# Generalized Fiber Contraction Mapping Principle

Alexandro Luna and Weiran Yang

#### Abstract

We prove a generalized non-stationary version of the fiber contraction mapping theorem. It was originally used in [\[HP\]](#page-8-0) to prove that the stable foliation of a  $C^2$  Anosov diffeomorphism of a surface is  $C^1$ . Our generalized principle is used in [\[L2\]](#page-8-1), where an analogous regularity result for stable foliations of non-stationary systems is proved. The result is stated in a general setting so that it may be used in future dynamical results in the random and nonstationary settings, especially for graph transform arguments.

### Introduction

The contraction mapping principle is a classical result in mathematical analysis that has an numerous applications in the theory of iterated function systems, Newton's method, the Inverse and Implicit Function Theorems, ordinary and partial differential equations, and more (see [\[BS\]](#page-8-2), and references therein, for a survey of applications). Many versions of this principle and converses have been studied and examined in different spaces. A detailed historical note of this theorem can be found in [\[JJT\]](#page-8-3).

This principle is frequently used in various areas of dynamical systems, especially in smooth dynamics. Since the early 1970s, it has been used in graph transform arguments to prove various existence and regularity results of stable foliations of hyperbolic systems [\[HP,](#page-8-0) [HPS\]](#page-8-4).

Recently, hyperbolic dynamics have been used in studying the so-called trace maps [\[C,](#page-8-5) [Ca,](#page-8-6) [DG1\]](#page-8-7). Understanding the dynamical behavior of these maps is a useful tool in deriving spectral properties of discrete Schrödinger operators with Sturmian potential [\[BIST,](#page-8-8) [D,](#page-8-9) [DEGT,](#page-8-10) [DG2,](#page-8-11) [DGY,](#page-8-12) [GJK,](#page-8-13) [L1,](#page-8-14) M. One promising approach to advance these results is to further develop the theory in the non-stationary case.

In the random and non-stationary settings, existence and smoothness of stable manifolds is well understood (see for example Chapter 7 of  $[Ar]$ ). In the non-stationary or non-autonomous settings, questions regarding dynamical properties of Anosov families such as existence of stable manifolds [\[Mu3\]](#page-8-17), openness in the space of two-sided sequences of diffeomorphisms [\[Mu1\]](#page-8-18), and structural stability [\[CRV,](#page-8-19) [Mu2\]](#page-8-20) have been addressed. When it comes to regularity of nonstationary stable foliations, only partial results are available, such as when the sequence of maps has a constant tail [\[S\]](#page-8-21) or for a neighborhood of a common fixed point of the maps [\[ZLZ\]](#page-8-22), but our overall goal is to derive regularity results of these foliations, currently not available in the literature. Our primary motivation comes from questions on spectral properties of Sturmian Hamiltonians.

This note is dedicated to providing the preliminary technical contraction mapping principles that will be useful in these non-stationary settings. In [\[L2\]](#page-8-1), it is proved that the non-stationary stable foliation of a collection of diffeomorphisms of  $\mathbb{T}^2$  that satisfy a common cone condition, and have uniformly bounded  $C^2$  norms, is a  $C^1$  foliation of  $\mathbb{T}^2$ . This result generalizes the clas-sical version in [\[HP\]](#page-8-0) where it is proved that the stable foliation of a  $C<sup>2</sup>$  Anosov diffeomorphism of a surface is  $C^1$ . In [\[HP\]](#page-8-0), a fibered version of the contraction mapping principle is used to prove this  $C^1$  smoothness, and this paper is dedicated to supplying the appropriate generalized version of this principle to be applicable in [\[L2\]](#page-8-1) and future analogous results.

