

# EXISTENCE AND APPROXIMATE CONTROLLABILITY FOR A CLASS OF FRACTIONAL ORDER HEMIVARIATIONAL INEQUALITIES.

GARIMA GUPTA<sup>1</sup> AND JAYDEV DABAS<sup>2\*</sup>

**ABSTRACT.** This paper discusses the approximate controllability of a fractional differential control problem driven by a nonlinear hemivariational inequality in a Hilbert space. First, we prove the existence of a mild solution for a fractional control inclusion problem which is equivalent to a hemivariational inequality by using the nonsmooth analysis and fixed point technique. Further, we established sufficient conditions for the approximate controllability of our inclusion problem by taking corresponding linear system is approximately controllable. The existence and controllability results obtained for the inclusion problem are valid for considered nonlinear hemivariational problem. Finally, we provide an example to illustrate the efficiency of the developed results.

## 1. Introduction

Hemivariational inequalities are a generalization of variational inequalities that arise in the study of nonconvex and nonsmooth energy functions. They have various applications across different fields due to their ability to model complex phenomena involving nonconvex and nonsmooth potentials. Panagiotopoulos initially introduced the concept of hemivariational inequality in 1981(cf. [24]). He utilized hemivariational inequalities to address mechanical problems characterized by nonconvex and nonsmooth superpotentials, see for example, [25, 26]. Over time, an increasing number of scholars have made significant contributions to the exploration of solution existence in hemivariational inequalities and various authors have proven the existence of solutions for hemivariational inequalities under different assumptions and hypotheses. For detailed information of existence of solution and its nature we refer Kavitha, Vijayakumar, Shukla, Nisar, Kottakkaran and Udhayakumar[13], Mohan Raja, Vijayakumar, Udhayakumar, Nisar and Kottakkaran [22], Jiang, Wei, Zhouchao, Guoji and Irene[10], Zeng, Liu and Migorski[31], Ma, Dineshkumar, Vijayakumar, Udhayakumar, Shukla, Anurag and Kottakkaran [19] and the references given in these articles. The notion of noninteger derivatives and integrals represents an extension of the conventional calculus based on integer orders. This extension is motivated by the distinctive memory-like characteristics inherent in fractional derivatives, rendering them more suitable for describing the

properties of diverse real materials compared to their integer-order counterparts. Over the past two decades, fractional calculus has drawn the interest of physicists, mathematicians, and engineers, leading to notable contributions in both theoretical advancements and practical applications of fractional differential equations. For more comprehensive insights into fractional calculus and fractional differential equations, readers are directed to the monograph authored by Kilbas[14]. Hemivariational inequalities with fractional derivatives are essential in modeling anomalous diffusion processes where the standard diffusion equations fail, such as in porous media or heterogeneous materials. The specifications of initial conditions for Riemann–Liouville fractional derivatives or integrals are pivotal in addressing certain practical challenges. Heymans and Podlubny[9, 27] have illustrated that it is feasible to assign a physical significance to initial conditions formulated using Riemann–Liouville fractional derivatives or integrals, particularly in the realm of viscoelasticity. Such initial conditions are deemed more suitable than those that are physically interpretable.

The nonlocal initial condition proves to be more effective in physics compared to the classical initial condition  $u(0) = u_0$ . To illustrate, in 1993, Deng [7] utilized the nonlocal condition to characterize the diffusion phenomenon of a small amount of gas within a transparent tube. In this context, condition (1.2) facilitates additional measurements at  $t_k$ , where  $k = 1, 2, \dots, m$ , offering greater precision than measurements solely at  $t = 0$ . Furthermore, in 1999, Byszewski[2] highlighted that if  $c_k \neq 0$ , where  $k = 1, 2, \dots, m$ , the outcomes can be employed in kinematics to ascertain the evolutionary path  $t \rightarrow u(t)$  of a physical object. This is particularly useful when the positions  $u(0), u(t_1), \dots, u(t_m)$  are unknown, but the nonlocal condition (1.2) is confirmed to hold. Few more articles by Mahmudov[21], Wang[30] and Chen[3, 4] considered semilinear systems with non-local conditions and proved the existence of solution.

The introduction of controllability by Kalman in 1963[11] marked the inception of an active research area, owing to its significant applications in physics. There are various works on approximate controllability of systems represented by fractional differential equations, integrodifferential equations, differential inclusions, neutral functional differential equations, and impulsive differential equations in Banach spaces; see[1, 17, 21] and their references. In recent years, the exploration of control systems governed by Caputo fractional evolution equations has seen considerable attention (see[4, 30, 22, 29, 32]). Despite this, the topic of approximate controllability for fractional evolution differential equations with Riemann–Liouville fractional derivative with local and nonlocal initial conditions under different hypothesis has been studied by many authors. For reference see the literature[8, 15, 16, 17, 18, 28]. This gap in knowledge serves as the motivation for the present work. The objective of this paper is to present suitable sufficient conditions for the existence and approximate controllability of fractional differential Hemivariational inequalities involving Riemann–Liouville fractional derivatives.

Let  $\mathbb{H}$  be a separable Hilbert space and  $\mathbb{U}$  be a Hilbert space. In this work, we investigate the existence of a mild solution and the approximate controllability of the following semilinear fractional differential hemivariational inequality:

$$\begin{cases} \langle -{}^R D_{0,t}^\alpha x(t) + Ax(t) + Bu(t), v \rangle_{\mathbb{H}} + F^0(t, x(t); v) \geq 0, & t \in J = [0, b], \forall v \in \mathbb{H}, \\ I_{0,t}^{1-\alpha} x(t)|_{t=0} = \sum_{k=1}^m c_k x_k. \end{cases} \quad (1.1)$$

where,  $\langle \cdot, \cdot \rangle_{\mathbb{H}}$  denotes the scalar product of the separable Hilbert space  $\mathbb{H}$  and the norm in  $\mathbb{H}$  is denoted by  $\|\cdot\|_{\mathbb{H}}$ ,  ${}^R D_{0,t}^\alpha$  denotes the Riemann-Liouville fractional derivative of order

$\alpha \in (0, 1)$  with the lower limit zero and  $I_{0,t}^{1-\alpha}$  denotes the Riemann-Liouville fractional integral of order  $1 - \alpha$  with lower limit zero,  $A : D(A) \subseteq \mathbb{H} \rightarrow \mathbb{H}$  is the infinitesimal generator of a  $C_0$ -semigroup  $\mathcal{T}(t)(t \geq 0)$  on  $\mathbb{H}$ . For  $\alpha > \frac{1}{2}$  the control function  $u$  takes value in  $L^2(J, \mathbb{U})$  of admissible control functions for a hilbert space  $\mathbb{U}$ ,  $B : \mathbb{U} \rightarrow \mathbb{H}$  is a bounded linear operator,  $F^0(t, \cdot; \cdot)$  stands for the generalized Clarke directional derivative of a locally Lipschitz function  $F(t, \cdot) : \mathbb{H} \rightarrow \mathbb{R}$ ,  $0 < t_1 < t_2 < \dots < t_m < b, m \in \mathbb{N}$ ,  $c_k$  are real constant,  $c_k \neq 0, k = 1, 2, \dots, m$  and  $x_k = x(t_k)$  for  $k = 1, 2, \dots, m$ .

## 2. Preliminaries

In this section, we recall some fundamental definitions, notations, which will help us to establish existence and controllability result for the system (1.1).

The norm of a Banach space  $\mathbb{X}$  will be denoted by  $\|\cdot\|_{\mathbb{X}}$ .  $L_b(\mathbb{X}, \mathbb{Y})$  denotes the space of bounded linear operators from a Banach space  $\mathbb{X}$  to Banach space  $\mathbb{Y}$ . For the uniformly bounded  $C_0$ -semigroup  $\mathcal{T}(t)(t \geq 0)$ , we set  $M := \sup_{t \geq 0} \|\mathcal{T}(t)\|_{L_b(\mathbb{X})} < \infty$ . Let  $C(J, \mathbb{X})$  denote the Banach space of all  $\mathbb{X}$  value continuous functions from  $J = [0, b]$  to  $\mathbb{X}$  with the norm  $\|x\|_C = \sup_{t \in J} \|x(t)\|_{\mathbb{X}}$ . Let  $C_{1-\alpha}(J, \mathbb{X}) = \{x : t^{1-\alpha}x(t) \in C(J, \mathbb{X})\}$  with the norm

$$\|x\|_{C_{1-\alpha}} = \sup\{t^{1-\alpha}\|x(t)\|_{\mathbb{X}} : t \in J\}.$$

Obviously, the space  $C_{1-\alpha}(J, \mathbb{X})$  is a Banach space. Some definitions related to fractional integral and derivatives are as follows:

**Definition 2.1.** [14] *The fractional integral of a function  $z : [a, b] \rightarrow \mathbb{R}$ ,  $a, b \in \mathbb{R}$  with  $a < b$ , of order  $\alpha > 0$  is defined as*

$$I_{a,t}^{\alpha}z(t) := \frac{1}{\Gamma(\alpha)} \int_a^t \frac{z(s)}{(t-s)^{1-\alpha}} ds, \quad \text{for a.e. } t \in [a, b],$$

where  $z \in L^1([a, b]; \mathbb{R})$  and  $\Gamma(\alpha) = \int_0^{\infty} t^{\alpha-1} e^{-t} dt$  is the Euler gamma function.

