^2 - k^2 + (x^{1/3}\omega + k - p)^2 - x^{2/3} + i\varepsilon}
$$
  
= 
$$
\frac{3}{8\pi^2} x^{4/3} \lim_{\varepsilon \to 0} \Re \int_{\mathbb{R}^3} dk \,\chi(x^{1/3}k) \int_{\mathbb{S}^2} d\omega \int_{\mathbb{R}^3} dp \, \frac{\chi(x^{1/3}p)}{p^2 - k^2 + (\omega + k - p)^2 - 1 + i\varepsilon}
$$

and

$$
x^{2} \left(x^{-4/3} f'(x)\right)' = -\frac{1}{8\pi^{2}} \lim_{\varepsilon \to 0} \Re \int_{\mathbb{S}^{2}} d\nu \int_{\mathbb{S}^{2}} d\omega \int_{\mathbb{R}^{3}} dp \frac{\chi(x^{1/3}p)}{p^{2} - x^{-2/3} + (\omega + x^{-1/3}\nu - p)^{2} - 1 + i\varepsilon}
$$

$$
- \frac{1}{8\pi^{2}} \lim_{\varepsilon \to 0} \Re \int_{\mathbb{R}^{3}} dk \int_{\mathbb{S}^{2}} d\omega \int_{\mathbb{S}^{2}} d\nu \frac{\chi(x^{1/3}k)}{x^{-2/3} - k^{2} + (\omega + k - x^{-1/3}\nu)^{2} - 1 + i\varepsilon}
$$

which can further be rewritten as

$$
x^{7/3} \left( x^{-4/3} f'(x) \right)' = -\frac{1}{8\pi^2} \lim_{\varepsilon \to 0} \Re \int_{\mathbb{S}^2} d\nu \int_{\mathbb{S}^2} d\omega \int_{\mathbb{R}^3} dp \frac{\chi(p)}{p^2 - 1 + (x^{1/3}\omega + \nu - p)^2 - x^{2/3} + i\varepsilon}
$$

$$
- \frac{1}{8\pi^2} \lim_{\varepsilon \to 0} \Re \int_{\mathbb{S}^2} d\omega \int_{\mathbb{S}^2} d\nu \int_{\mathbb{R}^3} dp \frac{\chi(p)}{1 - p^2 + (x^{1/3}\omega + \nu - p)^2 - x^{2/3} + i\varepsilon}.
$$

For the integration over p, we use that (for  $a^2 \ge 4b$ )

$$
\lim_{\varepsilon \to 0} \Re \int dp \, \frac{\chi(p)}{p^2 + ap + b + i\varepsilon} = 2\pi - \frac{\pi}{2} \sqrt{a^2 - 4b} \ln \left| \frac{b - 1 - \sqrt{a^2 - 4b}}{b - 1 + \sqrt{a^2 - 4b}} \right| + \frac{\pi}{2} \frac{a^2 - 2b - 2}{|a|} \ln \left| \frac{b + 1 - |a|}{b + 1 + |a|} \right|
$$

as well as

$$
\lim_{\varepsilon \to 0} \Re \int dp \vert m \frac{\chi(p)}{ap + b + i\varepsilon} = \frac{2\pi b}{a^2} - \frac{\pi}{|a|^3} \left( a^2 - b^2 \right) \ln \left| \frac{b - |a|}{b + |a|} \right|.
$$

Straightforward manipulations then lead to

$$
-8\pi x^{7/3} \left( x^{-4/3} f'(x) \right)' = 8\pi^2 \left( 2 + \frac{1}{x^{1/3}} (x^{2/3} - 1) \ln \frac{|1 - x^{1/3}|}{1 + x^{1/3}} \right).
$$