Given complete metric spaces X and Y, we consider a sequence of maps  $(f_n)$ ,  $f_n : X \to X$ , and for each  $x \in X$ , a sequence of maps  $(h_n^x)$ ,  $h_n^x : Y \to Y$ . Given a sequence of skew maps  $(F_n)$  via

$$
F_n: X \times Y \to X \times Y, (x, y) \mapsto (f_n(x), h_n^x(y)),
$$

we show that under uniform contraction rates and reasonable continuity and bounded orbit assumptions that there is a  $(x^*, y^*) \in X \times Y$  such that

$$
\lim_{n \to \infty} F_1 \circ \cdots \circ F_n(x, y) = (x^*, y^*)
$$

for all  $(x, y) \in X \times Y$ . Outside of its direct application in [\[L2\]](#page-8-1), this result has the potential to be used for various dynamical techniques in the random or non-stationary settings. This paper is a result of an undergraduate research project, supervised by the first author, that occurred during the Summer and Fall quarters of 2024.

#### Background and Main Results

Given a metric space  $(X, d)$  and a mapping  $f : X \to X$ , we define the Lipschitz constant of f to be

$$
\text{Lip}(f) := \sup_{x_1 \neq x_2} \frac{d(f(x_1), f(x_2))}{d(x_1, x_2)}.
$$

If  $Lip(f) < 1$ , then we say that f is a contraction on X. An element  $x^* \in X$  is a fixed point of  $f$  if

$$
f\left(x^*\right) = x^*.
$$

**Theorem 1** (Contraction Mapping Principle). If X is a complete metric space and  $f: X \to X$ is a contraction on X, then f has a unique fixed point  $x^* \in X$  and moreover,

$$
\lim_{n \to \infty} f^n(x) = x^*
$$

for all  $x \in X$ .

Our goal is to generalize the following fibered version of this principle.

**Theorem 2** (Fiber Contraction Principle  $[HP]$ ). Let X be a space, Y be a metric space,  $f: X \to X$  a mapping, and  $\{g_x\}_{x \in X}$  a family of maps  $g_x: Y \to Y$  such that

$$
F: X \times Y \to X \times Y, (x, y) \mapsto (f(x), g_x(y))
$$

is continuous. Suppose that  $p \in X$  is a fixed point of f satisfying  $\lim_{n \to \infty} f^{n}(x) = p$  for all  $x \in X$ ,  $q \in Y$  is a fixed point of  $g_p$ , and

$$
\limsup_{n \to \infty} \text{Lip}\left(g_{f^n(x)}\right) < 1
$$

for all  $x \in X$ . Then,  $(p, q) \in X \times Y$  is a fixed point of F satisfying

$$
\lim_{n \to \infty} F^n(x, y) = (p, q),
$$

for all  $(x, y) \in X \times Y$ .

The following theorem is a non-stationary version of the Contraction Mapping Principle.

<span id="page-2-0"></span>**Theorem 3.** Let  $(X,d)$  be a complete metric space and  $(f_n)$ ,  $f_n : X \to X$ , a sequence of contractions. If

$$
\mu:=\sup_{n\in\mathbb{N}}\mathrm{Lip}(f_n)<1
$$

and there is a  $x_0 \in X$  such that  $(d(f_n(x_0), x_0))$  is bounded, then there is a  $x^* \in X$  such that

$$
\lim_{n\to\infty}f_1\circ\cdots\circ f_n(x)=x^*
$$

for all  $x \in X$ .

The next theorem is a non-stationary version of the Fiber Contraction Mapping Principle.

