# **FROM BOSONIC CANONICAL ENSEMBLES TO NON-LINEAR GIBBS MEASURES**

#### VAN DUONG DINH AND NICOLAS ROUGERIE

Abstract. We study the mean-field limit of the 1D bosonic canonical ensemble in a superharmonic trap. This is the regime with temperature proportional to particle number, both diverging to infinity, and correspondingly scaled interactions. We prove that the limit model is a classical field theory based on a non-linear Schrödinger-Gibbs measure conditioned on the *L*<sup>2</sup> mass, thereby obtaining a canonical analogue of previous results for the grand-canonical ensemble. We take advantage of this set-up with fixed mass to include focusing/attractive interactions/non-linearities in our study.

#### 1. Introduction

<span id="page-1-6"></span><span id="page-1-0"></span>The study of mean-field (MF) limits of large bosonic quantum systems has been the source of a vast body of mathematical physics literature in the past decades. In the spirit of "molecular chaos", manybody wave-functions  $\Psi_N(\mathbf{x}_1,\ldots,\mathbf{x}_N) \in L^2_{sym}(\mathbb{R}^{dN})$  are well-approximated, for large *N*, by pure tensor powers  $u(\mathbf{x}_1) \dots u(\mathbf{x}_N)$ ,  $u \in L^2(\mathbb{R}^d)$ . The limit models, non-linear Schrödinger (NLS) type classical field theories have been derived at several levels:

**Static, ground-state configurations.** The bosonic lowest eigenfunctions of typical many-body Hamiltonians, say of the form

<span id="page-1-3"></span>
$$
H_N = \sum_{j=1}^N \left( -\Delta_{\mathbf{x}_j} + V(\mathbf{x}_j) \right) + \frac{g}{N-1} \sum_{1 \le j < k \le N} w(\mathbf{x}_j - \mathbf{x}_k) \tag{1.1}
$$

acting on  $L_{sym}^2(\mathbb{R}^{dN})$  are approximated [\[43,](#page-57-0) [57,](#page-57-1) [55\]](#page-57-2) by minimizing the corresponding NLS energy functionals

$$
\mathcal{E}^{\mathrm{MF}}[u] = \frac{1}{N} \left\langle u^{\otimes N}, H_N u^{\otimes N} \right\rangle = \int_{\mathbb{R}^d} |\nabla u|^2 + V|u|^2 + \frac{g}{2} \left( w \ast |u|^2 \right) |u|^2.
$$

over normalized  $u \in L^2(\mathbb{R}^d)$ .

**Excitation spectra.** The low-lying excited eigenvalues above the ground state energy are given by Bogoliubov theory, i.e. by second-quantizing the Hessian of the NLS functional at the minimizer [\[61,](#page-57-3) [32,](#page-56-1) [18,](#page-56-2) [42,](#page-57-4) [47,](#page-57-5) [2,](#page-56-3) [3,](#page-56-4) [4,](#page-56-5) [45,](#page-57-6) [50,](#page-57-7) [51,](#page-57-8) [52\]](#page-57-9).

**Dynamics, Schrödinger/Heisenberg evolution.** An initially approximately factorized datum  $\Psi_N^0 \simeq$  $(u_0)^{\otimes N}$  evolves along the many-body Schrödinger flow  $i\partial_t\Psi_N = H_N\Psi_N$  as  $\Psi_N(t) \simeq (u(t))^{\otimes N}$  where  $u(t)$ solves [\[1,](#page-56-6) [30,](#page-56-7) [60,](#page-57-10) [65\]](#page-57-11) a dynamical NLS equation

<span id="page-1-1"></span>
$$
i\partial_t u = \left(-\Delta + V + gw * |u|^2\right)u.
$$
\n(1.2)

The investigation of MF limits (in the sense to be detailed below) of positive temperature equilibria has been initiated more recently [\[25,](#page-56-8) [26,](#page-56-9) [29,](#page-56-10) [27,](#page-56-11) [28,](#page-56-12) [37,](#page-57-12) [39,](#page-57-13) [40,](#page-57-14) [38,](#page-57-15) [41,](#page-57-16) [64,](#page-57-17) [58,](#page-57-18) [59\]](#page-57-19). In this setting, a certain combination of factorized many-body wave-functions better approximates the equilibria. We refer to [\[21,](#page-56-13) [19,](#page-56-14) [20\]](#page-56-15) and references therein for different scaling limits of bosonic positive temperature ensembles.

A typical result in the mean-field limit essentially states that a grand-canonical Gibbs state

<span id="page-1-4"></span>
$$
\Gamma_{\nu} = \frac{1}{Z_{\nu}} \exp\left(-\frac{1}{T} \bigoplus_{N=0}^{\infty} \left(H_N - \nu N\right)\right) \tag{1.3}
$$

normalized as a positive trace-class operator on the bosonic Fock space

$$
\mathfrak{F}\left(L^2(\mathbb{R}^d)\right) = \bigoplus_{N=0}^{\infty} L^2_{\text{sym}}(\mathbb{R}^{dN})
$$

behaves in an appropriate sense and regime  $N, T \to \infty$  as

$$
\int_{u\in L^2(\mathbb{R}^d)} \left|\xi\left(\sqrt{T}u\right)\right\rangle \left\langle \xi\left(\sqrt{T}u\right)\right| d\mu(u)
$$

where  $\xi(\psi)$  is a bosonic coherent state

<span id="page-1-5"></span>
$$
\xi(\psi) = \exp\left(-\frac{1}{2} \left\|\psi\right\|_{L^2}^2\right) \bigoplus_{N=0}^{\infty} \frac{\psi^{\otimes N}}{\sqrt{N!}}\tag{1.4}
$$

and  $\mu$  is a nonlinear Schrödinger-Gibbs measure, formally given by

<span id="page-1-2"></span>
$$
d\mu(u) = \frac{1}{z} \exp\left(-\frac{1}{t}\left(\mathcal{E}^{\mathrm{MF}}[u] - c \int_{\mathbb{R}^d} |u|^2\right)\right) du.
$$
 (1.5)

Such results give a new perspective on the random data Cauchy theory for NLS [\[15,](#page-56-16) [17,](#page-56-17) [16,](#page-56-18) [35,](#page-56-19) [72,](#page-57-20) [6,](#page-56-20) [70,](#page-57-21) [71,](#page-57-22) [44,](#page-57-23) [69,](#page-57-24) [9,](#page-56-21) [14,](#page-56-22) [54,](#page-57-25) [10,](#page-56-23) [68,](#page-57-26) [53,](#page-57-27) [22,](#page-56-24) [23\]](#page-56-25) which considers, inter alias, the well-posedness of [\(1.2\)](#page-1-1) on the support of  $(1.5)$ , and the invariance of the latter along the flow.

The present paper aims at extending the previous results to the case of the canonical ensemble with fixed particle number *N*

$$
\Gamma_N = \frac{1}{Z_N} \exp\left(-\frac{1}{T}H_N\right),\,
$$

<span id="page-2-4"></span>seeking a result of flavor (again, in an appropriate sense, see below)

$$
\Gamma_N \simeq \int |u^{\otimes N} \rangle \langle u^{\otimes N} | d\mu_m(u)
$$

where  $\mu_m$  is a surface measure obtained by restricting  $(1.5)$  on a  $L^2$ -sphere

<span id="page-2-1"></span>
$$
d\mu_m(u) = \frac{1}{z_m} \exp\left(-\frac{1}{t} \mathcal{E}^{\mathrm{MF}}[u]\right) \mathbb{1}_{\left\{\int_{\mathbb{R}^d} |u|^2 = m\right\}} du. \tag{1.6}
$$

We consider for now the pendant of the frameworks of  $[37, 25, 26]$  $[37, 25, 26]$  $[37, 25, 26]$  $[37, 25, 26]$  $[37, 25, 26]$  where the  $L^2$ -mass is well-defined on the support of the Gibbs measure  $(1.5)$  so that the definition of  $(1.6)$  is natural [\[48,](#page-57-28) [7,](#page-56-26) [22\]](#page-56-24) and the appropriate limit is  $N = mT$  with *m* fixed and  $T \to +\infty$ . This limits us essentially to 1D, but allows to study attractive/focusing interactions  $(w < 0$  in  $(1.1)$ ). Indeed, in the grand-canonical ensemble  $(1.3)$ , the negative quartic (in *N*) behavior of attractive interactions cannot be balanced by the quadratic kinetic energy without a particle number cut-off. The attractive grand-canonical ensemble with such a cut-off has been considered recently in [\[58,](#page-57-18) [59\]](#page-57-19) in a setting similar to ours but with rather different tools. We will build on the general variational approach of [\[37,](#page-57-12) [39,](#page-57-13) [41\]](#page-57-16) based on coherent states/quantum de Finetti theorems and Berezin-Lieb-type inequalities. The main new aspects we tackle are linked to

• the definition of the Gibbs measure  $(1.6)$  conditioned on the  $L^2$  mass and how it relates to many-body quantum mechanics.

• the lack of Wick-type theorems for expectations in canonical ensembles (quantum or classical), which undermines many explicit calculations used in [\[37,](#page-57-12) [39,](#page-57-13) [41\]](#page-57-16) to tackle the non-interacting problem.

• the control of focusing interactions, made possible by considering the canonical ensemble, but which requires a more careful control of the limit.

We recall that the same type of problem, with a one-particle space restricted to finite dimensions has been considered in [\[31,](#page-56-27) [34,](#page-56-28) [55\]](#page-57-2). Our main contribution is thus to tackle the above aspects in the infinite-dimensional setting.

**Acknowledgments:** We thank Florent Fougères for sharing with us his master memoir [\[24\]](#page-56-29) on the free bosonic canonical ensemble and Nikolay Tzvetkov for his remarks and unpublished notes on massconditioned Gibbs measures.

# 2. MAIN RESULTS

<span id="page-2-0"></span>The non-interacting part of our model will be given by the 1-dimensional Schrödinger operator/anharmonic oscillator

<span id="page-2-3"></span>
$$
h = -\partial_x^2 + |x|^s, \quad s > 6. \tag{2.1}
$$

When  $s = \infty$ , we restrict our consideration to  $x \in [0,1]$  with Dirichlet boundary condition. It is wellknown that h is a non-negative self-adjoint operator with compact resolvent on  $\mathfrak{h} = L^2(X)$ , where  $X = \mathbb{R}$ if  $s < \infty$  and  $X = [0, 1]$  if  $s = \infty$ . By the spectral theorem, we can decompose

$$
h = \sum_{j\geq 1} \lambda_j |u_j\rangle\langle u_j|,
$$

where  $(\lambda_i, u_i)_{i \geq 1}$  are the eigenvalues and eigenfunctions of *h* satisfying

$$
0 < \lambda_1 \leq \lambda_2 \leq \ldots \leq \lambda_j \to +\infty
$$

and  $(u_j)_{j\geq 1}$  forms an orthonormal basis of  $\mathfrak h$ . The assumption  $s>6$  implies that the  $L^2$ -mass will be well-defined and finite in the limit we shall consider, without any renormalization [\[37,](#page-57-12) [22\]](#page-56-24). This in fact holds true for any  $s > 2$ , but a technical limitation in our proof imposes the stronger condition  $s > 6$  to deal with the mean-field limit.

As regards the interacting part of the Hamiltonian we work under (see remarks below for possible generalizations)

# <span id="page-2-2"></span>**Assumption 2.1** (**The interaction potential**)**.**

Let  $w : \mathbb{R} \to \mathbb{R}$  be an even function (or distribution). We assume that it can be decomposed in positive *and negative parts*

$$
w = w_+ - w_-, \quad w_+, w_- \ge 0
$$

*with*

- $w_+ \in \mathcal{M}(X) + L^p(X)$  with  $1 < p \leq \infty$ , where M is the set of Radon measures
- $w_- \in L^p(X)$  *with*  $p > \frac{s}{s-2}$ .

<span id="page-3-9"></span><span id="page-3-0"></span>2.1. **Quantum and classical models.** We set  $g \ge 0$  to play the role of an effective coupling constant and define the *N*-body Hamiltonian acting on  $\mathfrak{h}^N = \mathfrak{h}^{\otimes_{sym}N} = L^2_{sym}(X^N)$ 

<span id="page-3-3"></span>
$$
H_{N,g} := \sum_{j=1}^{N} h_{\mathbf{x}_j} + \frac{g}{N} \sum_{1 \le j < k \le N} w(\mathbf{x}_j - \mathbf{x}_k) \tag{2.2}
$$

The canonical Gibbs state is the trace-class operator

<span id="page-3-1"></span>
$$
\Gamma_{N,T,g}^c := \frac{1}{Z_{N,T,g}^c} \exp\left(-\frac{1}{T}H_{N,g}\right) \tag{2.3}
$$

where the partition function  $Z_{N,T,g}^c$  sets the trace equal to 1. For any  $k \geq 1$  we associate to  $\Gamma_{N,T,g}$ , or any other *N*-particles state (positive trace-class operator over  $\mathfrak{h}^N$ )  $\Gamma_N$ , its' *k*-particles reduced density matrix via a partial trace over  $N - k$  variables

<span id="page-3-8"></span><span id="page-3-2"></span>
$$
\Gamma_N^{(k)} := \binom{N}{k} \operatorname{Tr}_{k+1 \to N} [\Gamma_N]. \tag{2.4}
$$

We next define the limiting non-linear Gibbs measure, starting with the Gaussian measure with covariance  $h^{-1}$ . We denote

$$
P_{\Lambda} := \sum_{\lambda_j \leq \Lambda} |u_j\rangle\langle u_j|, \quad P_{\Lambda}^{\perp} = \mathbb{1}_{\mathfrak{h}} - P_{\Lambda}
$$
\n(2.5)

and the associated subspaces

<span id="page-3-7"></span>
$$
E_{\Lambda} = P_{\Lambda} \mathfrak{h} = \text{span}\{u_j : \lambda_j \le \Lambda\}, \quad E_{\Lambda}^{\perp} = P_{\Lambda}^{\perp} \mathfrak{h}.
$$
 (2.6)

Let also, for  $\theta \in \mathbb{R}$ 

$$
\mathcal{H}^{\theta} := \left\{ u = \sum_{j \ge 1} \alpha_j u_j : \sum_{j \ge 1} \lambda_j^{\theta} |\alpha_j|^2 < \infty \right\}, \quad \alpha_j = \langle u_j, u \rangle \in \mathbb{C} \tag{2.7}
$$

be the Sobolev space associated with *h*, equipped with the obvious norm  $\|\cdot\|_{\mathcal{H}^{\theta}}$ . By convention the  $L^2$ norm is denoted  $\|\cdot\| = \|\cdot\|_{\mathcal{H}^0}$  with associated scalar product  $\langle \cdot, \cdot \rangle$ *.* 

# <span id="page-3-5"></span>**Definition 2.2** (**The reference Gaussian measure**)**.**

*The sequence of probability measures*

$$
d\mu_{0,\Lambda}(u) := \prod_{\lambda_j \leq \Lambda} \frac{\lambda_j}{\pi} e^{-\lambda_j |\alpha_j|^2} d\alpha_j
$$
\n(2.8)

*over*  $E_{\Lambda}$  *is tight in*  $\mathcal{H}^{\theta}$  *for any*  $0 < \theta < 1/2 - 1/s$ *. It converges to a limit gaussian measure*  $\mu_0$  *over*  $\mathcal{H}^{\theta}$ *. Moreover, for all*  $\Lambda > 0$ *,*  $\mu_{0,\Lambda}$  *is the finite-dimensional cylindrical projection of*  $\mu_0$  *on*  $E_\Lambda$ *.* 

We refer e.g. to the introductory parts of [\[37\]](#page-57-12) for more background on the above. We proceed with

# <span id="page-3-4"></span>**Definition 2.3** (**Fixed mass Gaussian measure**)**.**

*For*  $\Lambda \geq \lambda_1$ , let  $\mu_{0,\Lambda}^{\perp}$  be the cylindrical projections of  $\mu_0$  on  $E_{\Lambda}^{\perp}$ , namely

$$
d\mu_{0,\Lambda}^{\perp}(u) = \prod_{\lambda_j > \Lambda} \frac{\lambda_j}{\pi} e^{-\lambda_j |\alpha_j|^2} d\alpha_j.
$$

Let  $f_{\Lambda}$  be the density function of the random variable  $||P_{\Lambda}^{\perp}u||$  $\int_a^2$  with respect to  $d\mu_{0,\Lambda}^{\perp}(u)$ , with the convention *that*  $f_0$  *is the density function of*  $||u||^2$  *with respect to*  $d\mu_0(u)$ *.* 

*For*  $m > 0$  *we define a measure on*  $E_{\Lambda}$  *by setting* 

<span id="page-3-6"></span>
$$
d\mu_{0,m,\Lambda}(u) := \frac{f_{\Lambda}\left(m - \|P_{\Lambda}u\|^2\right)}{f_0(m)} d\mu_{0,\Lambda}(u). \tag{2.9}
$$

*For any*  $0 < \theta < 1/2 - 1/s$  *the sequence of measures*  $(\mu_{0,m,\Lambda})$ <sup>*N*</sup> *is tight on*  $\mathcal{H}^{\theta}$  *and admits as limit a probability measure*  $\mu_{0,m}$  *on*  $\mathcal{H}^{\theta}$ *, which is concentrated on the sphere*  $\{|u\|^2 = m\}$ .

We refer to Section [3](#page-6-1) below for more details. In particular, the measure  $\mu_{0,m}$ , which is the restriction of  $\mu_0$  over a  $L^2$ -sphere, may naturally be defined as a limit  $\epsilon \to 0$  of restrictions  $\mu_{\epsilon,m}$  of  $\mu_0$  over  $L^2$ -annuli of thickness  $\epsilon \to 0$ .

The interacting Gibbs measure with fixed mass is then absolutely continuous with respect to  $\mu_{0,m}$ .

#### <span id="page-4-11"></span><span id="page-4-3"></span>**Definition 2.4** (**The non-linear Gibbs measure**)**.**

*The functional*

<span id="page-4-2"></span>
$$
u \mapsto \exp\left(-\frac{g}{2m} \iint_{X \times X} |u(\mathbf{x})|^2 w(\mathbf{x} - \mathbf{y}) |u(\mathbf{x})|^2 d\mathbf{x} d\mathbf{y}\right) \tag{2.10}
$$

*is in*  $L^1(d\mu_{0,m})$ . We hence define a probability measure over  $\mathcal{H}^{\theta}$ ,  $0 < \theta < 1/2 - 1/s$  by setting

$$
d\mu_{g,m}(u) := \frac{1}{z_m^r} \exp\left(-\frac{g}{2m} \iint_{X \times X} |u(\mathbf{x})|^2 w(\mathbf{x} - \mathbf{y}) |u(\mathbf{x})|^2 d\mathbf{x} d\mathbf{y}\right) d\mu_{0,m}(u)
$$
(2.11)

*with the classical relative partition function*

<span id="page-4-4"></span>
$$
z_m^r = \int \exp\left(-\frac{g}{2m} \iint_{X \times X} |u(\mathbf{x})|^2 w(\mathbf{x} - \mathbf{y}) |u(\mathbf{x})|^2 d\mathbf{x} d\mathbf{y}\right) d\mu_{0,m}(u). \tag{2.12}
$$

We will recap why the weight  $(2.10)$  is integrable in Appendix [A,](#page-51-0) using tools from e.g.  $[9, 22]$  $[9, 22]$  $[9, 22]$ .

#### <span id="page-4-0"></span>2.2. **Semi-classical limit.** We can now state our main theorem:

#### <span id="page-4-8"></span>**Theorem 2.5** (**Mean-field limit of the bosonic canonical ensemble**)**.**

Let the interacting canonical Gibbs state  $\Gamma_{mT,T,g}^c$  be defined as in [\(2.3\)](#page-3-1) with the particle number set as  $N = m, m > 0$ . Let the corresponding reduced density matrices be as in [\(2.4\)](#page-3-2). We fix  $m > 0, g \ge 0$  and *let*  $T \rightarrow \infty$ *. Then, for any*  $k > 1$ 

<span id="page-4-10"></span>
$$
\frac{k!}{T^k} \left( \Gamma^c_{mT,T,g} \right)^{(k)} \xrightarrow[T \to \infty]{} \int |u^{\otimes k} \rangle \langle u^{\otimes k} | d\mu_{g,m}(u) \tag{2.13}
$$

strongly in the trace-class  $\mathfrak{S}^1(\mathfrak{h}^k)$ . In particular, the interacting Gibbs measure with fixed mass  $\mu_{g,m}$  given *by Definition* [2.4](#page-4-3) *is the quantum de Finetti measure at scale*  $T^{-1}$  *of the sequence*  $(\Gamma^c_{mT,T,g})_T$ *, in the sense of* [\[37,](#page-57-12) Definition 4.1, Theorem 4.2]*.*

*Moreover, the relative quantum free-energy satisfies*

<span id="page-4-5"></span>
$$
-\log\left(Z_{mT,T,g}^c\right) + \log\left(Z_{mT,T,0}^c\right) \xrightarrow[T \to \infty]{} - \log z_m^r \tag{2.14}
$$

*where*  $z_m^r$  *is the classical relative partition function* [\(2.12\)](#page-4-4)*.* 

The above is the analogue of [\[37,](#page-57-12) Theorem 5.3] at fixed particle number, and allowing for attractive interactions, which is not possible in the grand-canonical framework of [\[25,](#page-56-8) [26,](#page-56-9) [29,](#page-56-10) [28,](#page-56-12) [37,](#page-57-12) [39,](#page-57-13) [41\]](#page-57-16). Our general approach to the proof is to use the (relative) variational principles defining the quantum state  $\Gamma^c_{mT,T,g}$  and the classical measure  $\mu_{g,m}$ , connecting them in the spirit of Γ-convergence. As in [\[37,](#page-57-12) [39,](#page-57-13) [41\]](#page-57-16) it is of some importance to characterize variationally the difference in the left-hand-side of [\(2.14\)](#page-4-5), for both terms taken separately diverge quite fast.

# <span id="page-4-1"></span>2.3. **Proof strategy.** The Gibbs variational principle characterizing  $\Gamma_{mT,T,g}^c$  states

$$
\mathcal{F}_g \left[ \Gamma^c_{N,T,g} \right] = -T \log \left( Z^c_{N,T,g} \right) = \inf \left\{ \mathcal{F}_g \left[ \Gamma_N \right], \Gamma_N \text{ a } N \text{-particles bosonic state} \right\} \tag{2.15}
$$

with the free-energy functional

$$
\mathcal{F}_g \left[ \Gamma_N \right] := \text{Tr} \left[ H_{N,g} \Gamma_N \right] + T \text{Tr} \left[ \Gamma_N \log \Gamma_N \right]. \tag{2.16}
$$

It follows that

<span id="page-4-6"></span>
$$
-\log\left(\frac{Z_{mT,T,g}^c}{Z_{mT,T,0}^c}\right) = \inf_{\substack{\Gamma \in \mathfrak{S}^1(\mathfrak{h}^{mT})\\ \Gamma \ge 0, \text{Tr}[\Gamma]=1}} \left\{ \mathcal{H}(\Gamma, \Gamma_{mT,T,0}^c) + \frac{g}{TN} \text{Tr}\left[w(\mathbf{x} - \mathbf{y})\Gamma^{(2)}\right] \right\},\tag{2.17}
$$

with the Von Neumann quantum relative entropy

 $\mathcal{H}(\Gamma,\Xi) := \text{Tr}[\Gamma(\log \Gamma - \log \Xi)].$ 

Moreover,  $\Gamma_{mT,T,g}^c$  is the unique solution of the above minimization problem. Similarly,

<span id="page-4-7"></span>
$$
-\log(z_m^r) = \inf_{\nu \text{ prob. meas.}} \left\{ \mathcal{H}_{\text{cl}}(\nu, \mu_{0,m}) + \frac{g}{2m} \int \left( \iint_{X \times X} |u(\mathbf{x})|^2 w(\mathbf{x} - \mathbf{y}) |u(\mathbf{y})|^2 d\mathbf{x} d\mathbf{y} \right) d\nu(u) \right\}, \tag{2.18}
$$

with the classical relative entropy

<span id="page-4-9"></span>
$$
\mathcal{H}_{\text{cl}}(\nu,\sigma) := \int \frac{d\nu}{d\sigma} \log \frac{d\nu}{d\sigma} d\sigma \tag{2.19}
$$

and  $\mu_{q,m}$  is the unique minimizer of the above. We shall prove matching upper and lower bounds relating the quantum [\(2.17\)](#page-4-6) and classical [\(2.18\)](#page-4-7) relative free-energies in the limit  $T \to \infty$ .

<span id="page-5-1"></span>To obtain a good free-energy upper bound we need to take into account that what [\(2.14\)](#page-4-5) means is that highly energetic particles behave as in the free ensemble  $\Gamma^c_{mT,T,0}$  while at low energies we have a semi-classical behavior. We capture this by using a trial state which "looks like  $\Gamma^c_{M,T,0}$  in a subspace with *M* particles in  $E_{\Lambda}^{\perp}$  (with large one-particle energy)" and "looks like"

$$
\int \left| u^{\otimes (N-M)} \right\rangle \left\langle u^{\otimes (N-M)} \right| d\mu_{g,m}(u)
$$

on a subspace where  $N - M = mT - M$  particles are in  $E_{\Lambda}$  (with moderate one-particle energy). We let  $\Lambda \to \infty$  when  $T \to \infty$  and optimize/average over M. In the grand-canonical case of [\[37\]](#page-57-12) this construction is straightforward, using the factorization property of the Fock space

$$
\mathfrak{F}(\mathfrak{h})\simeq \mathfrak{F}(E_\Lambda)\otimes \mathfrak{F}(E_\Lambda^\perp).
$$

In the more constrained canonical case that we tackle here, the construction and estimate of the freeenergy is much more delicate. It will require some new input regarding the classical minimization problem, and detailed bounds on the quantum free canonical ensemble, some of which we borrow from [\[21,](#page-56-13) [19,](#page-56-14) [67\]](#page-57-29). The restriction to  $s > 6$  arises in this construction. As per the procedure above, we have to consider, in the low-energy subspace, a superposition of measures conditioned on masses slightly different from *m* (because some of the mass/particles goes to the high-energy subspace instead). Controlling the error thus made turns out to be delicate, related to asking how much does the normalization of a Gaussian measure depend on its' covariance, see Section [3](#page-6-1) below.

For a free-energy lower bound we use the quantum de Finetti theorem (see [\[55,](#page-57-2) [56,](#page-57-30) [57\]](#page-57-1) for review), which essentially asserts that *any* reasonable sequence of *N*-particle states (Γ*<sup>N</sup>* )*<sup>N</sup>* satisfies (modulo subsequence)

<span id="page-5-0"></span>
$$
\Gamma_N \simeq \int |u^{\otimes N} \rangle \langle u^{\otimes N} | d\nu(u) \tag{2.20}
$$

for some probability measure *ν*, called the de Finetti measure of the (sub)sequence  $(\Gamma_N)_N$ . Inserting such a form in the interaction energy term of [\(2.17\)](#page-4-6) immediately yields a classical energy term akin to that of  $(2.18)$ . Hence we aim at passing to the liminf in the interaction energy in a sufficiently strong sense to be able to use the (rigorous version of)  $(2.20)$  in the resulting lower bound, as in [\[37\]](#page-57-12). However, we need extra control and arguments for the attractive part of the interaction since we allow for such a possibility.

As regards the relative entropy term in [\(2.17\)](#page-4-6) we use the Berezin-Lieb-type inequality of [\[37,](#page-57-12) Theorem 7.1]. If the sequences of *N*-particles states  $(\Gamma_N)_N$ ,  $(\Xi_N)_N$  have de Finetti measures  $\nu, \sigma$  (vaguely, in the sense of  $(2.20)$  then

$$
\liminf_{N \to \infty} \mathcal{H}(\Gamma_N, \Xi_N) \geq \mathcal{H}_{\text{cl}}(\nu, \sigma)
$$

which has the desired form to conclude the proof of the free-energy lower bound, provided we can prove separately that the free Gibbs measure conditioned on mass  $\mu_{0,m}$  is indeed the de Finetti measure of the free canonical state  $\Gamma_{m,T,T,0}^c$ . The equivalent of this input in the grand-canonical case is rather straightforward. We may apply the quantum and classical Wick theorems to compute expectations of observables in the quantum and classical ensembles respectively, and relate both formulas explicitly. In the canonical case of our concern, such explicit computations are not available to relate  $\Gamma^c_{mT,T,0}$  to  $\mu_{0,m}$ .

We follow instead a three-steps procedure: **First**  $\mu_{0,m}$  is related to a sequence  $\epsilon \to 0$  of measures  $\mu_{\epsilon,m}$ with a relaxed mass constraint, i.e. weighting the Gaussian measure  $\mu_0$  by a factor

$$
\exp\left(-\epsilon^{-1}\left(\|u\|^2 - m\right)^2\right)
$$

and normalizing. As mentioned above, this can be seen [\[48,](#page-57-28) [7,](#page-56-26) [22\]](#page-56-24) as a definition of  $\mu_{0,m}$ . **Second** a corresponding bosonic grand-canonical  $\Gamma_{\epsilon,m,T}$  ensemble with "interaction energy"

$$
\epsilon^{-1}T^{-2}\left(\mathcal{N}-mT\right)^2
$$

is shown to converge when  $T \to \infty$  to  $\mu_{\epsilon,m}$ . **Third**  $\Gamma_{\epsilon,m,T}$  is shown to converge to  $\Gamma^c_{m,T,T,0}$  when  $\epsilon \to 0$ . The desired result (i.e. Theorem [2.5](#page-4-8) in the case  $g = 0$ ) is obtained by commuting the  $T \to \infty$  and  $\epsilon \to 0$  limits. This is the delicate part: for the second step, which relies on the general framework for grand-canonical ensembles of [\[37,](#page-57-12) [41\]](#page-57-16) we need to make the arguments quantitative and track down *ϵ*-dependencies of error terms. For the third step we need a careful investigation of the *N*-dependence of the free canonical ensemble, relying in particular on combinatorial considerations we learned from [\[11\]](#page-56-30).

<span id="page-6-7"></span><span id="page-6-0"></span>2.4. **Possible extensions.** We would like to mention several possible/future extensions of our main result. Most of them have to do with the case of focusing/attractive interactions.

**Three-body interactions and quintic NLS.** We could probably include with minimal effort (properly scaled) three-particles interaction in [\(2.2\)](#page-3-3), or even higher order, as long as they are repulsive. A most interesting question concerns three-particle attractive interactions, leading to the Gibbs measure of a focusing quintic NLS equation as in [\[59\]](#page-57-19). The latter has a "phase transition" [\[35,](#page-56-19) [12,](#page-56-31) [5,](#page-56-32) [49,](#page-57-31) [23\]](#page-56-25), meaning it can be constructed only for sufficiently small  $L^2$ -mass, and blows up for larger ones. Our analysis can be adapted rather directly to the case of an attractive three-particle potential  $0 \geq W \in L^p(\mathbb{R} \times \mathbb{R})$  for an appropriately chosen *p*(*s*) (adapting the condition on *w*<sup>−</sup> from Assumption [2.1](#page-2-2) that we use for the free-energy lower bound). The derivation would work for any subcritical mass, as long as the limiting classical measure is well-defined. We plan to return to this question, in connection with the next one.

**Singular interactions.** As regards repulsive interactions, we have made essentially no unnecessary assumptions. The  $L^p$  condition for  $w_-\,$  in Assumption [2.1](#page-2-2) is however far from optimal, and we hope to be able to relax it greatly in the future. A related, perhaps more directly relevant, direction is to consider a scaled two-particles interaction ( $\beta > 0$  being fixed)

$$
w_N(\mathbf{x}) = N^{\beta} w(N^{\beta} \mathbf{x}) \xrightarrow[N \to \infty]{} \left( \int_{\mathbb{R}} w \right) \delta_0
$$

or three-particles interaction ( $\gamma > 0$ )

$$
W_N(\mathbf{x}, \mathbf{y}) = N^{2\gamma} W(N^{\gamma} \mathbf{x}, N^{\gamma} \mathbf{y}) \xrightarrow[N \to \infty]{} \left( \int_{\mathbb{R}^2} W \right) \delta_{0,0}
$$

to derive bona-fide local NLS equations in the limit. A natural question (left open in [\[58,](#page-57-18) [59\]](#page-57-19)) is whether one can control the limit to an extent allowing for  $\beta, \gamma > 1$  $\beta, \gamma > 1$  corresponding to dilute interactions<sup>1</sup>, especially in the focusing case.

**Cases of infinite mass.** When either the spatial dimension  $d \geq 2$  or the trap's exponent  $s \leq 2$  in [\(2.1\)](#page-2-3), the  $L^2$  norm is not well-defined on the support of the Gaussian measure, for rather different reasons (lack of local regularity in the first case, lack of decay at infinity in the second). One can instead condition on a renormalized version of the mass [\[9,](#page-56-21) [22\]](#page-56-24) and scale the particle number accordingly in the quantum model. For repulsive interactions we expect this to be feasible, adapting the approach of [\[39,](#page-57-13) [41\]](#page-57-16) in the cases  $s < 2$  and  $d \geq 2$  respectively (the latter would require some effort, since the grand-canonical case is already rather involved [\[29,](#page-56-10) [28,](#page-56-12) [41\]](#page-57-16)). For attractive interactions in  $d \geq 2$  there is a no-go theorem [\[8\]](#page-56-33) regarding the construction of the measure. The question stays interesting for  $d = 1$  and  $s \leq 2$  where the control of attractive interactions would require ideas beyond [\[39\]](#page-57-13). Probably, finding a way to relax the condition  $s > 6$  to the more natural  $s > 2$  in the case without mass renormalization is a pre-requisite for this problem.

# 3. The Gibbs measure conditioned on mass

<span id="page-6-1"></span>In this section we recall some elements from [\[48,](#page-57-28) [22\]](#page-56-24) about the definition of the conditioned Gibbs measure. We also add some elements that we specifically need in the sequel, especially in Section [3.2](#page-15-0) below.

<span id="page-6-2"></span>3.1. **More on definitions.** In Definition [2.3](#page-3-4) above we have given a concise definition of the Gaussian measure conditioned on mass. We now connect this to a natural approach where the mass is penalized instead of fixed. This will be very useful in Section [4](#page-20-0) below where we connect this measure to many-body quantum mechanics.