**Definition 2.2.** [14] *The Riemann-Liouville fractional derivative of a function  $z : [a, b] \rightarrow \mathbb{R}$  of order  $\alpha > 0$  is given as*

$${}^R D_{a,t}^{\alpha}z(t) := \frac{1}{\Gamma(n-\alpha)} \frac{d^n}{dt^n} \int_a^t (t-s)^{n-\alpha-1} z(s) ds, \quad \text{for a.e. } t \in [a, b],$$

with  $n - 1 < \alpha < n$ .

If  $z$  is an abstract function with values in  $\mathbb{X}$ , then the integrals which appear in 2.1 and 2.2 are taken in Bochner's sense, that is: a measurable function  $z$  maps from  $[0, +\infty)$  to  $\mathbb{X}$  is Bochner integrable if  $\|z\|$  is Lebesgue integrable. Furthermore, given a Banach space  $\mathbb{X}$ , we will use the following notations.

$$\mathcal{P}_{cl,cv}(X) := \{\Omega \subseteq \mathbb{X} : \Omega \text{ is nonempty, closed (convex)}\},$$

$$\mathcal{P}_{(w)cp(cv)}(X) := \{\Omega \subseteq \mathbb{X} : \Omega \text{ is nonempty, (weakly) compact (convex)}\}.$$

Now, we introduce some basic definitions and results from multivalued analysis. For more details on multivalued maps, please see the book[6].

- (i) For a given Banach space  $\mathbb{X}$ , a multivalued map  $F : \mathbb{X} \rightarrow 2^{\mathbb{X}} \setminus \{\emptyset\} := \mathcal{P}(\mathbb{X})$  is convex (closed) valued, if  $F(x)$  is convex (closed) for all  $x \in \mathbb{X}$ .

- (ii)  $F$  is called upper semicontinuous (u.s.c. for short) on  $\mathbb{X}$ , if for each  $x \in \mathbb{X}$ , the set  $F(x)$  is a nonempty, closed subset of  $\mathbb{X}$ , and if for each open set  $V$  of  $\mathbb{X}$  containing  $F(x)$ , there exists an open neighborhood  $N$  of  $x$  such that  $F(N) \subseteq V$ .
- (iii)  $F$  is said to be completely continuous if  $F(V)$  is relatively compact, for every bounded subset  $V \subseteq \mathbb{X}$ .
- (iv) Let  $\Sigma$  is the  $\sigma$ -algebra of subsets of the set  $\Omega$ ,  $(\Omega, \Sigma)$  be a measurable space and  $(\mathbb{X}, d)$  a separable metric space. A multivalued map  $F : \Omega \rightarrow \mathcal{P}(\mathbb{X})$  is said to be measurable, if for every closed set  $C \subseteq \mathbb{X}$ , we have  $F^{-1}(C) = \{t \in \Omega : F(t) \cap C \neq \emptyset\} \in \Sigma$ .

Now we recall the few elements of nonsmooth analysis(see [5] for detailed information).

**Definition 2.3.** Let  $h : \mathbb{X} \rightarrow \mathbb{R}$  be a locally Lipschitz function on a Banach space  $\mathbb{X}$ . The generalized directional derivative of  $h$  at  $y \in \mathbb{X}$  in the direction  $z \in \mathbb{X}$  is defined by

$$h^0(y; z) := \limsup_{\lambda \rightarrow 0^+} \sup_{\eta \rightarrow y} \frac{h(\eta + \lambda z) - h(\eta)}{\lambda}.$$

The generalized gradient of  $h$  at  $y \in X$  is the subset of  $\mathbb{X}^*$  which is the dual space of  $\mathbb{X}$ , is given by

$$\partial h(y) := \{y^* \in \mathbb{X}^* : h^0(y; z) \geq \langle y^*, z \rangle \forall z \in \mathbb{X}\},$$

Now we Consider the following semilinear inclusion

$$\begin{cases} {}^R D_{0,t}^\alpha x(t) \in Ax(t) + Bu(t) + \partial F(t, x(t)), & t \in J = [0, b], \\ I_{0,t}^{1-\alpha} x(t)|_{t=0} = \sum_{k=1}^m c_k x_k, \end{cases} \quad (2.1)$$

where,  $\partial F$  is the generalized Clarke subdifferential of a locally Lipschitz function  $F(t, \cdot) : \mathbb{H} \rightarrow \mathbb{R}$ . If  $x \in C_{1-\alpha}(J, \mathbb{H})$  is a solution of (2.1), then there exists  $f(t) \in \partial F(t, x(t))$  such that  $f(t) \in L^1(J, \mathbb{H})$  and

$$\begin{cases} {}^R D_{0,t}^\alpha x(t) = Ax(t) + Bu(t) + f(t), & t \in J = [0, b], \\ I_{0,t}^{1-\alpha} x(t)|_{t=0} = \sum_{k=1}^m c_k x_k, \end{cases}$$

which implies

$$\begin{cases} \langle -{}^R D_{0,t}^\alpha x(t) + Ax(t) + Bu(t), v \rangle_{\mathbb{H}} + \langle f(t), v \rangle_{\mathbb{H}} = 0, & t \in J = [0, b], \forall v \in \mathbb{H} \\ I_{0,t}^{1-\alpha} x(t)|_{t=0} = \sum_{k=1}^m c_k x_k. \end{cases}$$

since  $f \in \partial F(t, x(t))$  and  $\langle f(t), v \rangle_{\mathbb{H}} \leq F^0(t, x(t); v)$ , we obtain

$$\begin{cases} \langle -{}^R D_{0,t}^\alpha x(t) + Ax(t) + Bu(t), v \rangle_{\mathbb{H}} + F^0(t, x(t); v) \geq 0, & t \in J = [0, b], \forall v \in \mathbb{H} \\ I_{0,t}^{1-\alpha} x(t)|_{t=0} = \sum_{k=1}^m c_k x_k. \end{cases}$$

Therefore, in order to study the hemivariational inequality (1.1), we only need to deal with the semilinear inclusion (2.1).

Further, we define the operator

$$\begin{aligned} \mathcal{T}_\alpha(t) &= \alpha \int_0^\infty \theta \xi_\alpha(\theta) \mathcal{T}(t^\alpha \theta) d\theta, \\ \xi_\alpha(\theta) &= \frac{1}{\alpha} \theta^{-1-(1/\alpha)} \omega_\alpha(\theta^{-1/\alpha}), \end{aligned}$$

$$\omega_\alpha(\theta) = \frac{1}{\pi} \sum_{n=1}^{\infty} (-1)^{n-1} \theta^{-n\alpha-1} \frac{\Gamma(n\alpha+1)}{n!} \sin(\pi n\alpha), \quad \theta \in (0, \infty).$$

**Assumption 2.1.**  $\sum_{k=1}^m |c_k t_k^{\alpha-1}| < \frac{\Gamma_\alpha}{M}$ .

From assumption 2.1 , we have

$$\left\| \sum_{k=1}^m c_k t_k^{\alpha-1} \mathcal{T}_\alpha(t_k) \right\| < 1. \quad (2.2)$$

By equation(2.2) and operator spectrum theorem, we know that

$$\mathcal{O} = \left( I - \sum_{k=1}^m c_k t_k^{\alpha-1} \mathcal{T}_\alpha(t_k) \right)^{-1}, \quad (2.3)$$

exists and is a bounded operator with  $D(\mathcal{O}) = \mathbb{H}$ . Furthermore, by Neumann expression,  $\mathcal{O}$  can be expressed by

$$\mathcal{O} = \sum_{n=0}^{\infty} \left( \sum_{k=1}^m c_k t_k^{\alpha-1} \mathcal{T}_\alpha(t_k) \right)^n.$$

Therefore,

$$\begin{aligned} \|\mathcal{O}\| &\leq \sum_{n=0}^{\infty} \left\| \sum_{k=1}^m c_k t_k^{\alpha-1} \mathcal{T}_\alpha(t_k) \right\|^n, \\ &\leq \frac{1}{1 - \frac{M}{\Gamma_\alpha} \sum_{k=1}^m |c_k t_k^{\alpha-1}|}. \end{aligned}$$

By the above discussion, [18] and [16] We know that the mild solution for the fractional inclusion problem(2.1) can be written as

$$x(t) = t^{\alpha-1} \mathcal{T}_\alpha(t) (I_{0,t}^{1-\alpha} x(t)|_{t=0}) + \int_0^t (t-s)^{\alpha-1} \mathcal{T}_\alpha(t-s) [Bu(s) + f(s)] ds, \quad (2.4)$$

From (2.4) we have for each  $t_k$

$$x(t_k) = t_k^{\alpha-1} \mathcal{T}_\alpha(t_k) (I_{0,t}^{1-\alpha} x(t)|_{t=0}) + \int_0^{t_k} (t_k-s)^{\alpha-1} \mathcal{T}_\alpha(t_k-s) [Bu(s) + f(s)] ds. \quad (2.5)$$