<span id="page-2-1"></span>**Theorem 4.** Let X and Y be complete metric space. Suppose that  $(f_n)$ ,  $f_n : X \to X$ , is a sequence of mappings such that

<span id="page-2-3"></span>
$$
\mu := \sup_{n \in \mathbb{N}} \text{Lip}(f_n) < 1. \tag{0.1}
$$

For each  $x \in X$ , let  $(h_n^x)$ ,  $h_n^x : Y \to Y$ , be a sequence of mappings such that

<span id="page-2-2"></span>
$$
\lambda := \sup_{n \in \mathbb{N}} \sup_{x \in X} \text{Lip}(h_n^x) < 1. \tag{0.2}
$$

Suppose that

- (1) There is a  $x_0 \in X$  such that  $\{f_n(x_0)\}_{n \in \mathbb{N}}$  is bounded in X;
- (2) For any bounded set  $\Omega \subset X \times Y$ , the set  $\{h_n^x(y)\}_{(x,y)\in\Omega,n\in\mathbb{N}}$  is bounded in Y;
- (3) For any bounded set  $K \subset Y$  and any  $n \in \mathbb{N}$ , we have  $\lim_{|x-x'| \to 0} d_Y \left( h_n^x(y), h_n^{x'} \right)$  $\binom{x'}{n}(y) = 0$ , and this limit is uniform in  $y \in K$ .

Then, for the skew-maps  $F_n: X \times Y \to X \times Y$ , defined via  $F_n(x, y) := (f_n(x), h_n^x(y))$ , there is  $a(x^*,y^*) \in X \times Y$  such that

$$
\lim_{n \to \infty} F_1 \circ \cdots \circ F_n(x, y) = (x^*, y^*)
$$

for all  $(x, y) \in X \times Y$ .

### 1 Proofs of the Main Theorems

We first prove Theorem [3.](#page-2-0)

Proof of Theorem [3.](#page-2-0) Denote

$$
M := \sup_{n \in \mathbb{N}} \left\{ d(f_n(x_0), x_0) \right\}.
$$

Suppose  $n, m \in \mathbb{N}$  with  $m > n$ . Then,

$$
d(f_1 \circ \cdots \circ f_n(x), f_1 \circ \cdots \circ f_m(x)) \leq \mu^n d(f_{n+1} \circ \cdots \circ f_m(x_0), x_0),
$$
\n(1.1)

and by the triangle inequality,

$$
d(f_{n+1} \circ \dots \circ f_m(x_0), x_0)
$$
  
\n
$$
\leq d(f_{n+1}(x_0), x_0) + \sum_{i=2}^{m-n} d(f_{n+1} \circ \dots \circ f_{n+i}(x_0), f_{n+1} \circ \dots \circ f_{n+i-1}(x_0))
$$
  
\n
$$
\leq d(f_{n+1}(x_0), x_0) + \sum_{i=2}^{m-n} \mu^{i-1} d(f_{n+i}(x_0), x_0)
$$
  
\n
$$
\leq M \sum_{i=1}^{m-n} \mu^{i-1} \leq M \sum_{i=1}^{\infty} \mu^{i-1}.
$$

It follows that

$$
d(f_1 \circ \cdots \circ f_n(x), f_1 \circ \cdots \circ f_m(x)) \leq \mu^n M \sum_{i=1}^{\infty} \mu^{i-1} \to 0,
$$

as  $n, m \to \infty$ , so that  $(f_1 \circ \cdots \circ f_n(x_0))$  is a Cauchy sequence. Since X is complete, there is a  $x^* \in X$  such that

$$
\lim_{n\to\infty}f_1\circ\cdots\circ f_n(x_0)=x^*.
$$

If  $x \in X$ , then

$$
d(f_1 \circ \cdots \circ f_n(x), f_1 \circ \cdots \circ f_n(x_0)) \leq \mu^n d(x, x_0) \to 0
$$

as  $n \to \infty$ , and hence

$$
\lim_{n\to\infty}f_1\circ\cdots\circ f_n(x)=x^*.
$$

 $\Box$ 

<span id="page-3-0"></span>**Remark 1.** Notice that from the proof, we deduced that the condition that  $(d(f_n(x_0), x_0))$  is a bounded sequence implies that the set  $\{f_k \circ \cdots \circ f_l(x_0)\}_{k \leq l}$  is bounded in X, due to the uniform contraction rates of the maps.