Let  $\mu_0$  be the Gaussian measure from Definition [2.2](#page-3-5) and  $\epsilon > 0$ . We penalize the  $L^2$ -mass to define

<span id="page-6-6"></span><span id="page-6-5"></span>
$$
d\mu_{\epsilon,m}(u) = \frac{1}{z_{\epsilon,m}^r} \exp\left(-\frac{1}{\epsilon} \left(\int |u|^2 - m\right)^2\right) d\mu_0(u) \tag{3.1}
$$

where  $z_{\epsilon,m}^r$  normalizes  $\mu_{\epsilon,m}$  as a probability measure. We connect the above to  $\mu_{0,m}$  from Definition [2.3](#page-3-4) by proving the

# <span id="page-6-4"></span>**Proposition 3.1** (**Density matrices of the conditioned Gaussian measure**)**.** *For all*  $k \geq 1$ *,*

$$
\int |u^{\otimes k}\rangle \langle u^{\otimes k}|d\mu_{\epsilon,m}(u) \xrightarrow[\epsilon \to 0]{} \int |u^{\otimes k}\rangle \langle u^{\otimes k}|d\mu_{0,m}(u) \text{ strongly in } \mathfrak{S}^1(\mathfrak{h}^k). \tag{3.2}
$$

<span id="page-6-3"></span><sup>1</sup>With range much smaller than the typical interparticle distance.

<span id="page-7-7"></span>*Moreover, the classical relative partition function*  $z_{\epsilon,m}^r$  *satisfies* 

<span id="page-7-6"></span>
$$
\lim_{\epsilon \to 0} \frac{z_{\epsilon,m}^r}{\sqrt{\epsilon}} = c(m) > 0. \tag{3.3}
$$

This approach to defining the measure originates in  $[48]$  and has been used e.g. in [\[7,](#page-56-26) [22\]](#page-56-24). We first recall this before turning to the proof of Proposition [3.1.](#page-6-4)

<span id="page-7-4"></span>**Proposition 3.2** (**Gibbs measure conditioned on mass**)**.** *Let*  $s > 2$ *.* 

*(1)* For any borelian set *A* of  $E_{\Lambda}$ , the limit  $\lim_{\epsilon \to 0} \mu_{\epsilon,m}(A)$  exists, and we may define a probability *measure on E*<sup>Λ</sup> *by setting*

$$
\mu_{0,m,\Lambda}(A) := \lim_{\epsilon \to 0} \mu_{\epsilon,m}(A).
$$

*(2) There exists a unique measure*  $\mu_{0,m}$  *supported in*  $\mathcal{H}^{\theta} \cap \{\|u\|^2 = m\}$  *with*  $0 < \theta < \frac{1}{2} - \frac{1}{s}$  *such that for all*  $\Lambda \geq \lambda_1$ ,  $\mu_{0,m,\Lambda}$  *is the cylindrical projection of*  $\mu_{0,m}$  *on*  $E_\Lambda$ *. Moreover, for any measurable*  $set A \subset \mathcal{H}^{\theta},$ 

$$
\mu_{0,m}(A) = \lim_{\epsilon \to 0} \mu_{\epsilon,m}(A).
$$

We will need the following lemma, which is based on ideas from [\[48\]](#page-57-28) (see also [\[22,](#page-56-24) Lemma 6.3 and Lemma 6.4]).

# <span id="page-7-5"></span>Lemma 3.3 (Density functions of the  $L^2$  norm).

*For any*  $\Lambda \geq 0$ , let  $f_{\Lambda}, g_{\Lambda}$  be the density functions of  $||P_{\Lambda}^{\perp}u||^2$  (respectivey  $||P_{\Lambda}u||^2$ ) with respect to  $\mu_{0,\Lambda}^{\perp}$ *(respectively*  $\mu_{0,\Lambda}$ *). We have the following bounds* 

<span id="page-7-0"></span>
$$
||f_{\Lambda}||_{L^{\infty}((0,+\infty))} \leq C\Lambda
$$
\n(3.4)

*and*

<span id="page-7-2"></span>
$$
||g_{\Lambda}||_{L^{\infty}((0,+\infty))} \leq C, \quad ||g_{\Lambda}'||_{L^{\infty}((0,+\infty))} \leq C
$$
\n(3.5)

*Moreover, as measures,*

<span id="page-7-1"></span>
$$
f_{\Lambda} \xrightarrow[\Lambda \to \infty]{} \delta_0 \tag{3.6}
$$

*with*  $\delta_0$  *the Dirac delta function at the origin, whereas* 

<span id="page-7-3"></span>
$$
g_{\Lambda} \xrightarrow[\Lambda \to \infty]{} f_0. \tag{3.7}
$$

*,*

*In addition,*  $f_0(m) > 0$  *for any*  $m > 0$ *.* 

*Proof.* Denote  $\phi_{\Lambda}$  the characteristic function of  $||P_{\Lambda}^{\perp}u||$ <sup>2</sup> with respect to  $\mu_{0,\Lambda}^{\perp}$ . We have

$$
\phi_{\Lambda}(s) = \mathbb{E}_{\mu_{0,\Lambda}^{\perp}} \left[ e^{is \left\| P_{\Lambda}^{\perp} u \right\|^2} \right]
$$
\n
$$
= \int_{\mathcal{H}^{\theta}} e^{is \sum_{\lambda_j > \Lambda} |\alpha_j|^2} d\mu_{0,\Lambda}^{\perp}(u)
$$
\n
$$
= \int_{\mathcal{H}^{\theta}} \prod_{\lambda_j > \Lambda} e^{is |\alpha_j|^2} \prod_{\lambda_k > \Lambda} \frac{\lambda_k}{\pi} e^{-\lambda_k |\alpha_k|^2} d\alpha_k
$$
\n
$$
= \prod_{\lambda_j > \Lambda} \left( \int_{\mathbb{C}} \frac{\lambda_j}{\pi} e^{-(1-is\lambda_j^{-1})\lambda_j |\alpha_j|^2} d\alpha_j \right) \left( \prod_{\lambda_k \neq \lambda_j} \int_{\mathbb{C}} \frac{\lambda_k}{\pi} e^{-\lambda_k |\alpha_k|^2} d\alpha_k \right)
$$
\n
$$
= \prod_{\lambda_j > \Lambda} \frac{e^{-is\lambda_j^{-1}}}{1-is\lambda_j^{-1}}.
$$

Each factor of this product has complex norm smaller than or equal to 1, thus the norm of the product is bounded by the norm of a product of any number of terms. In particular, we have

$$
|\phi_{\Lambda}(s)| \le \left| \frac{e^{-is\lambda_{j_1}^{-1}}}{1-is\lambda_{j_1}^{-1}} \frac{e^{-is\lambda_{j_2}^{-1}}}{1-is\lambda_{j_2}^{-1}} \right| = \frac{1}{\sqrt{1+s^2\lambda_{j_1}^{-2}}} \frac{1}{\sqrt{1+s^2\lambda_{j_2}^{-2}}} \le \frac{1}{1+s^2\lambda_{j_2}^{-2}}
$$

where  $j_1$  and  $j_2$  are the first two indices such that  $\lambda_{j_2} \geq \lambda_{j_1} > \Lambda$ . We deduce that  $\phi_\Lambda \in L^1(\mathbb{R})$  with  $||\phi_\Lambda||_{L^1(\mathbb{R})} \leq C\lambda_{j_2}.$ 

$$
f_{\Lambda}(x) = \frac{1}{2\pi} \int_{\mathbb{R}} e^{-isx} \phi_{\Lambda}(s) ds.
$$

<span id="page-8-1"></span>For [\(3.6\)](#page-7-1), we will show that for any continuous and compactly supported test function  $\phi$  on [0, + $\infty$ ),

$$
\lim_{\Lambda \to 0} \int_0^{+\infty} f_{\Lambda}(x)\phi(x)dx = \phi(0). \tag{3.8}
$$

Let  $\delta > 0$ . Since  $\phi$  is continuous at 0, there exists  $M = M(\delta) > 0$  such that for  $0 \le x \le M$ ,

<span id="page-8-0"></span>
$$
|\phi(x) - \phi(0)| < \delta/2.
$$

We write

$$
\int_0^{+\infty} f_{\Lambda}(x)\phi(x)dx - \phi(0) = \left(\int_0^M f_{\Lambda}(x)\phi(x)dx - \phi(0)\right) + \int_M^{+\infty} f_{\Lambda}(x)\phi(x)dx = (I) + (II).
$$

We estimate

$$
|(I)| \leq |\phi(0) \left( \int_0^M f_\Lambda(x) dx - 1 \right)| + \left| \int_0^M f_\Lambda(x) (\phi(x) - \phi(0)) dx \right|
$$
  
\n
$$
\leq |\phi(0)| \int_M^{+\infty} f_\Lambda(x) dx + \delta/2 \int_0^M f_\Lambda(x) dx
$$
  
\n
$$
\leq |\phi(0)| \int_M^{+\infty} f_\Lambda(x) dx + \delta/2,
$$

where we used that  $f_{\Lambda}(x) \ge 0$  for all  $x \in [0, \infty)$  and  $\int_0^{+\infty} f_{\Lambda}(x)dx = 1$ . We also have

$$
|(\text{II})| \le ||\phi||_{L^{\infty}} \int_{M}^{+\infty} f_{\Lambda}(x) dx,
$$

hence

$$
\left| \int_0^{+\infty} f_\Lambda(x) \phi(x) dx - \phi(0) \right| \le \delta/2 + 2 \|\phi\|_{L^\infty} \int_M^{+\infty} f_\Lambda(x) dx.
$$

In addition, we bound for any  $M > 0$ ,

$$
\int_M^{+\infty} f_\Lambda(s)ds = \int 1_{\{||P_\Lambda^{\perp}u||^2 \ge M\}} d\mu_0(u) \le \frac{1}{M\Lambda^{\theta}} \int ||u||_{\mathcal{H}^{\theta}}^2 d\mu_0(u) \le C\frac{1}{M\Lambda^{\theta}} \xrightarrow[\Lambda \to \infty]{} 0
$$

where we chose some  $0 < \theta < 1/2 - 1/s$ . Hence, for any  $\delta > 0$  we may find  $\Lambda_{\delta}$  sufficiently large to get

$$
\Big|\int_0^{+\infty} f_{\Lambda}(x)\phi(x)dx - \phi(0)\Big| \leq \delta,
$$

for any  $\Lambda \geq \Lambda_{\delta}$  which vindicates [\(3.8\)](#page-8-0).

We proceed similarly for the proof of [\(3.5\)](#page-7-2). Let  $\psi_{\Lambda}$  be the characteristic function of  $||P_{\Lambda}u||^2$  with respect to  $\mu_{0,\Lambda}$ . We compute

$$
\psi_{\Lambda}(s) = \mathbb{E}_{\mu_{0,\Lambda}} \left[ e^{is||P_{\Lambda}u||^2} \right]
$$
  
=  $\int e^{is||P_{\Lambda}u||^2} d\mu_{0,\Lambda}(u)$   
=  $\int e^{is \sum_{\lambda_j \leq \Lambda} |\alpha_j|^2} \prod_{\lambda_k \leq \Lambda} \frac{\lambda_k}{\pi} e^{-\lambda_k |\alpha_k|^2} d\alpha_k$   
=  $\prod_{\lambda_j \leq \Lambda} \frac{1}{1 - is\lambda_j^{-1}}.$ 

As above, the modulus of this product is bounded by the product of the moduli of any two factors. Taking the first two factors, we get

$$
|\psi_\Lambda(s)|\leq \frac{1}{1+s^2\lambda_2^{-2}}
$$

<span id="page-9-3"></span>hence  $\|\psi_\Lambda\|_{L^1(\mathbb{R})} \leq C\lambda_2$ . In particular,  $g_\Lambda$  is uniformly bounded, independently of  $\Lambda$ . Taking more factors into account we obtain bounds on norms of  $\psi_{\Lambda}$  in  $L^1(\mathbb{R}, sds)$  and hence  $L^{\infty}$  bounds on the derivatives of  $g_{\Lambda}$  as in  $(3.5)$ . We can then extract a subsequence along which

$$
g_\Lambda \underset{\Lambda \to \infty}{\longrightarrow} g_\infty
$$

uniformly. Since  $f_\Lambda, g_\Lambda$  are the density functions of independent random variables adding to  $||u||^2$ , whose density function is  $f_0$ , we have that

$$
f_0 = g_\Lambda * f_\Lambda.
$$

Passing to the limit in the above and using [\(3.6\)](#page-7-1) we deduce that

$$
f_0 = g_{\infty} * \delta_0
$$

and thus that  $g_{\infty} = f_0$ , which proves [\(3.7\)](#page-7-3) by uniqueness of the limit. The proof that  $f_0(m) > 0$  is exactly similar to that of [\[22,](#page-56-24) Lemma 6.4].  $\Box$ 

*Proof of Proposition [3.2.](#page-7-4)* We follow closely arguments from [\[22\]](#page-56-24), which consist of two main steps:

- We first find a sequence of measures on the finite dimensional spaces  $E_\Lambda$ , which satisfies a cylindrical projection property.
- We then show that this sequence of measures is tight on a suitable Hilbert space, and the fixedmass measure can be defined as its limit.

**Step 1. Cylindrical projections.** Let  $\Lambda \geq \lambda_1$  and *A* be a borelian set of  $E_\Lambda$ . We claim that, with  $\mu_{\epsilon,m}$  as in [\(3.1\)](#page-6-5), we have

$$
\lim_{\epsilon \to 0} \mu_{\epsilon,m}(A) = \int_A \frac{f_\Lambda(m - \|P_\Lambda u\|^2)}{f_0(m)} d\mu_{0,\Lambda}(u) =: \mu_{0,m,\Lambda}(A). \tag{3.9}
$$

In particular,

$$
d\mu_{0,m,\Lambda}(u) = \frac{f_{\Lambda}(m - ||P_{\Lambda}u||^2)}{f_0(m)} d\mu_{0,\Lambda}(u)
$$

satisfies for any  $\Theta \geq \Lambda$ ,

<span id="page-9-1"></span><span id="page-9-0"></span>
$$
\mu_{0,m,\Theta}|_{E_{\Lambda}} = \mu_{0,m,\Lambda}.\tag{3.10}
$$

To this end, we write

$$
\mu_{\epsilon,m}(A) = \frac{1}{z_{\epsilon,m}^r} \int \mathbb{1}_A \exp\left(-\frac{1}{\epsilon}(\langle u, u \rangle - m)^2\right) d\mu_0(u)
$$
  
\n
$$
= \frac{1}{z_{\epsilon,m}^r} \int \mathbb{1}_A \exp\left(-\frac{1}{\epsilon} \left(\|P_\Lambda u\|^2 + \|P_\Lambda^\perp u\|^2 - m\right)^2\right) d\mu_{0,\Lambda}(u) d\mu_{0,\Lambda}^\perp(u)
$$
  
\n
$$
= \frac{1}{z_{\epsilon,m}^r} \int_A \left(\int \exp\left(-\frac{1}{\epsilon} \left(\|P_\Lambda^\perp u\|^2 - m + \|P_\Lambda u\|^2\right)^2\right) d\mu_{0,\Lambda}^\perp(u)\right) d\mu_{0,\Lambda}(u),
$$

where

$$
d\mu_{0,\Lambda}(u):=\prod_{\lambda_j\leq \Lambda}\frac{\lambda_j}{\pi}e^{-\lambda_j|\alpha_j|^2}d\alpha_j,\quad d\mu_{0,\Lambda}^{\perp}(u):=\prod_{\lambda_j>\Lambda}\frac{\lambda_j}{\pi}e^{-\lambda_j|\alpha_j|^2}d\alpha_j.
$$

In particular, the projection of  $\mu_{\epsilon,m}$  on  $E_{\Lambda}$  is given by

$$
d\mu_{\epsilon,m}(u)|_{E_{\Lambda}} = \frac{1}{z_{\epsilon,m}^r} \left( \int \exp\left(-\frac{1}{\epsilon} \left( ||P_{\Lambda}^{\perp}u||^2 - m + ||P_{\Lambda}u||^2 \right)^2 \right) d\mu_{0,\Lambda}^{\perp}(u) \right) d\mu_{0,\Lambda}(u)
$$
  
=:  $d\mu_{\epsilon,m,\Lambda}(u)$ .

The measure  $\mu_{\epsilon,m,\Lambda}$  is indeed the cylindrical projection of  $\mu_{\epsilon,m}$  on  $E_{\Lambda}$  in the sense that for  $\Theta \geq \Lambda$ ,

<span id="page-9-2"></span>
$$
\mu_{\epsilon,m,\Theta}|_{E_{\Lambda}} = \mu_{\epsilon,m,\Lambda}.\tag{3.11}
$$

In fact, for a borelian set *A* of  $E_{\Lambda}$ , we observe that  $A \times \mathbb{C}^N$  is a borelian set of  $E_{\Theta}$  with  $N = \#\{\lambda_j : \Lambda <$  $\lambda_j \leq \Theta$ }, hence

$$
\mu_{\epsilon,m,\Theta}|_{E_{\Lambda}}(A) = \int_{A \times \mathbb{C}^{N}} d\mu_{\epsilon,m,\Theta}(u)
$$
\n
$$
= \frac{1}{z_{\epsilon,m}^{r}} \int_{A \times \mathbb{C}^{N}} \left( \int \exp\left(-\frac{1}{\epsilon} \left( ||P_{\Theta}^{\perp}u||^{2} - m + ||P_{\Theta}u||^{2} \right)^{2} \right) d\mu_{0,\Theta}^{\perp}(u) \right) d\mu_{0,\Theta}(u)
$$
\n
$$
= \frac{1}{z_{\epsilon,m}^{r}} \int_{A} \left( \int_{\mathbb{C}^{N}} \left( \int \exp\left(-\frac{1}{\epsilon} \left( ||P_{\Theta}^{\perp}u||^{2} - m + ||P_{\Theta}u||^{2} \right)^{2} \right) d\mu_{0,\Theta}^{\perp}(u) \right) \prod_{\Lambda < \lambda_{j} \leq \Theta} \frac{\lambda_{j}}{\pi} e^{-\lambda_{j} |\alpha_{j}|^{2}} d\alpha_{j} \right) d\mu_{0,\Lambda}(u)
$$
\n
$$
= \frac{1}{z_{\epsilon,m}^{r}} \int_{A} \left( \int \exp\left(-\frac{1}{\epsilon} \left( ||P_{\Lambda}^{\perp}u||^{2} - m + ||P_{\Lambda}u||^{2} \right)^{2} \right) d\mu_{0,\Lambda}^{\perp}(u) \right) d\mu_{0,\Lambda}(u)
$$
\n
$$
= \mu_{\epsilon,m,\Lambda}(A).
$$

To further investigate the measures  $\mu_{\epsilon,m,\Lambda}$ , we set

<span id="page-10-0"></span> $\nu_{\Lambda} := ||P_{\Lambda}u||^2$ 

and denote by  $f_{\Lambda}$  the density function of  $||P_{\Lambda}^{\perp}u||^2$  with respect to  $\mu_{0,\Lambda}^{\perp}$ . In particular, we have

$$
\int \exp\left(-\frac{1}{\epsilon}\left(\|P_\Lambda^{\perp}u\|^2 - m + \|P_\Lambda u\|^2\right)^2\right)d\mu_{0,\Lambda}^{\perp}(u) = \int_0^{+\infty} \exp\left(-\frac{1}{\epsilon}(\eta - m + \nu_\Lambda)^2\right)f_\Lambda(\eta)d\eta
$$

and

$$
z_{\epsilon,m}^r = \int_0^{+\infty} \exp\left(-\frac{1}{\epsilon}(\eta - m)^2\right) f_0(\eta) d\eta.
$$
 (3.12)

Thus the measure  $\mu_{\epsilon,m,\Lambda}$  can be written as

$$
d\mu_{\epsilon,m,\Lambda}(u) = \frac{\left(\int_0^{+\infty} \exp\left(-\frac{1}{\epsilon}(\eta - m + \nu_\Lambda)^2\right) f_\Lambda(\eta) d\eta\right)}{\left(\int_0^{+\infty} \exp\left(-\frac{1}{\epsilon}(\eta - m)^2\right) f_0(\eta) d\eta\right)} d\mu_{0,\Lambda}(u).
$$

We have

$$
\frac{1}{\sqrt{\epsilon}} \int_0^{+\infty} \exp\left(-\frac{1}{\epsilon} (\eta - m + \nu_\Lambda)^2\right) f_\Lambda(\eta) d\eta
$$

$$
= \int_{\frac{1}{\sqrt{\epsilon}} (\nu_\Lambda - m)}^{+\infty} e^{-\eta^2} f_\Lambda(\sqrt{\epsilon}\eta + m - \nu_\Lambda) d\eta
$$

$$
= \int_{-\infty}^{+\infty} g_\epsilon(\eta) d\eta,
$$

where

$$
g_{\epsilon}(\eta) = \mathbb{1}_{\left(\frac{1}{\sqrt{\epsilon}}(\nu_{\Lambda}-m),+\infty\right)}(\eta)e^{-\eta^2}f_{\Lambda}(\sqrt{\epsilon}\eta+m-\nu_{\Lambda}).
$$

Since  $f_{\Lambda}$  is uniformly continuous, we have for a.e.  $\eta \in (-\infty, +\infty)$ ,  $g_{\epsilon}(\eta) \to e^{-\eta^2} f_{\Lambda}(m - \nu_{\Lambda})$  as  $\epsilon \to 0$  and

$$
|g_{\epsilon}(\eta)| \leq e^{-\eta^2} \|f_{\Lambda}\|_{L^{\infty}}, \quad \forall \eta \in (-\infty, +\infty).
$$

The dominated convergence theorem implies

$$
\frac{1}{\sqrt{\epsilon}} \int_0^{+\infty} \exp\left(-\frac{1}{\epsilon} (\eta - m + \nu_\Lambda)^2\right) f_\Lambda(\eta) dx \xrightarrow[\epsilon \to 0]{} f_\Lambda(m - \nu_\Lambda) \sqrt{\pi}.
$$

Similarly, we have

$$
\frac{1}{\sqrt{\epsilon}} \int_0^{+\infty} \exp\left(-\frac{1}{\epsilon}(\eta - m)^2\right) f_0(\eta) d\eta \xrightarrow[\epsilon \to 0]{} f_0(m)\sqrt{\pi}.
$$
 (3.13)

<span id="page-10-1"></span>*.*

In particular, we have

$$
\frac{\left(\int_0^{+\infty} \exp\left(-\frac{1}{\epsilon}(\eta - m + \nu_\Lambda)^2\right) f_\Lambda(\eta) d\eta\right)}{\left(\int_0^{+\infty} \exp\left(-\frac{1}{\epsilon}(\eta - m)^2\right) f_0(\eta) d\eta\right)} \xrightarrow[\epsilon \to 0]{} \frac{f_\Lambda(m - \nu_\Lambda)}{f_0(m)}
$$

<span id="page-11-2"></span>On the other hand,

$$
\frac{1}{\sqrt{\epsilon}} \int_0^{+\infty} \exp\left(-\frac{1}{\epsilon} (\eta - m + \nu_\Lambda)^2\right) f_\Lambda(\eta) d\eta \le ||f_\Lambda||_{L^\infty} \sqrt{\pi}
$$

and for  $\epsilon > 0$  small enough,

$$
\frac{1}{\sqrt{\epsilon}} \int_0^{+\infty} \exp\left(-\frac{1}{\epsilon} (\eta - m)^2\right) f_0(\eta) d\eta \ge \frac{1}{2} f_0(m) \sqrt{\pi}.
$$

Thus

$$
\frac{\left(\int_0^{+\infty} \exp\left(-\frac{1}{\epsilon}(\eta - m + \nu_\Lambda)^2\right) f_\Lambda(\eta) d\eta\right)}{\left(\int_0^{+\infty} \exp\left(-\frac{1}{\epsilon}(\eta - m)^2\right) f_0(\eta) d\eta\right)} d\mu_{0,\Lambda}(u) \le \frac{2\|f_\Lambda\|_{L^\infty}}{f_0(m)} d\mu_{0,\Lambda}(u)
$$

which is integrable on *A*. The dominated convergence theorem yields  $(3.9)$ . The cylindrical projection property  $(3.10)$  follows from  $(3.9)$  and  $(3.11)$ .

**Step 2. Tightness.** We have found a sequence of measures  $(\mu_{0,m,\Lambda})_{\Lambda \geq \lambda_1}$  on the finite dimensional spaces  $(E_\Lambda)_{\Lambda \geq \lambda_1}$  that satisfies the cylindrical projection property [\(3.10\)](#page-9-1). We will show that there exists a unique measure  $\mu_{0,m}$  on an infinite dimensional Hilbert space satisfying

<span id="page-11-0"></span>
$$
\mu_{0,m}|_{E_{\Lambda}} = \mu_{0,m,\Lambda}.
$$

By Skorokhod's criterion (see e.g., [\[63,](#page-57-32) Lemma 1]), it is enough to prove that the sequence  $(\mu_{0,m,\Lambda})_{\Lambda \geq \lambda_1}$ is tight in the sense that

$$
\lim_{R \to \infty} \sup_{\Lambda \ge \lambda_1} \mu_{0,m,\Lambda}(\{u \in E_\Lambda : ||u||_{\mathcal{H}^\theta} \ge R\}) = 0
$$

for some  $\theta < \frac{1}{2} - \frac{1}{s}$ . The above tightness condition is satisfied if we can prove

$$
\int_{E_{\Lambda}} \|u\|_{\mathcal{H}^{\theta}}^2 d\mu_{0,m,\Lambda}(u) \leq C(m,\theta), \quad \forall \Lambda \geq \lambda_1
$$

which is further reduced to showing

$$
\int \lambda_j |\alpha_j|^2 d\mu_{0,m,\Lambda}(u) \le C(m), \quad \forall \Lambda \ge \lambda_1, \quad \forall \lambda_1 \le \lambda_j \le \Lambda
$$
\n(3.14)

for some constant  $C(m)$  depending only on  $m$ . In fact, we have

$$
\int_{E_{\Lambda}} \|u\|_{\mathcal{H}^{\theta}}^{2} d\mu_{0,m,\Lambda}(u) = \int \sum_{\lambda_{j} \leq \Lambda} \lambda_{j}^{\theta} |\alpha_{j}|^{2} d\mu_{0,m,\Lambda}(u)
$$

$$
= \sum_{\lambda_{j} \leq \Lambda} \lambda_{j}^{\theta-1} \int \lambda_{j} |\alpha_{j}|^{2} d\mu_{0,m,\Lambda}(u)
$$

$$
\leq C(m) \sum_{\lambda_{j} \leq \Lambda} \lambda_{j}^{-(1-\theta)}
$$

$$
\leq C(m) \text{Tr}[h^{-(1-\theta)}] < \infty
$$

provided that  $\theta < \frac{1}{2} - \frac{1}{s}$ .

To prove  $(3.14)$ , we first show that for all  $\epsilon > 0$  sufficiently small,

<span id="page-11-1"></span>
$$
\int \lambda_j |\alpha_j|^2 d\mu_{\epsilon,m,\Lambda}(u) \le C(m), \quad \forall \Lambda \ge \lambda_1, \quad \forall \lambda_1 \le \lambda_j \le \Lambda
$$
\n(3.15)

with some constant  $C(m)$  depending only on  $m$ . We have

$$
\int \lambda_j |\alpha_j|^2 d\mu_{\epsilon,m,\Lambda}(u)
$$
\n
$$
= \frac{1}{z_{\epsilon,m}^r} \int \lambda_j |\alpha_j|^2 \left( \int \exp\left(-\frac{1}{\epsilon} \left( ||P_\Lambda^{\perp} u||^2 - m + ||P_\Lambda u||^2 \right)^2 \right) d\mu_{0,\Lambda}^{\perp}(u) \right) d\mu_{0,\Lambda}(u)
$$
\n
$$
= \frac{1}{z_{\epsilon,m}^r} \int \lambda_j |\alpha_j|^2 \left( \int \exp\left(-\frac{1}{\epsilon} \left( ||P_{\neq j} u||^2 - m + |\alpha_j|^2 \right)^2 \right) d\mu_{0,\neq j}(u) \right) \frac{\lambda_j}{\pi} e^{-\lambda_j |\alpha_j|^2} d\alpha_j,
$$

where

$$
P_{\neq j} = \sum_{k \neq j} |u_k\rangle\langle u_k|, \quad d\mu_{0,\neq j}(u) = \prod_{k \neq j} \frac{\lambda_k}{\pi} e^{-\lambda_k |\alpha_k|^2} d\alpha_k.
$$

Denote  $F_j$  the density function of  $||P_{\neq j}u||^2$  with respect to  $\mu_{0,\neq j}$ . We rewrite

$$
\int \lambda_j |\alpha_j|^2 d\mu_{\epsilon,m,\Lambda}(u) = \frac{1}{z_{\epsilon,m}^r} \int \lambda_j |\alpha_j|^2 \left( \int_0^{+\infty} \exp\left( -\frac{1}{\epsilon} \left( \eta - m + |\alpha_j|^2 \right)^2 \right) F_j(\eta) d\eta \right) \frac{\lambda_j}{\pi} e^{-\lambda_j |\alpha_j|^2} d\alpha_j.
$$

To proceed further, we denote by  $\Phi_j$  the characteristic function of  $||P_{\neq j}u||^2$  with respect to  $\mu_{0,\neq j}$ . We compute

$$
\Phi_j(s) = \mathbb{E}_{\mu_{0,\neq j}} [e^{is||P_{\neq j}u||^2}]
$$
\n
$$
= \int e^{is\sum_{k\neq j}|\alpha_k|^2} \prod_{l\neq j} \frac{\lambda_l}{\pi} e^{-\lambda_l|\alpha_l|^2} d\alpha_l
$$
\n
$$
= \prod_{k\neq j} \Big( \int_{\mathbb{C}} e^{-(1-is\lambda_k^{-1})\lambda_k|\alpha_k|^2} d\alpha_k \Big) \Big( \prod_{\lambda_l \neq \lambda_k \atop l, k \neq j} \int_{\mathbb{C}} \frac{\lambda_l}{\pi} e^{-\lambda_l|\alpha_l|^2} d\alpha_l \Big)
$$
\n
$$
= \prod_{k\neq j} \frac{1}{1-is\lambda_k^{-1}}.
$$

As in the proof of Lemma  $3.3$  we bound the norm of this product by the norm of a product of any two terms. Taking the first two terms, we obtain that for all  $\lambda_j \geq \lambda_1$ ,

$$
|\Phi_j(s)|\leq \frac{1}{1+s^2\lambda_3^{-2}}.
$$

In particular,  $\|\Phi_j\|_{L^1(\mathbb{R})} \leq C\lambda_3$  for all  $\lambda_j \geq \lambda_1$ . Thus  $F_j$  is bounded (uniformly in *j*) and uniformly continuous for all  $\lambda_j \geq \lambda_1$ .

Since

$$
\frac{1}{\sqrt{\epsilon}} z_{\epsilon,m}^r \xrightarrow[\epsilon \to 0]{} f_0(m) \sqrt{\pi}
$$

and  $f_0(m) > 0$ , we have for  $\epsilon > 0$  sufficiently small,

$$
\frac{1}{\sqrt{\epsilon}} z_{\epsilon,m}^r \ge \frac{1}{2} f_0(m) \sqrt{\pi}.
$$

We also have

$$
\frac{1}{\sqrt{\epsilon}} \int_0^{+\infty} \exp\left(-\frac{1}{\epsilon} (\eta - m + |\alpha_j|^2)^2\right) F_j(\eta) d\eta = \int_{\frac{1}{\sqrt{\epsilon}}(|\alpha_j|^2 - m)}^{+\infty} e^{-\eta^2} F_j(\sqrt{\epsilon}\eta + m - |\alpha_j|^2) d\eta
$$
  
\n
$$
\leq ||F_j||_{L^{\infty}} \sqrt{\pi}
$$
  
\n
$$
\leq C \|\Phi_j\|_{L^1(\mathbb{R})}
$$
  
\n
$$
\leq C \lambda_3, \quad \forall \lambda_j \geq \lambda_1.
$$

It follows that

$$
\int \lambda_j |\alpha_j|^2 d\mu_{\epsilon,m,\Lambda}(u) \le \frac{2C\lambda_3}{f_0(m)} \int \lambda_j |\alpha_j|^2 \frac{\lambda_j}{\pi} e^{-\lambda_j |\alpha_j|^2} d\alpha_j
$$

$$
= \frac{2C\lambda_3}{f_0(m)} \int_0^\infty \lambda e^{-\lambda} d\lambda
$$

$$
= C(m)
$$

for all  $\lambda_j \geq \lambda_1$  and all  $\epsilon > 0$  sufficiently small. This proves [\(3.15\)](#page-11-1).

We are now able to prove  $(3.14)$ . By the layer cake representation, the problem is reduced to showing that

$$
\int_0^{+\infty} \mu_{0,m,\Lambda}(\lambda_j|\alpha_j|^2 > \lambda) d\lambda = \lim_{\epsilon \to 0} \int_0^{+\infty} \mu_{\epsilon,m,\Lambda}(\lambda_j|\alpha_j|^2 > \lambda) d\lambda.
$$

Since  $\mu_{\epsilon,m,\Lambda}(\lambda_j|\alpha_j|^2 > \lambda) \to \mu_{0,m,\Lambda}(\lambda_j|\alpha_j|^2 > \lambda)$  as  $\epsilon \to 0$ , [\(3.14\)](#page-11-0) follows from the dominated convergence theorem and the fact that

$$
\mu_{\epsilon,m,\Lambda}(\lambda_j|\alpha_j|^2 > \lambda)
$$
\n
$$
= \int \mathbb{1}_{\{\lambda_j|\alpha_j|^2 > \lambda\}} d\mu_{\epsilon,m,\Lambda}(u)
$$
\n
$$
= \frac{1}{z_{\epsilon,m}^r} \int \mathbb{1}_{\{\lambda_j|\alpha_j|^2 > \lambda\}} \left( \int \exp\left(-\frac{1}{\epsilon} \left( ||P_\Lambda^{\perp}u||^2 - m + ||P_\Lambda u||^2 \right)^2 \right) d\mu_{0,\Lambda}^{\perp}(u) \right) d\mu_{0,\Lambda}(u)
$$
\n
$$
= \frac{1}{z_{\epsilon,m}^r} \int \mathbb{1}_{\{\lambda_j|\alpha_j|^2 > \lambda\}} \left( \int \exp\left(-\frac{1}{\epsilon} \left( ||P_{\neq j}u||^2 - m + |\alpha_j|^2 \right)^2 \right) d\mu_{0,\neq j}(u) \right) \frac{\lambda_j}{\pi} e^{-\lambda_j|\alpha_j|^2} d\alpha_j
$$
\n
$$
= \frac{1}{z_{\epsilon,m}^r} \int \mathbb{1}_{\{\lambda_j|\alpha_j|^2 > \lambda\}} \left( \int_0^{+\infty} \exp\left(-\frac{1}{\epsilon} \left( \eta - m + |\alpha_j|^2 \right)^2 \right) F_j(\eta) d\eta \right) \frac{\lambda_j}{\pi} e^{-\lambda_j|\alpha_j|^2} d\alpha_j
$$
\n
$$
\leq \frac{2C\lambda_3}{f_0(m)} \int \mathbb{1}_{\{\lambda_j|\alpha_j|^2 > \lambda\}} \frac{\lambda_j}{\pi} e^{-\lambda_j|\alpha_j|^2} d\alpha_j
$$
\n
$$
\leq \frac{2C\lambda_3}{f_0(m)} \int_{\lambda}^{+\infty} e^{-\tau} d\tau
$$
\n
$$
= \frac{2C\lambda_3}{f_0(m)} e^{-\lambda}
$$

which is integrable on  $(0, +\infty)$ . This proves  $(3.14)$  using  $(3.15)$ , hence the tightness condition.