Using Assumption 2.1 and the estimates(2.3), (2.4) and (2.5), we get

$$I_{0,t}^{1-\alpha} x(t)|_{t=0} = \sum_{k=1}^m c_k \mathcal{O} \int_0^{t_k} (t_k-s)^{\alpha-1} \mathcal{T}_\alpha(t_k-s) [Bu(s) + f(s)] ds. \quad (2.6)$$

By (2.4) and (2.6), we can write

$$\begin{aligned} x(t) &= \sum_{k=1}^m c_k t^{\alpha-1} \mathcal{T}_\alpha(t) \mathcal{O} \int_0^{t_k} (t_k-s)^{\alpha-1} \mathcal{T}_\alpha(t_k-s) [Bu(s) + f(s)] ds \\ &\quad + \int_0^t (t-s)^{\alpha-1} \mathcal{T}_\alpha(t-s) [Bu(s) + f(s)] ds. \end{aligned} \quad (2.7)$$

For convenience, we introduce the function  $G(t, s)$  as follows:

$$G(t, s) = \sum_{k=1}^m \chi_{t_k} t^{\alpha-1} \mathcal{T}_\alpha(t)(t_k - s)^{\alpha-1} \mathcal{O} \mathcal{T}_\alpha(t_k - s) + \chi_t(s)(t - s)^{\alpha-1} \mathcal{T}_\alpha(t - s), \quad (2.8)$$

with

$$\chi_{t_k}(s) = \begin{cases} c_k, & s \in [0, t_k) \\ 0, & s \in [t_k, b], \end{cases}$$

$$\chi_t(s) = \begin{cases} 1, & s \in [0, t) \\ 0, & s \in [t, b]. \end{cases}$$

Therefore, by (2.7) and (2.8) we know that the solution of fractional inclusion(2.1) can also be expressed as

$$x(t) = \int_0^b G(t, s)[Bu(s) + f(s)]ds. \quad (2.9)$$

Now we may define a mild solution of problem (2.1) as follows:

**Definition 2.4.** For each  $u \in L^2(J, \mathbb{U})$ , a function  $x \in C_{1-\alpha}(J, \mathbb{H})$  is called a mild solution of the control system (1.1) if  $I_t^{1-\alpha} x(t)|_{t=0} = \sum_{k=1}^m c_k x_k$  and there exists  $f \in L^1(J, \mathbb{H})$  such that  $f(t) \in \partial F(t, x(t))$  a.e. on  $t \in J$  and

$$x(t) = \int_0^b G(t, s)[Bu(s) + f(s)]ds. \quad (2.10)$$

**Lemma 2.1.** [18] The operator  $\mathcal{T}_\alpha(t)$  has the following properties:

(1) For any fixed  $t > 0$ ,  $\mathcal{T}_\alpha(t)$  is linear and bounded operator, that is for any  $x \in \mathbb{H}$ ,

$$\|\mathcal{T}_\alpha(t)x\| \leq \frac{M}{\Gamma_\alpha} \|x\|, \quad (2.11)$$

(2)  $\mathcal{T}_\alpha(t)(t \geq 0)$  is strongly continuous.

**Definition 2.5.** Let  $x$  be a mild solution of system (2.1) corresponding to the control  $u \in L^2(J, \mathbb{U})$ . Fractional evolution inclusion(2.1) is said to be approximately controllable on the interval  $J$  if the set  $\overline{\mathcal{R}_f(b)} = \mathbb{H}$ , where the set

$$\mathcal{R}_f(b) = \{x(b) \in \mathbb{H} : u \in L^2(J, \mathbb{U})\},$$

is called the reachable set of (2.1).

### 3. Existence of Mild Solution

In this section we will prove the existence of mild solution of system (2.1) by assuming some sufficient conditions and fixed point theorem. We start this section by defining the following operators

$$\Gamma_0^b = \int_0^b G(b, s)BB^*G^*(b, s)ds, \quad \frac{1}{2} < \alpha \leq 1,$$

and

$$R(a, \Gamma_0^b) = (aI + \Gamma_0^b)^{-1}, \quad a > 0,$$

where  $B^*$ ,  $\mathcal{O}^*$  and  $\mathcal{T}_\alpha^*$  is the adjoint of  $B$ ,  $\mathcal{O}$  and  $\mathcal{T}_\alpha$  respectively, and  $G^*$  is the adjoint of  $G$  defines as:

$$G^*(b, s) = \sum_{k=1}^m \chi_{t_k}(s) t^{\alpha-1} \mathcal{T}_\alpha^*(t) \mathcal{O}^*(t_k - s)^{\alpha-1} \mathcal{T}_\alpha^*(t_k - s) + \chi_t(s) (t - s)^{\alpha-1} \mathcal{T}_\alpha^*(t - s).$$

We consider the linear fractional differential control system:

$$\begin{cases} {}^R D_{0,t}^\alpha x(t) = Ax(t) + Bu(t), & t \in J = [0, b], \quad \frac{1}{2} < \alpha \leq 1, \\ I_{0,t}^{1-\alpha} x(t)|_{t=0} = \sum_{k=1}^m c_k x_k. \end{cases} \quad (3.12)$$

**Lemma 3.1.** [20] *The linear fractional differential system (3.12) is approximately controllable on  $J$  if and only if  $aR(a, \Gamma_0^b) \rightarrow 0$  as  $a \rightarrow 0^+$  in the strong operator topology.*

**Lemma 3.2.** [12] *Let  $\mathbb{X}$  be a Banach space. Let  $F : J \times \mathbb{X} \rightarrow \mathcal{P}_{cp,cv}(\mathbb{X})$  be an  $L^1$ -Caratheodory multivalued map with  $\mathcal{S}_{F(y)} = \{g \in L^1(J, \mathbb{X}) : g(t) \in F(t, y(t)), \text{ for a.e. } t \in J\}$  being nonempty and let  $\Gamma$  be a linear continuous mapping from  $L^1(J, \mathbb{X})$  to  $C(J, \mathbb{X})$ , then the operator*

$$\Gamma \circ \mathcal{S}_F : C(J, \mathbb{X}) \rightarrow \mathcal{P}_{cp,c}(C(J, \mathbb{X})),$$

$$y \rightarrow (\Gamma \circ \mathcal{S}_F)(y) := \Gamma(\mathcal{S}_{F(y)}),$$

is a closed graph operator in  $C(J, \mathbb{X}) \times C(J, \mathbb{X})$ .

**Theorem 3.1.** [6] *Let  $D$  be a bounded, convex, and closed subset in the Banach space  $\mathbb{X}$  and let  $V : D \rightarrow 2^{\mathbb{X}} \setminus \{\emptyset\}$  be a u.s.c. condensing multivalued map. If, for every  $x \in D$ ,  $V(x)$  is a closed and convex set in  $D$ , then  $V$  has a fixed point.*

To prove the existence of mild solution we need the following assumptions:

**Assumption 3.1.** (H1)  $\mathcal{T}_\alpha(t)$  is compact,

(H2) the function  $t \mapsto F(t, x)$  is measurable for all  $x \in \mathbb{H}$ ,

(H3) the function  $x \mapsto F(t, x)$  is locally Lipschitz continuous for a.e.  $t \in J$ ,

(H4) for each fixed  $x \in C_{1-\alpha}(J, \mathbb{H})$  the set

$$S_{\partial F, x} = \{f \in L^1(J, \mathbb{H}) : f(t) \in \partial F(t, x(t))\},$$

is nonempty,

(H5) there exist a function  $P(t) \in L^{\frac{1}{\gamma}}(J, \mathbb{R}^+)$  with  $0 \leq \gamma < \alpha$  and a nondecreasing function  $\psi : \mathbb{R} \rightarrow \mathbb{R}^+$ , such that

$$\|\partial F(t, x)\|_{\mathbb{H}} = \sup\{\|f(t)\|_{\mathbb{H}} : f(t) \in \partial F(t, x)\} \leq P(t)\psi(\|x\|_D),$$

for any  $t \in J$  for all  $x \in \mathbb{H}$  and for each  $r > 0$ , there exists  $0 < \rho < 1$ , such that

$$\liminf_{r \rightarrow \infty} \frac{\psi(r)}{r} \|P\|_{L^2} = \rho < 1.$$

**Theorem 3.2.** *If the assumption 2.1 and all the conditions (H1)-(H5) of assumption 3.1 are satisfied, then the system (2.1) has a mild solution.*