Consequently, we conclude that

$$
x^{-4/3}f'(x) - \frac{3}{7}A = \frac{1}{5}\left(9x^{-4/3} - 2x^{-2/3} - \left(3x^{-5/3} - 5x^{-1}\right)\ln\frac{|1-x^{1/3}|}{1+x^{1/3}} + 2\ln\frac{x^{2/3}}{|1-x^{2/3}|}\right)
$$

and hence

$$
f(x) - Ax^{7/3} - B = \frac{9}{14}x^{1/3} + \frac{99}{70}x - \frac{6}{35}x^{5/3} + \frac{3}{20}\left(\frac{15}{7} - 6x^{2/3} + 5x^{4/3}\right)\ln\frac{|1 - x^{1/3}|}{1 + x^{1/3}} + 24x^{7/3}\ln\frac{x^{2/3}}{|1 - x^{2/3}|}
$$

for some constants  $A, B \in \mathbb{R}$ . Since

$$
0 = F(0) = \frac{4}{\pi} (6\pi^2)^{1/3} \left( f(0) + \lim_{x \to 0} x^{7/3} f(x^{-1}) \right) = \frac{4}{\pi} (6\pi^2)^{1/3} (B + A)
$$

necessarily  $B = -A$ . The value of A is irrelevant as it drops out in the calculation of F using [\(B.3\)](#page-43-0), and we arrive at the desired formula (1.7). arrive at the desired formula [\(1.7\)](#page-2-3).

# <span id="page-44-0"></span>C Estimate of the integral in [\(6.5\)](#page-40-2)

<span id="page-44-1"></span>In this section we prove the bound claimed in [\(6.5\)](#page-40-2).

Lemma C.1.

$$
\sup_{0
$$

*Proof.* We start by observing that it suffices to integrate only over  $|p| \leq 2$ . For  $|p| \geq 2$ , the integrand is bounded by  $C/|p|^4$ , hence the resulting integral is finite and bounded uniformly in x.

In the following, let us use the notation  $e_k := ||k|^2 - 1|$ . Using that  $|r'-p| \geq x$  and  $x^2 - |r'|^2 \geq x(x - |r'|)$ , the integral to consider is bounded above by

$$
\mathrm I:=\int_{|p|<2} dp \int_{|r|<1<|r+p|} dr \int_{|r'|
$$

Let us split the domain of integration into two domains, depending on whether  $e_{r+p} \leq e_r$  or  $e_r < e_{r+p}$ , and denote the corresponding integrals by  $I_1$  and  $I_2$ . In the first case, we have  $1 < |r+p| \leq 2 - r^2$ . Dropping the positive term  $e_{r+p}^2$  in the denominator, we thus get the upper bound

$$
I_1 \le \frac{4\pi}{3} \int_{|r| < 1} dr \int_{|r'| < x} dr' \frac{(2 - |r|^2)^{3/2} - 1}{e_r^2 + x^2(x - |r'|)^2} \le C \int_{|r| < 1} dr \int_{|r'| < x} dr' \frac{e_r}{e_r^2 + x^2(x - |r'|)^2}
$$

where we have used that  $(2 - |r|^2)^{3/2} - 1 \le C(1 - r^2) = Ce_r$  for  $|r| \le 1$ . We further have, for any  $y > 0$ ,

<span id="page-45-17"></span>
$$
\int_{|r'|
$$

Hence  $I_1 \leq C$ . For the second term  $I_2$  we proceed similarly. If  $e_r < e_{r+p}$  we have  $(2 - |r+p|^2)_+ \leq |r|^2 \leq 1$ , with  $(\cdot)_+$  denoting the positive part. We change variables to  $q = r + p$ . Using  $1 < |q| \leq |r| + |p| \leq 3$  and  $1 - (2 - |q|^2)^{3/2} \leq C(|q|^2 - 1) = Ce_q$  we get

$$
\begin{array}{lcl} \mathrm{I}_2 & \leq & \displaystyle \int_{|r|<1} dr \int_{|r'|
$$

which is finite due to [\(C.1\)](#page-45-17).