**Step 3. The limit measure lives on a**  $L^2$ -sphere. There remains to prove that the measure  $\mu_{0,m}$  is concentrated on the sphere  $\{\|u\|^2 = m\}.$ 

We need to prove that

$$
\int \varphi\left(\|u\|^2\right) d\mu_{0,m}(u) = \varphi(m)
$$

for any bounded continuous function  $\varphi : \mathbb{R}^+ \to \mathbb{R}$ . Starting from the definition of  $\mu_{0,m}$  as the  $\Lambda \to \infty$ limit of [\(2.9\)](#page-3-6) this is reduced to the claim

<span id="page-13-0"></span>
$$
I_{\Lambda}(\varphi) := f_0(m) \int \varphi \left( \|P_{\Lambda}u\|^2 \right) d\mu_{0,m,\Lambda}(u) = \int \varphi \left( \|P_{\Lambda}u\|^2 \right) f_{\Lambda}(m - \|P_{\Lambda}u\|^2) d\mu_{0,\Lambda}(u) \xrightarrow[\Lambda \to \infty]{} f_0(m)\varphi(m).
$$
\n(3.16)

Denoting  $g_{\Lambda}$  the density function of  $||P_{\Lambda}u||^2$  with respect to  $\mu_{0,\Lambda}$ , we have that

$$
I_{\Lambda}(\varphi) = \int_0^{+\infty} g_{\Lambda}(\eta) \varphi(\eta) f_{\Lambda}(m - \eta) d\eta.
$$

We write

$$
\int_0^{+\infty} g_\Lambda(\eta)\varphi(\eta) f_\Lambda(m-\eta)d\eta - f_0(m)\varphi(m) = \int_0^{+\infty} f_\Lambda(m-\eta)(g_\Lambda(\eta) - f_0(\eta))\varphi(\eta)d\eta
$$

$$
+ \int_0^{+\infty} f_\Lambda(m-\eta)f_0(\eta)\varphi(\eta)d\eta - f_0(m)\varphi(m)
$$

$$
= (I) + (II).
$$

Since  $f_{\Lambda} \to \delta_0$ , we have (II)  $\to 0$  as  $\Lambda \to \infty$ . We write for some  $M > 0$  to be chosen shortly,

$$
(I) = \int_0^M f_\Lambda(m - \eta)(g_\Lambda(\eta) - f_0(\eta))\varphi(\eta)d\eta + \int_M^{+\infty} f_\Lambda(m - \eta)(g_\Lambda(\eta) - f_0(\eta))\varphi(\eta)d\eta
$$

Using the boundedness of  $g_{\Lambda}$ ,  $f_0$  and  $\varphi$ , the same argument as in the proof of [\(3.6\)](#page-7-1) yields the smallness of the second term when  $\Lambda \to \infty$  for any  $M > 0$ . We write

$$
\int_0^M f_{\Lambda}(m-\eta)(g_{\Lambda}(\eta) - f_0(\eta))\varphi(\eta)d\eta = \int_0^M f_{\Lambda}(m-\eta)(g_{\Lambda}(\eta) - g_{\Lambda}(m))\varphi(\eta)d\eta
$$

$$
+ (g_{\Lambda}(m) - f_0(m))\int_0^M f_{\Lambda}(m-\eta)\varphi(\eta)d\eta
$$

$$
+ \int_0^M f_{\Lambda}(m-\eta)(f_0(m) - f_0(\eta))\varphi(\eta)d\eta
$$

<span id="page-14-2"></span>Using the continuity of *g*<sup>Λ</sup> and *f*0, the first and third terms in the right hand side are small provided *M* is taken sufficiently small. The second term is also small since  $g_\Lambda$  converges to  $f_0$  pointwise as  $\Lambda \to \infty$ and  $\int^{+\infty}$  $f_{\Lambda}(\eta)d\eta = 1$ . The claim [\(3.16\)](#page-13-0) follows.  $\square$ 

We may now complete the

*Proof of Proposition* [3.1.](#page-6-4) The claim [\(3.3\)](#page-7-6) follows from [\(3.12\)](#page-10-0) and [\(3.13\)](#page-10-1). Hence there remains to prove the trace-class convergence of the *k*-particle density matrices [\(3.2\)](#page-6-6).

We recall the fact [\[62,](#page-57-33) Addendum H] that strong trace-class convergence is equivalent to weak-<sup>★</sup> traceclass convergence plus convergence of the trace-class norm. Since both sides of  $(3.2)$  are non negative operators, convergence of the trace-class norm is reduced to convergence of the trace. Hence the soughtafter strong trace-class convergence is equivalent to the convergence of [\(3.2\)](#page-6-6) tested against any bounded operator  $K$  (in particular the identity)

<span id="page-14-0"></span>
$$
\int \langle u^{\otimes k}, K u^{\otimes k} \rangle d\mu_{\epsilon, m}(u) \xrightarrow[\epsilon \to 0]{} \int \langle u^{\otimes k}, K u^{\otimes k} \rangle d\mu_{0, m}(u). \tag{3.17}
$$

We take some  $M > 0$  and write

$$
\left| \int \langle u^{\otimes k}, Ku^{\otimes k} \rangle d\mu_{\epsilon,m}(u) - \int \langle u^{\otimes k}, Ku^{\otimes k} \rangle d\mu_{0,m}(u) \right|
$$
  
\n
$$
\leq \left| \int_{\|u\|^2 \leq M} \langle u^{\otimes k}, Ku^{\otimes k} \rangle (d\mu_{\epsilon,m}(u) - d\mu_{0,m}(u)) \right| + \left| \int_{\|u\|^2 > M} \langle u^{\otimes k}, Ku^{\otimes k} \rangle (d\mu_{\epsilon,m}(u) - d\mu_{0,m}(u)) \right|
$$
  
\n
$$
\leq o_{\epsilon}(1) + o_{M}(1)
$$

where  $o_{\epsilon}(1) \rightarrow$  when  $\epsilon \rightarrow 0$  as per Proposition [3.2](#page-7-4) and  $o_M(1) \rightarrow 0$  when  $M \rightarrow \infty$ , independently of  $\epsilon$ , as we explain below. We then let  $\epsilon \to 0$  first and  $M \to \infty$  next to obtain [\(3.17\)](#page-14-0).

We have just used that

$$
\int_{\|u\|^2>M} \langle u^{\otimes k}, Ku^{\otimes k} \rangle d\mu_{\epsilon,m}(u) \to 0
$$

when  $M \to \infty$ , uniformly in  $\epsilon$ . Indeed, for *M* large enough,

$$
\left| \int_{\|u\|^2 > M} \langle u^{\otimes k}, Ku^{\otimes k} \rangle d\mu_{\epsilon,m}(u) \right| \leq \|K\| \int_{\|u\|^2 > M} \|u\|^{2k} d\mu_{\epsilon,m}(u)
$$
  
\n
$$
= \frac{\|K\|}{z_{\epsilon,m}^r} \int_M^{\infty} \eta^{2k} f_0(\eta) \exp\left(-\frac{1}{\epsilon}(\eta - m)^2\right) d\eta
$$
  
\n
$$
\leq \frac{C_{K,m}}{\sqrt{\epsilon}} \int_M^{\infty} \eta^{2k} \exp\left(-\frac{1}{\epsilon}(\eta - m)^2\right) d\eta
$$
  
\n
$$
\leq C_{K,m} \int_{M-m}^{\infty} (\sqrt{\epsilon} s + m)^{2k} e^{-s^2} ds
$$
  
\n
$$
\leq C_{K,m,k} e^{-cM^2}
$$

where we return to [\(3.3\)](#page-7-6) to bound  $z_{\epsilon,m}^r$  from below and use the boundedness (independently of  $\Lambda$ ) of  $f_0$ (see  $(3.4)$ ).

We add a lemma that in essence shows that the limits  $\epsilon \to 0$  of [\(3.1\)](#page-6-5) and  $\Lambda \to \infty$  of [\(2.9\)](#page-3-6) can be interchanged.

# <span id="page-14-1"></span>**Lemma 3.4** (**Measures restricted to finite-dimensional spheres**)**.**

 $Let \Lambda \geq \lambda_1$  and define a probability measure on the sphere  $S_m E_\Lambda := \left\{ u \in E_\Lambda : ||u||^2 = m \right\}$  in the manner

$$
d\sigma_{m,\Lambda}(u) = \frac{1}{z_{m,\Lambda}} \left( \prod_{\lambda_j \leq \Lambda} \frac{\lambda_j}{\pi} \exp\left( -\lambda_j |\alpha_j|^2 \right) \right) d_m u \tag{3.18}
$$

*where*  $d_m u$  *is the Lebesque measure on the finite-dimensional sphere*  $S_m E_\Lambda$ . When  $m = 1$ , we simply  $denote$   $SE_{\Lambda} := S_1 E_{\Lambda}$  *and*  $du := d_1 u$ *.* 

*For any uniformly bounded sequence of functions*  $F_{\Lambda}$  *on*  $E_{\Lambda}$  *we have that* 

$$
\int F_{\Lambda}(u)d\mu_{0,m,\Lambda}(u) - \int F_{\Lambda}(u)d\sigma_{m,\Lambda}(u) \xrightarrow[\Lambda \to \infty]{} 0.
$$
\n(3.19)

*Proof.* Observe that with the notation above,

$$
z_{m,\Lambda}=g_{\Lambda}(m).
$$

Hence, in view of  $(2.9)$  and  $(3.7)$  we have to prove that the difference between

$$
I = \int F_{\Lambda}(\alpha_1, \ldots, \alpha_N) f_{\Lambda} \left( m - \sum_{j=1}^N |\alpha_j|^2 \right) d\mu_{0,\Lambda}(\alpha_1, \ldots, \alpha_N)
$$

and

$$
II = \int F_{\Lambda}(\alpha_1, \dots, \alpha_N) \prod_{j=1}^N \frac{\lambda_j}{\pi} \exp\left(-\lambda_j |\alpha_j|^2\right) 1_{|\alpha_1|^2 = m - \sum_{j=2}^N |\alpha_j|^2} d\theta_1 d\alpha_2 \dots d\alpha_N
$$

goes to 0 when  $\Lambda \to \infty$ . Here N is the number of eigenvalue of h below the threshold  $\Lambda$ ,  $\alpha_j = \langle u_j, u \rangle$ identified with a vector in the plane, whose angle is denoted  $\theta_j$ .

Reorganizing the integration slightly we have that

<span id="page-15-2"></span>
$$
II = \frac{\lambda_1}{\pi} \exp\left(-\lambda_1 m\right) \int \prod_{j=2}^N \frac{\lambda_j}{\pi} \exp\left(-\left(\lambda_j - \lambda_1\right) |\alpha_j|^2\right) \left(\int F_{\Lambda} \left(m - \sum_{j=2}^N |\alpha_j|^2, \theta_1, \alpha_2, \dots, \alpha_N\right) d\theta_1\right) d\alpha_2 \dots d\alpha_N
$$
\n(3.20)

with  $F_{\Lambda} \left( |\alpha_1|^2, \theta_1, \alpha_2, \ldots, \alpha_N \right) \equiv F_{\Lambda}(\alpha_1, \ldots, \alpha_N)$ . On the other hand

$$
I = \int \prod_{j=2}^{N} \frac{\lambda_j}{\pi} \exp \left( -\lambda_j |\alpha_j|^2 \right) \left( \int \frac{\lambda_1}{\pi} \exp \left( -\lambda_1 |\alpha_1|^2 \right) f_{\Lambda} \left( m - \sum_{j=1}^{N} |\alpha_j|^2 \right) F_{\Lambda} \left( \alpha_1, \dots, \alpha_N \right) d\alpha_1 \right) d\alpha_2 \dots d\alpha_N
$$

Changing variables

$$
\int \frac{\lambda_1}{\pi} \exp\left(-\lambda_1 |\alpha_1|^2\right) f_{\Lambda} \left(m - \sum_{j=1}^N |\alpha_j|^2\right) F_{\Lambda} (\alpha_1, ..., \alpha_N) d\alpha_1
$$
  
= 
$$
\prod_{j=2}^N \exp\left(\lambda_1 |\alpha_j|^2\right) \int \frac{\lambda_1}{\pi} \exp\left(-\lambda_1 |\alpha_1|^2\right) f_{\Lambda} (m - |\alpha_1|^2) F_{\Lambda} \left(|\alpha_1|^2 - \sum_{j=2}^N |\alpha_j|^2, \theta_1, \alpha_2, ..., \alpha_N\right) d\alpha_1
$$

so that

$$
I = \int \prod_{j=2}^{N} \frac{\lambda_j}{\pi} \exp\left(-(\lambda_j - \lambda_1) |\alpha_j|^2\right)
$$

$$
\left(\int \frac{\lambda_1}{\pi} \exp\left(-\lambda_1 |\alpha_1|^2\right) f_{\Lambda} \left(m - |\alpha_1|^2\right) F_{\Lambda} \left(|\alpha_1|^2 - \sum_{j=2}^{N} |\alpha_j|^2, \theta_1, \alpha_2, \dots, \alpha_N\right) d\alpha_1\right) d\alpha_2 \dots d\alpha_N.
$$
\n(3.21)

Using  $(3.6)$  the integrand of the  $d\alpha_2, \ldots, d\alpha_N$  integral in  $(3.21)$  converges pointwise to that in  $(3.20)$ , and we can conclude using dominated convergence.  $\Box$ 

<span id="page-15-0"></span>3.2. **Dependence on the mass.** As hinted at in the introduction, our trial state linking the quantum and classical problems will involve measures in finite-dimensional subspaces (the dimension being ultimately sent to infinity), with shifted mass constraints. Controling the error thus made requires some input on the classical field theory side, that we now provide.

It is more convenient to start from the finite-dimensional measures restricted to spheres from Lemma [5.3,](#page-41-0) and to rescale them so that the mass dependence translates to a prefactor affecting the covariance operator. To this end let  $\Lambda > 0$  be a kinetic energy cut-off,  $m > 0$  a mass,  $g \ge 0$  a coupling constant, and let us define probability measures on  $SE_\Lambda$  - the  $L^2$ -unit sphere of  $E_\Lambda$  in the manner

<span id="page-15-1"></span>
$$
d\rho_{m,g}(u) = \frac{1}{z_{m,g}} \exp\left(-m\left\langle u, h u \right\rangle + \frac{mg}{2}\left\langle u^{\otimes 2}, w u^{\otimes 2} \right\rangle\right) du. \tag{3.22}
$$

We will identify  $d\rho_{m,g}(u)$  with its' density with respect to the normalized Lebesgue measure du on the sphere. In this notation, the free measure  $\rho_{m,0}$  is just  $\sigma_{m,\Lambda}$  from Lemma [5.3,](#page-41-0) rescaled to live on the unit sphere. The dependence on  $\Lambda$  will be implicit in this subsection.

<span id="page-16-4"></span>The dependence on *m* of the above will be pretty strong when  $\Lambda \to \infty$  (unsuprisingly, since we perturb the measure's covariance), so that it is important in our approach to deal with relative quantities involving differences between related measures.

The estimate we use in the sequel involves the kinetic energy as follows

<span id="page-16-0"></span>**Proposition 3.5** (**Varying the mass in the classical field theory**)**.** *Let*  $g > 0$  *be a fixed constant,*  $0 < m_1 \leq m_2$ *. With the notation above we have that* 

$$
\Delta_{m_1}^{m_2} := \int \langle u, h \, u \rangle \, (\rho_{m_1,0}(u) - \rho_{m_2,g}(u)) \, du \le C_{g,m_1,m_2} \max \left( \sqrt{d}, d|m_1 - m_2| \right) \tag{3.23}
$$

*where*  $d = \dim E_{\Lambda} \leq C \Lambda^{1/2+1/s}$  *and*  $C_{g,m_1,m_2}$  *stays uniformly bounded for bounded values of*  $g, m_1, m_2$  $and m_1^{-1}, m_2^{-1}.$ 

Note that if  $\Delta_{m_1}^{m_2} \leq 0$  the statement is empty, so that we are free to, and shall, assume that  $\Delta_{m_1}^{m_2} \geq 0$ in all this subsection. Our main inequality leading to Proposition [3.5](#page-16-0) is the following:

#### <span id="page-16-1"></span>**Proposition 3.6** (**From relative entropy to kinetic energy**)**.**

*Let*  $d\rho_{m,0}(u)$  *be as above and*  $\rho$  *be any other probability measure on the unit*  $L^2$ -sphere  $SE_\Lambda$ . Then

$$
\int \langle u, h \, u \rangle \, (d\rho_{m,0}(u) - d\rho(u)) \leq C_m \sqrt{d} \sqrt{\mathcal{H}_{\text{cl}}(\rho, \rho_{m,0})} \tag{3.24}
$$

*with*  $H_{\text{cl}}$  *the classical relative entropy* [\(2.19\)](#page-4-9) *and*  $C_m$  *a constant depending only on*  $m$ *.* 

Note that Pinsker's inequality (see [\[13\]](#page-56-34) and [\[41,](#page-57-16) Section 6]) gives (identifying the measures with their density wrt to the Lebesgue measure on the unit sphere *SE*Λ)

$$
\int |\rho_{m,0}(u) - \rho(u)| \, du \le C \sqrt{\mathcal{H}_{\text{cl}}(\rho, \rho_{m,0})}
$$

leading, by the definition  $(2.6)$  of  $E_\Lambda$ , to

$$
\int \langle u, h u \rangle (d\rho_{m,0}(u) - d\rho(u)) \leq C \Lambda \sqrt{\mathcal{H}_{\text{cl}}(\rho, \rho_{m,0})}.
$$

Since a Cwikel-Lieb-Rozenbljum estimate such as [\[22,](#page-56-24) Lemma D1] yields

$$
d = \dim E_{\Lambda} \le C\Lambda^{1/2 + 1/s}
$$

we see that Proposition [3.6](#page-16-1) is a net improvement over Pinsker's inequality as soon as  $s > 2$ , which will be crucial in Section [5.3](#page-47-0) below

Our proof of Proposition [3.6](#page-16-1) uses crucially the following estimates on correlations in a Gibbs measure conditioned on the mass:

<span id="page-16-3"></span>**Lemma 3.7** (**Correlations in a canonical classical ensemble**)**.** *Let*

$$
\gamma_{\rho_{m,0}}^{(1)} = \int |u\rangle\langle u|\rho_{m,0}(u)du, \quad \gamma_{\rho_{m,0}}^{(2)} = \int |u^{\otimes 2}\rangle\langle u^{\otimes 2}|\rho_{m,0}(u)du.
$$
  
We have, for any  $j \neq k$ ,  

$$
\langle u_j \otimes u_k|\gamma_{\rho_{m,0}}^{(2)}|u_j \otimes u_k\rangle \le \langle u_j|\gamma_{\rho_{m,0}}^{(1)}|u_j\rangle\langle u_k|\gamma_{\rho_{m,0}}^{(1)}|u_k\rangle
$$
(3.25)

hence, with 
$$
\alpha_j = \langle u, u_j \rangle
$$
,  
\n
$$
\int |\alpha_j|^2 |\alpha_k|^2 \rho_{m,0}(u) du \leq \left( \int |\alpha_j|^2 \rho_{m,0}(u) du \right) \left( \int |\alpha_k|^2 \rho_{m,0}(u) du \right), \quad \forall j \neq k.
$$
\nIn particular

*In particular*

<span id="page-16-2"></span>
$$
\operatorname{Tr}\left[h^{\otimes 2}\left(\gamma_{\rho_{m,0}}^{(2)} - (\gamma_{\rho_{m,0}}^{(1)})^{\otimes 2}\right)\right] \le C \dim(E_{\Lambda}).\tag{3.26}
$$

Without the conditioning on the sphere, the relationship between  $\gamma_{\rho_{m,0}}^{(2)}$  and  $\gamma_{\rho_{m,0}}^{(1)}$  would be given by Wick's theorem. The above lemma is a convenient replacement in the canonical case. It might be known to experts but we could not find a reference. Since the quantum analogue is contained in [\[66\]](#page-57-34) we derive the estimate by semiclassical means, but a direct combinatorial proof is probably feasible.

*Proof.* Define a bosonic canonical state on  $(E_{\Lambda})^{\otimes_s M}$  by

$$
\Gamma_M = \frac{1}{Z_M} \exp\Big(-\frac{m}{M} \sum_{j=1}^M h_j\Big)
$$

<span id="page-17-2"></span>and denote for  $1 \leq k \leq M$ ,

$$
\Gamma_M^{(k)} = \binom{M}{k} \text{Tr}_{k+1 \to M}[\Gamma_M].
$$

From  $[66,$  Theorem, Item (ii)] we know that

$$
\mathrm{Tr}\left[\mathcal{N}_j\mathcal{N}_k\Gamma_M\right] \leq \mathrm{Tr}\left[\mathcal{N}_j\Gamma_M\right]\mathrm{Tr}\left[\mathcal{N}_k\Gamma_M\right], \quad j \neq k,
$$

where

<span id="page-17-0"></span>
$$
\mathcal{N}_j = a_j^{\dagger} a_j = a^{\dagger} (u_j) a(u_j)
$$

in terms of the annihilation and creation operators  $a^{\dagger}(u_j)$ ,  $a(u_j)$ . Since these operators commute for  $j \neq k$ , the above inequality is equivalent to

$$
2\langle u_j \otimes u_k | \Gamma_M^{(2)} | u_j \otimes u_k \rangle \le \langle u_j | \Gamma_M^{(1)} | u_j \rangle \langle u_k | \Gamma_M^{(1)} | u_k \rangle, \tag{3.27}
$$

where we have used that

$$
k! \langle u_1 \otimes \ldots \otimes u_k | \Gamma_M^{(k)} | v_1 \otimes \ldots \otimes v_k \rangle = \text{Tr} \left[ a^{\dagger}(v_1) \ldots a^{\dagger}(v_k) a(u_1) \ldots a(u_k) \Gamma_M \right].
$$

On the other hand, it is known (see for example [\[55,](#page-57-2) Appendix B] and references therein) that

<span id="page-17-1"></span>
$$
\binom{M}{k}^{-1} \Gamma_M^{(k)} \xrightarrow[M \to \infty]{} \gamma_{\rho_{m,0}}^{(k)}, \quad \forall k \ge 1.
$$

In particular,

$$
\left(\frac{M}{2}\right)^{-1} \langle u_j \otimes u_k | \Gamma_M^{(2)} | u_j \otimes u_k \rangle - \left(\frac{M}{1}\right)^{-2} \langle u_j | \Gamma_M^{(1)} | u_j \rangle \langle u_k | \Gamma_M^{(1)} | u_k \rangle \n\frac{M}{M \to \infty} \langle u_j \otimes u_k | \gamma_{\rho_{m,0}}^{(2)} | u_j \otimes u_k \rangle - \langle u_j | \gamma_M^{(1)} | u_j \rangle \langle u_k | \Gamma_M^{(1)} | u_k \rangle.
$$
\n(3.28)

Using  $(3.27)$ , we have

LHS of (3.28) 
$$
\leq \left(\frac{1}{2}\left(\frac{M}{2}\right)^{-1} - {M \choose 1}^{-2}\right) \langle u_j | \Gamma_M^{(1)} | u_j \rangle \langle u_k | \Gamma_M^{(1)} | u_k \rangle
$$
  
\n $\leq \frac{1}{M^2(M-1)} \langle u_j | \Gamma_M^{(1)} | u_j \rangle \langle u_k | \Gamma_M^{(1)} | u_k \rangle$   
\n $\leq \frac{1}{M^2(M-1)} ||u_j||^2 ||u_k||^2 ||\Gamma_M^{(1)}||_{\mathfrak{S}^1}^2$   
\n $= \frac{1}{M-1} \xrightarrow[M \to \infty]{} 0.$ 

In particular, the limit in the right hand side of  $(3.28)$  must be non-positive and  $(3.25)$  follows. Applying [\(3.25\)](#page-16-2), we have

$$
\begin{split} \operatorname{Tr}\Big[\Big(h^{\otimes2}\Big(\gamma_{\rho_{m,0}}^{(2)}-(\gamma_{\rho_{m,0}}^{(1)})^{\otimes2}\Big)\Big] &= \sum_{j,k=1}^{d} \lambda_{j} \lambda_{k} \left(\langle u_{j}\otimes u_{k} | \gamma_{\rho_{m,0}}^{(2)} | u_{j}\otimes u_{k}\rangle - \langle u_{j} | \gamma_{\rho_{m,0}}^{(1)} | u_{j}\rangle \langle u_{k} | \gamma_{\rho_{m,0}}^{(1)} | u_{k}\rangle\right) \\ & \leq \sum_{j=1}^{d} \lambda_{j}^{2} \Big(\int |\alpha_{j}|^{4} \rho_{m,0}(u) du - \Big(\int |\alpha_{j}|^{2} \rho_{m,0}(u) du\Big)^{2}\Big) \\ & \leq \sum_{j=1}^{d} \int (\lambda_{j} |\alpha_{j}|^{2})^{2} \rho_{m,0}(u) du \\ & \leq C \dim E_{\Lambda} \end{split}
$$

for some constant  $C > 0$  independent of  $n, T, \eta$ . Here we have used that

$$
\int \left(\lambda_j |\alpha_j|^2\right)^2 \rho_{m,0}(u) du \le C \tag{3.29}
$$

for some universal constant  $C > 0$ . This is proven similarly to  $(3.14)$  so we omit the detail here.  $\Box$ 

We now turn to the

*Proof of Proposition* [3.6.](#page-16-1) For  $\epsilon > 0$  we perturb  $\rho_{m,0}$  in the manner<sup>[2](#page-18-0)</sup>

$$
\mu_{\epsilon} = \frac{1}{z_{\epsilon}} \exp(-m(1+\epsilon)\langle u, hu \rangle).
$$

This is the unique minimizer of

$$
\mathcal{F}_{\epsilon}[\mu] = m(1+\epsilon) \int \langle u, hu \rangle \mu(u) du + \int \mu(u) \log(\mu(u)) du
$$

over all probability measures  $\mu$  on the sphere  $SE_\Lambda$ . We have that

$$
F_\epsilon = \inf \{ \mathcal{F}_\epsilon[\mu], \mu \text{ a probability measure on } SE_\Lambda \} = -\log(z_\epsilon).
$$

By the classical Gibbs variational principle and the non-negativity of the classical relative entropy, we find, for any probability measure  $\mu$ 

$$
\mathcal{H}_{\text{cl}}(\mu, \mu_0) + \epsilon m \int \langle u, hu \rangle \mu(u) du \geq \mathcal{H}_{\text{cl}}(\mu_{\epsilon}, \mu_0) + \epsilon m \int \langle u, hu \rangle \mu_{\epsilon}(u) du
$$

$$
\geq \epsilon m \int \langle u, hu \rangle \mu_{\epsilon}(u) du.
$$

Subtracting  $\epsilon m \int \langle u, h u \rangle \mu_0(u) du$  from both sides leads to

$$
\epsilon m \int \langle u, hu \rangle (\mu(u) - \mu_0(u)) du \ge -\mathcal{H}_{\text{cl}}(\mu, \mu_0) + \epsilon n \int \langle u, hu \rangle (\mu_{\epsilon}(u) - \mu_0(u)) du. \tag{3.30}
$$

Using

$$
F_{\eta} = -\log(z_{\eta}) = -\log\left(\int \exp\left(-m(1+\eta)\langle u, hu\rangle\right)du\right),\,
$$

we have

$$
\partial_{\eta} F_{\eta} = -\frac{\partial_{\eta} z_{\eta}}{z_{\eta}}, \quad \partial_{\eta}^{2} F_{\eta} = -\frac{\partial_{\eta}^{2} z_{\eta}}{z_{\eta}} + \frac{(\partial_{\eta} z_{\eta})^{2}}{z_{\eta}^{2}}.
$$

We compute

$$
\partial_{\eta} z_{\eta} = -m \int \langle u, hu \rangle \exp \Big( -m(1 + \eta) \langle u, hu \rangle \Big) du
$$

$$
= -m z_{\eta} \int \langle u, hu \rangle \mu_{\eta}(u) du.
$$

In particular, we have

<span id="page-18-2"></span><span id="page-18-1"></span>
$$
\partial_{\eta} F_{\eta} = m \int \langle u, hu \rangle \mu_{\eta}(u) du. \tag{3.31}
$$

We also have

$$
\partial_{\eta}^{2} z_{\eta} = m^{2} \int \langle u, hu \rangle^{2} \exp(-m(1 + \eta) \langle u, hu \rangle) du
$$

$$
= m^{2} z_{\eta} \int \langle u, hu \rangle^{2} \mu_{\eta}(u) du.
$$

Thus

$$
\partial_{\eta}^{2}F_{\eta} = -\left(\mathbb{E}_{\mu_{\eta}}\left[\left(m\langle u, hu\rangle\right)^{2}\right] - \left(\mathbb{E}_{\mu_{\eta}}\left[m\langle u, hu\rangle\right]\right)^{2}\right) \leq 0
$$

by Jensen's inequality.

Thanks to  $(3.31)$ , we have

$$
\epsilon m \int \langle u, hu \rangle (\mu(u) - \mu_0(u)) du \ge -\mathcal{H}_{\text{cl}}(\mu, \mu_0) + \epsilon m \int \langle u, hu \rangle (\mu_{\epsilon}(u) - \mu_0(u)) du
$$
  

$$
= -\mathcal{H}_{\text{cl}}(\mu, \mu_0) + \epsilon (\partial_{\eta} F_{\eta}|_{\eta = \epsilon} - \partial_{\eta} F_{\eta}|_{\eta = 0})
$$
  

$$
= -\mathcal{H}_{\text{cl}}(\mu, \mu_0) + \epsilon \int_0^{\epsilon} \partial_{\eta}^2 F_{\eta} d\eta.
$$
 (3.32)

<span id="page-18-0"></span> $2$ This notation is strictly restriced to this proof, it should not generate confusion with the rest of the text.

We estimate

$$
\left| \int_0^{\epsilon} \partial_{\eta}^2 F_{\eta} d\eta \right| \leq \int_0^{\epsilon} |\partial_{\eta}^2 F_{\eta}| d\eta
$$
  
\n
$$
\leq \epsilon m^2 \sup_{\eta \in [0,\epsilon]} \left( \mathbb{E}_{\mu_{\eta}} \left[ \langle u, hu \rangle^2 \right] - \left( \mathbb{E}_{\mu_{\eta}} \left[ \langle u, hu \rangle \right] \right)^2 \right)
$$
  
\n
$$
= \epsilon m^2 \sup_{\eta \in [0,\epsilon]} \text{Tr} \left[ m^2 h^{\otimes 2} \left( \gamma_{\mu_{\eta}}^{(2)} - (\gamma_{\mu_{\eta}}^{(1)})^{\otimes 2} \right) \right],
$$
\n(3.33)

where

$$
\gamma_{\mu_{\eta}}^{(1)} = \int |u\rangle\langle u|\mu_{\eta}(u)du, \quad \gamma_{\mu_{\eta}}^{(2)} = \int |u^{\otimes 2}\rangle\langle u^{\otimes 2}|\mu_{\eta}(u)du.
$$

Applying Lemma [3.7,](#page-16-3) we deduce

$$
\sup_{\eta \in [0,\epsilon]} \text{Tr}\left[h^{\otimes 2}\left(\gamma_{\mu_{\eta}}^{(2)} - (\gamma_{\mu_{\eta}}^{(1)})^{\otimes 2}\right)\right] \le C \dim(E_{\Lambda}).\tag{3.34}
$$

Collecting  $(3.32)$ ,  $(3.33)$ , and  $(3.34)$ , we obtain

$$
\epsilon m \int \langle u, hu \rangle (\mu_0(u) - \mu(u)) du \leq \mathcal{H}_{\text{cl}}(\mu, \mu_0) + C\epsilon^2 \dim(E_{\Lambda}).
$$

There remains to optimize over  $\epsilon$ , i.e. set

<span id="page-19-1"></span><span id="page-19-0"></span>
$$
\epsilon = C_m \sqrt{\frac{\mathcal{H}_\text{cl}(\mu, \mu_0)}{\dim(E_\Lambda)}}
$$

and recall that, within the notation of this proof  $\mu_0 = \rho_{m,0}$  to complete the proof. □

We complete Proposition [3.6](#page-16-1) by a bound on the entropy of the interacting measure relative to the free one:

#### <span id="page-19-2"></span>**Lemma 3.8** (**Relative entropy bound**)**.**

*With the notation of Proposition [3.5](#page-16-0) we have that*

$$
\mathcal{H}_{\rm cl}\left(\rho_{m_2,g},\rho_{m_1,0}\right) \leq C\left(|m_1-m_2|\Delta_{m_1}^{m_2}+1\right),\,
$$

assuming that  $\Delta_{m_1}^{m_2} \geq 0$ .