**Proof:** We consider a set

$$B_r = \{x \in C_{1-\alpha}(J, \mathbb{H}) : \|x\| \leq r, r > 0\}.$$

on the space  $C_{1-\alpha}(J, \mathbb{H})$ , We easily know that  $B_r$  is a bounded, closed, and convex set in  $C_{1-\alpha}(J, \mathbb{H})$ . For  $a > 0$ , for all  $x(\cdot) \in C_{1-\alpha}(J, \mathbb{H})$ ,  $x_1 \in \mathbb{H}$ , we take the control function as

$$u(t) = B^*G^*(b, t)R(a, \Gamma_0^b)P(x(\cdot)),$$

where

$$P(x(\cdot)) = x_1 - \int_0^b G(b, s)f(s)ds, \quad f \in S_{\partial F, x}.$$

By this control, we define the operator  $\Phi_a : C_{1-\alpha}(J, \mathbb{H}) \rightarrow \mathcal{P}(C_{1-\alpha}(J, \mathbb{H}))$  as follows:

$$\Phi_a(x) = \{\tau \in C_{1-\alpha}(J, \mathbb{H}) : \tau(t) = \int_0^b G(t, s)[f(s) + Bu(s)]ds, \quad f \in S_{\partial F, x}, t \in (0, b]\}.$$

To prove that the operator  $\Phi_a : C_{1-\alpha}(J, \mathbb{H}) \rightarrow \mathcal{P}(C_{1-\alpha}(J, \mathbb{H}))$  has a fixed point, we subdivided the proof into following steps:

**Step1:**  $\Phi_a$  is convex for each  $x \in C_{1-\alpha}(J, \mathbb{H})$ .

if  $\tau_1, \tau_2 \in \Phi_a(x)$ , then for each  $t \in J$ ,  $f_1, f_2 \in S_{\partial F, x}$  s.t.

$$\tau_i(t) = \int_0^b G(t, s)[f_i(s) + BB^*G^*(b, t)R(a, \Gamma_0^b)\{x_1 - \int_0^b G(b, \mu)f_i(s) d\mu\}]ds.$$

Let  $0 \leq \lambda \leq 1$ , then for each  $t \in J$ , we have

$$\begin{aligned} & \lambda\tau_1(t) + (1 - \lambda)\tau_2(t) \\ &= \int_0^b G(t, s)[\lambda f_1(s) + (1 - \lambda)f_2(s)]ds + \int_0^b G(t, s)BB^*G^*(b, t)R(a, \Gamma_0^b) \left[ x_1 \right. \\ & \quad \left. - \int_0^b G(b, \mu)(\lambda f_1(\mu) + (1 - \lambda)f_2(\mu)) d\mu \right] ds. \end{aligned}$$

Since  $S_{\partial F, x}$  is convex (as  $\partial F$  has convex values),  $\lambda f_1 + (1 - \lambda)f_2 \in S_{\partial F, x}$ , thus  $\lambda\tau_1(t) + (1 - \lambda)\tau_2(t) \in \Phi_a(x)$ .

**Step2:** For each  $a > 0$ , there is a positive constant  $r_0 = r(a)$ , such that  $\Phi_a(B_{r_0}) \subseteq B_{r_0}$ .

If this is not true, there  $\exists a > 0$  such that  $\forall r > 0$  there exists a  $\bar{x}$  such that  $\Phi_a(\bar{x}) \not\subseteq B_r$ , that is

$$\|\Phi_a(\bar{x})\| = \sup\{\|\tau\|_{C_{1-\alpha}(J, \mathbb{H})} : \tau \in \Phi_a(\bar{x}), \|\tau\| > r\}.$$

Since

$$\begin{aligned} \tau(t) &= \int_0^b G(t, s)[f(s) + Bu(s)]ds, \\ \tau(t) &= \int_0^b G(t, s)f(s) ds + \int_0^b G(t, s)BB^*G^*(t, s)R(a, \Gamma_0^b)\{x_1 - \int_0^b G(b, \mu)f(\mu)d\mu\}ds, \end{aligned}$$

for some  $f \in S_{\partial F, \bar{x}}$ .

By using Holder's inequality and (H5), we get

$$\|\tau(t)\| \leq \left\| \int_0^b G(t, s)f(s) ds \right\| + \left\| \int_0^b G(t, s)Bu(s)ds \right\|.$$

Let us consider

$$M_B = \|B\|, \quad \beta = \left( \frac{1-\gamma}{\alpha-\gamma} b^{(\alpha-\gamma)/(1-\gamma)} \right)^{1-\gamma}, \quad \Lambda_0 = \frac{\sum_{k=1}^m c_k}{1 - \frac{M}{\Gamma(\alpha)} \sum_{k=1}^m |c_k t_k^{\alpha-1}|},$$

$$\Lambda_1 = \frac{M}{\Gamma(\alpha)} \beta (b^{\alpha-1} M \Lambda_0 + 1), \quad \Lambda_2 = \left( \Lambda_0 b^{\alpha-1} \frac{M}{\Gamma(\alpha) + 1} \right).$$

$$\begin{aligned} \left\| \int_0^b G(t, s) f(s) ds \right\| &\leq b^{\alpha-1} \frac{M}{\Gamma(\alpha)} \|O\| \int_0^{t_k} \sum_{k=1}^m \chi_{t_k}(s) (t_k - s)^{\alpha-1} \|T_\alpha(t_k - s)\| \|f(s)\| ds \\ &\quad + \int_0^t \sum_{k=1}^m |\chi_t(s)| (t - s)^{\alpha-1} \|T_\alpha(t - s)\| \|f(s)\| ds, \\ &\leq \frac{b^{\alpha-1} M^2}{\Gamma(\alpha)} \Lambda_0 \int_0^{t_k} (t_k - s)^{\alpha-1} P(s) \psi(r) ds \\ &\quad + \frac{M}{\Gamma(\alpha)} \int_0^t (t - s)^{\alpha-1} P(s) \psi(r) ds, \\ &\leq \frac{M}{\Gamma(\alpha)} \psi(r) \|P\|_{L_{\frac{1}{\gamma}}} \left( \frac{1-\gamma}{\alpha-\gamma} b^{\frac{\alpha-\gamma}{1-\gamma}} \right)^{1-\gamma} (b^{\alpha-1} M \Lambda_0 + 1), \\ &= \frac{M}{\Gamma(\alpha)} \psi(r) \|P\|_{L_{\frac{1}{\gamma}}} \beta (b^{\alpha-1} M \Lambda_0 + 1), \\ &= \psi(r) \|P\|_{L_{\frac{1}{\gamma}}} \Lambda_1. \end{aligned}$$

We have the norm of  $G$  as

$$\|G(t, s)\| = \frac{M}{\Gamma(\alpha)} (b - s) \Lambda_2,$$

and of  $u$  as

$$\|u(s)\| = \frac{M_B M}{a \Gamma(\alpha)} \Lambda_2 \left( \|x_1\| + \psi(r) + \|P\|_{L_{\frac{1}{\gamma}}} \Lambda_1 \right),$$

and

$$\begin{aligned} \left\| \int_0^b G(t, s) B u(s) ds \right\| &\leq \frac{M_B^2 M^2 \Lambda_1 \Lambda_2}{a \Gamma(\alpha)^2} \left( \|x_1\| + \psi(r) + \|P\|_{L_{\frac{1}{\gamma}}} \Lambda_1 \right) \int_0^t (t - s)^{2\alpha-2} ds, \\ &\leq \frac{M_B^2 M^2 b^{2\alpha-1} \Lambda_1 \Lambda_2}{a \Gamma(\alpha)^2 (2\alpha - 1)} \left( \|x_1\| + \psi(r) + \|P\|_{L_{\frac{1}{\gamma}}} \Lambda_1 \right). \end{aligned}$$

Now we have,

$$\begin{aligned} t^{1-\alpha} \|\tau(t)\| &= t^{1-\alpha} \left\| \int_0^b G(t, s) [f(s) + B u(s)] ds \right\|, \\ &\leq t^{1-\alpha} \left\| \int_0^b G(t, s) f(s) ds \right\| + t^{1-\alpha} \left\| \int_0^b G(t, s) B u(s) ds \right\|, \\ &\leq b^{1-\alpha} \frac{M}{\Gamma(\alpha)} \psi(r) \|P\|_{L_{\frac{1}{\gamma}}} \beta (b^{\alpha-1} M \Lambda_0 + 1) \end{aligned}$$

$$+ \frac{M_B^2 M^2 b^{2\alpha-1} \Lambda_1 \Lambda_2}{a\Gamma(\alpha)^2(2\alpha-1)} \left( \|x_1 + \|\psi(r)\|P\|_{L^{\frac{1}{\gamma}}} \Lambda_1 \right).$$

Thus,

$$\begin{aligned} r &\leq b^{1-\alpha} \frac{M}{\Gamma(\alpha)} \psi(r)\|P\|_{L^{\frac{1}{\gamma}}} \beta(b^{\alpha-1} M \Lambda_0 + 1) + \frac{M_B^2 M^2 b^\alpha \Lambda_1 \Lambda_2}{a\Gamma(\alpha)^2(2\alpha-1)} \left( \|x_1\| + \psi(r)\|P\|_{L^{\frac{1}{\gamma}}} \Lambda_1 \right), \\ r &\leq \left\{ \frac{M}{\Gamma(\alpha)} \beta(M \Lambda_0 + b^{1-\alpha}) + \frac{M_B^2 M^2 b^\alpha \Lambda_1 \Lambda_2}{a\Gamma(\alpha)^2(2\alpha-1)} \right\} \psi(r)\|P\|_{L^{\frac{1}{\gamma}}} + \frac{M_B^2 M^2 b^\alpha \Lambda_1 \Lambda_2}{a\Gamma(\alpha)^2(2\alpha-1)} \|x_1\|. \end{aligned}$$

Dividing both sides by  $r$  and taking the low limit as  $r \rightarrow \infty$ , we get

$$1 \leq \liminf_{r \rightarrow \infty} \frac{\psi(r)}{r} \|P\|_{L^{\frac{1}{\gamma}}},$$

which is a contradiction to (H6).