We also note that this condition cannot be removed. As an example, let  $X = \mathbb{R}$  and define  $f_n : \mathbb{R} \to \mathbb{R}$  via  $f_n(x) := \frac{1}{2}x + 3^n$ . Then, we have that

$$
f_1 \circ \cdots \circ f_n(0) = \sum_{i=1}^n \frac{3^i}{2^{i-1}} \to \infty
$$

as  $n \to \infty$ .

We now prove Theorem [4.](#page-2-1)

Proof of Theorem [4.](#page-2-1) If  $\pi_Y : X \times Y \to Y$  is the projection map  $\pi_Y(x, y) = y$ , then for each  $k \leq n$ , we have

<span id="page-3-2"></span>
$$
\pi_Y \circ F_k \circ \cdots \circ F_n(x, y) = h_k^{f_{k+1} \cdots f_n x} \cdots h_n^x(y). \tag{1.2}
$$

From Remark [1,](#page-3-0) we know there is a  $M = M(x_0) > 0$  such that

<span id="page-3-1"></span>
$$
d_X(f_k \circ \cdots \circ f_l(x_0), x_0) < M \tag{1.3}
$$

for all  $k \leq l$ . Fix  $y_0 \in Y$ . By condition (2), there is an  $S > 0$  such that

$$
d_Y\left(h_n^x(y_0), y_0\right) < S
$$

for all  $n \in \mathbb{N}$  and  $x \in B_M(x_0)$ . From the triangle inequality, [\(0.2\)](#page-2-2), and [\(1.3\)](#page-3-1), if  $k \leq n$ , we have

$$
d_{Y}\left(h_{k}^{f_{k+1}\cdots f_{n}x_{0}}\cdots h_{n}^{x_{0}}(y_{0}),y_{0}\right) \leq d_{Y}\left(h_{k}^{f_{k+1}\cdots f_{n}x_{0}}(y_{0}),y_{0}\right) + \sum_{i=2}^{n-k} d_{Y}\left(h_{k}^{f_{k+1}\cdots f_{n}x_{0}}\cdots h_{k+j}^{f_{k+j+1}\cdots f_{n}x_{0}}(y_{0}), h_{k}^{f_{k+1}\cdots f_{n}x_{0}}\cdots h_{k+j-1}^{f_{k+j}\cdots f_{n}x_{0}}(y_{0})\right) \leq d_{Y}\left(h_{k}^{f_{k+1}\cdots f_{n}x_{0}}(y_{0}),y_{0}\right) + \sum_{i=2}^{n-k} \lambda^{i-1} d_{Y}\left(h_{k+j}^{f_{k+j+1}\cdots f_{n}x_{0}}(y_{0}),y_{0}\right) \leq S \sum_{i=1}^{n-k} \lambda^{i-1}.
$$

That is,

<span id="page-3-3"></span>
$$
d_Y\left(h_k^{f_{k+1}\circ\cdots\circ f_nx_0}\circ\cdots\circ h_{n-1}^{f_nx_0}\circ h_n^{x_0}(y_0),y_0\right) < L := S\sum_{i=1}^{\infty}\lambda^{i-1} \tag{1.4}
$$

for all  $k \leq n$ .

<span id="page-4-0"></span>**Claim 1.** There is a  $y^* \in Y$  such that

$$
\lim_{n\to\infty}h_1^{f_2\cdots f_nx_0}\circ\cdots\circ h_n^{x_0}(y_0)=y^*.
$$

*Proof of Claim [1.](#page-4-0)* Let  $\epsilon > 0$ . Choose  $N_0$  such that

<span id="page-4-6"></span>
$$
2\lambda^{N_0 - 1}L < \epsilon. \tag{1.5}
$$

By condition (3), there is a  $\delta > 0$  such that if  $d_X(x, x') < \delta$ ,  $x, x' \in B_M(x_0)$ , then