*Proof.* By definition,

$$
\mathcal{H}_{\text{cl}}\left(\rho_{m_2,g},\rho_{m_1,0}\right) = \int \rho_{m_2,g}(u) \log \left(\rho_{m_2,g}(u)\right) du - \int \rho_{m_1,0}(u) \log \left(\rho_{m_1,0}(u)\right) du \n+ m_1 \int \langle u, hu \rangle \left(\rho_{m_2,g}(u) - \rho_{m_1,0}(u)\right) du.
$$

But, by the Gibbs variational principle defining  $\rho_{m_2,g}$ 

$$
\int \left( m_2 \langle u, hu \rangle + \frac{gm_2}{2} \langle u^{\otimes 2}, w u^{\otimes 2} \rangle \right) \rho_{m_2, g}(u) du + \int \rho_{m_2, g}(u) \log \left( \rho_{m_2, g}(u) \right) du
$$
  
\n
$$
\leq \int \left( m_2 \langle u, hu \rangle + \frac{gm_2}{2} \langle u^{\otimes 2}, w u^{\otimes 2} \rangle \right) \rho_{m_1, 0}(u) du + \int \rho_{m_1, 0}(u) \log \left( \rho_{m_1, 0}(u) \right) du.
$$

Hence

$$
\mathcal{H}_{\text{cl}}\left(\rho_{m_2,g},\rho_{m_1,0}\right) \leq (m_1 - m_2) \int \langle u, hu \rangle \left(\rho_{m_2,g}(u) - \rho_{m_1,0}(u)\right) du \n+ \frac{gm_2}{2} \int \langle u^{\otimes 2}, w u^{\otimes 2} \rangle \rho_{m_1,0}(u) du - \frac{gm_2}{2} \int \langle u^{\otimes 2}, w u^{\otimes 2} \rangle \rho_{m_2,g}(u) du.
$$

By arguments mimicking those involved in the definition of the interacting Gibbs measure (see Appendix [A](#page-51-0) and references therein) we find that the last two terms are bounded independently of  $\Lambda$ . The conclusion follows. □

Finally we can give the final step of the

*Proof of Proposition* [3.5.](#page-16-0) Recall that we are free to assume that  $\Delta_{m_1}^{m_2} \geq 0$ . Combining Proposition [3.6](#page-16-1) and Lemma [3.8](#page-19-2) leads to √

$$
\Delta_{m_1}^{m_2} \le C\sqrt{d}\sqrt{|m_1 - m_2|}\Delta_{m_1}^{m_2} + 1
$$

hence

$$
\Delta_{m_1}^{m_2} \le C\sqrt{d|m_1 - m_2|\Delta_{m_1}^{m_2}} + C\sqrt{d}
$$

<span id="page-20-5"></span>with a generic notation *C* for constants depending only on  $m_1, m_2, g$ . Writing this as

<span id="page-20-1"></span>
$$
\sqrt{\Delta_{m_1}^{m_2}} \left( \sqrt{\Delta_{m_1}^{m_2}} - C \sqrt{d|m_1 - m_2|} \right) \le C \sqrt{d}
$$
 (3.35)

we see that either

$$
\Delta_{m_1}^{m_2} \le 2C^2 d |m_1 - m_2|
$$

or the parenthesis in the left-hand side of  $(3.35)$  is bounded below by  $C\sqrt{\Delta_{m_1}^{m_2}}$  and hence

$$
\Delta_{m_1}^{m_2} \le C\sqrt{d}.
$$

<span id="page-20-0"></span>The proof is complete.  $\Box$ 

#### 4. From the free canonical state to the fixed mass Gaussian measure

We now consider the limit  $N \propto T \to \infty$  of the free canonical Gibbs state, and relate it to the Gaussian measure conditioned on the *L* <sup>2</sup> mass:

<span id="page-20-2"></span>**Theorem 4.1** (**Limit of the free canonical state**)**.**  $Let N = mT$ ,

$$
H_{N,0}:=\sum_{j=1}^N h_j
$$

acting on  $\mathfrak{h}^{\otimes_{sym}N} =: \mathfrak{h}^N$  and the associated canonical Gibbs state

$$
\Gamma_{N,T,0}^{c} = \frac{1}{Z_{N,T,0}^{c}} \exp\left(-\frac{1}{T}H_{N,0}\right).
$$
\n(4.1)

*Define the associated reduced density matrices*

$$
(\Gamma^c_{N,T,0})^{(k)} := \binom{N}{k} \operatorname{Tr}_{k+1 \to N} [\Gamma^c_{N,T,0}].
$$

*In the limit*  $T \to \infty$  *with*  $m > 0$  *fixed*,  $\Gamma^c_{mT,T,0}$  *converges to*  $\mu_{0,m}$  *in the sense that, for all*  $k \in \mathbb{N}$ *,* 

$$
k! \frac{\left(\Gamma_{m}^{c}T_{,\mathcal{I},0}\right)^{(k)}}{T^{k}} \xrightarrow[T \to \infty]{} \int |u^{\otimes k}\rangle \langle u^{\otimes k}| d\mu_{0,m}(u) \tag{4.2}
$$

*strongly in the trace-class on*  $\mathfrak{h}^k$ . Hence  $\mu_{0,m}$  *is the de Finetti measure at scale*  $T^{-1}$  *of the sequence*  $(\Gamma^c_{mT,T,0})_T$  *in the sense of* [\[37,](#page-57-12) Definition 4.1, Theorem 4.2].

The above fixed mass Gaussian measure can be thought of formally as

$$
d\mu_{0,m}(u) = \frac{1}{z_{0,m}} \exp(-\langle u|h u \rangle) \mathbb{1}_{\{ \int |u|^2 = m \}} du.
$$

We have seen in Proposition [3.1](#page-6-4) that  $\mu_{0,m}$  is the limit, as  $\epsilon \to 0$ , of the probability measure

$$
d\mu_{\epsilon,m}(u) = \frac{1}{z_{\epsilon,m}^r} \exp\left(-\frac{1}{\epsilon} \left(\int |u|^2 - m\right)^2\right) d\mu_0(u).
$$

For fixed  $\epsilon > 0$ , it follows from the main results of [\[41,](#page-57-16) [25\]](#page-56-8) that  $\mu_{\epsilon,m}$  is a limit, as  $T \to \infty$ , of the Gibbs state

<span id="page-20-3"></span>
$$
\Gamma_{\epsilon,m,T} = \frac{1}{Z_{\epsilon,m,T}} \exp\left(-\frac{1}{T} \left(d\Gamma(h) + \frac{T}{\epsilon} \left(\frac{\mathcal{N}}{T} - m\right)^2\right)\right),\tag{4.3}
$$

where

$$
d\Gamma(h) = \bigoplus_{N \geq 0} \sum_{j=1}^{N} h_{\mathbf{x}_j}, \quad \left(\frac{\mathcal{N}}{T} - m\right)^2 = \bigoplus_{N \geq 0} \left(\frac{N}{T} - m\right)^2 \mathbb{1}_{\mathfrak{h}^N}.
$$

Here  $\mathfrak{h}^N := \mathfrak{h}^{\otimes_s N}$  is the symmetric tensor product of *N* copies of  $\mathfrak{h}$ .

On the other hand, if we take the limit  $\epsilon \to 0$  in the first place, the Gibbs state  $\Gamma_{\epsilon,m,T}$  clearly converges to the canonical Gibbs state  $\Gamma^c_{mT,T}$  we are interested in. Our strategy of proof for Theorem [4.1](#page-20-2) is therefore to commute the  $T \to \infty$  and  $\epsilon \to 0$  limits, which we obtain by investigating the uniformity of the aforementioned convergences, to allow convergence along a sequence  $\epsilon(T) \to 0$  when  $T \to \infty$ (respectively a sequence  $T(\epsilon) \to \infty$  when  $\epsilon \to 0$ ).

We summarize this scheme of proof in Figure [1.](#page-21-1) The dashed arrow on the right is the content of Theorem [4.1,](#page-20-2) which we obtain by following successively the three solid arrows (Steps 1, 2 and 3). Propo-sition [3.1](#page-6-4) provides Step 1 of this scheme (which, again, can be seen as the very definition of  $\mu_{0,m}$ ). To achieve Steps 2 and 3 we shall prove the two Propositions below.

<span id="page-20-4"></span>

<span id="page-21-7"></span><span id="page-21-1"></span>

FIGURE 1. Derivation of the fixed mass Gaussian measure

Step 2 of the proof of Theorem [4.1](#page-20-2) follows from (a particular case of) the analysis of grand-canonical states in [\[41\]](#page-57-16), with some extra care to track the dependence of remainder terms on  $\epsilon$ :

<span id="page-21-2"></span>**Proposition 4.2** (**Classical limit of the relaxed free canonical Gibbs state**)**.** *Set*

$$
\epsilon = T^{-a}, \quad 0 < a < \frac{s-2}{4s}
$$

*Then, for all*  $k \geq 1$ 

$$
k! \frac{\Gamma_{\epsilon,m,T}^{(k)}}{T^k} - \int |u^{\otimes k}\rangle \langle u^{\otimes k} | d\mu_{\epsilon,m}(u) \xrightarrow[T \to \infty]{}^{\star} 0
$$
\n(4.4)

weakly- $\star$  *in the trace-class*  $\mathfrak{S}^1(\mathfrak{h}^k)$ *. Moreover* 

<span id="page-21-6"></span>
$$
\frac{Z_{\epsilon,m,T}}{Z_{0,T}} - z_{\epsilon,m}^r \xrightarrow[T \to \infty]{} 0.
$$
\n(4.5)

As for the third ingredient we show that the Gibbs state with "relaxed particle number constraint" [\(4.3\)](#page-20-3) indeed converges to the canonical state  $\Gamma^c_{mT,T}$  in the limit  $\epsilon \to 0$  with a controlled dependence on *T* of the limit:

# <span id="page-21-3"></span>**Proposition 4.3** (**Relaxation of the free canonical Gibbs state**)**.**

*Let a >* 0 *and set*

$$
\epsilon = T^{-a}
$$

<span id="page-21-5"></span><span id="page-21-4"></span>*.*

*Then, for all*  $k \geq 1$ *,* 

$$
\frac{\Gamma_{\epsilon,m,T}^{(k)}}{T^k} - \frac{(\Gamma_{mT,T,0}^c)^{(k)}}{T^k} \xrightarrow[T \to \infty]{} 0
$$
\n(4.6)

*weakly-* $\star$  *in*  $\mathfrak{S}^1(\mathfrak{h}^k)$ .

*Proof of Theorem [4.1,](#page-20-2) given Propositions [4.2](#page-21-2) and [4.3.](#page-21-3)* Theorem [4.1](#page-20-2) follows from the combination of Propo-sition [3.1,](#page-6-4) Proposition [4.3](#page-21-3) and Proposition [4.2.](#page-21-2) In fact, the combination of  $(3.2)$ ,  $(4.4)$  and  $(4.6)$  gives weak- $\star$  trace-class convergence in [\(4.2\)](#page-20-4), choosing  $\epsilon(T)$  appropriately, e.g.  $\epsilon = T^{\frac{2-s}{8s}}$ . Convergence in trace-class norm follows as usual from [\[62,](#page-57-33) Addendum H] because both sides of the equation are positive operators, and that the trace (hence the trace-norm) of the left side is easily seen to converge to the trace of the right side.  $\Box$ 

The rest of this section focuses on proving Propositions [4.2](#page-21-2) and [4.3](#page-21-3) (in two separate subsections), i.e. giving the two missing steps outlined in Figure [1.](#page-21-1)

<span id="page-21-0"></span>4.1. **Classical limit of the relaxed free canonical Gibbs state.** We turn to the proof of Proposition [4.2.](#page-21-2) We follow the general variational approach of [\[37,](#page-57-12) [39,](#page-57-13) [41\]](#page-57-16), proving upper and lower bounds to the free energy associated to  $(4.3)$  in terms of the classical partition function defined in  $(3.1)$ . We skip some details since we are mostly concerned with tracking the dependence on  $\epsilon$  of various error terms that have been studied extensively in the mentioned references.

The Gibbs variational principle gives

$$
-\log\left(\frac{Z_{\epsilon,m,T}}{Z_{0,T}}\right) = \inf_{\substack{\Gamma \ge 0 \\ \text{Tr}_{\mathcal{F}}[\Gamma]=1}} \left\{ \mathcal{H}(\Gamma,\Gamma_{0,T}) + \frac{1}{\epsilon} \text{Tr}\left[\left(\frac{\mathcal{N}}{T}-m\right)^2 \Gamma\right] \right\}
$$

where

$$
\mathcal{H}(\Gamma,\Gamma_{0,T}) := \text{Tr}[\Gamma(\log \Gamma - \log \Gamma_{0,T})]
$$

is the von Neumann quantum relative entropy and  $\Gamma_{0,T}$  is the free Gibbs state

$$
\Gamma_{0,T} := \frac{1}{Z_{0,T}} \exp\left(-\frac{1}{T}d\Gamma(h)\right).
$$

Moreover, the Gibbs state  $\Gamma_{\epsilon,m,T}$  is the unique minimizer of the above.

In a similar manner, we have at the classical level

$$
-\log(z_{\epsilon,m}^r) = \inf_{\substack{\nu \text{ prob. meas.} \\ \text{on } \mathfrak{h}}} \left\{ \mathcal{H}_{\text{cl}}(\nu,\mu_0) + \frac{1}{\epsilon} \int (\langle u, u \rangle - m)^2 d\nu(u) \right\},
$$

where

$$
\mathcal{H}_{\text{cl}}(\nu,\mu_0) = \int \frac{d\nu}{d\mu_0} \log \frac{d\nu}{d\mu_0} d\mu_0
$$

is the classical relative entropy and the Gibbs measure  $\mu_{\epsilon,m}$  is the unique minimizer of the above minimization problem.

We relate the above variational problems in the limit  $T \to \infty$  to provide the Proof of Proposition [4.2.](#page-21-2) We begin by controling the expected particle number in  $\Gamma_{\epsilon,m,T}$ , uniformly in  $\epsilon$ :

## <span id="page-22-4"></span>**Lemma 4.4** (**Particle number in the relaxed canonical Gibbs state**)**.**

*Let*  $k \geq 1$  *and*  $m > 0$ *. Then there exists*  $C(k, m) > 0$  *such that for all*  $T \geq 1$  *and all*  $\epsilon > 0$  *small,* 

$$
\operatorname{Tr}\left[\left(\frac{\mathcal{N}}{T}\right)^k \Gamma_{\epsilon,m,T}\right] \le C(k,m). \tag{4.7}
$$

*In particular, we get*

<span id="page-22-1"></span><span id="page-22-0"></span>
$$
\frac{1}{T^k} \text{Tr} \left[ \Gamma_{\epsilon,m,T}^{(k)} \right] \le C(k,m). \tag{4.8}
$$

*Proof.* It suffices to prove  $(4.7)$  since  $(4.8)$  clearly follows. We denote

$$
\Gamma_M = \frac{1}{Z_M} \exp\left(-\frac{1}{T} d\Gamma(h) - M\left(\frac{\mathcal{N}}{T} - m\right)^2\right),\,
$$

where  $Z_M$  is the partition function so that  $Tr[\Gamma_M] = 1$ . In particular,  $\Gamma_{\epsilon,m,T} = \Gamma_{M=1/\epsilon}$ . Recall that  $\Gamma_M$ is the unique minimizer for the free energy functional

$$
\mathcal{F}_M(\Gamma) := \text{Tr}\left[ \left( d\Gamma(h) + MT\left(\frac{\mathcal{N}}{T} - m\right)^2 \right) \Gamma \right] + T \text{Tr}[\Gamma \log \Gamma]
$$

over all states

$$
\Gamma \in \mathcal{S}(\mathcal{F}) := \{0 \leq \Gamma = \Gamma^*, \quad \text{Tr}[\Gamma] = 1\}.
$$

Moreover,

<span id="page-22-3"></span><span id="page-22-2"></span>
$$
\mathcal{F}_M(\Gamma_M) = -T \log Z_M.
$$

Observe that

$$
\frac{Z_{M(1-c)}}{Z_M} = \text{Tr}\left[\exp\left(cM\left(\frac{\mathcal{N}}{T} - m\right)^2\right)\Gamma_M\right].\tag{4.9}
$$

We also note that for all  $M, K > 0$ ,

$$
\mathcal{F}_M(\Gamma_M) = \mathcal{F}_K(\Gamma_K) + T\mathcal{H}(\Gamma_M, \Gamma_K) + T(M - K)\text{Tr}\left[\left(\frac{\mathcal{N}}{T} - m\right)^2 \Gamma_M\right],\tag{4.10}
$$

where

$$
\mathcal{H}(\Gamma_M, \Gamma_K) = \text{Tr}[\Gamma_M(\log \Gamma_M - \log \Gamma_K)]
$$

is the quantum relative entropy.

<span id="page-23-4"></span>Let  $0 < c < 1$  be a constant to be chosen later. Applying  $(4.10)$  with  $M = M(1 - c)$  and  $K = M$ , we have

$$
\mathcal{F}_{M(1-c)}(\Gamma_{M(1-c)}) = T\mathcal{H}(\Gamma_{M(1-c)}, \Gamma_M) + \mathcal{F}_M(\Gamma_M) - cMT\text{Tr}\left[\left(\frac{\mathcal{N}}{T} - m\right)^2 \Gamma_{M(1-c)}\right]
$$

$$
\geq \mathcal{F}_M(\Gamma_M) - cMT\text{Tr}\left[\left(\frac{\mathcal{N}}{T} - m\right)^2 \Gamma_{M(1-c)}\right]
$$

$$
-T \log Z_{M(1-c)} \geq -T \log Z_M - cMT\text{Tr}\left[\left(\frac{\mathcal{N}}{T} - m\right)^2 \Gamma_{M(1-c)}\right].
$$

or

$$
-T \log Z_{M(1-c)} \ge -T \log Z_M - cMT \text{Tr} \left[ \left( \frac{N}{T} - m \right) \Gamma_{M(1-c)} \right].
$$

Hence

<span id="page-23-0"></span>
$$
\log \frac{Z_{M(1-c)}}{Z_M} \le cM \text{Tr} \left[ \left( \frac{\mathcal{N}}{T} - m \right)^2 \Gamma_{M(1-c)} \right]. \tag{4.11}
$$

Applying [\(4.10\)](#page-22-2) with  $M = M(1 - c)$  and  $K = 0$ , we have

$$
\mathcal{F}_{M(1-c)}(\Gamma_{M(1-c)}) = \mathcal{F}_0(\Gamma_0) + T\mathcal{H}(\Gamma_{M(1-c)}, \Gamma_0) + M(1-c)T\text{Tr}\left[\left(\frac{\mathcal{N}}{T} - m\right)^2 \Gamma_{M(1-c)}\right]
$$

$$
\geq \mathcal{F}_0(\Gamma_0) + MT(1-c)\text{Tr}\left[\left(\frac{\mathcal{N}}{T} - m\right)^2 \Gamma_{M(1-c)}\right].
$$

Since  $\Gamma_{M(1-c)}$  is the (unique) minimizer of  $\mathcal{F}_{M(1-c)}(\Gamma)$ , we have

$$
\mathcal{F}_{M(1-c)}(\Gamma_{M(1-c)}) \leq \mathcal{F}_{M(1-c)}(\Gamma_0) = \mathcal{F}_0(\Gamma_0) + TM(1-c)\text{Tr}\left[\left(\frac{\mathcal{N}}{T}-m\right)^2\Gamma_0\right].
$$

Thus we get

$$
\operatorname{Tr}\left[\left(\frac{\mathcal{N}}{T} - m\right)^2 \Gamma_{M(1-c)}\right] \le \operatorname{Tr}\left[\left(\frac{\mathcal{N}}{T} - m\right)^2 \Gamma_0\right].\tag{4.12}
$$

From  $(4.9)$ ,  $(4.11)$  and  $(4.12)$ , we obtain

$$
\operatorname{Tr}\left[\exp\left(cM\left(\frac{\mathcal{N}}{T}-m\right)^2\right)\Gamma_M\right] \leq e^{\operatorname{Tr}\left[cM\operatorname{Tr}\left[\left(\frac{\mathcal{N}}{T}-m\right)^2\Gamma_0\right]\right]}.
$$

Taking  $c = 1/M = \epsilon \rightarrow 0$  and using known bounds on  $\Gamma_0$  (see e.g. [\[37,](#page-57-12) Section 3]), we obtain for all  $T > 1$ ,

<span id="page-23-2"></span><span id="page-23-1"></span>
$$
\operatorname{Tr}\left[\exp\left(\left(\frac{\mathcal{N}}{T}-m\right)^2\right)\Gamma_{\epsilon,m,T}\right]\leq C(m).
$$

In particular,

<span id="page-23-3"></span>
$$
\operatorname{Tr}\left[\left(\frac{\mathcal{N}}{T} - m\right)^{2k} \Gamma_{\epsilon,m,T}\right] \le C(k,m), \quad \forall k \in \mathbb{N}.
$$
\n(4.13)

It follows that

$$
\operatorname{Tr}\left[\left(\frac{\mathcal{N}}{T}\right)^k \Gamma_{\epsilon,m,T}\right] = \operatorname{Tr}\left[\left(\frac{\mathcal{N}}{T} - m + m\right)^k \Gamma_{\epsilon,m,T}\right]
$$

$$
= \operatorname{Tr}\left[\sum_{l=0}^k \binom{k}{l} m^{k-l} \left(\frac{\mathcal{N}}{T} - m\right)^l \Gamma_{\epsilon,m,T}\right]
$$

which, together with a Cauchy-Schwarz inequality and  $(4.13)$ , proves  $(4.7)$ .  $\Box$ 

We now proceed with the

*Proof of Proposition* [4.2.](#page-21-2) Recall that we set  $\epsilon = T^{-a}$  with  $0 < a < \frac{s-2}{4s}$ . **Step 1. Free energy upper bound.** We first prove by a trial state argument that

$$
\lim_{T \to \infty} -\log \left( \frac{Z_{\epsilon, m, T}}{Z_{0, T}} \right) + \log \left( \int_{P_{\mathfrak{h}}} \exp \left( -\frac{1}{\epsilon} \left( \langle u, u \rangle - m \right)^2 \right) d\mu_{0, \Lambda}(u) \right) \le 0, \tag{4.14}
$$

<span id="page-24-4"></span>where  $P = P_{\Lambda} = \mathbb{1}_{\{h \leq \Lambda\}}$  with

<span id="page-24-1"></span>
$$
\Lambda = T^b
$$

for some  $b > 0$  to be chosen later (see [\(4.23\)](#page-27-0) below), and  $d\mu_{0,\Lambda}(u)$  is the cylindrical projection of  $\mu_0$  on *P*h. As per the results in Section [3](#page-6-1) this implies that

$$
\frac{Z_{0,T}}{Z_{\epsilon,m,T}} \le \frac{C(m)}{\sqrt{\epsilon}}.\tag{4.15}
$$

It is known that the Fock space can be factorized as

$$
\mathcal{F} \simeq \mathcal{F}(P\mathfrak{h}) \otimes \mathcal{F}(Q\mathfrak{h})
$$

in the sense that there exists a unitary map

$$
\mathcal{U}:\mathcal{F}(P\mathfrak{h}\oplus Q\mathfrak{h})\to\mathcal{F}(P\mathfrak{h})\otimes\mathcal{F}(Q\mathfrak{h}).
$$

Here  $Q = P_{\Lambda}^{\perp} = \mathbb{1}_{\{h > \Lambda\}}$ .

The free Gibbs state  $\Gamma_{0,T}$  can be factorized as

$$
\Gamma_{0,T} = \mathcal{U}^*(\Gamma_{0,T,P} \otimes \Gamma_{0,T,Q})\mathcal{U},
$$

where

$$
\Gamma_{0,T,P} = \text{Tr}_{\mathcal{F}(Q\mathfrak{h})}[\mathcal{U}\Gamma_{0,T}\mathcal{U}^*] = \frac{\exp\left(-\frac{1}{T}d\Gamma(Ph)\right)}{\text{Tr}_{\mathcal{F}(P\mathfrak{h})}[\exp\left(-\frac{1}{T}d\Gamma(Ph)\right)]},
$$
  

$$
\Gamma_{0,T,Q} = \text{Tr}_{\mathcal{F}(P\mathfrak{h})}[\mathcal{U}\Gamma_{0,T}\mathcal{U}^*] = \frac{\exp\left(-\frac{1}{T}d\Gamma(Qh)\right)}{\text{Tr}_{\mathcal{F}(Q\mathfrak{h})}[\exp\left(-\frac{1}{T}d\Gamma(Qh)\right)]}.
$$

We also denote the *P*-localization of the interacting Gibbs state  $\Gamma_{\epsilon,m,T}$  by

$$
\Gamma_{\epsilon,m,T,P} = \text{Tr}_{\mathcal{F}(Q\mathfrak{h})}[\mathcal{U}\Gamma_{\epsilon,m,T}\mathcal{U}^*] = \frac{\exp\left(-\frac{1}{T}d\Gamma(Ph) - \frac{1}{\epsilon}\left(\frac{d\Gamma(P)}{T} - m\right)^2\right)}{\text{Tr}_{\mathcal{F}(P\mathfrak{h})}\left[\exp\left(-\frac{1}{T}d\Gamma(Ph) - \frac{1}{\epsilon}\left(\frac{d\Gamma(P)}{T} - m\right)^2\right)\right]}.
$$
(4.16)

We define the following trial state

<span id="page-24-3"></span><span id="page-24-0"></span>
$$
\boxed{\Gamma = \mathcal{U}^*(\Gamma_{\epsilon,m,T,P} \otimes \Gamma_{0,T,Q})\mathcal{U}}.\tag{4.17}
$$

By the Gibbs variational principle, we have

$$
-\log\left(\frac{Z_{\epsilon,m,T}}{Z_{0,T}}\right) \le \mathcal{H}(\Gamma,\Gamma_{0,T}) + \frac{1}{\epsilon}\text{Tr}\left[\left(\frac{\mathcal{N}}{T}-m\right)^2\Gamma\right].\tag{4.18}
$$

Following step by step the arguments of the proof of [\[37,](#page-57-12) Lemma 8.3] to track the dependence on  $\epsilon$  of error terms we obtain first

$$
-\log\left(\frac{Z_{\epsilon,m,T}}{Z_{0,T}}\right) \leq \mathrm{Tr}_{\mathcal{F}(P\mathfrak{h})}\left[\Gamma_{\epsilon,m,T,P}\left(\log\Gamma_{\epsilon,m,T,P}-\log\Gamma_{0,T,P}\right)\right] + \mathrm{Tr}_{\mathcal{F}(P\mathfrak{h})}\left[\left(\frac{d\Gamma(P)}{T}-m\right)^2\Gamma_{\epsilon,m,T,P}\right] + (\mathrm{Tr}[Qh^{-1}Q])^2 + C(m)\mathrm{Tr}[Qh^{-1}Q] + C(m)\epsilon^{-1}\mathrm{Tr}[Qh^{-1}Q].\tag{4.19}
$$

The terms on the second line are errors. We focus on the first line and estimate it in terms of the classical variational problem.

By the Gibbs variational principle, the right hand side in the first line is equal to

$$
-\log\left(\frac{\operatorname{Tr}\left[\exp\left(-\frac{1}{T}d\Gamma(Ph)-\frac{1}{\epsilon}\left(\frac{d\Gamma(P)}{T}-m\right)^2\right)\right]}{\operatorname{Tr}[\exp\left(-\frac{1}{T}d\Gamma(Ph)\right)]}\right).
$$

We first have, for the denominator,

<span id="page-24-2"></span>
$$
\operatorname{Tr}\left[\exp\left(-\frac{1}{T}d\Gamma(Ph)\right)\right] = \prod_{\lambda_j\leq\Lambda} \frac{1}{1 - e^{-\lambda_j/T}}.\tag{4.20}
$$

To estimate the numerator, we first use the resolution of identity in terms of coherent states (see  $(1.4)$ )

$$
\left(\frac{T}{\pi}\right)^{\text{Tr}[P]} \int_{P\mathfrak{h}} |\xi(u\sqrt{T})\rangle \langle \xi(u\sqrt{T})| du = \mathbb{1}_{\mathcal{F}(P\mathfrak{h})}
$$

to obtain

$$
\begin{split} \operatorname{Tr}\Big[\exp\Big(-\frac{1}{T}d\Gamma(Ph)-\frac{1}{\epsilon}\Big(\frac{d\Gamma(P)}{T}-m\Big)^2\Big)\Big] \\ & =\Big(\frac{T}{\pi}\Big)^{\operatorname{Tr}[P]} \int_{P\mathfrak{h}} \operatorname{Tr}\Big[\exp\Big(-\frac{1}{T}d\Gamma(Ph)-\frac{1}{\epsilon}\Big(\frac{d\Gamma(P)}{T}-m\Big)^2\Big) |\xi(u\sqrt{T})\langle\xi(u\sqrt{T})|\Big] du \\ & =\Big(\frac{T}{\pi}\Big)^{\operatorname{Tr}[P]} \int_{P\mathfrak{h}} \Big\langle\xi(u\sqrt{T}), \exp\Big(-\frac{1}{T}d\Gamma(Ph)-\frac{1}{\epsilon}\Big(\frac{d\Gamma(P)}{T}-m\Big)^2\Big)\xi(u\sqrt{T})\Big\rangle du. \end{split}
$$

We next use the Peierls-Bogoliubov inequality: for  $F : \mathbb{R} \to \mathbb{R}$  a convex function and A is a self-adjoint operator on a Hilbert space  $\mathcal{H},$ 

$$
\langle x, F(A)x \rangle \ge F(\langle x, Ax \rangle), \quad \forall x \in \mathcal{H}, ||x|| = 1
$$

with 
$$
F(\lambda) = e^{\lambda}
$$
,  $A = -\frac{1}{T}d\Gamma(Ph) - \frac{1}{\epsilon} \left(\frac{d\Gamma(P)}{T} - m\right)^2$ ,  $x = \xi(u\sqrt{T})$ , and  $\mathcal{H} = \mathcal{F}$  to get  
\n
$$
\text{Tr}\left[\exp\left(-\frac{1}{T}d\Gamma(Ph) - \frac{1}{\epsilon}\left(\frac{d\Gamma(P)}{T} - m\right)^2\right)\right]
$$
\n
$$
\geq \left(\frac{T}{\pi}\right)^{\text{Tr}[P]}\int_{P_0} \exp\left(-\left\langle\xi(u\sqrt{T}), \left(\frac{1}{T}d\Gamma(Ph) + \frac{1}{\epsilon}\left(\frac{d\Gamma(P)}{T} - m\right)^2\right\rangle\xi(u\sqrt{T})\right\rangle\right)du.
$$

Using

<span id="page-25-0"></span>
$$
d\Gamma(Ph) = \sum_{\lambda_j \leq \Lambda} \lambda_j a^{\dagger}(u_j) a(u_j),
$$

with creation/annihilation operators  $a^{\dagger}(u_j)$ ,  $a(u_j)$ , we have for  $u \in P\mathfrak{h}$  that

$$
\langle \xi(u\sqrt{T}), d\Gamma(Ph)\xi(u\sqrt{T}) \rangle = \sum_{\lambda_j \leq \Lambda} \lambda_j \langle \xi(u\sqrt{T}), a^{\dagger}(u_j)a(u_j)\xi(u\sqrt{T}) \rangle
$$
  
\n
$$
= \sum_{\lambda_j \leq \Lambda} \lambda_j \langle a(u_j)\xi(u\sqrt{T}), a(u_j)\xi(u\sqrt{T}) \rangle
$$
  
\n
$$
= \sum_{\lambda_j \leq \Lambda} \lambda_j |\langle u_j, u\sqrt{T} \rangle|^2 ||\xi(u\sqrt{T})||^2_{\mathcal{F}}
$$
  
\n
$$
= T \sum_{\lambda_j \leq \Lambda} \lambda_j |\langle u, u_j \rangle|^2
$$
  
\n
$$
= T \langle u, hu \rangle,
$$
 (4.21)

where we used

$$
a(f)\xi(u) = \langle f, u \rangle \xi(u), \quad \|\xi(u)\|_{\mathcal{F}} = 1.
$$

Similarly, we have

$$
\left(\frac{d\Gamma(P)}{T} - m\right)^2 = \frac{1}{T^2} (d\Gamma(P))^2 - \frac{2m}{T} d\Gamma(P) + m^2
$$

with

$$
d\Gamma(P) = \sum_{\lambda_j \leq \Lambda} a^{\dagger}(u_j) a(u_j).
$$

We observe that

$$
(d\Gamma(P))^2 = \sum_{\lambda_j, \lambda_l \leq \Lambda} a^{\dagger}(u_j) a(u_j) a^{\dagger}(u_l) a(u_l)
$$
  
\n
$$
= \sum_{\lambda_j \leq \Lambda} a^{\dagger}(u_j) a(u_j) a^{\dagger}(u_j) a(u_j) + \sum_{\lambda_j, \lambda_l \leq \Lambda} a^{\dagger}(u_j) a^{\dagger}(u_l) a(u_j) a(u_l)
$$
  