**Step3:**  $\Phi_a(x)$  is closed for each  $x \in C_{1-\alpha}(J, \mathbb{H})$ .

For each given  $x \in C_{1-\alpha}(J, \mathbb{H})$ , let  $\{\tau_n\}_{n \geq 0} \subset \Phi_a(x)$  such that  $\tau_n \rightarrow \tau$  in  $C_{1-\alpha}(J, \mathbb{H})$ . Then there exists  $f_n \in S_{\partial F, x}$  such that for all  $t \in J$

$$\tau_n(t) = \int_0^b G(t, s)[f_n(s) + Bu_n(s)]ds,$$

$$\text{where } u_n(t) = B^*G^*(b, t)R(a, \Gamma_0^b) \left\{ x_1 - \int_0^b G(b, \mu) f_n(\mu) d\mu \right\}.$$

From [23], Propositions 3.1,  $S_{\partial F, x}$  is weakly compact in  $L^1(J, \mathbb{H})$  which implies that  $f_n$  converges weakly to some  $f \in S_{\partial F, x}$  in  $L^1(J, \mathbb{H})$ . Thus,  $u_n \rightarrow u$  and

$$u_n(t) = B^*G^*(b, t)R(a, \Gamma_0^b) \left\{ x_1 - \int_0^b G(b, \mu) f_n(\mu) d\mu \right\}.$$

Then for each  $t \in J$ ,  $\tau_n \rightarrow \tau(t)$

$$\tau(t) = \int_0^b G(t, s) f(s) ds + \int_0^b G(t, s) B B^* G^*(t, s) R(a, \Gamma_0^b) \left\{ x_1 - \int_0^b G(b, \mu) f(\mu) d\mu \right\} ds.$$

Thus we showed the closedness of  $\Phi_a(x) \forall x \in C_{1-\alpha}(J, \mathbb{H})$ .

**Step4:**  $\Phi_a$  is upper semicontinuous and condensing.

We have

$$\Phi_a(x) = \left\{ \tau \in C_{1-\alpha}(J, \mathbb{H}) : \tau(t) = \int_0^b G(t, s)[f(s) + Bu(s)]ds, \quad f \in S_{\partial F, x}, t \in (0, b] \right\}.$$

Now we prove  $\Phi_a(x)$  is upper semicontinuous and completely continuous. We subdivide the proof into several claims.

**Claim 1:** There exists a  $r > 0$  such that  $\Phi_a(B_r) \subseteq B_r$ .

By utilizing the method employed in step 2, it becomes straightforward to demonstrate the existence of  $r > 0$  such that  $\Phi_a(B_r) \subseteq B_r$ .

**Claim 2:**  $\Phi_a(B_r)$  is a family of equicontinuous function

Let  $0 \leq s \leq t_1 \leq t_2 \leq b$ . For each  $x \in B_r$ ,  $\phi \in \Phi_a(x)$ ,  $\exists f \in S_{\partial F, x}$  such that

$$\tau(t) = \int_0^b G(t, s)[f(s) + Bu(s)]ds,$$

then we have

$$\begin{aligned}
\tau_2 - \tau_1 &= \int_0^b [G(t_2, s) - G(t_1, s)][f(s) + Bu(s)]ds, \\
&= \int_0^b \left[ \sum_{k=1}^m \chi_{t_k} t_2^{\alpha-1} T_\alpha(t_2) O(t_k - s)^{\alpha-1} T_\alpha(t_k - s) \right. \\
&\quad \left. + \chi_{t_2}(s)(t_2 - s)^{\alpha-1} T_\alpha(t_2 - s) \right] [f(s) + Bu(s)]ds \\
&\quad - \int_0^b \left[ \sum_{k=1}^m \chi_{t_k} t_1^{\alpha-1} T_\alpha(t_1) O(t_k - s)^{\alpha-1} T_\alpha(t_k - s) \right. \\
&\quad \left. + \chi_{t_1}(s)(t_1 - s)^{\alpha-1} T_\alpha(t_1 - s) \right] [f(s) + Bu(s)]ds.
\end{aligned}$$

Now,

$$\begin{aligned}
&\|\tau_2 - \tau_1\| \\
&\leq \left\| \left[ t_2^{\alpha-1} T_\alpha(t_2) - t_1^{\alpha-1} T_\alpha(t_1) \right] \int_0^b \sum_{k=1}^m \chi_{t_k}(s) O(t_k - s)^{\alpha-1} T_\alpha(t_k - s) [f(s) + Bu(s)] ds \right\| \\
&\quad + \left\| \int_0^b \chi_{t_1}(s) [(t_2 - s)^{\alpha-1} T_\alpha(t_2 - s) - (t_1 - s)^{\alpha-1} T_\alpha(t_1 - s)] [f(s) + Bu(s)] ds \right\| \\
&\quad + \left\| \int_0^b [\chi_{t_2} - \chi_{t_1}(s)] (t_2 - s)^{\alpha-1} T_\alpha(t_2 - s) [f(s) + Bu(s)] ds \right\|, \\
&\leq \left\| \left[ t_2^{\alpha-1} T_\alpha(t_2) - t_1^{\alpha-1} T_\alpha(t_1) \right] \int_0^b \sum_{k=1}^m \chi_{t_k} O(t_k - s)^{\alpha-1} T_\alpha(t_k - s) [f(s) + Bu(s)] ds \right\| \\
&\quad + \int_0^{t_1} \left\| [(t_2 - s)^{\alpha-1} T_\alpha(t_2 - s) - (t_1 - s)^{\alpha-1} T_\alpha(t_1 - s)] [f(s) + Bu(s)] ds \right\| \\
&\quad + \int_{t_1}^{t_2} \left\| (t_2 - s)^{\alpha-1} T_\alpha(t_2 - s) [f(s) + Bu(s)] ds \right\|, \\
&= \int_0^b \left\| \left[ t_2^{\alpha-1} \{T_\alpha(t_2) - T_\alpha(t_1)\} + (t_2^{\alpha-1} - t_1^{\alpha-1} T_\alpha(t_1)) \right] \right. \\
&\quad \left. \sum_{k=1}^m \chi_{t_k} O(t_k - s)^{\alpha-1} T_\alpha(t_k - s) [f(s) + Bu(s)] ds \right\| \\
&\quad + \int_0^{t_1} \left\| \left[ (t_2 - s)^{\alpha-1} \{T_\alpha(t_2 - s) - T_\alpha(t_1 - s)\} + \{(t_2 - s)^{\alpha-1} - (t_1 - s)^{\alpha-1}\} T_\alpha(t_1 - s) \right] \right. \\
&\quad \left. [f(s) + Bu(s)] ds \right\| + \int_{t_1}^{t_2} \left\| (t_2 - s)^{\alpha-1} T_\alpha(t_2 - s) [f(s) + Bu(s)] ds \right\|, \\
&\leq \Lambda_0 \max_{t_1, t_2 \in [0, b]} \{T_\alpha(t_2) - T_\alpha(t_1)\} b^{\alpha-1} \frac{M}{\Gamma_\alpha} \left[ \int_0^{t_k} (t_k - s)^{\alpha-1} \|BB\| \|u(s)\| ds \right]
\end{aligned}$$

$$\begin{aligned}
& + \int_0^{t_k} (t_k - s)^{\alpha-1} \|f(s)\| ds \Big] \\
& + \max_{s \in [0, t_1]} \|T_\alpha(t_2 - s) - T_\alpha(t_1 - s)\| \int_0^{t_1} (t_2 - s)^{\alpha-1} \|[f(s) + Bu(s)]\| ds \\
& + \frac{M}{\Gamma_\alpha} \int_0^{t_1} \{(t_2 - s)^{\alpha-1} - (t_1 - s)^{\alpha-1}\} \|[f(s) + Bu(s)]\| ds \\
& + \frac{M}{\Gamma_\alpha} \int_{t_1}^{t_2} (t_2 - s)^{\alpha-1} \|[f(s) + Bu(s)]\| ds, \\
& \leq \Lambda_0 \max_{t_1, t_2 \in [0, b]} \{T_\alpha(t_2) - T_\alpha(t_1)\} b^{\alpha-1} \frac{MM_B}{\Gamma_\alpha} \int_0^{t_k} (t_k - s)^{\alpha-1} \|u(s)\| ds \\
& + \Lambda_0 \max_{t_1, t_2 \in [0, b]} \{T_\alpha(t_2) - T_\alpha(t_1)\} b^{\alpha-1} \frac{MM_B}{\Gamma_\alpha} \int_0^{t_k} (t_k - s)^{\alpha-1} \|f(s)\| ds \\
& + M_B \max_{s \in [0, t_1]} \|T_\alpha(t_2 - s) - T_\alpha(t_1 - s)\| \int_0^{t_1} (t_2 - s)^{\alpha-1} \|u(s)\| ds \\
& + \max_{s \in [0, t_1]} \|T_\alpha(t_2 - s) - T_\alpha(t_1 - s)\| \int_0^{t_1} (t_2 - s)^{\alpha-1} \|f(s)\| ds \\
& + \frac{MM_B}{\Gamma_\alpha} \int_0^{t_1} \{(t_2 - s)^{\alpha-1} - (t_1 - s)^{\alpha-1}\} \|u(s)\| ds \\
& + \frac{M}{\Gamma_\alpha} \int_0^{t_1} \{(t_2 - s)^{\alpha-1} - (t_1 - s)^{\alpha-1}\} \|f(s)\| ds \\
& + \frac{MM_B}{\Gamma_\alpha} \int_{t_1}^{t_2} (t_2 - s)^{\alpha-1} \|u(s)\| ds + \frac{M}{\Gamma_\alpha} \int_{t_1}^{t_2} (t_2 - s)^{\alpha-1} \|f(s)\| ds,
\end{aligned}$$