<span id="page-4-2"></span>
$$
d_Y\left(h_n^x(y), h_n^{x'}(y)\right) < \epsilon,\tag{1.6}
$$

for all  $y \in B_L(y_0)$  and  $n = 1, 2, ..., N_0$ . Choose  $N_1$  such that

<span id="page-4-1"></span>
$$
\mu^{N_1} M < \delta. \tag{1.7}
$$

Now, suppose  $m, n > \tilde{N} := N_0 + N_1$  with  $m > n$ . For  $j = 1, \ldots, N_0$ , define

$$
A_j := d_Y \left( \pi_Y \circ F_j \circ \cdots \circ F_m(x_0, y_0), h_j^{f_{j+1}\cdots f_m(x_0)} \left( \pi_Y \circ F_{j+1} \circ \cdots \circ F_n(x_0, y_0) \right) \right),
$$
  

$$
B_j := d_Y \left( h_j^{f_{j+1}\cdots f_m(x_0)} \circ \pi_Y \circ F_{j+1} \circ \cdots \circ F_n(x_0, y_0), \pi_Y \circ F_j \circ \cdots \circ F_n(x_0, y_0) \right),
$$

and

$$
C_j := d_Y (\pi_Y \circ F_j \circ \cdots \circ F_m(x_0, y_0), \pi_Y \circ F_j \circ \cdots \circ F_n(x_0, y_0)).
$$

We will show that

$$
C_1 \leq (\text{Constant}) \cdot \epsilon
$$

for some constant that only depends on  $\lambda$ . First, we derive relations between the quantities  $A_j$ ,  $B_j$  and  $C_j$ .

Notice that from  $(1.2)$  and  $(1.4)$ , we have

<span id="page-4-5"></span>
$$
C_{N_0} \le 2L\tag{1.8}
$$

and by the triangle inequality, we have

<span id="page-4-3"></span>
$$
C_j \le A_j + B_j. \tag{1.9}
$$

In addition, since

$$
A_j = d_Y \left( h_j^{f_{j+1} \cdots f_m(x_0)} \left( \pi_Y \circ F_{j+1} \circ \cdots \circ F_m(x_0, y_0) \right), h_j^{f_{j+1} \cdots f_m(x_0)} \left( \pi_Y \circ F_{j+1} \circ \cdots \circ F_n(x_0, y_0) \right) \right),
$$

by  $(0.2)$ , this implies that

<span id="page-4-4"></span>
$$
A_j \le \lambda C_{j+1}.\tag{1.10}
$$

Also, since  $j \leq N_0$ , we have that

$$
n-j \ge \tilde{N} - N_0 = N_1
$$

so from  $(0.1)$ ,  $(1.3)$ , and  $(1.7)$ , we have

$$
d_X(f_{j+1}\circ\cdots\circ f_m(x_0),f_{j+1}\circ\cdots\circ f_n(x_0))\leq \mu^{n-j}d_X(f_{n+1}\circ\cdots\circ f_m(x_0),x_0)\leq \mu^{N_1}M<\delta.
$$

Since

$$
B_j = d_Y \left( h_j^{f_{j+1} \cdots f_m(x_0)} \left( \pi_Y \circ F_{j+1} \circ \cdots \circ F_n(x_0, y_0) \right), h_j^{f_{j+1} \cdots f_n(x_0)} \circ \left( \pi_Y \circ F_{j+1} \circ \cdots \circ F_n(x_0, y_0) \right) \right),
$$

in combination with  $(1.4)$  and  $(1.6)$ , this implies that

<span id="page-5-0"></span>
$$
B_j < \epsilon,\tag{1.11}
$$

for all  $j \leq N_0$ . By a repeated application of equations [\(1.9\)](#page-4-3), [\(1.10\)](#page-4-4), and [\(1.11\)](#page-5-0), we have

$$
d_Y(\pi_Y \circ F_1 \circ \cdots \circ F_m(x_0, y_0), \pi_Y \circ F_1 \circ \cdots \circ F_n(x_0, y_0)) = C_1
$$
  