\n
$$
= \sum_{\lambda_j \leq \Lambda} a^{\dagger}(u_j) a^{\dagger}(u_j) a(u_j) a(u_j) + \sum_{\lambda_j \leq \Lambda} a^{\dagger}(u_j) a(u_j) + \sum_{\lambda_j, \lambda_l \leq \Lambda} a^{\dagger}(u_j) a^{\dagger}(u_l) a(u_j) a(u_l)
$$

where we used the canonical commutation relations

$$
a(u_j)a^{\dagger}(u_l) = a^{\dagger}(u_l)a(u_j) - [a^{\dagger}(u_l), a(u_j)] = a^{\dagger}(u_l)a(u_j) - \delta_{jl}.
$$

$$
\langle \xi(u\sqrt{T}), d\Gamma(P)\xi(u\sqrt{T}) \rangle = \sum_{\lambda_j \le \Lambda} \langle \xi(u\sqrt{T}), a^{\dagger}(u_j)a(u_j)\xi(u\sqrt{T}) \rangle
$$

$$
= T \sum_{\lambda_j \le \Lambda} |\langle u_j, u \rangle|^2
$$

$$
= T \langle u, u \rangle
$$

and

$$
\langle \xi(u\sqrt{T}), (d\Gamma(P))^2 \xi(u\sqrt{T}) \rangle = \sum_{\lambda_j \leq \Lambda} \langle \xi(u\sqrt{T}), a^\dagger(u_j) a^\dagger(u_j) a(u_j) \xi(u\sqrt{T}) \rangle
$$
  
 
$$
- \sum_{\lambda_j \leq \Lambda} \langle \xi(u\sqrt{T}), a^\dagger(u_j) a(u_j) \xi(u\sqrt{T}) \rangle
$$
  
 
$$
+ \sum_{\lambda_j, \lambda_l \leq \Lambda \atop j \neq l} \langle \xi(u\sqrt{T}), a^\dagger(u_j) a^\dagger(u_l) a(u_j) a(u_l) \xi(u\sqrt{T}) \rangle
$$
  
 
$$
= -T \langle u, u \rangle + T^2 \sum_{\lambda_j \leq \Lambda} |\langle u_j, u \rangle|^4 + T^2 \sum_{\lambda_j, \lambda_l \leq \Lambda \atop j \neq l} |\langle u_j, u \rangle|^2 |\langle u_l, u \rangle|^2
$$
  
 
$$
= T^2 \Big( \sum_{\lambda_j \leq \Lambda} |\langle u_j, u \rangle|^2 \Big)^2 - T \langle u, u \rangle
$$
  
 
$$
= T^2 (\langle u, u \rangle)^2 - T \langle u, u \rangle.
$$

Thus we obtain for  $u \in P\mathfrak{h}$ ,

$$
\begin{split}\n\left\langle \xi(u\sqrt{T}), \left(\frac{d\Gamma(P)}{T} - m\right)^2 \xi(u\sqrt{T}) \right\rangle \\
&= \frac{1}{T^2} \langle \xi(u\sqrt{T}), (d\Gamma(P))^2 \xi(u\sqrt{T}) \rangle - \frac{2m}{T} \langle \xi(u\sqrt{T}), d\Gamma(P) \xi(u\sqrt{T}) \rangle + m^2 \\
&= \frac{1}{T^2} \left( T^2(\langle u, u \rangle)^2 - T\langle u, u \rangle \right) - \frac{2m}{T} T\langle u, u \rangle + m^2 \\
&= (\langle u, u \rangle - m)^2 - \frac{1}{T} \langle u, u \rangle.\n\end{split}
$$

Putting the above identities together, we get

$$
\begin{split} \operatorname{Tr}\Big[\exp\Big(-\frac{1}{T}d\Gamma(Ph)-\frac{1}{\epsilon}\Big(\frac{d\Gamma(P)}{T}-m\Big)^2\Big)\Big] \\ &\geq \Big(\frac{T}{\pi}\Big)^{\operatorname{Tr}[P]} \int_{P\mathfrak{h}} \exp\Big(-\langle u, hu\rangle-\frac{1}{\epsilon}\big(\langle u, u\rangle-m\big)^2+\frac{1}{T\epsilon}\langle u, u\rangle\Big)du \\ &\geq \Big(\frac{T}{\pi}\Big)^{\operatorname{Tr}[P]} \int_{P\mathfrak{h}} \exp\Big(-\langle u, hu\rangle-\frac{1}{\epsilon}\big(\langle u, u\rangle-m\big)^2\Big)du. \end{split}
$$

Observe also that for  $u \in P\mathfrak{h}$ ,

$$
e^{-\langle u, hu \rangle} du = \prod_{\lambda_j \leq \Lambda} e^{-\lambda_j |\alpha_j|^2} d\alpha_j = \Big(\prod_{\lambda_j \leq \Lambda} \frac{\pi}{\lambda_j}\Big) d\mu_{0,\Lambda}(u).
$$

Thus,

$$
\begin{split} \operatorname{Tr}\Bigl[\exp\Big( &-\frac{1}{T}d\Gamma(Ph)-\frac{1}{\epsilon}\Big(\frac{d\Gamma(P)}{T}-m\Big)^2\Bigr)\Bigr] \\ &\geq \Bigl(\prod_{\lambda_j\leq\Lambda}\frac{T}{\lambda_j}\Bigr)\int_{P\mathfrak{h}}\exp\Big(-\frac{1}{\epsilon}(\langle u,u\rangle-m)^2\Bigr)d\mu_{0,\Lambda}(u), \end{split}
$$

hence

$$
- \log \left( \frac{\text{Tr} \left[ \exp \left( -\frac{1}{T} d\Gamma(Ph) - \frac{1}{\epsilon} \left( \frac{d\Gamma(P)}{T} - m \right)^2 \right) \right]}{\text{Tr} \left[ \exp \left( -\frac{1}{T} d\Gamma(Ph) \right) \right]} \right)
$$
  

$$
\leq - \log \left( \left( \prod_{\lambda_j \leq \Lambda} \frac{T(1 - e^{-\lambda_j/T})}{\lambda_j} \right) \int_{P \mathfrak{h}} \exp \left( -\frac{1}{\epsilon} \left( \langle u, u \rangle - m \right)^2 \right) d\mu_{0,\Lambda}(u) \right).
$$

<span id="page-27-1"></span>Inserting the above in  $(4.19)$  we obtain

$$
-\log\left(\frac{Z_{\epsilon,m,T}}{Z_{0,T}}\right) \le -\log\left(\left(\prod_{\lambda_j\le\Lambda}\frac{T(1-e^{-\lambda_j/T})}{\lambda_j}\right)\int_{P\mathfrak{h}}\exp\left(-\frac{1}{\epsilon}\left(\langle u,u\rangle-m\right)^2\right)d\mu_{0,\Lambda}(u)\right) + (\text{Tr}[Qh^{-1}Q])^2 + C(m)\text{Tr}[Qh^{-1}Q] + C(m)\epsilon^{-1}\text{Tr}[Qh^{-1}Q].
$$

We estimate for any  $\frac{1}{2} + \frac{1}{s} < q < 1$ ,

$$
\text{Tr}[Qh^{-1}Q] = \sum_{\lambda_j > \Lambda} \lambda_j^{-1} \leq \Lambda^{-(1-q)} \sum_{\lambda_j > \Lambda} \lambda_j^{-q} \leq \Lambda^{-(1-q)} \text{Tr}[h^{-q}],
$$

where we recall (see [\[39\]](#page-57-13)) that  $Tr[h^{-q}] < \infty$  for all  $q > 1/2 + 1/s$ . We deduce

$$
-\log\left(\frac{Z_{\epsilon,m,T}}{Z_{0,T}}\right) \leq -\log\left(\left(\prod_{\lambda_j\leq\Lambda}\frac{T(1-e^{-\lambda_j/T})}{\lambda_j}\right)\int_{P\mathfrak{h}}\exp\left(-\frac{1}{\epsilon}\left(\langle u,u\rangle - m\right)^2\right)d\mu_{0,\Lambda}(u)\right) + C(m,q)\epsilon^{-1}\Lambda^{-(1-q)}
$$

for all  $\Lambda > 0$  sufficiently large and all  $\epsilon > 0$  sufficiently small. In particular, we have

$$
-\log\left(\frac{Z_{\epsilon,m,T}}{Z_{0,T}}\right) + \log\left(\int_{P\mathfrak{h}} \exp\left(-\frac{1}{\epsilon}\left(\langle u, u\rangle - m\right)^2\right) d\mu_{0,\Lambda}(u)\right)
$$
  

$$
\leq -\log\left(\prod_{\lambda_j\leq\Lambda} \frac{T(1 - e^{-\lambda_j/T})}{\lambda_j}\right) + C(m,q)\epsilon^{-1}\Lambda^{-(1-q)}.
$$

To estimate the log term, we write

$$
-\log\Big(\prod_{\lambda_j\leq\Lambda}\frac{T(1-e^{-\lambda_j/T})}{\lambda_j}\Big)=-\sum_{\lambda_j\leq\Lambda}\log\Big(\frac{T(1-e^{-\lambda_j/T})}{\lambda_j}\Big)
$$

$$
=\sum_{\lambda_j\leq\Lambda}\log\Big(\frac{\lambda_j/T}{1-e^{-\lambda_j/T}}\Big).
$$

Since

$$
e^{-\frac{\lambda_j}{T}} = 1 - \frac{\lambda_j}{T} + O\left(\left(\frac{\lambda_j}{T}\right)^2\right),\,
$$

we have

$$
\frac{\lambda_j/T}{1 - e^{-\lambda_j/T}} = 1 + O(\lambda_j/T).
$$

Since

$$
\log(1+x) \leq Cx, \quad \forall x \geq 0
$$

we get

$$
\sum_{\lambda_j \le \Lambda} \log \left( \frac{\lambda_j/T}{1 - e^{-\lambda_j/T}} \right) \le C \sum_{\lambda_j \le \Lambda} (\lambda_j/T) \le C T^{-1} \Lambda^{3/2 + 1/s},
$$

where we have used the Cwikel-Lieb-Rozenbljum law (see [\[22,](#page-56-24) Lemma D1])

$$
\#\{\lambda_j : \lambda_j \le \Lambda\} \sim \Lambda^{1/2 + 1/s}.\tag{4.22}
$$

Altogether we have proved that

$$
-\log\left(\frac{Z_{\epsilon,m,T}}{Z_{0,T}}\right) + \log\left(\int_{P\mathfrak{h}} \exp\left(-\frac{1}{\epsilon}\left(\langle u,u\rangle - m\right)^2\right) d\mu_{0,\Lambda}(u)\right) \leq CT^{-1}\Lambda^{3/2+1/s} + C(m,q)\epsilon^{-1}\Lambda^{-(1-q)}
$$

for any  $1/2 + 1/2 < q < 1$ . With  $\epsilon = T^{-a}$  and  $\Lambda = T^b$  this reads

$$
-\log\left(\frac{Z_{\epsilon,m,T}}{Z_{0,T}}\right) + \log\left(\int_{P\mathfrak{h}} \exp\left(-\frac{1}{\epsilon}\left(\langle u, u\rangle - m\right)^2\right) d\mu_{0,\Lambda}(u)\right) \leq CT^{b(3/2+1/s)-1} + C(m,q)T^{a-b(1-q)}.
$$

To make the error small, we need

<span id="page-27-0"></span>
$$
\frac{a}{1-q} < b < \frac{2s}{3s+2}.\tag{4.23}
$$

<span id="page-28-2"></span>For  $0 < a < \frac{s-2}{4s}$  we can always find  $q \in (1/2+1/s, 1)$  and b so that  $(4.23)$  is satisfied. We pick one and finally obtain the desired upper bound [\(4.14\)](#page-23-3).

**Step 2. Free energy lower bound.** Let again  $P = P_{\Lambda}$  for  $\Lambda = T^b$ ,  $0 < b < 1$  to be optimized over later.

Let  $\Gamma_{\epsilon,m,T,P}$  be the *P*-localization of  $\Gamma_{\epsilon,m,T}$  satisfying

$$
P^{\otimes k} \Gamma_{\epsilon,m,T}^{(k)} P^{\otimes k} = \Gamma_{\epsilon,m,T,P}^{(k)},
$$

for all  $k \geq 1$ . Let

$$
d\mu_{\epsilon,m,T,P}(u)=\left(\frac{T}{\pi}\right)^{\text{Tr}[P]}\left\langle\xi(u\sqrt{T}),\Gamma_{\epsilon,m,T,P}\xi(u\sqrt{T})\right\rangle_{\mathcal{F}(P\mathfrak{h})}du
$$

be the lower symbol of  $\Gamma_{\epsilon,m,T}$  on  $P\mathfrak{h}$  at scale  $\frac{1}{T}$  and

$$
d\mu_{0,T,P}(u)=\left(\frac{T}{\pi}\right)^{\text{Tr}[P]}\left\langle\xi(u\sqrt{T}),\Gamma_{0,T,P}\xi(u\sqrt{T})\right\rangle_{\mathcal{F}(P\mathfrak{h})}du
$$

be that of the *P*-localization of  $\Gamma_{0,T}$ . Define further the probability measure

$$
d\tilde{\mu}_{\epsilon,m,T,P}(u) := \frac{1}{\tilde{z}_{\epsilon,m,T,P}} \exp\left(-\frac{1}{\epsilon}(\langle u,u\rangle - m)^2\right) d\mu_{0,T,P}(u)
$$

with

<span id="page-28-1"></span>
$$
\tilde{z}_{\epsilon,m,T,P} = \int_{P\mathfrak{h}} \exp\left(-\frac{1}{\epsilon}(\langle u, u \rangle - m)^2\right) d\mu_{0,T,P}(u).
$$

We claim that

$$
-\log\left(\frac{Z_{\epsilon,m,T}}{Z_{0,T}}\right) \geq \mathcal{H}_{\text{cl}}(\mu_{\epsilon,m,T,P}, \tilde{\mu}_{\epsilon,m,T,P}) - \log(\tilde{z}_{\epsilon,m,T,P}) - \mathcal{H}_{\text{cl}}(\tilde{z}_{\epsilon,m,T,P}) - C(m)T^{-(b(1-p)-a)}\log(T^a), \tag{4.24}
$$

The second term of the right-hand side will be shown to match the main term of the upper bound from Step 1, hence proving [\(4.5\)](#page-21-6). The first term will provide the desired control leading to the convergence of density matrices.

By (elements of the proof of) the Berezin-Lieb type inequality from [\[37,](#page-57-12) Theorem 7.1] or [\[41,](#page-57-16) Theorem 5.9]), the entropy term is bounded from below by

<span id="page-28-0"></span>
$$
\mathcal{H}(\Gamma_{\epsilon,m,T},\Gamma_{0,T}) \geq \mathcal{H}(\Gamma_{\epsilon,m,T,P},\Gamma_{0,T,P}) \geq \mathcal{H}_{\text{cl}}(\mu_{\epsilon,m,T,P},\mu_{0,T,P}).\tag{4.25}
$$

For the interaction term, we write

$$
\begin{split}\n\text{Tr}_{\mathcal{F}(\mathfrak{h})}\left[\left(\frac{\mathcal{N}}{T}-m\right)^{2}\Gamma_{\epsilon,m,T}\right] \\
&= \text{Tr}_{\mathcal{F}(P\mathfrak{h})\otimes\mathcal{F}(Q\mathfrak{h})}\left[\mathcal{U}^{*}\left(\frac{\mathcal{N}}{T}-m\right)^{2}\Gamma_{\epsilon,m,T}\mathcal{U}\right] \\
&= \text{Tr}_{\mathcal{F}(P\mathfrak{h})\otimes\mathcal{F}(Q\mathfrak{h})}\left[\mathcal{U}^{*}\left(\frac{\mathcal{N}}{T}-m\right)^{2}\mathcal{U}\mathcal{U}^{*}\Gamma_{\epsilon,m,T}\mathcal{U}\right] \\
&= \text{Tr}_{\mathcal{F}(P\mathfrak{h})\otimes\mathcal{F}(Q\mathfrak{h})}\left[\left(\frac{d\Gamma(P)+d\Gamma(Q)}{T}-m\right)^{2}\mathcal{U}^{*}\Gamma_{\epsilon,m,T}\mathcal{U}\right] \\
&= \text{Tr}_{\mathcal{F}(P\mathfrak{h})\otimes\mathcal{F}(Q\mathfrak{h})}\left[\left(\left(\frac{d\Gamma(P)}{T}\right)^{2}-2m\frac{d\Gamma(P)}{T}+m^{2}+\left(\frac{d\Gamma(Q)}{T}\right)^{2}-2m\frac{d\Gamma(Q)}{T}\right)\mathcal{U}^{*}\Gamma_{\epsilon,m,T}\mathcal{U}\right] \\
&= \text{Tr}_{\mathcal{F}(P\mathfrak{h})}\left[\left(\left(\frac{d\Gamma(P)}{T}\right)^{2}-2m\frac{d\Gamma(P)}{T}+m^{2}\right)\text{Tr}_{\mathcal{F}(Q\mathfrak{h})}\left[\mathcal{U}^{*}\Gamma_{\epsilon,m,T}\mathcal{U}\right]\right] \\
&+ \text{Tr}_{\mathcal{F}(Q\mathfrak{h})}\left[\left(\left(\frac{d\Gamma(Q)}{T}\right)^{2}-2m\frac{d\Gamma(Q)}{T}\right)\text{Tr}_{\mathcal{F}(P\mathfrak{h})}\left[\mathcal{U}^{*}\Gamma_{\epsilon,m,T}\mathcal{U}\right]\right] \\
&= \text{Tr}_{\mathcal{F}(P\mathfrak{h})}\left[\left(\left(\frac{d\Gamma(P)}{T}\right)^{2}-2m\frac{d\Gamma(P)}{T}+m^{2}\right)\Gamma_{\epsilon,m,T,P}\right] \\
&+ \text{Tr}_{\
$$

<span id="page-29-1"></span>Observe that

$$
\begin{split} \operatorname{Tr}_{\mathcal{F}(P\mathfrak{h})} & \Big[ \Big( \Big(\frac{d\Gamma(P)}{T}\Big)^2 - 2m\frac{d\Gamma(P)}{T} + m^2 \Big) \Gamma_{\epsilon,m,T,P} \Big] \\ & = \frac{2}{T^2} \operatorname{Tr}_{\mathcal{F}(P\mathfrak{h})} \Big[ \Big(\frac{d\Gamma(P)}{2}\Big) \Gamma_{\epsilon,m,T,P} \Big] + \frac{1}{T} \Big(\frac{1}{T} - 2m\Big) \operatorname{Tr}_{\mathcal{F}(P\mathfrak{h})} \Big[ \Big(\frac{d\Gamma(P)}{1}\Big) \Gamma_{\epsilon,m,T,P} \Big] + m^2 \\ & = 2 \operatorname{Tr}_{\mathcal{F}(P\mathfrak{h})} \Big[ \frac{1}{T^2} \Gamma_{\epsilon,m,T,P}^{(2)} \Big] + \Big(\frac{1}{T} - 2m\Big) \operatorname{Tr}_{\mathcal{F}(P\mathfrak{h})} \Big[ \frac{1}{T} \Gamma_{\epsilon,m,T,P}^{(1)} \Big] + m^2. \end{split}
$$

By omitting a non-negative term and noting that

<span id="page-29-0"></span>
$$
\mathrm{Tr}_{\mathcal{F}(Q\mathfrak{h})}[d\Gamma(Q)\Gamma_{\epsilon,m,T,Q}] = \mathrm{Tr}[Q\Gamma^{(1)}_{\epsilon,m,T}],
$$

we obtain

$$
\frac{1}{\epsilon} \text{Tr} \left[ \left( \frac{\mathcal{N}}{T} - m \right)^2 \Gamma_{\epsilon, m, T} \right]
$$
\n
$$
\geq \frac{1}{\epsilon} \left( 2 \text{Tr}_{\mathcal{F}(P\mathfrak{h})} \left[ \frac{1}{T^2} \Gamma_{\epsilon, m, T, P}^{(2)} \right] + \left( \frac{1}{T} - 2m \right) \text{Tr}_{\mathcal{F}(P\mathfrak{h})} \left[ \frac{1}{T} \Gamma_{\epsilon, m, T, P}^{(1)} \right] + m^2 \right) - \frac{2m}{\epsilon T} \text{Tr}[Q \Gamma_{\epsilon, m, T}^{(1)}].
$$
\nand so Einstein theorem (see [27-Lemma 6.2) and Remark 6.41 or [41. Theorem 5.81), we have

By the de Finetti theorem (see [\[37,](#page-57-12) Lemma 6.2 and Remark 6.4] or [\[41,](#page-57-16) Theorem 5.8]), we have for all  $k \geq 1$ ,

$$
\int_{P\mathfrak{h}} |u^{\otimes k}\rangle \langle u^{\otimes k}| d\mu_{\epsilon,m,T,P}(u) = \frac{k!}{T^k} \Gamma_{\epsilon,m,T,P}^{(k)} + \frac{k!}{T^k} \sum_{l=0}^{k-1} {k \choose l} \Gamma_{\epsilon,m,T,P}^{(l)} \otimes_s \mathbb{1}_{(P\mathfrak{h})^{k-l}} \tag{4.26}
$$

and

$$
\frac{k!}{T^k} \Gamma_{\epsilon,m,T,P}^{(k)} - \int_{P\mathfrak{h}} |u^{\otimes k}\rangle \langle u^{\otimes k} | d\mu_{\epsilon,m,T,P}(u) \Big\|_{\mathfrak{S}^1((P\mathfrak{h})^k)}
$$
\n
$$
\leq \frac{1}{T^{k-l}} \sum_{l=0}^{k-1} {k \choose l}^2 \frac{(k-l+\text{Tr}[P]-1)!}{(\text{Tr}[P]-1)!} \text{Tr}_{\mathcal{F}(P\mathfrak{h})} \Big[ \Big(\frac{d\Gamma(P)}{T}\Big)^l \Gamma_{\epsilon,m,T,P} \Big].
$$

In particular

 $\begin{array}{c} \hline \end{array}$ 

$$
\frac{1}{T}\Gamma^{(1)}_{\epsilon,m,T,P} = \int_{P\mathfrak{h}} |u\rangle\langle u| d\mu_{\epsilon,m,T,P}(u) - \frac{1}{T}P
$$

and

$$
\frac{1}{T^2} \Gamma_{\epsilon,m,T,P}^{(2)} = \frac{1}{2} \int_{P\mathfrak{h}} |u^{\otimes 2}\rangle \langle u^{\otimes 2}| d\mu_{\epsilon,m,T,P}(u) - \frac{2}{T^2} \Gamma_{\epsilon,m,T,P}^{(1)} \otimes_s P - \frac{2}{T^2} P \otimes_s P.
$$

Thus

$$
2\text{Tr}_{\mathcal{F}(P\mathfrak{h})}\Big[\frac{1}{T^2}\Gamma_{\epsilon,m,T,P}^{(2)}\Big] + \Big(\frac{1}{T} - 2m\Big)\text{Tr}_{\mathcal{F}(P\mathfrak{h})}\Big[\frac{1}{T}\Gamma_{\epsilon,m,T,P}^{(1)}\Big] + m^2
$$
  
\n
$$
= \int_{P\mathfrak{h}} \langle u, u \rangle^2 d\mu_{\epsilon,m,T,P}(u) - \frac{4}{T^2}\text{Tr}[P]\text{Tr}[\Gamma_{\epsilon,m,T,P}^{(1)}] - \frac{4}{T^2}(\text{Tr}[P])^2
$$
  
\n
$$
+ \Big(\frac{1}{T} - 2m\Big) \int_{P\mathfrak{h}} \langle u, u \rangle d\mu_{\epsilon,m,T,P}(u) + \Big(\frac{1}{T} - 2m\Big) \frac{1}{T}\text{Tr}[P] + m^2
$$
  
\n
$$
\geq \int_{P\mathfrak{h}} (\langle u, u \rangle - m)^2 d\mu_{\epsilon,m,T,P}(u) - \frac{4}{T^2}\text{Tr}[P]\text{Tr}[\Gamma_{\epsilon,m,T,P}^{(1)}] - \frac{4}{T^2}(\text{Tr}[P])^2 - 2m\frac{1}{T}\text{Tr}[P].
$$

Since  $(by (4.8))$  $(by (4.8))$  $(by (4.8))$ 

$$
\frac{1}{T} \text{Tr}[\Gamma^{(1)}_{\epsilon,m,T,P}] = \frac{1}{T} \text{Tr}[\Gamma_{\epsilon,m,T}] \le C(m)
$$

and  $\text{Tr}[P] = \Lambda^{1/2+1/s} \ll T$ , we have

$$
2\mathrm{Tr}_{\mathcal{F}(P\mathfrak{h})}\Big[\frac{1}{T^2}\Gamma_{\epsilon,m,T,P}^{(2)}\Big] + \Big(\frac{1}{T} - 2m\Big)\mathrm{Tr}_{\mathcal{F}(P\mathfrak{h})}\Big[\frac{1}{T}\Gamma_{\epsilon,m,T,P}^{(1)}\Big] + m^2
$$
  

$$
\geq \int_{P\mathfrak{h}} (\langle u, u \rangle - m)^2 d\mu_{\epsilon,m,T,P}(u) - C(m)\frac{\mathrm{Tr}[P]}{T}.
$$

In particular, we have

$$
\frac{1}{\epsilon}\text{Tr}\Big[\Big(\frac{\mathcal{N}}{T}-m\Big)^2\Gamma_{\epsilon,m,T}\Big]\geq \frac{1}{\epsilon}\int_{P\mathfrak{h}}(\langle u,u\rangle-m)^2d\mu_{\epsilon,m,T,P}(u)-C(m)\frac{\text{Tr}[P]}{\epsilon T}-\frac{2m}{\epsilon T}\text{Tr}[Q\Gamma_{\epsilon,m,T}^{(1)}].
$$

Thanks to [\(4.15\)](#page-24-1), the same argument as in the proof of [\[37,](#page-57-12) Lemma 8.2] yields

$$
\frac{1}{T}\Gamma_{\epsilon,m,T}^{(1)} \le C(m)\log\left(\frac{1}{\epsilon}\right)h^{-1},\,
$$

<span id="page-30-4"></span>hence

$$
\frac{1}{T} \text{Tr}[Q\Gamma_{\epsilon,m,T}^{(1)}] \le C(m) \log\left(\frac{1}{\epsilon}\right) \text{Tr}[Qh^{-1}] \le C(m,q) \log\left(\frac{1}{\epsilon}\right) \Lambda^{-(1-q)}
$$

for any  $q \in (1/2 + 1/s, 1)$ . It follows that

$$
\frac{1}{\epsilon} \text{Tr} \Big[ \Big( \frac{\mathcal{N}}{T} - m \Big)^2 \Gamma_{\epsilon, m, T} \Big] \ge \frac{1}{\epsilon} \int_{P\mathfrak{h}} (\langle u, u \rangle - m)^2 d\mu_{\epsilon, m, T, P}(u) \n- C(m) \epsilon^{-1} T^{-1} \Lambda^{1/2 + 1/s} - C(m, q) \epsilon^{-1} \log \Big( \frac{1}{\epsilon} \Big) \Lambda^{-(1-q)}.
$$

Since  $\epsilon = T^{-a}$  and  $\Lambda = T^b$ , we have

$$
\frac{1}{\epsilon} \text{Tr} \left[ \left( \frac{\mathcal{N}}{T} - m \right)^2 \Gamma_{\epsilon, m, T} \right] \ge \frac{1}{\epsilon} \int_{P_{\mathfrak{h}}} (\langle u, u \rangle - m)^2 d\mu_{\epsilon, m, T, P}(u) \n- C(m) T^{-(1 - a - b(1/2 + 1/s))} - C(m, q) T^{-(b(1 - q) - a)} \log(T^a).
$$
\n(4.27)

To make the error small, we need

$$
a+b(1/2+1/s)<1,\quad a
$$

These conditions are fulfilled if

<span id="page-30-1"></span><span id="page-30-0"></span>
$$
\frac{a}{1-q} < b < \frac{1-a}{1/2 + 1/s}.\tag{4.28}
$$

Again, for  $0 < a < \frac{s-2}{4s}$ , we can always find  $q \in (1/2+1/s, 1)$  and *b* so that  $(4.28)$  is satisfied. Collecting [\(4.25\)](#page-28-0) and [\(4.27\)](#page-30-1) gives [\(4.24\)](#page-28-1).

**Step 3. Comparison of classical measures.** The lower bound  $(4.24)$  involves objects that are similar to the classical measures and partition functions of Section [3,](#page-6-1) but not exactly identical. We bridge this gap by proving that, with  $\epsilon = T^{-a}$  and  $\Lambda = T^b$ , assuming

<span id="page-30-3"></span><span id="page-30-2"></span>
$$
0 < b < \frac{1 - a}{3/2 + 1/s},\tag{4.29}
$$

then we have

$$
\|\tilde{\mu}_{\epsilon,m,T,P} - \mu_{\epsilon,m}\|_{L^1(P\mathfrak{h})} \xrightarrow[T \to \infty]{} 0.
$$
\n(4.30)

and

$$
\left|\frac{1}{\tilde{z}_{\epsilon,m,T,P}} - \frac{1}{z_{\epsilon,m,P}}\right| \le C(m) \frac{\Lambda^{3/2+1/s}}{T\epsilon}.
$$
\n(4.31)

with

$$
z_{\epsilon,m,P} := \int_{P\mathfrak{h}} \exp\left(-\frac{1}{\epsilon}(\langle u, u \rangle - m)^2\right) d\mu_{0,\Lambda}(u).
$$

We argue as in [\[41,](#page-57-16) Lemma 9.3]. First we have

$$
\left| \tilde{z}_{\epsilon,m,T,P} - z_{\epsilon,m,P} \right| = \left| \int_{P\mathfrak{h}} \exp\left( -\frac{1}{\epsilon} (\langle u, u \rangle - m)^2 \right) (d\mu_{0,T,P}(u) - d\mu_{0,\Lambda}(u)) \right|
$$
  

$$
\leq \|\mu_{0,T,P} - \mu_{0,\Lambda}\|_{L^1(P\mathfrak{h})}.
$$

Recall that, with  $K = \text{rank}(P)$ 

$$
d\mu_{0,\Lambda}(u) = \prod_{j=1}^{K} \frac{\lambda_j}{\pi} \exp(-\lambda_j |\alpha_j|^2) d\alpha_j, \quad u = \sum_{j=1}^{K} \alpha_j u_j
$$

and

$$
d\mu_{0,T,P}(u) = \left(\frac{T}{\pi}\right)^K \left\langle \xi(u\sqrt{T}), \Gamma_{0,T,P}\xi(u\sqrt{T}) \right\rangle_{\mathcal{F}(P\mathfrak{h})} du
$$
  
=  $\left(\frac{T}{\pi}\right)^K \frac{1}{\text{Tr}\left[\exp\left(-\frac{1}{T}d\Gamma(Ph)\right)\right]} \left\langle \xi(u\sqrt{T}), \exp\left(-\frac{1}{T}d\Gamma(Ph)\right) \xi(u\sqrt{T}) \right\rangle_{\mathcal{F}(P\mathfrak{h})} du.$ 

By the Peierls-Bogoliubov inequality, we have (see  $(4.21)$ ) for  $u \in P\mathfrak{h}$ ,

$$
\left\langle \xi(u\sqrt{T}), \exp\left(-\frac{1}{T}d\Gamma(Ph)\right)\xi(u\sqrt{T}) \right\rangle \ge \exp\left(-\left\langle \xi(u\sqrt{T}), \frac{1}{T}d\Gamma(Ph)\xi(u\sqrt{T}) \right\rangle \right)
$$

$$
= \exp\left(-\sum_{j=1}^{K} \lambda_j |\alpha_j|^2\right).
$$

By  $(4.20)$ , we get

$$
d\mu_{0,T,P}(u) \ge \Big(\prod_{j=1}^K \frac{T}{\lambda_j} (1 - e^{-\lambda_j/T})\Big) d\mu_{0,\Lambda}(u).
$$

*K*

Using

$$
\frac{1 - e^{-x}}{x} \ge 1 - \frac{x}{2}, \quad \forall x > 0
$$

and

$$
\prod_{j=1}^{K} (1 - a_j) \ge 1 - \sum_{j=1}^{K} a_j, \quad \forall 0 < a_j < 1,
$$

we see that

$$
\prod_{j=1}^{K} \frac{T}{\lambda_j} (1 - e^{-\lambda_j/T}) \ge \prod_{j=1}^{K} \left(1 - \frac{\lambda_j}{2T}\right)
$$
\n
$$
\ge 1 - \frac{1}{2T} \sum_{j=1}^{K} \lambda_j
$$
\n
$$
\ge 1 - \frac{1}{2T} \Lambda \cdot \# \{\lambda_j : \lambda_j \le \Lambda\}
$$
\n
$$
\ge 1 - \frac{C}{T} \Lambda^{\frac{3}{2} + \frac{1}{s}}
$$

hence

$$
d\mu_{0,T,P}(u) \ge \Big(1 - \frac{C}{T}\Lambda^{3/2+1/s}\Big)d\mu_{0,\Lambda}(u).
$$

This shows that

$$
(d\mu_{0,T,P}(u) - d\mu_{0,\Lambda}(u))_- \leq \frac{C}{T} \Lambda^{3/2+1/s} d\mu_{0,\Lambda}(u),
$$

where  $f_$  = max( $-f$ , 0) is the negative part. Integrating over  $u \in P$ h, we get

$$
\int_{P\mathfrak{h}} (d\mu_{0,T,P}(u)-d\mu_{0,\Lambda}(u))_- \leq \frac{C}{T} \Lambda^{3/2+1/s}.
$$

Since  $\mu_{0,T,P}$  and  $\mu_{0,\Lambda}$  are probability measures and  $f = f_+ - f_-,$  we have

$$
0 = \int_{P\mathfrak{h}} d\mu_{0,T,P}(u) - d\mu_{0,\Lambda}(u) = \int_{P\mathfrak{h}} (d\mu_{0,T,P}(u) - d\mu_{0,\Lambda}(u))_{+} - \int_{P\mathfrak{h}} (d\mu_{0,T,P}(u) - d\mu_{0,\Lambda}(u))_{-}.
$$

Because  $|f| = f_{+} + f_{-}$ , we obtain

$$
\int_{P\mathfrak{h}} |d\mu_{0,T,P}(u) - d\mu_{0,\Lambda}(u)| \leq 2 \int_{P\mathfrak{h}} (d\mu_{0,T,P}(u) - d\mu_{0,\Lambda}(u))_- \leq \frac{C}{T} \Lambda^{3/2+1/s}.
$$

This shows that

$$
|\tilde{z}_{\epsilon,m,T,P} - z_{\epsilon,m,P}| \leq \frac{C}{T} \Lambda^{3/2 + 1/s}.
$$

Since  $z_{\epsilon,m,P} \geq C(m)\sqrt{\epsilon}$  (cf Section [3\)](#page-6-1), we infer that

$$
\tilde{z}_{\epsilon,m,T,P} \ge z_{\epsilon,m,P} - \frac{C}{T} \Lambda^{3/2+1/s}
$$

$$
\ge C(m)\sqrt{\epsilon}
$$

because of  $\Lambda^{3/2+1/s} \ll T\sqrt{\epsilon}$  due to [\(4.29\)](#page-30-2). In particular, we have

$$
\left| \frac{1}{\tilde{z}_{\epsilon,m,T,P}} - \frac{1}{z_{\epsilon,m,P}} \right| = \frac{|\tilde{z}_{\epsilon,m,T,P} - z_{\epsilon,m,P}|}{\tilde{z}_{\epsilon,m,T,P} z_{\epsilon,m,P}} \leq C(m) \frac{\Lambda^{3/2+1/s}}{T\epsilon}.
$$

<span id="page-32-1"></span>We now estimate

$$
\|\tilde{\mu}_{\epsilon,m,T,P} - \mu_{\epsilon,m,P}\|_{L^{1}(P\mathfrak{h})} \leq \left|\frac{1}{\tilde{z}_{\epsilon,m,T,P}} - \frac{1}{z_{\epsilon,m,P}}\right| \int_{P\mathfrak{h}} \exp\left(-\frac{1}{\epsilon}(\langle u, u \rangle - m)^{2}\right) d\mu_{0,T,P}(u) \n+ \int_{P\mathfrak{h}} \frac{1}{z_{\epsilon,m,P}} \exp\left(-\frac{1}{\epsilon}(\langle u, u \rangle - m)^{2}\right) |d\mu_{0,T,P}(u) - d\mu_{0,\Lambda}(u)| \n\leq \left|\frac{1}{\tilde{z}_{\epsilon,m,T,P}} - \frac{1}{z_{\epsilon,m,P}}\right| + \frac{1}{z_{\epsilon,m,P}} \|\mu_{0,T,P} - \mu_{0,\Lambda}\|_{L^{1}(P\mathfrak{h})} \n\leq C(m) \frac{\Lambda^{3/2+1/s}}{T\epsilon} + C(m) \frac{\Lambda^{3/2+1/s}}{T\sqrt{\epsilon}} \n\leq C(m) \frac{\Lambda^{3/2+1/s}}{T\epsilon} \n= C(m) T^{-(1-a-b(3/2+1/s))} \n\frac{\lambda^{-3/2}}{T\lambda} \frac{0}
$$

1

thanks to  $(4.29)$ .