$$\leq I_1 + I_2 + I_3 + I_4 + I_5 + I_6 + I_7 + I_8, \quad (3.13)$$

where

$$\begin{aligned}
I_1 & := \Lambda_0 \max_{t_1, t_2 \in [0, b]} \{T_\alpha(t_2) - T_\alpha(t_1)\} b^{\alpha-1} \frac{MM_B}{\Gamma_\alpha} \int_0^{t_k} (t_k - s)^{\alpha-1} \|u(s)\| ds, \\
I_2 & := \Lambda_0 \max_{t_1, t_2 \in [0, b]} \{T_\alpha(t_2) - T_\alpha(t_1)\} b^{\alpha-1} \frac{M}{\Gamma_\alpha} \|P\|_{\frac{1}{\gamma}} \psi(r) \frac{1-\gamma}{\alpha-\gamma} t_k^{\frac{\alpha-\gamma}{1-\gamma}}, \\
I_3 & := M_B \max_{s \in [0, t_1]} \|T_\alpha(t_2 - s) - T_\alpha(t_1 - s)\| \int_0^{t_1} (t_2 - s)^{\alpha-1} \|u(s)\| ds, \\
I_4 & := M_B \max_{s \in [0, t_1]} \|T_\alpha(t_2 - s) - T_\alpha(t_1 - s)\| \|P\|_{\frac{1}{\gamma}} \psi(r) \left[ \left( \frac{1-\gamma}{\alpha-\gamma} \right) \left\{ t_2 \frac{\alpha-\gamma}{1-\gamma} - t_2 - t_1^{\frac{\alpha-\gamma}{1-\gamma}} \right\} \right], \\
I_5 & := \frac{M}{\Gamma_\alpha} \|P\|_{\frac{1}{\gamma}} \psi(r) \left( \frac{1-\gamma}{\alpha-\gamma} \right) \left[ -(t_2 - t_1)^{\frac{\alpha-\gamma}{1-\gamma}} + t_2^{\frac{\alpha-\gamma}{1-\gamma}} - t_1^{\frac{\alpha-\gamma}{1-\gamma}} \right], \\
I_6 & := \frac{MM_B}{\Gamma_\alpha} \int_{t_1}^{t_2} (t_2 - s)^{\alpha-1} \|u(s)\| ds,
\end{aligned}$$

$$I_7 := \frac{M}{\Gamma_\alpha} \|P\|_{\frac{1}{\gamma}} \psi(r) \left( \frac{1-\gamma}{\alpha-\gamma} \right) (t_2 - t_1)^{\frac{\alpha-\gamma}{1-\gamma}},$$

$$I_8 := \frac{MM_B}{\Gamma_\alpha} \int_{t_1}^{t_2} (t_2 - s)^{\alpha-1} \|u(s)\| ds.$$

From lemma 2.1  $T_\alpha(t)$  is continuous in the uniform operator topology for  $t > 0$ . From this property of  $T_\alpha$  we directly obtain  $I_1, I_2, I_3, I_4$  tends to 0 independently of  $x \in B_r$  as  $t_2 \rightarrow t_1$ .  $I_5$  also tends to 0 independently of  $x \in B_r$  as  $t_2 \rightarrow t_1$ . Using the absolute continuity of Lebesgue integral, we have  $I_6, I_7, I_8$  tending to 0 independently of  $x \in B_r$  as  $t_2 \rightarrow t_1$ .

Therefore,  $\Phi_a(B_r) \subset C_{1-\alpha}(J, \mathbb{H})$  is a family of equicontinuous function.

**Claim 3:** The set  $\Pi(t) = \{\tau(t) : \tau \in \Phi_a(B_r)\} \subset \mathbb{H}$  is relatively compact for each  $t \in J$ .

Let  $0 < t \leq b$  be fixed. For  $x \in B_r$  and  $\tau \in \Phi_a(x)$ ,  $f \in S_{\partial F, x}$  such that for each  $t \in J$ ,

$$\begin{aligned} \tau(t) &= \sum_{k=1}^m \int_0^{t_k} c_k t^{\alpha-1} T_\alpha(t) O(t_k - s)^{\alpha-1} T_\alpha(t_k - s) [f(s) + Bu(s)] ds \\ &\quad + \int_0^t (t-s)^{\alpha-1} T_\alpha(t-s) [f(s) + Bu(s)] ds, \end{aligned}$$

where

$$\begin{aligned} u(t) &= B^* \left( \sum_{k=1}^m \chi_{t_k}(s) t^{\alpha-1} T_\alpha^*(t) o^*(t_k - s)^{\alpha-1} T_\alpha^*(t_k - s) + \chi_t(s) (t-s)^{\alpha-1} T_\alpha^*(t-s) \right) R(a, \Gamma_0^b) \\ &\quad \left( x_1 - \sum_{k=1}^m \int_0^{t_k} c_k t^{\alpha-1} T_\alpha(b) o(t_k - s)^{\alpha-1} T_\alpha^*(t_k - s) f(s) ds \right. \\ &\quad \left. - \int_0^b (b-s)^{\alpha-1} T_\alpha(b-s) f(s) ds \right). \end{aligned}$$

For all  $\epsilon \in (0, t)$  and for all  $\delta > 0$ , define

$$\begin{aligned} &\tau^{\epsilon, \delta}(t) \\ &= \alpha t^{\alpha-1} \mathcal{T}_\alpha(t) \mathcal{T}(\epsilon^\alpha \delta) \sum_{k=1}^m c_k o \int_0^{t_k - \epsilon} \int_\delta^\infty \theta (t_k - s)^{\alpha-1} \xi_\alpha(\theta) \mathcal{T}((t_k - s)^\alpha \theta - \epsilon^\alpha \delta) f(s) d\theta ds \\ &\quad + \alpha t^{\alpha-1} \mathcal{T}(t) \mathcal{T}(\epsilon^\alpha \delta) \sum_{k=1}^m c_k o \int_0^{t_k - \epsilon} \int_\delta^\infty \theta (t_k - s)^{\alpha-1} \xi_\alpha(\theta) \mathcal{T}((t_k - s)^\alpha \theta - \epsilon^\alpha \delta) BB^* u(t) d\theta ds \\ &\quad + \alpha \mathcal{T}(\epsilon^\alpha \delta) \int_0^{t-\epsilon} \int_\delta^\infty \theta (t-s)^{\alpha-1} \xi_\alpha(\theta) \mathcal{T}((t-s)^\alpha \theta - \epsilon^\alpha \delta) f(s) d\theta ds \\ &\quad + \alpha \mathcal{T}(\epsilon^\alpha \delta) \int_0^{t-\epsilon} \int_\delta^\infty \theta (t-s)^{\alpha-1} \xi_\alpha(\theta) \mathcal{T}((t-s)^\alpha \theta - \epsilon^\alpha \delta) BB^* u(t) d\theta ds. \end{aligned}$$