\n
$$
\leq A_1 + B_1 \leq \lambda C_2 + \epsilon
$$
  
\n
$$
\leq \lambda (A_2 + B_2) + \epsilon \leq \lambda^2 C_3 + \lambda \epsilon + \epsilon
$$
  
\n
$$
\leq \lambda^2 (A_3 + B_3) + \lambda \epsilon + \epsilon \leq \lambda^3 C_4 + \lambda^2 \epsilon + \lambda \epsilon + \epsilon
$$
  
\n
$$
\leq \cdots \leq \lambda^{N_0 - 1} C_{N_0} + \lambda^{n - 2} \epsilon + \cdots + \lambda \epsilon + \epsilon
$$
  
\n
$$
\leq 2\lambda^{N_0 - 1} L + \lambda^{n - 2} \epsilon + \cdots + \lambda \epsilon + \epsilon
$$
  
\n
$$
\leq \epsilon + \epsilon \sum_{i=0}^{n-2} \lambda^i \leq \left(1 + \sum_{i=0}^{\infty} \lambda^i\right) \cdot \epsilon,
$$

where the third to last inequality follows from  $(1.8)$  and the second to last follows from  $(1.5)$ . We conclude that  $(\pi_Y \circ F_1 \circ \cdots \circ F_n(x_0, y_0))$  is a Cauchy sequence in Y and hence convergent, since  $Y$  is complete.  $\Box$ 

Denoting the limit of the sequence  $(\pi_Y \circ F_1 \circ \cdots \circ F_n(x_0, y_0))_{n \in \mathbb{N}}$  by  $y^*$ , we see that for any  $y \in Y$ , we have

$$
d_Y(\pi_Y \circ F_1 \circ \cdots \circ F_n(x_0, y), \pi_Y \circ F_1 \circ \cdots \circ F_n(x_0, y_0)) \leq \lambda^n d_Y(y, y_0) \to 0
$$

as  $n \to \infty$ , so that

<span id="page-5-6"></span>
$$
\lim_{n \to \infty} \pi_Y \circ F_1 \circ \cdots \circ F_n(x_0, y) = y^*.
$$
\n(1.12)

<span id="page-5-1"></span>**Claim 2.** For each  $x \in X$  and  $y \in Y$ , we have

$$
\lim_{n\to\infty}\pi_Y\circ F_1\circ\cdots\circ F_n(x,y)=y^*.
$$

*Proof of Claim [2.](#page-5-1)* Let  $\epsilon > 0$ ,  $x \in X$ ,  $y \in Y$ . Set  $L' := d_Y(y, y_0) + L$ . By property (2), there is a  $S' > 0$  such that if  $d_X(x', x'') < d_X(x, x_0)$ , then

<span id="page-5-2"></span>
$$
d\left(h_n^{x'}(y), h_n^{x''}(y)\right) \le S'\tag{1.13}
$$

for all  $y \in B_{L'}(y_0)$  and  $n \in \mathbb{N}$ . Choose  $N_0$  so large such that

<span id="page-5-5"></span>
$$
S' \sum_{i=N_0}^{\infty} \lambda^i < \epsilon. \tag{1.14}
$$

By condition (3), there is a  $\delta > 0$  such that if  $d_X(x', x'') < \delta$ , then

<span id="page-5-4"></span>
$$
d_Y\left(h_n^{x'}(y), h_n^{x''}(y)\right) < \epsilon,\tag{1.15}
$$

for all  $y \in B_{L'}(y_0)$  and  $n = 1, 2, ..., N_0$ . Choose  $N_1$  so large such that