**Step 4. Convergence of lower symbols and density matrices.** Combining [\(4.14\)](#page-23-3) with [\(4.24\)](#page-28-1) we conclude that

$$
\lim_{T \to \infty} \mathcal{H}_{\text{cl}}(\mu_{\epsilon,m,T,P}, \tilde{\mu}_{\epsilon,m,T,P}) = 0
$$

provided that the conditions [\(4.23\)](#page-27-0), [\(4.28\)](#page-30-0) and [\(4.29\)](#page-30-2) are satisfied simultaniously. These conditions require

$$
\frac{a}{1-q} < b < \frac{1-a}{3/2+1/s}
$$

for some  $q \in (1/2 + 1/s, 1)$ . This is possible if we impose

$$
0 < a < \frac{1-q}{5/2+1/s-q}
$$

Since *q* can take any value in  $(1/2 + 1/s, 1)$ , we can match this condition if

$$
0 < a < \frac{1}{2} \left( \frac{1}{2} - \frac{1}{s} \right).
$$

Using Pinsker's inequality (see [\[13\]](#page-56-34))

$$
\mathcal{H}_{\mathrm{cl}}(\mu,\nu) \geq \frac{1}{2} (\|\mu - \nu\|_{L^1})^2,
$$

we get

 $\overline{\phantom{a}}$  $\overline{\phantom{a}}$  $\overline{\phantom{a}}$ 

$$
\|\mu_{\epsilon,m,T,P} - \tilde{\mu}_{\epsilon,m,T,P}\|_{L^1(P\diamond)} \xrightarrow[T \to \infty]{} 0.
$$
\n(4.32)

<span id="page-32-0"></span>*.*

1

Combining with [\(4.30\)](#page-30-3) we deduce

$$
\|\mu_{\epsilon,m,T,P} - \mu_{\epsilon,m}\|_{L^1(P\diamond)} \xrightarrow[T \to \infty]{} 0. \tag{4.33}
$$

Let now *K* be a bounded operator on  $(P\mathfrak{h})^k$ . Let  $\delta > 0$  and set  $f(u) = \langle u^{\otimes k}, Ku^{\otimes k} \rangle$ . For  $A > 0$  to be chosen later, we estimate

$$
\Big| \int_{P\mathfrak{h}} f(u)(d\mu_{\epsilon,m,T,P}(u) - d\mu_{\epsilon,m}(u)) \Big| \leq \Big| \int_{\substack{u \in P\mathfrak{h} \\ \|u\| \leq A}} f(u)(d\mu_{\epsilon,m,T,P}(u) - d\mu_{\epsilon,m}(u)) \Big| + \Big| \int_{\substack{u \in P\mathfrak{h} \\ \|u\| > A}} f(u)d\mu_{\epsilon,m,T,P}(u) \Big| + \Big| \int_{\substack{u \in P\mathfrak{h} \\ \|u\| > A}} f(u)d\mu_{\epsilon,m}(u) \Big|.
$$

Since  $|f(u)| \leq ||K||_{\infty} ||u||^{2k}$ , we have

$$
\int_{P\mathfrak{h}} f(u) (d\mu_{\epsilon,m,T,P}(u) - d\mu_{\epsilon,m}(u)) \Big| \leq \|K\|_{\infty} A^{2k} \|\mu_{\epsilon,m,T,P} - \mu_{\epsilon,m}\|_{L^{1}(P\mathfrak{h})} + A^{-2k} \left( \int_{P\mathfrak{h}} \|u\|^{4k} d\mu_{\epsilon,m,T,P}(u) + \int \|u\|^{4k} d\mu_{\epsilon,m}(u) \right).
$$

By the de Finetti theorem  $(4.26)$  and  $(4.7)$ , we have

$$
\int_{P\mathfrak{h}} \|u\|^{4k} d\mu_{\epsilon,m,T,P}(u) \le C(k,m)
$$

<span id="page-33-2"></span>uniformly in  $\epsilon > 0$ . On the other hand, from Proposition [4.2](#page-21-2) we have

$$
\int \|u\|^{4k} d\mu_{\epsilon,m}(u) \le C(k,m)
$$

uniformly in  $\epsilon > 0$  small.

By choosing  $A = A(\delta) > 0$  large, we have

$$
A^{-2k}\left(\int_{P\mathfrak{h}}\|u\|^{4k}d\mu_{\epsilon,m,T,P}(u)+\int\|u\|^{4k}d\mu_{\epsilon,m}(u)\right)<\delta/2.
$$

With  $A$  chosen above, we can use  $(4.33)$  to make

$$
||K||_{\infty} A^{2k} || \mu_{\epsilon,m,T,P} - \mu_{\epsilon,m} ||_{L^1(P\mathfrak{h})} < \delta/2.
$$

This shows that, for any bounded operator *K*

$$
\Big|\int_{P\mathfrak{h}}\langle u^{\otimes k}, Ku^{\otimes k}\rangle d\mu_{\epsilon,m,T,P}(u)-\int_{P\mathfrak{h}}\langle u^{\otimes k}, Ku^{\otimes k}\rangle d\mu_{\epsilon,m}(u)\Big|\xrightarrow{T\to\infty}0.
$$

Combining with the de Finetti theorem  $(5.16)-(5.17)$  $(5.16)-(5.17)$  $(5.16)-(5.17)$  we deduce that

$$
\left\| \frac{k!}{T^k} P^{\otimes k} \Gamma_{\epsilon,m,T}^{(k)} P^{\otimes k} - \int | (Pu)^{\otimes k} \rangle \langle (Pu)^{\otimes k} | d\mu_{\epsilon,m}(u) \right\|_{\mathfrak{S}^1((P\mathfrak{h})^k)} \to 0.
$$

It follow that for any fixed  $\phi_k \in \mathfrak{h}^k$ 

$$
\frac{k!}{T^k} \left\langle \phi_k, \Gamma_{\epsilon,m,T}^{(k)} \phi_k \right\rangle - \int \left| \left\langle \phi_k, u^{\otimes k} \right\rangle \right|^2 d\mu_{\epsilon,m}(u) \to 0
$$

and [\(4.4\)](#page-21-4) follows from combining with uniform bounds in trace-class norm that we have already used.  $\Box$ 

<span id="page-33-0"></span>4.2. **Convergence of the relaxed Gibbs state to the canonical Gibbs state.** We now study the limit, when  $\epsilon \to 0$ , of the relaxed free canonical Gibbs state  $\Gamma_{\epsilon,m,T}$ , and prove Proposition [4.3.](#page-21-3)

We have the following immediate relations:

**Lemma 4.5** (**Relaxed Gibbs state and canonical Gibbs state**)**.** *We have*

$$
\Gamma_{\epsilon,m,T} = \bigoplus_{N \ge 0} (\Gamma_{\epsilon,m,T})_N = \bigoplus_{N \ge 0} \Gamma^c_{N,T,0} a_N^{\epsilon}
$$

*with*

$$
\Gamma_{N,T,0}^c = \frac{1}{Z_{N,T,0}^c} \exp\left(-\frac{1}{T}H_{N,0}\right)
$$

*and*

$$
a_N^{\epsilon} = \frac{1}{Z_{\epsilon,m,T}} \exp\left(-\frac{1}{T} \left(F_0^c(N) + \frac{T}{\epsilon} \left(\frac{N}{T} - m\right)^2\right)\right),\,
$$

*where*

$$
Z_{N,T,0}^c = \text{Tr}\left[\exp\left(-\frac{1}{T}H_{N,0}\right)\right], \quad F_0^c(N) = -T\log(Z_{N,T,0}^c).
$$

*In particular,*

$$
Z_{\epsilon,m,T} = \sum_{N \ge 0} \exp\left(-\frac{1}{T} \left(F_0^c(N) + \frac{T}{\epsilon} \left(\frac{N}{T} - m\right)^2\right)\right). \tag{4.34}
$$

We will need to control the dependence on the particle number of the free canonical Gibbs state:

<span id="page-33-1"></span>**Lemma 4.6** (**Dependence of the canonical ensemble on the particle number**)**.** *For each*  $\phi_k \in \mathfrak{h}^k$ , there exists  $C > 0$  *such that* 

$$
\left| \left\langle \phi_k | (\Gamma^c_{N,T,0})^{(k)} - (\Gamma^c_{N+1,T,0})^{(k)} | \phi_k \right\rangle \right| \leq C N^{k-1}.
$$

*In particular, for*  $M > N$ *,* 

$$
\left| \left\langle \phi_k | (\Gamma^c_{N,T,0})^{(k)} - (\Gamma^c_{M,T,0})^{(k)} | \phi_k \right\rangle \right| \leq C N^{k-1} (M - N).
$$

We need the following combinatorial lemma from [\[11,](#page-56-30) Combinatorial Proposition on Page 102]:

## <span id="page-34-1"></span>**Lemma 4.7** (**Combinatorics**)**.**

*Given a non-negative integer*  $N$  *and a sequence of non-negative integers*  $(g_j) \in \mathbb{N}^{\mathbb{N}}$  *with*  $|g| = 2N + 1$  *we let*

$$
S_N = \left\{ (n_j) \in \mathbb{N}^{\mathbb{N}} : |n| = N, n_j \le g_j, \forall j \right\}.
$$

*Then there exists a bijection*  $\Phi: S_N \to S_{N+1}$  *such that for all*  $n \in S_N$ , *there exists*  $j(n)$  *so that* 

$$
(\Phi(n))_j = \begin{cases} n_j & \text{if } j \neq j(n), \\ n_{j(n)} + 1 & \text{if } j = j(n). \end{cases}
$$

*Proof of Lemma* [4.6.](#page-33-1) Since the eigenfunctions  $(u_j)_{j\geq 1}$  form an orthonormal basis of h,  $(u_{j_1} \otimes_s ... \otimes_s)$  $(u_{j_k})_{j_1 \leq \ldots \leq j_k}$  is an orthogonal basis of  $\mathfrak{h}^k$ . It suffices to consider  $\phi_k = u_{j_1} \otimes_s \ldots \otimes_s u_{j_k}$ . We have

$$
\left\langle \phi_k | (\Gamma^c_{N,T,0})^{(k)} | \phi_k \right\rangle = \text{Tr} \left[ a_{j_1}^\dagger ... a_{j_k}^\dagger a_{j_1} ... a_{j_k} \Gamma^c_{N,T,0} \right],
$$

where  $a_{j_i} = a(u_{j_i})$  and  $a_{j_i}^{\dagger} = a^{\dagger}(u_{j_i})$  are the annihilation and creation operators. Using the canonical commutation relation

$$
[a(f), a(g)] = [a^{\dagger}(f), a^{\dagger}(g)] = 0, \quad [a(f), a^{\dagger}(g)] = \langle f, g \rangle,
$$

we have

$$
\operatorname{Tr}\left[a_{j_1}^{\dagger}...a_{j_k}^{\dagger}a_{j_1}...a_{j_k}\Gamma_{N,T,0}^c\right] = \operatorname{Tr}\left[a_{j_1}^{\dagger}a_{j_1}a_{j_2}^{\dagger}a_{j_2}...a_{j_k}^{\dagger}a_{j_k}\Gamma_{N,T,0}^c\right] + \text{lower order terms in }k
$$
\n(4.35)

where the lower order terms come from normal ordering and thus consist of polynomials of degree at most  $k-1$ , so that

<span id="page-34-2"></span><span id="page-34-0"></span>
$$
|\text{ lower order terms in } k| \leq CN^{k-1}.\tag{4.36}
$$

We thus focus on the first term in [\(4.35\)](#page-34-0).

One can represent all the possible configurations of occupation of the energy levels by the sequences  $n = (n_j) \in \mathbb{N}^{\mathbb{N}}$  such that  $|n| := \sum_j n_j = N$ . Since the eigenvalues of  $H_{N,0}$  are  $\sum_j n_j \lambda_j$  with  $|n| = N$ , the partition function is given by

$$
Z_{N,T,0}^c = \sum_{|n|=N} \exp\left(-\frac{1}{T} \sum_j \lambda_j n_j\right).
$$

We also have

$$
\text{Tr}\left[a_{j_1}^{\dagger}a_{j_1}a_{j_2}^{\dagger}a_{j_2}...a_{j_k}^{\dagger}a_{j_k}\Gamma_{N,T,0}^c\right] = \frac{1}{Z_{N,T,0}^c} \sum_{|n|=N} \exp\left(-\frac{1}{T}\sum_j \lambda_j n_j\right) n_{j_1}...n_{j_k}.
$$

For a sequence  $n = (n_j) \in \mathbb{N}^{\mathbb{N}}$ , we denote

$$
f(n) = n_{j_1}...n_{j_k}, \quad G(n) = \exp\left(-\frac{1}{T}\sum_j \lambda_j n_j\right).
$$

In particular,

$$
Z_{N,T,0}^c = \sum_{|n|=N} G(n)
$$

and

$$
\text{Tr}\left[a_{j_1}^{\dagger}a_{j_1}a_{j_2}^{\dagger}a_{j_2}...a_{j_k}^{\dagger}a_{j_k}\Gamma_{N,T,0}^c\right] = \frac{1}{Z_{N,T,0}^c} \sum_{|n|=N} G(n)f(n).
$$

It follows that

$$
I := \left| \text{Tr} \left[ a_{j_1}^{\dagger} a_{j_1} a_{j_2}^{\dagger} a_{j_2} \dots a_{j_k}^{\dagger} a_{j_k} (\Gamma_{N,T,0}^c - \Gamma_{N+1,T,0}^c) \right] Z_{N,T,0}^c Z_{N+1,T,0}^c \right|
$$
  
\n
$$
= \left| \sum_{|m|=N+1} G(m) \sum_{|n|=N} G(n) f(n) - \sum_{|n|=N} G(n) \sum_{|m|=N+1} G(m) f(m) \right|
$$
  
\n
$$
= \left| \sum_{|n|=N} \sum_{|m|=N+1} G(n+m) (f(n) - f(m)) \right|
$$
  
\n
$$
= \left| \sum_{|g|=2N+1} G(g) \left( \sum_{\substack{n \le g \\ |n|=N}} f(n) - \sum_{\substack{m \le g \\ |m|=N+1}} f(m) \right) \right|,
$$

where we set  $g = n + m$  and  $n \leq g$  means  $n_j \leq g_j$  for all *j*.

Using Lemma [4.7,](#page-34-1) we get

$$
I = \sum_{|g|=2N+1} G(g) \sum_{\substack{n \le g \\ |n|=N}} (f(n) - f(\Phi(n))).
$$

Since  $\Phi(n)_j$  is  $n_j$  for all *j* except a single one where  $\Phi(n)_j = n_j + 1$  and  $n_j \leq N$  for all *j*, we have

$$
|f(n) - f(\Phi(n))| \le N^{k-1}
$$

*.*

We obtain

$$
I \le N^{k-1} \sum_{|g|=2N+1} G(g) \sum_{\substack{n \le g \\ |n|=N}} 1
$$
  
=  $N^{k-1} \sum_{|n|=N} G(n) \sum_{|m|=N+1} G(m)$   
=  $N^{k-1} Z_{N,T,0}^c Z_{N+1,T,0}^c$ .

Dividing by  $Z_{N,T,0}^c Z_{N+1,T,0}^c$  this shows that

$$
\left| \text{Tr} \left[ a_{j_1}^\dagger a_{j_1} a_{j_2}^\dagger a_{j_2} \dots a_{j_k}^\dagger a_{j_k} (\Gamma^c_{N,T,0} - \Gamma^c_{N+1,T,0}) \right] \right| \le N^{k-1}.
$$

Returning to  $(4.35)-(4.36)$  $(4.35)-(4.36)$  $(4.35)-(4.36)$  completes the proof. □

We may now complete the

*Proof of Proposition* [4.3.](#page-21-3) From Lemma [4.4](#page-22-4) we deduce that the trace of  $T^{-k}\Gamma_{\epsilon,m,T}^{(k)}$  is uniformly bounded. We can thus reduce the convergence  $(4.6)$  to the proof of

$$
\frac{1}{T^k} \left\langle \phi_k \left| \Gamma_{\epsilon,m,T}^{(k)} - \left( \Gamma_{mT,T,0}^c \right)^{(k)} \right| \phi_k \right\rangle \xrightarrow[T \to \infty]{} 0 \tag{4.37}
$$

for all  $\phi_k \in \mathfrak{h}^k$ . Since  $(u_{j(1)} \otimes_s ... \otimes_s u_{j(k)})_{j(1) \leq ... \leq j(k)}$  forms an orthogonal basis of  $\mathfrak{h}^k$ , it suffices to show the above convergence with  $\phi_k = u_{j(1)} \otimes_s \dots \otimes_s u_{j(k)}$ . By the definition, we have

$$
\Gamma_{\epsilon,m,T}^{(k)} = \sum_{N \ge k} a_N^{\epsilon} (\Gamma_{N,T,0}^c)^{(k)}.
$$

For  $\Delta = \Delta(T) \ll T$  a large parameter to be chosen later, we write

$$
\Gamma_{\epsilon,m,T}^{(k)} - (\Gamma_{mT,T,0}^c)^{(k)} = \sum_{\substack{N \geq k \\ |N-mT| \leq \Delta}} a_N^{\epsilon} (\Gamma_{N,T,0}^c)^{(k)} - (\Gamma_{mT,T,0}^c)^{(k)} + \sum_{\substack{N \geq k \\ |N-mT| > \Delta}} a_N^{\epsilon} (\Gamma_{N,T,0}^c)^{(k)}.
$$

Thus

$$
\frac{1}{T^k} \left\langle \phi_k \Big| \Gamma_{\epsilon,m,T}^{(k)} - \left( \Gamma_{mT,T,0}^{c} \right)^{(k)} \Big| \phi_k \right\rangle = \frac{1}{T^k} \left\langle \phi_k \Big| \sum_{\substack{N \ge k \\ |N - mT| \le \Delta}} a_N^{\epsilon} \left( \Gamma_{N,T,0}^{c} \right)^{(k)} - \left( \Gamma_{mT,T,0}^{c} \right)^{(k)} \Big| \phi_k \right\rangle
$$

$$
+ \frac{1}{T^k} \left\langle \phi_k \Big| \sum_{\substack{N \ge k \\ |N - mT| > \Delta}} a_N^{\epsilon} \left( \Gamma_{N,T,0}^{c} \right)^{(k)} \Big| \phi_k \right\rangle
$$

$$
=: (I) + (II).
$$

<span id="page-35-0"></span>

<span id="page-36-1"></span>For (II), we have

$$
|(\text{II})| \leq \frac{1}{T^k} ||\phi_k||^2 \Big\| \sum_{\substack{N \geq k \\ |N - mT| > \Delta}} a_N^{\epsilon} (\Gamma_{N,T,0}^c)^{(k)} \Big\|_{\mathfrak{S}^1(\mathfrak{h}^k)}
$$
  

$$
\leq \frac{1}{T^k} ||\phi_k||^2 \sum_{\substack{N \geq k \\ |N - mT| > \Delta}} a_N^{\epsilon} ||(\Gamma_{N,T,0}^c)^{(k)}||_{\mathfrak{S}^1(\mathfrak{h}^k)}.
$$

Recall that

$$
(\Gamma_{N,T,0}^c)^{(k)} = \binom{N}{k} \text{Tr}_{k+1 \to N} [\Gamma_{N,T,0}^c].
$$

Thus

$$
|(\text{II})| \le \frac{1}{T^k} \|\phi_k\|^2 \sum_{\substack{N \ge k \\ |N - mT| > \Delta}} a_N^{\epsilon} {N \choose k}.
$$

We have

$$
\frac{1}{T^k} \sum_{\substack{N \geq k \\ |N - mT| > \Delta}} a_N^{\epsilon} {N \choose k} = \frac{1}{T^k} \sum_{\substack{N \geq k \\ |N - mT| > \Delta}} {N \choose k} \frac{1}{Z_{\epsilon, m, T}} \exp \left( -\frac{1}{T} F_0^c(N) - \frac{1}{\epsilon} \left( \frac{N}{T} - m \right)^2 \right)
$$
\n
$$
\leq \frac{1}{T^k} \exp \left( -\frac{\Delta^2}{\epsilon T^2} \right) \frac{1}{Z_{\epsilon, m, T}} \sum_{N \geq k} {N \choose k} \exp \left( -\frac{1}{T} F_0^c(N) \right)
$$
\n
$$
= \frac{1}{T^k} \exp \left( -\frac{\Delta^2}{\epsilon T^2} \right) \frac{1}{Z_{\epsilon, m, T}} \sum_{N \geq k} {N \choose k} \text{Tr} \left[ \exp \left( -\frac{1}{T} H_{N, 0} \right) \right]
$$

Recall that

$$
\Gamma_{0,T} = \frac{1}{Z_{0,T}} \exp\left(-\frac{1}{T}d\Gamma(h)\right) = \frac{1}{Z_{0,T}} \bigoplus_{N \ge 0} \exp\left(-\frac{1}{T}H_{N,0}\right)
$$

and

$$
\operatorname{Tr}[\Gamma_{0,T}^{(k)}] = \operatorname{Tr}\left[\binom{\mathcal{N}}{k}\Gamma_{0,T}\right] = \frac{1}{Z_{0,T}}\sum_{N\geq k} \binom{N}{k} \operatorname{Tr}\left[\exp\left(-\frac{1}{T}H_{N,0}\right)\right].
$$

It follows that

$$
\sum_{N\geq k} {N \choose k} \text{Tr}\left[\exp\left(-\frac{1}{T}H_{N,0}\right)\right] = Z_{0,T} \text{Tr}[\Gamma_{0,T}^{(k)}]
$$

hence

$$
\frac{1}{T^k} \sum_{\substack{N \geq k \\ |N - mT| > \Delta}} a_N^{\epsilon} \binom{N}{k} \leq \exp\left(-\frac{\Delta^2}{\epsilon T^2}\right) \frac{Z_{0,T}}{Z_{\epsilon,m,T}} \text{Tr}\left[\frac{1}{T^k} \Gamma_{0,T}^{(k)}\right].
$$

From  $(4.5)$  and  $(3.3)$  we deduce

$$
\frac{Z_{0,T}}{Z_{\epsilon,m,T}} \le \frac{C(m)}{\sqrt{\epsilon}}
$$

and since we have (see e.g. [\[37,](#page-57-12) Section 2])

<span id="page-36-0"></span>
$$
\text{Tr}\left[\frac{1}{T^k}\Gamma_{0,T}^{(k)}\right] \le C(k).
$$

Thus we conclude that

$$
|(\text{II})| \le C(m,k) \|\phi_k\|^2 \exp\left(-\frac{\Delta^2}{\epsilon T^2}\right) \frac{1}{\sqrt{\epsilon}}.\tag{4.38}
$$

For (I), we write

$$
\sum_{\substack{N\geq k\\ |N-mT|\leq \Delta}}a_N^\epsilon(\Gamma_{N,T,0}^c)^{(k)}=\sum_{\substack{N\geq k\\ |N-mT|\leq \Delta}}a_N^\epsilon\left((\Gamma_{N,T,0}^c)^{(k)}-(\Gamma_{mT,T,0}^c)^{(k)}\right)+\Big(\sum_{\substack{N\geq k\\ |N-mT|\leq \Delta}}a_N^\epsilon\Big)(\Gamma_{mT,T,0}^c)^{(k)}.
$$

Thus

$$
|(I)| \leq \frac{1}{T^k} \left| \left\langle \phi_k \right| \sum_{\substack{N \geq k \\ |N-m^T| \leq \Delta}} a_N^{\epsilon} \left( (\Gamma^c_{N,T,0})^{(k)} - (\Gamma^c_{mT,T,0})^{(k)} \right) \middle| \phi_k \right\rangle \right|
$$
  
+ 
$$
\frac{1}{T^k} \left| \left\langle \phi_k \right| \left( \sum_{\substack{N \geq k \\ |N-m^T| \leq \Delta}} a_N^{\epsilon} - 1 \right) (\Gamma^c_{mT,T,0})^{(k)} \left| \phi_k \right\rangle \right|
$$
  
=:  $(I_1) + (I_2).$ 

We have

$$
|(I_2)| \leq ||\phi_k||^2 \text{Tr}\Big[\frac{1}{T^k} \big(\Gamma^c_{mT,T,0}\big)^{(k)}\Big]\Big|\sum_{\substack{N \geq k \\ |N-m^T| \leq \Delta}} a_N^{\epsilon} - 1\Big|.
$$

Since  $\text{Tr}[\Gamma_{\epsilon,m,T}] = 1$ , we have that  $\sum_{N} a_N^{\epsilon} = 1$  and thus

$$
\sum_{\substack{N\geq k\\ |N-mT|\leq \Delta}} a^\epsilon_N-1=\sum_{N< k} a^\epsilon_N+\sum_{\substack{N\geq k\\ |N-mT|> \Delta}} a^\epsilon_N\leq \sum_{\substack{N\geq 0\\ |N-mT|> \Delta}} a^\epsilon_N
$$

as  $|N - mT| \geq mT - N \gg \Delta$  for  $N < k$  and *T* large. It follows that

$$
\left| \sum_{\substack{N \geq k \\ |N-mT| \leq \Delta}} a_N^{\epsilon} - 1 \right| \leq \sum_{\substack{|N-mT| > \Delta \\ |\Delta| = m, T}} a_N^{\epsilon}
$$
\n
$$
= \sum_{\substack{|N-mT| > \Delta \\ |\Delta| = m, T}} \frac{1}{Z_{\epsilon, m, T}} \exp\left(-\frac{1}{T} F_0^c(N) - \frac{1}{\epsilon} \left(\frac{N}{T} - m\right)^2\right)
$$
\n
$$
\leq \frac{1}{Z_{\epsilon, m, T}} \exp\left(-\frac{\Delta^2}{\epsilon T^2}\right) \sum_{\substack{|N-mT| > \Delta \\ N \geq 0}} \exp\left(-\frac{1}{T} F_0^c(N)\right)
$$
\n
$$
\leq \frac{1}{Z_{\epsilon, m, T}} \exp\left(-\frac{\Delta^2}{\epsilon T^2}\right) \sum_{N \geq 0} \text{Tr}\left[\exp\left(-\frac{1}{T} H_{N, 0}\right)\right]
$$
\n
$$
\leq \frac{Z_{0, T}}{Z_{\epsilon, m, T}} \exp\left(-\frac{\Delta^2}{\epsilon T^2}\right)
$$
\n
$$
\leq C(m) \exp\left(-\frac{\Delta^2}{\epsilon T^2}\right) \frac{1}{\sqrt{\epsilon}}.
$$

In addition, we have

$$
\operatorname{Tr}\left[\frac{1}{T^k}(\Gamma^c_{mT,T,0})^{(k)}\right] = \frac{1}{T^k} \binom{m}{k} \le C(m,k).
$$

This shows that

<span id="page-37-0"></span>
$$
|(I_2)| \le C(m,k) \exp\left(-\frac{\Delta^2}{\epsilon T^2}\right) \frac{1}{\sqrt{\epsilon}}.
$$
\n(4.39)

For  $(I_1)$ , we use the weak convergence of *k*-particle density matrice of  $\Gamma^c_{N,T,0}$  given in Lemma [4.6](#page-33-1) to get

$$
|(I_1)| \leq \frac{1}{T^k} \sum_{\substack{N \geq k \\ |N - m^T| \leq \Delta}} a_N^{\epsilon} |\langle \phi_k | (\Gamma^c_{N,T,0})^{(k)} - (\Gamma^c_{mT,T,0})^{(k)} | \phi_k \rangle|
$$
  

$$
\leq \frac{(mT)^{k-1}}{T^k} \sum_{\substack{N \geq k \\ |N - m^T| \leq \Delta}} |N - mT| a_N^{\epsilon}
$$
  

$$
\leq m^{k-1} \frac{\Delta}{T}
$$
 (4.40)

because  $a_N^{\epsilon}$  are non-negative and  $\sum_N a_N^{\epsilon} = 1$ . Collecting [\(4.38\)](#page-36-0), [\(4.39\)](#page-37-0) and [\(4.40\)](#page-37-1), we obtain

$$
\left|\frac{1}{T^k}\langle\phi_k|(\Gamma_{\epsilon,m,T}^{(k)}-(\Gamma_{mT,T,0}^c)^{(k)})|\phi_k\rangle\right|\leq C(m,k)\left(\exp\left(-\frac{\Delta^2}{\epsilon T^2}\right)\frac{1}{\sqrt{\epsilon}}+\frac{\Delta}{T}\right).
$$

Since  $\epsilon = T^{-a}$  with  $a > 0$ , we can take

<span id="page-37-1"></span>
$$
\Delta = T^{1-a/4} \ll T
$$

and obtain

$$
\left|\frac{1}{T^k} \langle \phi_k | (\Gamma_{\epsilon,m,T}^{(k)} - (\Gamma_{mT,T,0}^c)^{(k)}) | \phi_k \rangle \right| \le C(m,k) \left( \exp(-T^{a/2}) T^{a/2} + T^{-a/4} \right) \to 0
$$

<span id="page-38-7"></span><span id="page-38-0"></span>as  $T \to \infty$ . This proves [\(4.37\)](#page-35-0) and thus completes the proof of [\(4.6\)](#page-21-5).

5. Free energy upper bound

Here we prove the upper bound corresponding to [\(2.14\)](#page-4-5).

## <span id="page-38-3"></span>**Proposition 5.1** (**Free-energy upper bound**)**.**

*Under the assumptions of Theorem [2.5](#page-4-8) we have that*

$$
\limsup_{T \to \infty} -\log \left( \frac{Z_{mT,T,g}^c}{Z_{mT,T,0}^c} \right) \le -\log(z_m^r). \tag{5.1}
$$

We obtain the above by inserting an appropriate trial state in the variational principle defining  $-\log Z_{mT,T,g}^c$ .