By the compactness of  $\mathcal{T}(\epsilon^\alpha \delta) (\epsilon^\alpha \delta > 0)$ , we obtain the set  $\Pi^{\epsilon, \delta}(t) = \{\phi^{\epsilon, \delta}(t); \tau \in \Phi_a(B_r)\}$  which is relatively compact in  $\mathbb{H} \forall \epsilon \in (0, t)$  and  $\delta > 0$ , moreover we have

$$\begin{aligned} &\|\tau(t) - \tau^{\epsilon, \delta}(t)\| \\ &\leq \left\| \alpha \mathcal{T}_\alpha(t) t^{\alpha-1} \sum_{k=1}^m \int_0^{t_k} \int_0^\infty c_k o (t_k - s)^{\alpha-1} \mathcal{T}((t_k - s)^\alpha \theta) \xi_\alpha(\theta) \theta [f(s) + Bu(s)] d\theta ds \right. \end{aligned}$$

$$\begin{aligned}
& + \alpha \int_0^t \int_0^\infty \theta(t-s)^{\alpha-1} \xi_\alpha(\theta) \mathcal{T}((t-s)^\alpha \theta) [f(s) + Bu(s)] d\theta ds \\
& + \alpha \mathcal{T}_\alpha(t) t^{\alpha-1} \mathcal{T}(\epsilon^\alpha \delta) \sum_{k=1}^m \int_0^{t_k - \epsilon} \int_\delta^\infty c_k o(t_k - s)^{\alpha-1} \mathcal{T}((t_k - s)^\alpha \theta - \epsilon^\alpha \delta) \xi_\alpha(\theta) \theta \\
& \quad [f(s) + Bu(s)] d\theta ds \\
& + \alpha \mathcal{T}(\epsilon^\alpha \delta) \int_0^{t-\epsilon} \int_\delta^\infty \theta(t-s)^{\alpha-1} \xi_\alpha(\theta) \mathcal{T}((t-s)^\alpha \theta - \epsilon^\alpha \delta) [f(s) + Bu(s)] d\theta ds \Big\|, \\
& = \left\| \alpha \mathcal{T}_\alpha(t) t^{\alpha-1} \left[ \sum_{k=1}^m \int_0^{t_k} \int_0^\infty c_k o(t_k - s)^{\alpha-1} \mathcal{T}((t_k - s)^\alpha \theta) \xi_\alpha(\theta) \theta [f(s) + Bu(s)] d\theta ds \right. \right. \\
& \quad \left. \left. - \sum_{k=1}^m \int_0^{t_k - \epsilon} \int_\delta^\infty c_k o(t_k - s)^{\alpha-1} \mathcal{T}((t_k - s)^\alpha \theta) \xi_\alpha(\theta) \theta [f(s) + Bu(s)] d\theta ds \right] \right. \\
& \quad \left. + \alpha \left[ \int_0^t \int_0^\infty \theta(t-s)^{\alpha-1} \xi_\alpha(\theta) \mathcal{T}((t-s)^\alpha \theta) [f(s) + Bu(s)] d\theta ds \right. \right. \\
& \quad \left. \left. - \int_0^{t-\epsilon} \int_\delta^\infty \theta(t-s)^{\alpha-1} \xi_\alpha(\theta) \mathcal{T}((t-s)^\alpha \theta) [f(s) + Bu(s)] d\theta ds \right] \right\|, \\
& \leq \left\| \alpha \mathcal{T}_\alpha t^{\alpha-1} \left[ \sum_{k=1}^m \int_{t_k - \epsilon}^{t_k} \int_0^\delta c_k o \theta (t_k - s)^{\alpha-1} \mathcal{T}((t_k - s)^{\alpha-1} \theta) \xi_\alpha(\theta) \{f(s) + Bu(s)\} d\theta ds \right] \right\| \\
& \quad + \left\| \alpha \left[ \int_{t-\epsilon}^t \int_0^\delta \theta(t-s)^{\alpha-1} \xi_\alpha(\theta) \mathcal{T}((t-s)^\alpha \theta) \{Bu(s) + f(s)\} d\theta ds \right] \right\|, \\
& \leq \alpha \frac{M^2}{\Gamma_\alpha} b^{\alpha-1} \Lambda_0 M_B \int_{t_k - \epsilon}^{t_k} (t_k - s)^{\alpha-1} \|u(s)\| ds \int_0^\delta \theta \xi_\alpha(\theta) d\theta \\
& \quad + \alpha \frac{M^2}{\Gamma_\alpha} b^{\alpha-1} \Lambda_0 \|P\|_{\frac{1}{\gamma}} \psi(r) \int_{t_k - \epsilon}^{t_k} (t_k - s)^{\alpha-1} ds \int_0^\delta \xi_\alpha d\theta \\
& \quad + \alpha M \|P\|_{\frac{1}{\gamma}} \psi(r) \int_{t-\epsilon}^t (t-s)^{\alpha-1} ds \int_0^\delta \theta \xi_\alpha(\theta) d\theta \\
& \quad + \alpha M M_B \int_{t-\epsilon}^t (t-s)^{\alpha-1} \|u(s)\| ds \int_0^\delta \theta \xi_\alpha(\theta) d\theta.
\end{aligned}$$

In the above inequality, as  $\epsilon$  approaches zero, the right-hand side of the inequality approaches zero as well. This implies that there exist relatively compact sets that are arbitrarily close to the set  $\Pi(t)$  for  $t > 0$ . Consequently, the set  $\Pi(t)$ ,  $t > 0$  is also relatively compact in  $\mathbb{H}$ . Combining Claims 1–3 with the Arzola-Ascoli theorem, we can deduce that  $\Phi_a$  is a completely continuous function.

**Claim 4:**  $\Phi_a$  has a closed graph.

Let  $x_n \rightarrow x^*$  ( $n \rightarrow \infty$ ),  $\tau_n \in \Phi_a(x_n)$ ,  $\tau_n \rightarrow \tau^*$  ( $n \rightarrow \infty$ ). Our aim is to prove  $\tau^* \in \Phi_a(x^*)$ . Since  $\tau_n \in \Phi_a(x_n)$ ,  $\exists f_n \in S_{\partial F, x_n}$  such that for each  $t \in J$  we have

$$\tau_n(t) = \int_0^b G(t, s) f_n(s) ds + \int_0^b G(t, s) B B^* G^*(t, s) R(a, \Gamma_0^b) \left\{ x_1 - \int_0^b G(b, \mu) f_n(\mu) d\mu \right\} ds,$$

$$\begin{aligned}
&= \sum_{k=1}^m c_k \int_0^{t_k} t^{\alpha-1} \mathcal{T}_\alpha(t) \mathcal{O}(t_k - s)^{\alpha-1} \mathcal{T}_\alpha(t_k - s) f_n(s) ds + \int_0^t (t - s)^{\alpha-1} \mathcal{T}_\alpha(t - s) f_n(s) ds \\
&\quad + \int_0^b G(t, s) \text{BB}^* G^*(t, s) \text{R}(a, \Gamma_0^b) \left\{ x_1 - \int_0^b G(b, s) f_n(\mu) d\mu \right\} ds.
\end{aligned}$$

we must prove that  $\exists f^*(s) \in S_{\partial F, x^*}$ , such that  $\forall t \in J$ ,

$$\tau^*(t) = \int_0^b G(t, s) f^*(s) ds + \int_0^b G(t, s) \text{BB}^* G^*(t, s) \text{R}(a, \Gamma_0^b) \left\{ x_1 - \int_0^b G(b, s) f^*(\mu) d\mu \right\} ds.$$

Since  $\tau_n \rightarrow \tau^*(n \rightarrow \infty)$ , we can obtain

$$\begin{aligned}
&\| \int_0^b G(t, s) f_n(s) ds + \int_0^b G(t, s) \text{BB}^* G^*(t, s) \text{R}(a, \Gamma_0^b) \left\{ x_1 - \int_0^b G(b, s) f_n(\mu) d\mu \right\} ds \\
&\quad - \int_0^b G(t, s) f^*(s) ds + \int_0^b G(t, s) \text{BB}^* G^*(t, s) \text{R}(a, \Gamma_0^b) \left\{ x_1 - \int_0^b G(b, s) f^*(\mu) d\mu \right\} ds \| \rightarrow 0 \text{ as } n \rightarrow \infty.
\end{aligned}$$

Consider the linear continuous operator  $\Gamma : L^{\frac{1}{\gamma}}(J, \mathbb{H}) \rightarrow C_{1-\alpha}(J, \mathbb{H})$

$$(\Gamma f)(t) = \int_0^b G(t, s) f(s) ds - \int_0^b G(t, s) \text{BB}^* G^*(t, s) \text{R}(a, \Gamma_0^b) \left( \int_0^b G(t, \mu) f(\mu) d\mu \right) ds.$$

Clearly it follows from lemma3.2 that  $\Gamma \circ S_{\partial F}$  is a closed graph operator. Moreover, we have

$$\tau_n(t) - \int_0^b G(t, s) \text{BB}^* G^*(t, s) \text{R}(a, \Gamma_0^b) x_1 ds \in \Gamma(S_{\partial f, x_n}).$$

Since  $x_n \rightarrow x_*$ , it follows from lemma3.2 that

$$\tau_*(t) - \int_0^b G(t, s) \text{BB}^* G^*(t, s) \text{R}(a, \Gamma_0^b) x_1 ds \in \Gamma(S_{\partial f, x_*}).$$

Therefore  $\Phi_a$  has a closed graph from lemma3.2. Since  $\Phi_a$  is completely continuous multi-valued map with compact value, we have that  $\Phi_a$  is upper semi continuous.

Thus  $\Phi_a$  is upper semicontinuous and condensing. Therefore by theorem3.1, we conclude that  $\Phi_a$  has a fixed point  $x(\cdot)$  on  $B_{r_0}$ . Thus, the fractional control system(1.1) has a mild solution.