<span id="page-5-3"></span>
$$
\mu^{N_1} d(x, x_0) < \delta. \tag{1.16}
$$

Suppose  $n > \tilde{N} := N_0 + N_1$ . Let us adopt the notation

$$
T_k^x := h_1^{f_2 \cdots f_n x} \circ \cdots \circ h_k^{f_{k+1} \cdots f_n x}
$$

so that

$$
\pi_Y \circ F_1 \circ \cdots \circ F_n(x, y) = T_{k-1}^x (\pi_Y \circ F_k \circ \cdots \circ F_n(x, y))
$$

for each  $k \leq n$ . Define

$$
A_k := d_Y \left( T_{k-1}^x(\pi_Y \circ F_k \circ \cdots \circ F_n(x, y), T_{k-1}^x(\pi_Y \circ F_k \circ \cdots \circ F_n(x_0, y)) \right)
$$
  

$$
B_k := d_Y \left( h_k^{f_{k+1} \cdots f_n x} (\pi_Y \circ F_{k+1} \circ \cdots \circ F_n(x_0, y)), h_k^{f_{k+1} \cdots f_n x_0} (\pi_Y \circ F_{k+1} \circ \cdots \circ F_n(x_0, y)) \right)
$$

and

$$
C_k := d_Y (T_k^x (\pi_Y \circ F_{k+1} \circ \cdots \circ F_n(x_0, y)), T_n^{x_0}(y_0))
$$

for  $k \leq n$ .

We will show that

 $C_n \leq (Constant) \cdot \epsilon$ 

for some constant that only depends on  $\lambda$ , but we first establish relations between the quantities  $A_k$ ,  $B_k$  and  $C_k$ .

First notice that by definition of  $A_k$  and  $B_k$ , and  $(0.2)$ , we have

<span id="page-6-0"></span>
$$
A_k \le \lambda^{k-1} B_k,\tag{1.17}
$$

and by the triangle inequality,

<span id="page-6-1"></span>
$$
C_k \le A_k + C_{k-1}.\tag{1.18}
$$

From  $(1.4)$ ,  $(0.2)$  and the triangle inequality, we have

$$
d_Y(\pi_Y \circ F_{k+1} \circ \cdots \circ F_n(x_0, y), y_0)
$$
  
\n
$$
\leq d_Y(\pi_Y \circ F_{k+1} \circ \cdots \circ F_n(x_0, y), \pi_Y \circ F_{k+1} \circ \cdots \circ F_n(x_0, y_0))
$$
  
\n
$$
+ d_Y(\pi_Y \circ F_{k+1} \circ \cdots \circ F_n(x_0, y_0), y_0)
$$
  
\n
$$
\leq \lambda^{n-k} d_Y(y, y_0) + d_Y(\pi_Y \circ F_{k+1} \circ \cdots \circ F_n(x_0, y_0), y_0)
$$
  
\n
$$
\leq d_Y(x_0, y_0) + L = L'.
$$

and also

$$
d_X(f_{k+1}\circ\cdots\circ f_n(x), f_{k+1}\circ\cdots\circ f_n(x_0))\leq \mu^{n-k}d(x,x_0)\leq d_X(x,x_0)
$$
 for all  $k\leq n$ . So, from (1.13), we have

<span id="page-6-2"></span>
$$
B_k \le S',\tag{1.19}
$$

for all  $k \leq n$ . Also, for  $k \leq N_0$ , we have that

$$
n - k \ge \tilde{N} - N_0 = N_1,
$$

so from  $(0.1)$  and  $(1.16)$ , we know that

$$
d_X(f_{k+1}\circ\cdots\circ f_n(x_0),f_{k+1}\circ\cdots\circ f_n(x))\leq\mu^{n-k}d_X(x,x_0)\leq\mu^{N_1}d(x,x_0)<\delta.
$$

Thus, from [\(1.15\)](#page-5-4), we have

<span id="page-6-3"></span>
$$
B_k \le \epsilon \tag{1.20}
$$

for all  $k \leq N_0$ . Now, using a repeated application of [\(1.17\)](#page-6-0) and [\(1.18\)](#page-6-1), we have

$$
d_Y(\pi_Y (F_1 \circ \cdots \circ F_n(x, y)), \pi_Y (F_1 \circ \cdots \circ F_n(x_0, y_0))) = C_n
$$
  