<span id="page-38-1"></span>5.1. **Trial state and reduction to a finite dimensional estimate.** Let Λ *>* 0 be an energy cutoff. We define the projections

$$
P^- := P_\Lambda, \quad P^+ := P_\Lambda^\perp,
$$

where  $P_{\Lambda}$  and  $P_{\Lambda}^{\perp}$  are as in [\(2.5\)](#page-3-8). We denote

$$
P^\#:=\left\{\begin{array}{ll} 1 & \textrm{if }\#=\varnothing \\ P^+ & \textrm{if }\#=\mp \\ P^- & \textrm{if }\#=- \end{array}\right\}
$$

and

$$
h^\# = P^\# h P^\#, \quad \mathfrak{h}^\# = P^\# \mathfrak{h}.
$$

Let  $n \in \mathbb{N}$ . We denote the free canonical Gibbs state by

$$
\Gamma_{n,T,0}^{c,\#} = \frac{1}{Z_{n,T,0}^{c,\#}} \exp\left(-\frac{1}{T}H_{n,0}^{\#}\right)
$$

where

$$
H_{n,0}^{\#} = \sum_{j=1}^{n} h_j^{\#}.
$$

As usual  $\Gamma_{n,T,0}^{c,\#}$  is the unique minimizer of the free (canonical) energy

$$
F_0^{c, \#}(n) = \inf \left\{ \mathcal{F}_{n,0}^{c, \#}[\Gamma] := \text{Tr}[H_{n,0}^{\#}\Gamma] + T \text{Tr}[\Gamma \log \Gamma] : \Gamma \in \mathcal{S}((\mathfrak{h}^{\#})^{\otimes_s n}) \right\},\
$$

where  $\mathcal{S}((\mathfrak{h}^{\#})^{\otimes_{s}n})$  is the set of states (non-negative self-adjoint operators with unit trace) on  $(\mathfrak{h}^{\#})^{\otimes_{s}n}$ . Moreover, we have

$$
F_0^{c, \#}(n) = \mathcal{F}_{n,0}^{c, \#}[\Gamma_{n,T,0}^{c, \#}] = -T \log(Z_{n,T,0}^{c, \#}).
$$

We will need a simple observation on the relationship between the full free Gibbs state  $(2.3)$  and the corresponding state on the projected spaces  $\Gamma_{n,T,0}^{c,\#}$ . It will replace the factorization property [\(4.17\)](#page-24-3) of free grand-canonical Gibbs states used at length in [\[37,](#page-57-12) [39,](#page-57-13) [41\]](#page-57-16). This uses the unitary map  $U$  from  $\mathcal{F}(\mathfrak{h}^- \oplus \mathfrak{h}^+)$  to  $\mathcal{F}(\mathfrak{h}^-) \otimes \mathcal{F}(\mathfrak{h}^+)$  defined by its' action

<span id="page-38-2"></span>
$$
\mathcal{U}a^{\dagger}(f)\mathcal{U}^* = a^{\dagger}(P^-f) \otimes 11 + 1 \otimes a^{\dagger}(P^+f) \tag{5.2}
$$

on creation/annihilation operators, see e.g. [\[33,](#page-56-35) Appendix A]

**Lemma 5.2** (**Factorization of free canonical Gibbs states**)**.** *For*  $N \in \mathbb{N}$ *, we have* 

$$
\mathcal{U}\Gamma^c_{N,T,0}\mathcal{U}^* = \bigoplus_{n=0}^N c_n \Gamma^{c,-}_{n,T,0} \otimes \Gamma^{c,+}_{N-n,T,0}
$$

*where*

$$
c_n = \frac{1}{Z_{N,T,0}^c} Z_{n,T,0}^{c,-} Z_{N-n,T,0}^{c,+}.
$$
\n(5.3)

*Moreover, define for*  $M \leq N$ 

<span id="page-38-5"></span><span id="page-38-4"></span>
$$
D_M := \sum_{n=M}^{N} c_n \tag{5.4}
$$

*and set*

<span id="page-38-6"></span>
$$
M = N - T\delta \tag{5.5}
$$

*for some*  $\delta > 0$  *small. Taking*  $N = mT$  *for a fixed*  $m > 0$  *we have for*  $\Lambda > 0$  *large,* 

<span id="page-39-0"></span>
$$
D_M = 1 + O\left(\delta^{-1} \Lambda^{\frac{1}{s} - \frac{1}{2}}\right). \tag{5.6}
$$

*Proof.* We write

$$
\Gamma^c_{N,T,0} = \frac{1}{Z^c_{N,T,0}} \exp\left(-\frac{1}{T}d\Gamma(h)\right) \mathbb{1}_{\{\mathcal{N}=N\}},
$$

where

$$
d\Gamma(h) = \bigoplus_{n\geq 1} H_{n,0}, \quad \mathcal{N} = d\Gamma(\mathbb{1}) = \bigoplus_{n\geq 0} n \mathbb{1}_{\mathfrak{h}^{\otimes_s n}}.
$$

Denote

$$
\mathcal{N}^{\#} = d\Gamma(P^{\#}).
$$

Since U acts on creation/annihilation operators as in  $(5.2)$  and  $UU^* = 1$ , writing the *N*-particles space as the span of vectors  $a^{\dagger}(f_1) \ldots a^{\dagger}(f_N)$ ,  $f_1, \ldots, f_N \in \mathfrak{h}$  we find that

$$
\mathcal{U}\mathbb{1}_{\{\mathcal{N}=N\}}\mathcal{U}^* = \bigoplus_{n=0}^N \mathbb{1}_{\{\mathcal{N}^-=n\}} \otimes \mathbb{1}_{\{\mathcal{N}^+=N-n\}}.
$$

Hence

$$
\mathcal{U}\Gamma_{N,T,0}^c \mathcal{U}^* = \frac{1}{Z_{N,T,0}^c} \left( \mathcal{U} \exp\left(-\frac{1}{T} d\Gamma(h)\right) \mathcal{U}^*\right) \left( \mathcal{U}\mathbb{1}_{\{\mathcal{N}=N\}} \mathcal{U}^*\right) \n= \frac{1}{Z_{N,T,0}^c} \left( \exp\left(-\frac{1}{T} d\Gamma(h^-)\right) \otimes \exp\left(-\frac{1}{T} d\Gamma(h^+)\right) \right) \left( \bigoplus_{n=0}^N \mathbb{1}_{\{\mathcal{N}^-=n\}} \otimes \mathbb{1}_{\{\mathcal{N}^+=N-n\}} \right).
$$

Since these operators commute, we get

$$
\mathcal{U}\Gamma_{N,T,0}^{c}\mathcal{U}^{*} = \frac{1}{Z_{N,T,0}^{c}}\bigoplus_{n=0}^{N}\left(\exp\left(-\frac{1}{T}d\Gamma(h^{-})\right)1_{\{\mathcal{N}^{-}=n\}}\right)\otimes\left(\exp\left(-\frac{1}{T}d\Gamma(h^{+})\right)1_{\{\mathcal{N}^{+}=N-n\}}\right)
$$

$$
=\frac{1}{Z_{N,T,0}^{c}}\bigoplus_{n=0}^{N}(Z_{n,T,0}^{c,-}\Gamma_{n,T,0}^{c,-})\otimes\left(Z_{N-n,T,0}^{c,+}\Gamma_{N-n,T,0}^{c,+}\right)
$$

$$
=\bigoplus_{n=0}^{N}c_{n}\Gamma_{n,T,0}^{c,-}\otimes\Gamma_{N-n,T,0}^{c,+}.
$$

We now turn to the proof of  $(5.6)$ . We have

$$
mT = \text{Tr}\left[ (\Gamma^c_{mT,T,0})^{(1)} \right] = \text{Tr}\left[ P^-(\Gamma^c_{mT,T,0})^{(1)} \right] + \text{Tr}\left[ P^+(\Gamma^c_{mT,T,0})^{(1)} \right].
$$

Since

$$
(\Gamma_{mT,T,0}^{c})^{(1)} = \sum_{n=0}^{mT} c_n \left( (\Gamma_{n,T,0}^{c,-})^{(1)} + (\Gamma_{mT-n,T,0}^{c,+})^{(1)} \right)
$$

and by definition

$$
(\Gamma_{n,T,0}^{c,-})^{(1)} = P^-(\Gamma_{n,T,0}^{c})^{(1)}P^-, \quad (P^-)^2 = P^-, \quad P^-P^+ = 0,
$$

we have

$$
P^{-}(\Gamma^{c}_{mT,T,0})^{(1)} = \sum_{n=0}^{mT} c_n (\Gamma^{c,-}_{n,T,0})^{(1)}
$$

hence

$$
\text{Tr}\left[P^-(\Gamma_{n,T,0}^c)^{(1)}\right] = \sum_{n=0}^{mT} c_n \text{Tr}\left[(\Gamma_{n,T,0}^{c,-})^{(1)}\right] = \sum_{n=0}^{mT} n c_n.
$$

In particular, we get

$$
mT - \sum_{n=0}^{mT} nc_n = \text{Tr} \left[ P^+(\Gamma^c_{mT,T,0})^{(1)} \right]. \tag{5.7}
$$

<span id="page-40-0"></span>Using  $(B.5)$ , we have

$$
mT - \sum_{n=0}^{mT} nc_n \le C \text{Tr} \left[ P^+(\Gamma_T^{\nu})^{(1)} \right]
$$
  
= 
$$
\sum_{\lambda_j > \Lambda} \frac{1}{e^{(\lambda_j + \nu)/T} - 1}
$$
  
= 
$$
T \sum_{\lambda_j > \Lambda} \frac{1}{T(e^{(\lambda_j + \nu)/T} - 1)}
$$
  

$$
\le T \sum_{\lambda_j > \Lambda} \frac{1}{\lambda_j + \nu}.
$$

Here  $\nu > -\lambda_1$  is such that

$$
mT = \sum_{j\geq 1} \frac{1}{e^{(\lambda_j + \nu)/T - 1}}.
$$

If  $\nu \geq 0$ , then we simply bound

$$
\frac{1}{\lambda_j + \nu} \le \lambda_j^{-1}.
$$

If  $\nu \in (-\lambda_1, 0)$ , then for  $\Lambda > 0$  large

$$
\frac{1}{\lambda_j + \nu} \le 2\lambda_j^{-1}, \quad \forall \lambda_j > \Lambda.
$$

In particular, we have

$$
mT - \sum_{n=0}^{mT} nc_n \le 2T \sum_{\lambda_j > \Lambda} \lambda_j^{-1}.
$$

 $rac{1}{s} - \frac{1}{2}$ 

By the tail estimate (see [\[23,](#page-56-25) Corollary 2.7]), we know

$$
\sum_{\lambda_j>\Lambda}\lambda_j^{-1}\sim\Lambda
$$

hence

$$
mT - \sum_{n=0}^{mT} nc_n \leq C T \Lambda^{\frac{1}{s} - \frac{1}{2}}.
$$

It follows that

$$
\sum_{n=0}^{m} nc_n = \sum_{n=M}^{m} nc_n + \sum_{n=0}^{M} nc_n
$$
  
\n
$$
\leq mT \sum_{n=M}^{mT} c_n + M \sum_{n=0}^{M} c_n
$$
  
\n
$$
= mT \sum_{n=M}^{mT} c_n + (mT - T\delta) \sum_{n=0}^{M} c_n
$$
  
\n
$$
= mT \sum_{n=0}^{mT} c_n - T\delta \sum_{n=0}^{M} c_n.
$$

This implies

$$
T\delta \sum_{n=0}^{M} c_n = mT - \sum_{n=0}^{mT} nc_n \le C T \Lambda^{\frac{1}{s} - \frac{1}{2}}
$$

hence the desired

$$
\sum_{n=0}^{M} c_n \leq C\delta^{-1} \Lambda^{\frac{1}{s} - \frac{1}{2}}.
$$

□

For 
$$
g > 0
$$
 we denote (again with # standing for +, – or  $\varnothing$ )

$$
H_{n,g}^{\#} = \sum_{j=1}^{n} h_j^{\#} + \frac{g}{N} \sum_{1 \le j < k \le n} w_{ij}^{\#},
$$

where

$$
w_{jk}^{\#} = (P_j^{\#} \otimes P_k^{\#}) w_{jk} (P_j^{\#} \otimes P_k^{\#})
$$

with

$$
w_{jk} = w(\mathbf{x}_j - \mathbf{x}_k).
$$

The interacting canonical state is defined as

$$
\Gamma_{n,T,g}^{c,\#}=\frac{1}{Z_{n,T,g}^{c,\#}}\exp\left(-\frac{1}{T}H_{n,g}^{\#}\right).
$$

It is the unique minimizer of the interacting (canonical) energy

$$
F_g^{c, \#}(n) = \inf \left\{ \mathcal{F}_{n,g}^{c, \#}[\Gamma] := \text{Tr}[H_{n,g}^{\#}\Gamma] + T \text{Tr}[\Gamma \log \Gamma] : \Gamma \in \mathcal{S}((\mathfrak{h}^{\#})^{\otimes_s n}) \right\}.
$$

Moreover, we have

$$
F_g^{c, \#}(n) = \mathcal{F}_{n,g}^{c, \#}[\Gamma_{n,T,g}^{c, \#}] = -T \log(Z_{n,T,g}^{c, \#}).
$$

In this notation, the targeted quantity in Proposition [5.1](#page-38-3) reads as

$$
-\log\left(\frac{Z_{mT,T,g}^c}{Z_{mT,T,0}^c}\right) = \frac{1}{T}\left(F_g^c(mT) - F_0^c(mT)\right).
$$

To obtain an upper bound of the right hand side, we pick a large cut-off  $\Lambda \geq \lambda_1$  and define a trial state using the unitary map (cf  $(5.2)$ )

$$
\mathcal{U}:\mathfrak{F}\left(\mathfrak{h}^-\oplus\mathfrak{h}^+\right)\mapsto\mathfrak{F}\left(\mathfrak{h}^-\right)\otimes\left(\mathfrak{h}^+\right)
$$

in the manner

$$
\Xi_{mT} = \mathcal{U}^* \left( \bigoplus_{n=0}^{mT} d_n \Gamma_{n,T,g}^{c,-} \otimes \Gamma_{mT-n,T,0}^{c,+} \right) \mathcal{U},\tag{5.8}
$$

where

<span id="page-41-2"></span>
$$
d_n = \begin{cases} c_n D_M^{-1} & \text{if } n \ge M \\ 0 & \text{if } n < M \end{cases} \tag{5.9}
$$

with  $M > 0$  to be chosen later and  $c_n$  as in [\(5.3\)](#page-38-4) with  $N = mT$ . Note that the definition [\(5.4\)](#page-38-5) of  $D_M$ ensures

<span id="page-41-3"></span><span id="page-41-1"></span>
$$
\sum_{n=0}^{m} d_n = 1 \tag{5.10}
$$

so that  $\Xi_{mT}$  is indeed a state on  $\mathfrak{h}^{mT}$ .

# <span id="page-41-0"></span>**Lemma 5.3** (**Reduction to a finite dimensional upper bound**)**.**

*Fixing*  $m, g > 0$  *and setting*  $N = mT$ *, choosing*  $\Lambda$  *such that*  $\Lambda \xrightarrow{T \to \infty} \infty$  *and*  $M$  *as in* [\(5.5\)](#page-38-6) *with*  $\delta \gg \Lambda^{1/s-1/2}$ , we have in the notation above

$$
\limsup_{T \to \infty} -\log \left( \frac{Z_{mT,T,g}^c}{Z_{mT,T,0}^c} \right) \le \limsup_{T \to \infty} \frac{1}{T} \left( \mathcal{F}_{n,g}^c \left[ \Xi_{mT} \right] - F_0^c(mT) \right)
$$
\n
$$
\le \limsup_{T \to \infty} \frac{1}{T} \sum_{n=0}^{mT} d_n \left( \mathcal{F}_{n,g}^{c,-} \left[ \Gamma_{n,T,g}^{c,-} \right] - \mathcal{F}_{n,0}^{c,-} \left[ \Gamma_{n,T,0}^{c,-} \right] \right). \tag{5.11}
$$

This lemma effectively dispatches the contribution of high one-body energy modes and lets us focus on estimates in the finite dimensional space  $\mathfrak{h}^-$ .

*Proof.* Using the trial state  $(5.8)$  we have

$$
F_g^c(mT) - F_0^c(mT) \leq \mathcal{F}_{mT,g}^c[\Xi_{mT}] - \mathcal{F}_{mT,0}^c[\Gamma_{mT,T,0}^c]
$$
  
= 
$$
T\mathcal{H}(\Xi_{mT},\Gamma_{mT,T,0}^c) + \frac{g}{mT}\text{Tr}[w\,\Xi_{mT}^{(2)}].
$$

Since the relative entropy is unaffected by the unitary map  $U$  and the summands live on orthogonal subspaces, we have

$$
\mathcal{H}(\Xi_{mT},\Gamma_{mT,T,0}^{c}) = \mathcal{H}\left(\bigoplus_{n=0}^{mT} d_n \Gamma_{n,T,g}^{c,-} \otimes \Gamma_{mT-n,T,0}^{c,+}, \bigoplus_{n=0}^{mT} c_n \Gamma_{n,T,0}^{c,-} \otimes \Gamma_{mT-n,T,0}^{c,+}\right)
$$
  
\n
$$
= \sum_{n=0}^{mT} \mathcal{H}\left(d_n \Gamma_{n,T,g}^{c,-} \otimes \Gamma_{mT-n,T,0}^{c,+}, c_n \Gamma_{n,T,0}^{c,-} \otimes \Gamma_{mT-n,T,0}^{c,+}\right)
$$
  
\n
$$
= \sum_{n=0}^{mT} \text{Tr}\left[d_n \Gamma_{n,T,g}^{c,-} \otimes \Gamma_{mT-n,T,0}^{c,+} \left(\log(d_n \Gamma_{n,T,g}^{c,-} \otimes \Gamma_{mT-n,T,0}^{c,+}) - \log(c_n \Gamma_{n,T,0}^{c,-} \otimes \Gamma_{mT-n,T,0}^{c,+})\right)\right].
$$

Using

$$
\log(A \otimes B) = (\log A) \otimes 1 + 1 \otimes (\log B),
$$

we have

 $\log(d_n \Gamma^{c,-}_{n,T,g} \otimes \Gamma^{c,+}_{mT-n,T,0}) - \log(c_n \Gamma^{c,-}_{n,T,0} \otimes \Gamma^{c,+}_{mT-n,T,0})) = \log\left(\frac{d_n}{d\Gamma^{c,-}_{n,T,g} \otimes \Gamma^{c,+}_{mT-n,T,0}\right)$ *cn*  $\left(\log(\Gamma^{c,-}_{n,T,g}) - \log(\Gamma^{c,-}_{n,T,0})\right) \otimes 1.$ Thus

$$
\begin{split} \operatorname{Tr}\Big[d_n\Gamma_{n,T,g}^{c,-}\otimes\Gamma_{mT-n,T,0}^{c,+}\left(\log(d_n\Gamma_{n,T,g}^{c,-}\otimes\Gamma_{mT-n,T,0}^{c,+})-\log(c_n\Gamma_{n,T,0}^{c,-}\otimes\Gamma_{mT-n,T,0}^{c,+})\right)\Big] \\ &=d_n\log\left(\frac{d_n}{c_n}\right)+d_n\operatorname{Tr}\Big[\Gamma_{n,T,g}^{c,-}\left(\log(\Gamma_{n,T,g}^{c,-})-\log(\Gamma_{n,T,0}^{c,-})\right)\otimes\Gamma_{mT-n,T,0}^{c,+}\Big] \\ &=d_n\log\left(\frac{d_n}{c_n}\right)+d_n\mathcal{H}\left(\Gamma_{n,T,g}^{c,-},\Gamma_{n,T,0}^{c,-}\right). \end{split}
$$

By the choice of  $d_n$  (see [\(5.9\)](#page-41-2) and [\(5.10\)](#page-41-3)), we have

$$
\sum_{n=0}^{mT} d_n \log \left( \frac{d_n}{c_n} \right) = \log \left( \frac{1}{D_M} \right)
$$

which tends to zero as long as (see  $(5.6)$ )

$$
\delta^{-1} \Lambda^{\frac{1}{s} - \frac{1}{2}} \to 0 \text{ as } \Lambda \to \infty. \tag{5.12}
$$

For the interaction term, we use

$$
\Xi_{m}^{(2)} = \sum_{n=0}^{m} d_n \left( (\Gamma_{n,T,g}^{c,-})^{(2)} + (\Gamma_{mT-n,T,0}^{c,+})^{(2)} + (\Gamma_{n,T,g}^{c,-})^{(1)} \otimes (\Gamma_{mT-n,T,0}^{c,+})^{(1)} + (\Gamma_{mT-n,T,0}^{c,+})^{(1)} \otimes (\Gamma_{n,T,g}^{c,-})^{(1)} \right)
$$

to obtain

$$
\begin{split} \text{Tr}[w \, \Xi_{mT}^{(2)}] &= \sum_{n=0}^{mT} d_n \left( \text{Tr} \left[ w(\Gamma_{n,T,g}^{c,-})^{(2)} \right] + \text{Tr} \left[ w(\Gamma_{mT-n,T,0}^{c,+})^{(2)} \right] \right) \\ &+ \sum_{n=0}^{mT} d_n \left( \text{Tr} \left[ w(\Gamma_{n,T,g}^{c,-})^{(1)} \otimes (\Gamma_{mT-n,T,0}^{c,+})^{(1)} \right] + \text{Tr} \left[ w(\Gamma_{mT-n,T,0}^{c,+})^{(1)} \otimes (\Gamma_{n,T,g}^{c,-})^{(1)} \right] \right). \end{split}
$$

We now choose  $\nu \in \mathbb{R}$  such that [\(B.2\)](#page-54-1) holds. Using [\(B.4\)](#page-54-2), [\(5.10\)](#page-41-3) and<sup>[3](#page-42-0)</sup>  $w \in L^p(X)$ , we have

$$
\sum_{n=0}^{m} d_n \text{Tr} \left[ w(\Gamma_{m}^{c,+}{}_{-n,T,0})^{(2)} \right] = \sum_{n=0}^{m} d_n \iint w(\mathbf{x}-\mathbf{y}) \left( \Gamma_{m}^{c,+}{}_{-n,T,0} \right)^{(2)} (\mathbf{x}, \mathbf{y}; \mathbf{x}, \mathbf{y}) d\mathbf{x} d\mathbf{y} \n\leq \sum_{n=0}^{m} d_n \iint |w(\mathbf{x}-\mathbf{y})| \left( \Gamma_{m}^{c,+}{}_{-n,T,0} \right)^{(2)} (\mathbf{x}, \mathbf{y}; \mathbf{x}, \mathbf{y}) d\mathbf{x} d\mathbf{y} \n\leq C \iint |w(\mathbf{x}-\mathbf{y})| \left( P^{+}(\Gamma_{T}^{\nu})^{(1)} P^{+} \right) (\mathbf{x}, \mathbf{x}) \left( P^{+}(\Gamma_{T}^{\nu})^{(1)} P^{+} \right) (\mathbf{y}, \mathbf{y}) d\mathbf{x} d\mathbf{y} \n\leq C \left\| \left( P^{+}(\Gamma_{T}^{\nu})^{(1)} P^{+} \right) (\cdot, \cdot) \right\|_{L^{q}(X)} \left\| |w| \ast \left( P^{+}(\Gamma_{T}^{\nu})^{(1)} P^{+} \right) \right\|_{L^{p}(X)} \n\leq C \|w\|_{L^{p}(X)} \left\| P^{+}(\Gamma_{T}^{\nu})^{(1)} P^{+} (\cdot, \cdot) \right\|_{L^{q}(X)} \left\| P^{+}(\Gamma_{T}^{\nu})^{(1)} P^{+} (\cdot, \cdot) \right\|_{L^{1}(X)},
$$

<span id="page-42-0"></span><sup>&</sup>lt;sup>3</sup>We allow for the possibility that *w* has a measure part in the  $p = 1$  case, with a slight abuse of notation.

<span id="page-43-0"></span>where  $1 = \frac{1}{p} + \frac{1}{q}$ . Since

$$
(\Gamma_T^{\nu})^{(1)}(x, x) = \sum_{j \ge 1} \frac{1}{e^{(\lambda_j + \nu)/T} - 1} |u_j(x)|^2
$$
  
=  $T \sum_{j \ge 1} \frac{1}{T(e^{(\lambda_j + \nu)/T} - 1)} |u_j(x)|^2$   
 $\le T \sum_{j \ge 1} \frac{1}{\lambda_j + \nu} |u_j(x)|^2$ ,

we have for  $\Lambda > 0$  large,

$$
P^{+}(\Gamma_{T}^{\nu})^{(1)}P^{+}(x,x) \leq T \sum_{\lambda_{j} > \Lambda} \frac{1}{\lambda_{j} + \nu} |u_{j}(x)|^{2}
$$
  

$$
\leq 2T \sum_{\lambda_{j} > \Lambda} \lambda_{j}^{-1} |u_{j}(x)|^{2}
$$
  

$$
\leq 2TP^{+}h^{-1}P^{+}(x,x)
$$

Since  $h^{-1}(.,.) \in L^q(X)$  for all  $1 \leq q \leq \infty$  (see [\[39,](#page-57-13) Lemma 3.2]), the dominated convergence theorem implies

$$
||P^+h^{-1}P^+(\cdot,\cdot)||_{L^q(X)}\to 0 \text{ as } \Lambda\to\infty.
$$

In particular, we have

$$
\sum_{n=0}^{mT} d_n \text{Tr} \left[ w(\Gamma_{mT-n,T,0}^{c,+})^{(2)} \right] = o_{\Lambda}(1)T^2.
$$

Similarly

$$
\sum_{n=0}^{m} d_n \text{Tr} \Big[ w(\Gamma_{n,T,g}^{c,-})^{(1)} \otimes (\Gamma_{mT-n,T,0}^{c,+})^{(1)} \Big] \n= \sum_{n=0}^{m} d_n \iint w(\mathbf{x} - \mathbf{y}) (\Gamma_{n,T,g}^{c,-})^{(1)}(\mathbf{x}, \mathbf{x}) (\Gamma_{n,T,0}^{c,+})^{(1)}(\mathbf{y}, \mathbf{y}) d\mathbf{x} d\mathbf{y} \n\leq \sum_{n=0}^{m} d_n \iint |w(\mathbf{x} - \mathbf{y})| (\Gamma_{n,T,g}^{c,-})^{(1)}(\mathbf{x}, \mathbf{x}) (\Gamma_{n,T,0}^{c,+})^{(1)}(\mathbf{y}, \mathbf{y}) d\mathbf{x} d\mathbf{y} \n\leq C \sum_{n=0}^{m} d_n \iint |w(\mathbf{x} - \mathbf{y})| (\Gamma_{n,T,g}^{c,-})^{(1)}(\mathbf{x}, \mathbf{x}) (\left. P^{+}(\Gamma_{T}^{\nu})^{(1)} P^{+}\right) (\mathbf{y}, \mathbf{y}) d\mathbf{x} d\mathbf{y} \n\leq C \left\| \left( P^{+}(\Gamma_{T}^{\nu})^{(1)} P^{+}\right) (\cdot, \cdot) \right\|_{L^{q}(X)} \sum_{n=0}^{m} \left\| |w| * (\Gamma_{n,T,g}^{c,-})^{(1)} \right\|_{L^{p}(X)} \n\leq C \|\mathbf{w}\|_{L^{p}(X)} \left\| \left( P^{+}(\Gamma_{T}^{\nu})^{(1)} P^{+}\right) (\cdot, \cdot) \right\|_{L^{q}(X)} \sum_{n=0}^{m} d_n \|\langle \Gamma_{n,T,g}^{c,-} \rangle^{(1)} \|\mathbf{L}^{1}(X) \n\leq C \|\mathbf{w}\|_{L^{p}(X)} \left\| \left( P^{+}(\Gamma_{T}^{\nu})^{(1)} P^{+}\right) (\cdot, \cdot) \right\|_{L^{q}(X)} \sum_{n=0}^{m} d_n \text{Tr} \left[ (\Gamma_{n,T,g}^{c,-})^{(1)} \right] \n\leq C \|\mathbf{w}\|_{L^{p}(X)} \left\| \left( P^{+}(\Gamma_{T}^{\nu})^{(1)} P^{+}\right) (\cdot, \cdot) \right\|
$$

We may also bound

$$
\sum_{n=0}^{mT} nd_n = \sum_{n=M}^{mT} nc_n \le \sum_{n=0}^{mT} nc_n \le mT,
$$

<span id="page-44-4"></span>because

$$
mT = \text{Tr}\left[ (\Gamma_{mT,T,0}^{c})^{(1)} \right]
$$
  
=  $\text{Tr}\left[ (\Gamma_{mT,T,0}^{c,-})^{(1)} \right] + \text{Tr}\left[ P^+(\Gamma_{mT,T,0}^{c})^{(1)} \right]$   
=  $\sum_{n=0}^{mT} nc_n + \text{Tr}\left[ P^+(\Gamma_{mT,T,0}^{c})^{(1)} \right].$  (5.13)

This yields

$$
\sum_{n=0}^{m} d_n \text{Tr} \Big[ w(\Gamma_{n,T,g}^{c,-})^{(1)} \otimes (\Gamma_{mT-n,T,0}^{c,+})^{(1)} \Big] = o_{\Lambda}(1) T^2.
$$

Collecting the previous bounds we deduce

$$
-\log\left(\frac{Z_{mT,T,g}^c}{Z_{mT,T,0}^c}\right) \leq \frac{1}{T} \sum_{n=0}^{mT} d_n \left( T\mathcal{H}(\Gamma_{n,T,g}^{c,-}, \Gamma_{n,T,0}^{c,-}) + \frac{g}{m} \text{Tr}[w(\Gamma_{n,T,g}^{c,-})^{(2)}] \right) + o_{\Lambda}(1) + \log\left(\frac{1}{D_M}\right).
$$

The main term is rewritten as

$$
\frac{1}{T} \sum_{n=0}^{m} d_n \left( T \mathcal{H}(\Gamma_{n,T,g}^{c,-}, \Gamma_{n,T,0}^{c,-}) + \frac{g}{m} \text{Tr} \left[ w(\Gamma_{n,T,g}^{c,-})^{(2)} \right] \right) = \frac{1}{T} \sum_{n=0}^{m} d_n \left( \mathcal{F}_{n,g}^{c,-} [\Gamma_{n,T,g}^{c,-}] - \mathcal{F}_{n,0}^{c,-} [\Gamma_{n,T,0}^{c,-}] \right),
$$
\nwhich concludes the proof.

<span id="page-44-0"></span>5.2. **Semiclassics for the finite dimensional canonical ensemble.** The problem is now reduced to the finite dimensional setting. We are thus in a position to insert estimates from [\[55,](#page-57-2) Appendix B] and references therein to obtain

## <span id="page-44-3"></span>**Lemma 5.4** (**Finite-dimensional semi-classics**)**.**

Let  $\mu_{mT,T,g}$  be the probability measure over the unique sphere  $S\mathfrak{h}^-$  be defined by

<span id="page-44-2"></span>
$$
d\mu_{mT,T,g}(u) = \frac{1}{z_{mT,T,g}} \exp\left(-\frac{1}{T} \left(mT\langle u, h^-u\rangle + \frac{g(mT-1)}{2} \langle u^{\otimes 2}, w^-u^{\otimes 2} \rangle\right)\right) du\tag{5.14}
$$

*with du the Lebesgue measure on S*h −*.*

*We have*

$$
\frac{1}{T} \sum_{n=0}^{m} d_n \left( \mathcal{F}_{n,g}^{c,-} [\Gamma_{n,T,g}^{c,-}] - \mathcal{F}_{n,0}^{c,-} [\Gamma_{n,T,0}^{c,-}] \right) \le -\log z_m^r + o_T(1) + o_{\Lambda}(1) + C \frac{\Lambda}{T} \dim(\mathfrak{h}^-) \n+ \frac{1}{T} \sum_{n=0}^{m} d_n (mT - n) \int_{S\mathfrak{h}^-} \langle u, h^- u \rangle (\mu_{n,T,0}(u) - \mu_{mT,T,g}(u)) du, \tag{5.15}\n+ \frac{1}{T} \sum_{n=0}^{m} d_n \left( \frac{n(n-1)}{2} - \frac{mT(mT - 1)}{2} \right) \frac{g}{mT} \int_{S\mathfrak{h}^-} \langle u^{\otimes 2}, w^- u^{\otimes 2} \rangle \mu_{mT,T,g}(u) du,
$$

*where*  $o_T(1), o_\Lambda(1) \to 0$  *respectively when*  $T \to \infty$  *and*  $\Lambda \to \infty$ *.* 

The main term we are after now appears explicitly on the first line of [\(5.15\)](#page-44-1). Note however that we still need to control the contribution from the second and third lines, which involve the measures  $(5.14)$ , i.e. projected and rescaled versions of Definition [2.4.](#page-4-3)

*Proof.* We want to bound  $\mathcal{F}_{n,g}^{c,-}[\Gamma_{n,T,g}^{c,-}]$  from above and  $\mathcal{F}_{n,0}^{c,-}[\Gamma_{n,T,0}^{c,-}]$  from below. **Upper bound on**  $\mathcal{F}_{n,g}^{c,-}[\Gamma_{n,T,g}^{c,-}]$ . We are free to insert a convenient trial state in place of the true minimizer  $\mathcal{F}_{n,g}^{c,-}[\Gamma_{n,T,g}^{c,-}].$  We take

<span id="page-44-1"></span>
$$
\Gamma_n = \int_{S\mathfrak{h}^-} |u^{\otimes n}\rangle \langle u^{\otimes n}|\mu(u)du, \quad \mu = \mu_{mT,T,g}.
$$

We have

$$
\mathcal{F}_{n,g}^{c,-}[\Gamma_n] = \text{Tr}[H_{n,g}^-\Gamma_n] + T\text{Tr}[\Gamma_n \log \Gamma_n].
$$

<span id="page-45-2"></span>A direct computation gives

$$
\begin{split} \text{Tr}[H_{n,g}^{-}\Gamma_n] &= \text{Tr}\left[\left(\sum_{j=1}^n h_j^{-} + \frac{g}{mT} \sum_{1 \le j < k \le n} w_{jk}^{-}\right) \int_{S\mathfrak{h}^-} |u^{\otimes n}\rangle \langle u^{\otimes n}|\mu(u)du\right] \\ &= n \int_{S\mathfrak{h}^-} \langle u, h^-u \rangle \mu(u)du + \frac{gn(n-1)}{2mT} \int_{S\mathfrak{h}^-} \langle u^{\otimes 2}, w^-u^{\otimes 2} \rangle \mu(u)du. \end{split}
$$

We apply the second Berezin-Lieb inequality (see [\[55,](#page-57-2) Lemma B.4]) with  $f(x) = x \log x$  to get

$$
\mathrm{Tr}[\Gamma_n \log \Gamma_n] \leq \dim \left( \left( \mathfrak{h}^- \right)^{\otimes_s n} \right) \int_{S \mathfrak{h}^-} \frac{\mu(u)}{\dim \left( \left( \mathfrak{h}^- \right)^{\otimes_s n} \right)} \log \left( \frac{\mu(u)}{\dim \left( \left( \mathfrak{h}^- \right)^{\otimes_s n} \right)} \right) du
$$
  
= 
$$
- \log \left( \dim \left( \left( \mathfrak{h}^- \right)^{\otimes_s n} \right) \right) + \int_{S \mathfrak{h}^-} \mu(u) \log \left( \mu(u) \right) du.
$$

It follows that

$$
\mathcal{F}_{n,g}^{c,-}[\Gamma_{n,T,g}^{c,-}] = F_g^{c,-}(n)
$$
  
\n
$$
\leq \mathcal{F}_{n,g}^{c,-}[\Gamma_n]
$$
  
\n
$$
\leq n \int_{S\mathfrak{h}^-} \langle u, h^-u \rangle \mu(u) du + \frac{n(n-1)}{2N} g \int_{S\mathfrak{h}^-} \langle u^{\otimes 2}, w^-u^{\otimes 2} \rangle \mu(u) du
$$
  
\n
$$
+ T \int_{S\mathfrak{h}^-} \mu(u) \log(\mu(u)) du - T \log \left( \dim \left( \left( \mathfrak{h}^- \right)^{\otimes_s n} \right) \right).
$$

**Lower bound on**  $\mathcal{F}_{n,0}^{c,-}[\Gamma_{n,T,0}^{c,-}].$  Let us denote

$$
\tilde{\mu}_n(u) = \dim\left(\left(\mathfrak{h}^-\right)^{\otimes_s n}\right)\left\langle u^{\otimes n}, \Gamma_{n,T,0}^{c,-} u^{\otimes n}\right\rangle
$$

the lower symbol of  $\Gamma_{n,T,0}^{c,-}$ .