#### 4. Approximate Controllability Results

In this section we obtain sufficient conditions of approximate controllability of the system (2.1). Motivation is from the case of linear system. Here we additionally assume

**Assumption 4.1.** (H5') *There exists a positive constant  $L$  such that  $\|\partial F(t, x(t))\| \leq L$  for all  $(t, x) \in J \times \mathbb{H}$ .*

**Theorem 4.1.** *Assume that assumptions (H1)-(H5) and (H5') are satisfied and the linear system (3.12) is approximately controllable on  $J$ . Then system (2.1) is approximately controllable on  $J$ .*

Proof: Let  $x^a$  be a fixed point of  $\Phi_a$  in  $B_{r_0}$ , this means that  $\exists f^a \in S_{\partial F, x^a}$  such that  $\forall t \in J$ ,

$$x^a(t) = \int_0^b G(t, s)[f^a(s) + \text{BB}^*G^*(t, s)\text{R}(a, \Gamma_0^b)\{x_1 - \int_0^b G(b, \mu)f^a(\mu)d\mu\}]ds.$$

Now we define a function

$$P(f^a) = x_1 - \int_0^b G(b, s)f^a(s)ds, \quad \text{for some } f^a \in S_{\partial F, x^a}.$$

Note that  $I - \Gamma_0^b\text{R}(a, \Gamma_0^b) = a\text{R}(a, \Gamma_0^b)$ , we get

$$x^a(b) = X_1 - a\text{R}(a, \Gamma_0^b)P(f^a).$$

By assumption (H5'),

$$\int_0^b \|f^a(s)\|^2 ds \leq L^2 b.$$

This implies that the sequence  $\{f^a\}$ , that converges weakly to say,  $f$  in  $L^{\frac{1}{\gamma}}(J, \mathbb{H})$ . Let us denote

$$h = x_1 - \int_0^b G(b, s)f(s)ds,$$

we see that

$$\begin{aligned} \|P(f^a) - h\| &= \left\| x_1 - \int_0^b G(b, s)f^a(s)ds - x_1 + \int_0^b G(b, s)f(s)ds \right\|, \\ &\leq \sup_{t \in J} \left\| \int_0^b G(b, s)[f^a(s) - f(s)]ds \right\|. \end{aligned} \quad (4.14)$$

By (H6') and Ascoli- Arzela theorem we can show that the linear operator  $g \rightarrow \int_0^b G(\cdot, s)g(s)ds : L^{\frac{1}{\gamma}}(J, \mathbb{H}) \rightarrow C_{1-\alpha}(J, \mathbb{H})$  is compact, consequently the right hand side of (4.14) tends to zero as  $a \rightarrow 0^+$ . Now

$$\begin{aligned} \|x^a(b) - x_1\| &= \|a\text{R}(a, \Gamma_0^b)P(f^a)\|, \\ &\leq \|a\text{R}(a, \Gamma_0^b)(h)\| + \|a\text{R}(a, \Gamma_0^b)(P(f^a) - h)\|, \\ &\leq \|a\text{R}(a, \Gamma_0^b)(h)\| + \|(P(f^a) - h)\| \rightarrow 0, \end{aligned}$$

as  $a \rightarrow 0^+$ . This proves the approximate controllability of system (1.1).

## 5. Application

In this section, we provide a examples to validate the results obtained in the previous sections.

**Example 5.1.** *Let us consider the following heat conduction system:*

$$\left\{ \begin{array}{l} {}^R D_{0,t}^{\frac{3}{4}} x(t, y) - \frac{\partial^2}{\partial y^2} x(t, y) = b(y)u(t) + Q(t, y), \quad 0 < y < \pi, \quad t \in J = [0, b], \\ x(t, 0) = x(t, \pi) = 0, \quad t \in J, \\ I_{0,t_0^+}^{1-\alpha} x(t)|_{t=0} = \sum_{k=1}^m c_k x(t_k, y), \quad y \in [0, \pi]. \end{array} \right. \quad (5.1)$$

where  $x(t, y)$  represents the temperature at point  $y \in [0, \pi]$  and time  $t \in J$ .  ${}^R D_{0,t}^{\frac{3}{4}}$  is the R-L fractional derivative of order  $\frac{3}{4}$ ,  $J = [0, b]$ . It is supposed that  $Q = \bar{Q} + \bar{\bar{Q}}$ , where  $\bar{\bar{Q}}$  is a continuous function and  $\bar{Q}$  is a known function of the temperature of the form

$$-\bar{Q} \in \partial F(t, x(t, y)) \quad (t, y) \in J \times (0, \pi),$$

with a measurable function  $F$  provided  $F(t, \cdot)$  is locally Lipschitz on  $\mathbb{R}$ , so its generalized gradient  $\partial F$  is well defined. For  $k = 1, 2, \dots, m$  all  $c_k \in \mathbb{R}$  and satisfy 2.1.

Let us take  $\mathbb{H} = L^2([0, \pi]; \mathbb{R})$ , and the family of operators  $A$  as

$$Ax = \frac{\partial^2}{\partial y^2} x(t, y),$$

with the domain  $D(A) = \{x \in \mathbb{H}; x, x' \text{ are absolutely continuous, } x'' \in \mathbb{H}, x(0) = x(\pi) = 0\}$ .

Then

$$Ax = - \sum_{n=1}^{\infty} n^2 \langle x, e_n \rangle e_n, \quad x \in D(A),$$

where

$$e_n(y) = \sqrt{\frac{2}{\pi}} \sin ny, \quad y \in [0, \pi], \quad n = 1, 2, \dots,$$

is orthogonal set of eigenvectors of  $A$ . It is well known that the operator  $A$  generates a strongly continuous semigroup  $\mathcal{T}(t) (t \geq 0)$  on  $\mathbb{H}$ , which are compact and is given by

$$\mathcal{T}(t)x = \sum_{n=1}^{\infty} e^{-n^2 t} \langle x, e_n \rangle e_n, \quad x \in \mathbb{H}$$

and

$$\begin{aligned} \mathcal{T}_{\frac{3}{4}}(t) &= \frac{3}{4} \int_0^\infty \theta \xi_{\frac{3}{4}}(\theta) \mathcal{T}(t^{\frac{3}{4}} \theta) d\theta, \\ \mathcal{T}_{\frac{3}{4}}(t) &= \frac{3}{4} \sum_{n=1}^{\infty} \int_0^\infty \theta \xi_{\frac{3}{4}}(\theta) \exp(-n^2 t^{\frac{3}{4}} \theta) d\theta \langle x, e_n \rangle. \end{aligned}$$

$\mathcal{T}_{\frac{3}{4}}$  and  $F(t, y)$  satisfy (H2)-(H5).

Let  $B \in L(\mathbb{R}, \mathbb{H})$  be defined as,

$$(Bu)(y) = b(y)u, \quad B^*v = \sum_{n=1}^{\infty} \langle b, e_n \rangle \langle v, e_n \rangle,$$

where  $y \in [0, \pi]$ ,  $u \in \mathbb{R}$  and  $b(y) \in L_2[0, \pi]$ .

In order to show that associated linear system is approximate controllable on  $[0, b]$ , we need to show that  $(b-s)^{\alpha-1}B^*\mathcal{T}_\alpha(b-s)x=0 \implies x=0$ . We observe that for  $\frac{1}{2} < \mu \leq 1$

$$\begin{aligned} (b-s)^{\mu-1}B^*\mathcal{T}_\alpha(b-s)x &= (b-s)^{\mu-1} \sum_{n=1}^{\infty} \langle b, e_n \rangle \frac{3}{4} \int_0^\infty \theta \xi_{\frac{3}{4}}(\theta) \exp(-n^2 t^{\frac{3}{4}} \theta) d\theta \langle x, e_n \rangle, \quad (5.2) \\ &= (b-s)^{\mu-1} \frac{3}{4} \sum_{n=1}^{\infty} \int_0^\infty \theta \xi_{\frac{3}{4}}(\theta) \exp(-n^2 t^{\frac{3}{4}} \theta) d\theta \langle b, e_n \rangle \langle x, e_n \rangle = 0. \end{aligned} \quad (5.3)$$

This gives  $\langle x, e_n \rangle = 0 \implies x = 0$  provided that  $\langle b, e_n \rangle = \int_0^\pi b(\theta) e_n \theta d\theta \neq 0$  for  $n = 1, 2, \dots$

Therefore, the associated linear system is approximate controllable provided that  $\int_0^\pi b(\theta) e_n(\theta) d\theta \neq 0$  for  $n = 1, 2, 3, \dots$ . Because of the compactness of the semigroup  $\mathcal{T}$  generated by  $A$ , the associated linear system is not exactly controllable but it is approximate controllable. Hence from theorem 3.2 there exists a mild solution of problem (5.1) and by theorem 4.1 the given system (5.1) is approximate controllable.

## 6. Conclusion

This paper explores the existence of mild solutions and approximate controllability for Riemann-Liouville fractional differential Hemivariational inequalities within a separable Hilbert space. Employing nonsmooth analysis and multivalued theory, we utilize fixed-point techniques and ideas from semigroup theory to derive our results. Additionally, we provide an illustrative example to demonstrate the efficacy of our findings. Our future aims include delving into the existence and controllability of Hemivariational Inequality problems within separable reflexive Banach spaces, while also addressing the impulse effect within this framework.