\n
$$
\leq A_n + C_{n-1} \leq \lambda^{n-1} B_n + A_{n-1} + C_{n-2}
$$
  
\n
$$
\leq \lambda^{n-1} B_n + \lambda^{n-2} B_{n-1} + A_{n-2} + C_{n-3}
$$
  
\n
$$
\leq \lambda^{n-1} B_n + \lambda^{n-2} B_{n-1} + \lambda^{n-3} B_{n-2} + A_{n-3} + C_{n-4}
$$
  
\n
$$
\leq \cdots \leq \lambda^{n-1} B_n + \lambda^{n-2} B_{n-1} + \cdots + \lambda B_2 + B_1
$$

and from  $(1.19)$ ,  $(1.20)$  and  $(1.14)$ , the last quantity satisfies

$$
\sum_{k=1}^{n} \lambda^{k-1} B_k \le \sum_{k=1}^{N_0} \lambda^{k-1} B_k + \sum_{k=N_0+1}^{n} \lambda^{k-1} B_k
$$
  

$$
\le \epsilon \sum_{k=1}^{N_0} \lambda^{k-1} + \epsilon \le \left(1 + \sum_{k=1}^{\infty} \lambda^{k-1}\right) \cdot \epsilon.
$$

Therefore,

$$
\lim_{n\to\infty} d_Y(\pi_Y(F_1\circ\cdots\circ F_n(x,y)),\pi_Y(F_1\circ\cdots\circ F_n(x_0,y_0)))=0,
$$

so from [\(1.12\)](#page-5-6), the claim holds.

Combining these claims with Lemma [3](#page-2-0) implies that there is some  $x^* \in X$  such that

$$
\lim_{n \to \infty} F_1 \circ \cdots \circ F_n(x, y) = (x^*, y^*)
$$

for all  $(x, y) \in X \times Y$ .

Remark 2. Notice that condition (4) can be reformulated as the assumption that for bounded  $K \subset Y$ , the family of maps  $\{x \mapsto h_n^x\}_{y \in K}$  is uniformly equicontinuous for each  $n \in \mathbb{N}$ . This is analogous to the continuity assumption in the Fiber Contraction Theorem.

We now give examples demonstrating the conditions (2) and (3) cannot be removed in Theorem [4.](#page-2-1) Notice that condition (1) cannot be removed by Remark [1.](#page-3-0)

**Example.** Condition (2) cannot be removed for if we set  $X = Y = \mathbb{R}$ , and for all  $x, y \in \mathbb{R}$  and  $n \in \mathbb{N}$ , set  $f_n(x) = \frac{1}{2}x$  and  $h_n^x(y) = \frac{1}{2}y + 3^n$ , then

$$
\lim \pi_Y \circ F_1 \circ \cdots \circ F_n(0,0) = \sum_{i=1}^n \frac{3^i}{2^{i-1}} \to \infty
$$

as  $n \to \infty$ .

**Example.** Condition (3) cannot be removed for if we set  $X = Y = \mathbb{R}$ , and for all  $x, y \in \mathbb{R}$  and  $n \in \mathbb{N}$ , we have  $f_n(x) = \frac{1}{2}x$  and

$$
h_n^x(y) = \begin{cases} 0 & x = 0\\ \frac{1}{2}(y - \frac{1}{4}) + \frac{1}{4} & x \neq 0 \end{cases}
$$

then

$$
\lim_{n \to \infty} F_1 \circ \cdots \circ F_n(x, y) = \begin{cases} (0,0) & \text{if } x = 0 \\ (0, \frac{1}{4}) & \text{if } x \neq 0 \end{cases}.
$$