Using the quantitative quantum de Finetti theorem (see [\[55,](#page-57-2) Theorem 4.1]), we have

<span id="page-45-0"></span>
$$
\text{Tr}\left|\left(\Gamma_{n,T,0}^{c,-}\right)^{(1)} - \int_{S\mathfrak{h}^-} |u\rangle\langle u|\tilde{\mu}_n(u)du\right| \leq C\frac{\dim(\mathfrak{h}^-)}{n} \tag{5.16}
$$

which implies

<span id="page-45-1"></span>
$$
\begin{split} \text{Tr}[H_{n,0}^{-} \Gamma_{n,T,0}^{c,-}] &= n \text{Tr}[h^{-} (\Gamma_{n,T,0}^{c,-})^{(1)}] \\ &= n \text{Tr}\Big[h^{-} \int_{S\mathfrak{h}^{-}} |u\rangle \langle u|\tilde{\mu}_{n}(u)du\Big] + n \text{Tr}\Big[h^{-} \Big((\Gamma_{n,T,0}^{c,-})^{(1)} - \int_{S\mathfrak{h}^{-}} |u\rangle \langle u|\tilde{\mu}_{n}(u)du\Big)\Big] \\ &\ge n \int_{S\mathfrak{h}^{-}} \langle u, h^{-}u\rangle \tilde{\mu}_{n}(u)du - n||h^{-}||_{\text{Op}} \Big\| (\Gamma_{n,T,0}^{c,-})^{(1)} - \int_{S\mathfrak{h}^{-}} |u\rangle \langle u|\tilde{\mu}_{n}(u)du\Big\|_{\mathfrak{S}^{1}} \Big\| \\ &\ge n \int_{S\mathfrak{h}^{-}} \langle u, h^{-}u\rangle \tilde{\mu}_{n}(u)du - C\Lambda \dim(\mathfrak{h}^{-}), \end{split} \tag{5.17}
$$

where  $||h^-||_{\text{Op}} \leq \Lambda$ .

For the entropy term, we use the first Berezin-Lieb inequality (see [\[55,](#page-57-2) Lemma B.3]) to get

$$
\begin{split} \operatorname{Tr}[\Gamma_{n,T,0}^{c,-}\log\Gamma_{n,T,0}^{c,-}] &\geq \dim\left(\left(\mathfrak{h}^-\right)^{\otimes_s n}\right) \int_{S\mathfrak{h}^-} \frac{\tilde{\mu}_n(u)}{\dim\left(\left(\mathfrak{h}^-\right)^{\otimes_s n}\right)} \log\left(\frac{\tilde{\mu}_n(u)}{\dim\left(\left(\mathfrak{h}^-\right)^{\otimes_s n}\right)}\right) du \\ &= -\log\left(\dim\left(\left(\mathfrak{h}^-\right)^{\otimes_s n}\right)\right) + \int_{S\mathfrak{h}^-} \tilde{\mu}_n(u) \log(\tilde{\mu}_n(u)) du. \end{split}
$$

In particular, we have

$$
\mathcal{F}_{n,0}^{c,-}[\Gamma_{n,T,0}^{c,-}]
$$
\n
$$
\geq n \int_{S\mathfrak{h}^{-}} \langle u, h^{-}u \rangle \tilde{\mu}_{n}(u) du + T \int_{S\mathfrak{h}^{-}} \tilde{\mu}_{n}(u) \log(\tilde{\mu}_{n}(u)) du - T \log \left( \dim \left( \left( \mathfrak{h}^{-} \right)^{\otimes_{s} n} \right) \right) - C\Lambda \dim(\mathfrak{h}^{-})
$$
\n
$$
\geq n \int_{S\mathfrak{h}^{-}} \langle u, h^{-}u \rangle \mu_{n,T,0}(u) du + T \int_{S\mathfrak{h}^{-}} \mu_{n,T,0}(u) \log(\mu_{n,T,0}(u)) du
$$
\n
$$
- T \log \left( \dim \left( \left( \mathfrak{h}^{-} \right)^{\otimes_{s} n} \right) \right) - C\Lambda \dim(\mathfrak{h}^{-}),
$$

where

$$
d\mu_{n,T,0}(u) = \frac{1}{z_{n,T,0}} \exp\left(-\frac{n}{T}\langle u, h^-u\rangle\right) du\tag{5.18}
$$

is the unique minimizer of

$$
\mathcal{F}_{n,T,0}(\mu) = n \int_{S\mathfrak{h}^-} \langle u, h^- u \rangle \mu(u) du + T \int_{S\mathfrak{h}^-} \mu(u) \log(\mu(u)) du
$$

over all  $\mu \in \mathcal{P}(S\mathfrak{h}^-)$ , where  $\mathcal{P}(S\mathfrak{h}^-)$  is the set of all probability measures on  $S\mathfrak{h}^-$ . It follows that

$$
\frac{1}{T} \sum_{n=0}^{m} d_n \left( \mathcal{F}_{n,g}^{c,-} [\Gamma_{n,T,g}^{c,-}] - \mathcal{F}_{n,0}^{c,-} [\Gamma_{n,T,0}^{c,-}] \right)
$$
\n
$$
\leq \frac{1}{T} \sum_{n=0}^{m} d_n \left( n \int_{S\mathfrak{h}^-} \langle u, h^- u \rangle \mu(u) du + \frac{n(n-1)}{2m} g \int_{S\mathfrak{h}^-} \langle u^{\otimes 2}, w^- u^{\otimes 2} \rangle \mu(u) du + T \int_{S\mathfrak{h}^-} \mu(u) \log(\mu(u)) du - n \int_{S\mathfrak{h}^-} \langle u, h^- u \rangle \mu_{n,T,0}(u) du - T \int_{S\mathfrak{h}^-} \mu_{n,T,0}(u) \log(\mu_{n,T,0}(u)) du + C \Lambda \dim(\mathfrak{h}^-) \right)
$$

where we took  $\mu = \mu_{mT,T,g}$  defined as in [\(5.14\)](#page-44-2), leading to

$$
\frac{1}{T} \sum_{n=0}^{m} d_n \left( \mathcal{F}_{n,g}^{c,-} [\Gamma_{n,T,g}^{c,-}] - \mathcal{F}_{n,0}^{c,-} [\Gamma_{n,T,0}^{c,-}] \right)
$$
\n
$$
\leq \frac{1}{T} \sum_{n=0}^{m} d_n \left( n \int_{S\mathfrak{h}^-} \langle u, h^- u \rangle \mu_{mT,T,g}(u) du + \frac{n(n-1)g}{2m} \int_{S\mathfrak{h}^-} \langle u^{\otimes 2}, w^- u^{\otimes 2} \rangle \mu_{mT,T,g}(u) du + T \int_{S\mathfrak{h}^-} \mu_{mT,T,g}(u) \log(\mu_{mT,T,g}(u)) du - n \int_{S\mathfrak{h}^-} \langle u, h^- u \rangle \mu_{n,T,0}(u) du - T \int_{S\mathfrak{h}^-} \mu_{n,T,0}(u) \log(\mu_{n,T,0}(u)) du \right) + \frac{C}{T} \Lambda \dim(\mathfrak{h}^-).
$$

We write the quantity between parenthesis on the right-hand side as

$$
(\cdots)=(I)+(II)+(III),
$$

where

$$
(I) = mT \int_{S\mathfrak{h}^{-}} \langle u, h^{-}u \rangle \mu_{mT,T,g}(u) du + \frac{mT(mT-1)}{2mT} g \int_{S\mathfrak{h}^{-}} \langle u^{\otimes 2}, w^{-}u^{\otimes 2} \rangle \mu_{mT,T,g}(u) du + T \int_{S\mathfrak{h}^{-}} \mu_{mT,T,g}(u) \log(\mu_{mT,T,g}(u)) du - mT \int_{S\mathfrak{h}^{-}} \langle u, h^{-}u \rangle \mu_{n,T,0}(u) du - T \int_{S\mathfrak{h}^{-}} \mu_{n,T,0}(u) \log(\mu_{n,T,0}(u)) du, (II) = (mT - n) \int_{S\mathfrak{h}^{-}} \langle u, h^{-}u \rangle (\mu_{n,T,0}(u) - \mu_{mT,T,g}(u)) du, (III) = \left( \frac{n(n-1)}{2} - \frac{mT(mT-1)}{2} \right) \frac{g}{mT} \int_{S\mathfrak{h}^{-}} \langle u^{\otimes 2}, w^{-}u^{\otimes 2} \rangle \mu_{mT,T,g}(u) du.
$$

The terms (II) and (III) appear on the right side of [\(5.15\)](#page-44-1), so that there remains to control (I). Observe that

$$
m \int_{S\mathfrak{h}^-} \langle u, h^- u \rangle \mu_{n,T,0}(u) du + T \int_{S\mathfrak{h}^-} \mu_{n,T,0}(u) \log(\mu_{n,T,0}(u)) du
$$
  
\n
$$
= m \int \left( \int_{S\mathfrak{h}^-} \langle u, h^- u \rangle \mu_{n,T,0}(u) du + \frac{1}{m} \int_{S\mathfrak{h}^-} \mu_{n,T,0}(u) \log(\mu_{n,T,0}(u)) du \right)
$$
  
\n
$$
\geq m \int \inf \left\{ \int_{S\mathfrak{h}^-} \langle u, h^- u \rangle \mu(u) du + \frac{1}{m} \int_{S\mathfrak{h}^-} \mu(u) \log(\mu(u)) du : \mu \in \mathcal{P}(S\mathfrak{h}^-) \right\}
$$
  
\n
$$
\geq m \int \left( \int_{S\mathfrak{h}^-} \langle u, h^- u \rangle \rho_m(u) du + \frac{1}{m} \int_{S\mathfrak{h}^-} \rho_m(u) \log(\rho_m(u)) du \right),
$$
  
\nwhere

where

$$
d\rho_m(u) = \frac{1}{\tilde{z}_m} \exp(-m\langle u, h^-u \rangle) du.
$$

<span id="page-47-2"></span>It follows that

$$
(I) \leq mT \int_{S\mathfrak{h}^-} \langle u, h^-u \rangle \mu_{mT,T,g}(u) du + \frac{g(mT-1)}{2} \int_{S\mathfrak{h}^-} \langle u^{\otimes 2}, w^-u^{\otimes 2} \rangle \mu_{mT,T,g}(u) du
$$
  
+
$$
T \int_{S\mathfrak{h}^-} \mu_{mT,T,g}(u) \log(\mu_{mT,T,g}(u)) du
$$
  
-
$$
mT \int_{S\mathfrak{h}^-} \langle u, h^-u \rangle \rho_m(u) du - T \int_{S\mathfrak{h}^-} \rho_m(u) \log(\rho_m(u)) du.
$$

A direct computation gives

$$
(I) \leq -T \log(z_{mT,T,g}) + T \log(\tilde{z}_m)
$$
  
=  $-T \log \left( \frac{z_{mT,T,g}}{\tilde{z}_m} \right)$   
=  $-T \log \left( \int_{S \mathfrak{h}^-} \exp \left( -\frac{g(mT-1)}{2T} \langle u^{\otimes 2}, w^- u^{\otimes 2} \rangle \right) \rho_m(u) du \right)$ 

with the partition function  $z_{mT,T,g}$  as in [\(5.14\)](#page-44-2).

 $\overline{m}$ 

Thus, using  $(5.10)$  and the notation of Lemma [3.4](#page-14-1) we have

$$
\frac{1}{T} \sum_{n=0}^{m} d_n \times (I) \le -\log \Big( \int_{S\mathfrak{h}^-} \exp \Big( -\frac{g(mT-1)}{2T} \langle u^{\otimes 2}, w^- u^{\otimes 2} \rangle \Big) \rho_m(u) du \Big)
$$
  
\n
$$
\le -\log \Big( \int_{S\mathfrak{h}^-} \exp \Big( -\frac{mg}{2} \langle u^{\otimes 2}, w^- u^{\otimes 2} \rangle \Big) \rho_m(u) du \Big) + o_T(1)
$$
  
\n
$$
= -\log \Big( \int \exp \Big( -\frac{g}{2m} \langle u^{\otimes 2}, w^- u^{\otimes 2} \rangle \Big) d\sigma_{m,\Lambda}(u) \Big) + o_T(1)
$$
  
\n
$$
= -\log (z_m^r) + o_T(1) + o_\Lambda(1).
$$

Here we have changed variables  $u \to \sqrt{m}u$  to go to the third line, and used Lemma [3.4](#page-14-1) to go the last one.

<span id="page-47-0"></span>5.3. **Controling particle number fluctuations and conclusion.** There remains to estimate the spurious terms from the right-hand side of [\(5.15\)](#page-44-1) to complete the

*Proof of Proposition* [5.1.](#page-38-3) We will again use repeatedly the estimate from [\[22,](#page-56-24) Lemma D1]

$$
\dim \mathfrak{h}^- = \dim E_\Lambda \le C\Lambda^{1/2+1/s}.
$$

We combine Lemma [5.3](#page-41-0) with Lemma [5.4](#page-44-3) and choose

<span id="page-47-1"></span>
$$
\delta = \Lambda^{1/s - 1/2} \Lambda^{\alpha} \tag{5.19}
$$

□

with  $\alpha > 0$  suitably small, in particular so that

$$
\delta \xrightarrow[\Lambda \to \infty]{} 0.
$$

This way the assumptions of Lemma [5.3](#page-41-0) are fulfilled. We choose  $\Lambda(T) \to \infty$  in dependence with respect to *T* such that

$$
\Lambda^{3/2+1/s}T^{-1} \to 0.
$$

This way the three error terms of the first line of  $(5.15)$  are negligible in the limit  $T \to \infty$ .

We quickly dispatch the third line of  $(5.15)$ . This term is bounded by

$$
\frac{g}{mT^2}\sum_{n=0}^{mT}d_n\left(\frac{mT(mT-1)}{2}-\frac{n(n-1)}{2}\right)\int_{S\mathfrak{h}^-}\left|\left\langle u^{\otimes2},w^-u^{\otimes2}\right\rangle\right|\mu_{mT,T,g}(u)du.
$$

Bounding the interaction term as in Appendix [A,](#page-51-0) using [\(5.5\)](#page-38-6), [\(5.10\)](#page-41-3) and  $d_n = D^{-1}c_n \mathbb{1}_{\{n \ge M\}}$ , the above quantity is bounded by

$$
\frac{1}{T^2} \sum_{n=0}^{mT} d_n (mT - n) \frac{mT + n - 1}{2} \le \delta m
$$

which tends to 0 as soon as  $\delta \to 0$ .

<span id="page-48-6"></span>Our main task is to control the second line of [\(5.15\)](#page-44-1), using Section [3.2.](#page-15-0) Since the sum is limited to  $n \sim mT$  by our choice of  $d_n$  we may apply Proposition [3.5](#page-16-0) with  $m_1 = n/T$ ,  $m_2 = m$  (and the immaterial change  $g \to g(1 - O(N^{-1})))$  to obtain

$$
\int_{S\mathfrak{h}^-} \langle u, hu \rangle \left( \mu_{n,T,0}(u) - \mu_{mT,T,g}(u) \right) du \leq C\Lambda^{\frac{1}{4} + \frac{1}{2s}} + C \left| \frac{n}{T} - m \right| \Lambda^{\frac{1}{2} + \frac{1}{s}}
$$

provided the left-hand side is non-negative. Thus, since  $\sum_{n=0}^{mT} d_n = 1$  and with the choice [\(5.19\)](#page-47-1)

$$
\frac{1}{T} \sum_{n=0}^{m} d_n (mT - n) \int_{S \mathfrak{h}^-} \langle u, hu \rangle \left( \mu_{n,T,0}(u) - \mu_{mT,T,g}(u) \right) du \leq C \delta \Lambda^{\frac{1}{4} + \frac{1}{2s}} + C \delta^2 \Lambda^{\frac{1}{2} + \frac{1}{s}} \leq C \Lambda^{\frac{3}{2s} - \frac{1}{4} + \alpha}.
$$
\n(5.20)

Since we assume  $s > 6$ , we may always take  $\alpha > 0$  small enough so that

$$
\frac{3}{2s} - \frac{1}{4} + \alpha < 0
$$

<span id="page-48-0"></span>and thus [\(5.19\)](#page-47-1) tends to 0 when  $\Lambda \to \infty$ , as needed, which concludes the proof. □

#### 6. Free energy lower bound bound

In this section, we turn to the energy lower bound, completing the proof of Theorem [2.5:](#page-4-8)

#### <span id="page-48-1"></span>**Proposition 6.1** (**Free energy lower bound**)**.**

Let the interacting canonical Gibbs state  $\Gamma_{mT,T,g}^c$  be defined as in [\(2.3\)](#page-3-1) with the particle number set as  $N = mT$ *, with*  $m > 0$ *, q*  $> 0$  *fixed.* 

*There exists a probability measure*  $\nu$  *over*  $L^2(\mathbb{R})$  *such that, modulo subsequence, for any*  $k \geq 1$ *,* 

<span id="page-48-3"></span><span id="page-48-2"></span>
$$
\frac{k!}{T^k} \left( \Gamma^c_{mT,T,g} \right)^{(k)} \xrightarrow[T \to \infty]{}^* \int |u^{\otimes k} \rangle \langle u^{\otimes k} | d\nu(u) \tag{6.1}
$$

weakly- $\star$  in the trace-class  $\mathfrak{S}^1(\mathfrak{h}^k)$ , where the reduced density matrices are defined as in [\(2.4\)](#page-3-2).

*The relative quantum free-energy satisfies*

$$
\liminf_{T \to \infty} \left( -\log \left( Z_{mT,T,g}^c \right) + \log \left( Z_{mT,T,0}^c \right) \right)
$$
\n
$$
\geq \mathcal{H}_c(\nu, \mu_{0,m}) + \frac{g}{2m} \int \left( \iint_{X \times X} |u(\mathbf{x})|^2 w(\mathbf{x} - \mathbf{y}) |u(\mathbf{y})|^2 d\mathbf{x} d\mathbf{y} \right) d\nu(u) \geq -\log z_m^r \quad (6.2)
$$

*where*  $z_m^r$  *is the classical relative partition function* [\(2.12\)](#page-4-4)*.* 

*Proof of Proposition [6.1](#page-48-1) and completion of the proof of Theorem [2.5.](#page-4-8)* The existence of the measure *ν* in [\(6.1\)](#page-48-2) is a general fact, following from the weak quantum de Finetti theorem, e.g. in the version of [\[36,](#page-56-36) Section 2].

Combining  $(6.2)$  and Proposition [5.1](#page-38-3) gives the energy convergence  $(2.14)$ . Moreover it shows that any limit measure  $\nu$  in [\(6.1\)](#page-48-2) must minimize the classical relative free energy, and hence be equal to  $\mu_{g,m}$ . By uniqueness of the limit this leads to  $(2.13)$  in the sense of weak- $\star$  convergence. Since  $\mu_{g,m}$  lives on the sphere  $\int |u|^2 = m$ , the trace of the left-hand side of  $(6.1)$  converges to the trace of the right-hand side. Both sides being positive trace-class operators, the usual criterion [\[62,](#page-57-33) Addendum-H] upgrades the convergence to strong in the trace-class.

Everything thus now relies on, given  $(6.1)$ , passing to the liminf to prove the first inequality in  $(6.2)$ . We start from the fact that  $\Gamma^c_{mT,T,g}$  minimizes the relative free energy functional

$$
\mathcal{H}\left(\Gamma,\Gamma_{mT,T,0}^{c}\right)+\frac{g}{mT^{2}}\text{Tr}\left[w(\mathbf{x}-\mathbf{y})\Gamma^{(2)}\right]=\text{Tr}\left[\Gamma(\log\Gamma-\log\Gamma_{mT,T,0}^{c})\right]+\frac{g}{mT^{2}}\text{Tr}\left[w(\mathbf{x}-\mathbf{y})\Gamma^{(2)}\right]
$$

The Berezin-Lieb inequality of [\[37,](#page-57-12) Theorem 7.1] deals conveniently with the relative entropy term. Indeed,  $(6.1)$  says that  $\nu$  is de Finetti measure of the sequence  $\Gamma^c_{mT,T,g}$  at scale  $T^{-1}$ . Since we know from Theorem [4.1](#page-20-2) that  $\mu_{0,m}$  is de Finetti measure of the sequence  $\Gamma^c_{mT,T,0}$  at scale  $T^{-1}$ , we obtain

<span id="page-48-5"></span>
$$
\liminf_{T \to \infty} \text{Tr} \left[ \Gamma^c_{mT,T,g} (\log \Gamma^c_{mT,T,g} - \log \Gamma^c_{mT,T,0}) \right] \ge \int \frac{d\nu}{d\mu_{0,m}} \log \frac{d\nu}{d\mu_{0,m}} d\mu_{0,m}. \tag{6.3}
$$

There remains to pass to the liminf in the interaction energy term. For a purely repulsive/defocusing interaction, this would be done exactly as in [\[37\]](#page-57-12). The sequel is thus primarily aimed at allowing for an attractive/focusing component in *w*.

**First** we claim that, with

<span id="page-48-4"></span>
$$
0 < \alpha < \frac{1}{2} - \frac{1}{s} \tag{6.4}
$$

<span id="page-49-3"></span>we have

<span id="page-49-0"></span>
$$
\operatorname{Tr}\left[\frac{h^{\alpha}}{T}\left(\Gamma^{c}_{mT,T,g}\right)^{(1)}\right] \leq C\mathcal{H}\left(\Gamma^{c}_{mT,T,g},\Gamma^{c}_{mT,T,0}\right) + C_{\alpha}.\tag{6.5}
$$

To this end we define the auxiliary *mT*-particles Gibbs state

$$
\Gamma_{mT,0}^{\alpha} := \frac{1}{Z_{mT,0}^{\alpha}} \exp\left(-\frac{1}{T} \sum_{j=1}^{mT} \left(h_{\mathbf{x}_j} - ch_{\mathbf{x}_j}^{\alpha}\right)\right)
$$

where *c* is small enough for  $h - ch^{\alpha} \ge c'h$  to be a non-negative operator. Following the first few lines of the proof of [\[41,](#page-57-16) Theorem 6.1] we find

$$
\mathcal{H}\left(\Gamma_{mT,T,g}^{c},\Gamma_{mT,T,0}^{c}\right)-\frac{c}{T}\operatorname{Tr}\left[h^{\alpha}\left(\Gamma_{mT,T,g}^{c}\right)^{(1)}\right]
$$
\n
$$
=\frac{1}{T}\operatorname{Tr}\left[\left(h-ch^{\alpha}\right)\left(\Gamma_{mT,T,g}^{c}\right)^{(1)}\right]+\operatorname{Tr}\left[\Gamma_{mT,T,g}^{c}\log\left(\Gamma_{mT,T,g}^{c}\right)\right]-\frac{1}{T}\operatorname{Tr}\left[h\left(\Gamma_{mT,T,0}^{c}\right)^{(1)}\right]-\operatorname{Tr}\left[\Gamma_{mT,T,0}^{c}\log\left(\Gamma_{mT,T,0}^{c}\right)\right]
$$
\n
$$
\geq\frac{1}{T}\operatorname{Tr}\left[\left(h-ch^{\alpha}\right)\left(\Gamma_{mT,0}^{\alpha}\right)^{(1)}\right]+\operatorname{Tr}\left[\Gamma_{mT,0}^{\alpha}\log\left(\Gamma_{mT,0}^{\alpha}\right)\right]-\frac{1}{T}\operatorname{Tr}\left[h\left(\Gamma_{mT,T,0}^{c}\right)^{(1)}\right]-\operatorname{Tr}\left[\Gamma_{mT,T,0}^{c}\log\left(\Gamma_{mT,T,0}^{c}\right)\right]
$$
\n
$$
\geq-\frac{c}{T}\operatorname{Tr}\left[h^{\alpha}\left(\Gamma_{mT,0}^{\alpha}\right)^{(1)}\right]
$$

using successively the variational principles defining  $\Gamma^{\alpha}_{mT,0}$  and  $\Gamma^c_{mT,T,0}$ . Arguing as in Appendix [B](#page-53-0) (changing *h* to  $h - ch^{\alpha}$ ) we find that, for a well-chosen fixed  $\nu \in \mathbb{R}$ 

$$
(\Gamma_{mT,0}^{\alpha})^{(1)} \le C \frac{1}{\exp(T^{-1}(h - ch^{\alpha} + \nu)) - 1} \le C \frac{T}{h - ch^{\alpha} + \nu}.
$$

Inserting in the above we deduce

$$
\operatorname{Tr}\left[\frac{h^{\alpha}}{T}\left(\Gamma_{mT,T,g}^{c}\right)^{(1)}\right] \leq \mathcal{H}\left(\Gamma_{mT,T,g}^{c},\Gamma_{mT,T,0}^{c}\right) + C \operatorname{Tr} h^{\alpha-1}
$$

and since  $h^{\alpha-1}$  is trace-class for  $\alpha$  as in [\(6.4\)](#page-48-4) (see e.g. [\[22,](#page-56-24) Appendix A]), we have proven [\(6.5\)](#page-49-0).

**Next,** we deduce that

<span id="page-49-2"></span>
$$
\mathcal{H}\left(\Gamma_{m}^{c}T_{,T,g},\Gamma_{m}^{c}T_{,T,0}\right)\leq C\tag{6.6}
$$

independently of *T*. To this end we first recall that, under Assumption [2.1](#page-2-2) on the negative part of *w* we have that, for any  $t > 0$ , the two-particle operator

<span id="page-49-1"></span>
$$
H_2^t := \frac{h_x^{\alpha}}{4} + \frac{h_y^{\alpha}}{4} + tw(\mathbf{x} - \mathbf{y}) \ge -C
$$
\n(6.7)

is bounded below as a self-adjoint operator acting on  $L^2(\mathbb{R}^2)$  for

$$
\alpha \ge \frac{1}{2p}.
$$

Indeed, following [\[55,](#page-57-2) Remark 3.1] or adapting the proof of [\[46,](#page-57-35) Inequality  $(3.3)$ ] we see that  $(6.7)$  holds as soon as  $H^{\alpha}$  continuously embeds into  $L^{2q}$ , with

$$
\frac{1}{p} + \frac{1}{q} = 1.
$$

This requires

$$
2\frac{p}{p-1} \le \frac{2}{1-2\alpha}
$$
 i.e.  $\alpha \ge \frac{1}{2p}$ .

But, with  $p > \frac{s}{s-2}$ , the right-hand side is smaller than  $1/2 - 1/s$  so that we may pick

$$
\alpha = \frac{1}{2} - \frac{1}{s} - \eta
$$

with  $\eta > 0$  sufficiently small. Then [\(6.4\)](#page-48-4) is satisfied and we may apply the previous step to obtain [\(6.5\)](#page-49-0). Combining this with the free-energy upper bound of Proposition [5.1](#page-38-3) we are led to

$$
C \geq \mathcal{H}\left(\Gamma_{mT,T,g}^c, \Gamma_{mT,T,0}^c\right) + \frac{g}{mT^2} \text{Tr}\left[w(\mathbf{x} - \mathbf{y})\left(\Gamma_{mT,T,g}^c\right)^{(2)}\right]
$$
  
\n
$$
\geq \frac{1}{2} \mathcal{H}\left(\Gamma_{mT,T,g}^c, \Gamma_{mT,T,0}^c\right) + \frac{1}{2} \text{Tr}\left[\frac{h^{\alpha}}{T}\left(\Gamma_{mT,T,g}^c\right)^{(1)}\right] + \frac{g}{mT^2} \text{Tr}\left[w(\mathbf{x} - \mathbf{y})\Gamma^{(2)}\right] - C
$$
  
\n
$$
\geq \frac{1}{2} \mathcal{H}\left(\Gamma_{mT,T,g}^c, \Gamma_{mT,T,0}^c\right) + \frac{1}{T^2} \text{Tr}\left[H_2^t\left(\Gamma_{mT,T,g}^c\right)^{(2)}\right] - C
$$

for a suitably chosen fixed  $t > 0$ . Inserting  $(6.7)$  we deduce  $(6.6)$ .

$$
\mathcal{H}\left(\Gamma_{mT,T,g}^{c},\Gamma_{mT,T,0}^{c}\right) + \frac{g}{mT^{2}} \text{Tr}\left[w(\mathbf{x}-\mathbf{y})\left(\Gamma_{mT,T,g}^{c}\right)^{(2)}\right] \n\geq (1-\varepsilon)\mathcal{H}\left(\Gamma_{mT,T,g}^{c},\Gamma_{mT,T,0}^{c}\right) + \frac{1}{T^{2}} \text{Tr}\left[G_{2}^{\epsilon}\left(\Gamma_{mT,T,g}^{c}\right)^{(2)}\right] - C\varepsilon
$$

with, similarly as above

$$
G_2^{\varepsilon}:=\varepsilon\left(\frac{h_{\mathbf{x}}^{\alpha}}{2}+\frac{h_{\mathbf{y}}^{\alpha}}{2}\right)+\frac{g}{m}w(\mathbf{x}-\mathbf{y})\geq -f(\varepsilon)
$$

for some finite  $f(\varepsilon) > 0$ . Using [\(6.6\)](#page-49-2) and the fact that the trace of  $(\Gamma^c_{mT,T,g})^{(2)}$  is by definition

$$
\frac{mT(mT-1)}{2} \propto \frac{m^2T^2}{2}
$$

we infer

$$
\mathcal{H}\left(\Gamma_{mT,T,g}^c,\Gamma_{mT,T,0}^c\right)+\frac{mg}{T^2}\text{Tr}\left[w(\mathbf{x}-\mathbf{y})\left(\Gamma_{mT,T,g}^c\right)^{(2)}\right]
$$
\n
$$
\geq \mathcal{H}\left(\Gamma_{mT,T,g}^c,\Gamma_{mT,T,0}^c\right)+\frac{1}{T^2}\text{Tr}\left[\left(G_2^{\epsilon}+f(\epsilon)\right)^{1/2}\left(\Gamma_{mT,T,g}^c\right)^{(2)}\left(G_2^{\epsilon}+f(\epsilon)\right)^{1/2}\right]-C\varepsilon-\frac{m^2}{2}f(\varepsilon).
$$

Using Proposition [5.1](#page-38-3) it follows that the non-negative operator

$$
T^{-2} \left(G_2^{\epsilon} + f(\epsilon)\right)^{1/2} \left(\Gamma_{mT,T,g}^c\right)^{(2)} \left(G_2^{\epsilon} + f(\epsilon)\right)^{1/2}
$$

is bounded in trace-class. Modulo subsequence it converges weakly- $\star$  when  $T \to \infty$  to some operator that we may identify with the help of  $(6.1)$ :

$$
\frac{1}{T^2} \left( G_2^{\epsilon} + f(\epsilon) \right)^{1/2} \left( \Gamma_{mT,T,g}^c \right)^{(2)} \left( G_2^{\epsilon} + f(\epsilon) \right)^{1/2} \rightharpoonup^{\star} \frac{1}{2} \left( G_2^{\epsilon} + f(\epsilon) \right)^{1/2} \int |u^{\otimes 2} \rangle \langle u^{\otimes 2} | d\nu(u) \left( G_2^{\epsilon} + f(\epsilon) \right)^{1/2}.
$$

Using Fatou's lemma for trace-class operators (i.e. the fact that the trace-class norm is weakly-*⋆* lower semi-continuous) and combining with [\(6.3\)](#page-48-5) we get

$$
\liminf_{T \to \infty} \left( \mathcal{H} \left( \Gamma^c_{mT,T,g}, \Gamma^c_{mT,T,0} \right) + \frac{g}{mT^2} \text{Tr} \left[ w(\mathbf{x} - \mathbf{y}) \left( \Gamma^c_{mT,T,g} \right)^{(2)} \right] \right)
$$
\n
$$
\geq \mathcal{H}_{\text{cl}} \left( \nu, \mu_{0,m} \right) + \frac{1}{2} \int \left\langle u^{\otimes 2} |G_2^{\epsilon} + f(\epsilon)| u^{\otimes 2} \right\rangle d\nu(u) - C\varepsilon - \frac{m^2}{2} f(\varepsilon).
$$

Since  $G_2^{\epsilon} + f(\epsilon) \geq 0$  it follows that  $\mathcal{H}_{\text{cl}}(\nu, \mu_{0,m})$  is finite and hence  $\nu$  is absolutely continuous with respect to  $\mu_{0,m}$ . In particular  $\int |u|^2 = m$  for *ν*-almost every *u* so that

$$
\liminf_{T \to \infty} \left( \mathcal{H} \left( \Gamma^c_{mT,T,g}, \Gamma^c_{mT,T,0} \right) + \frac{g}{mT^2} \text{Tr} \left[ w(\mathbf{x} - \mathbf{y}) \left( \Gamma^c_{mT,T,g} \right)^{(2)} \right] \right)
$$
\n
$$
\geq \mathcal{H}_{\text{cl}} \left( \nu, \mu_{0,m} \right) + \frac{1}{2} \int \left\langle u^{\otimes 2} |G_2^{\epsilon} u^{\otimes 2} \right\rangle d\nu(u) - C \varepsilon.
$$

Since by definition

$$
G_2^{\varepsilon} \ge \frac{g}{m} w(\mathbf{x} - \mathbf{y})
$$

we may finally pass to the limit  $\varepsilon \to 0$  to conclude that

$$
\liminf_{T \to \infty} \left( \mathcal{H}\left( \Gamma^c_{mT,T,g}, \Gamma^c_{mT,T,0} \right) + \frac{g}{mT^2} \text{Tr}\left[ w(\mathbf{x} - \mathbf{y}) \left( \Gamma^c_{mT,T,g} \right)^{(2)} \right] \right)
$$
\n
$$
\geq \mathcal{H}_{\text{cl}}\left( \nu, \mu_{0,m} \right) + \frac{g}{2m} \int \left\langle u^{\otimes 2} |w(\mathbf{x} - \mathbf{y}) u^{\otimes 2} \right\rangle d\nu(u)
$$

which is the desired lower bound on the relative free energy functional, concluding the proof.  $\Box$ 

#### Appendix A. Interacting Gibbs measure

<span id="page-51-3"></span><span id="page-51-0"></span>We recap the construction of the interacting Gibbs measure, vindicating that Definition [2.4](#page-4-3) makes sense. More details may be found e.g. [\[22,](#page-56-24) [23\]](#page-56-25).

We will assume that

*w* = *w*<sub>1</sub> + *w*<sub>2</sub>*, w*<sub>1</sub> ∈ *M, w*<sub>2</sub> ∈ *L*<sup>*p*</sup> with 1 < *p* < ∞*,* 

where  $M$  is the set of bounded (Radom) measures. The measure part  $w_1$  can include a delta function.

Under this assumption, we will show that the interacting Gibbs measure  $\mu_m$  is well-defined as a probability measure. We will show that the partition function is finite by considering separately two cases: defocusing  $w \geq 0$  and focusing  $w \leq 0$ .

## <span id="page-51-1"></span>A.1. **Reduction to local interactions. Defocusing part of the interaction.**

For a non-negative interaction potential

$$
F_{\rm NL}(u):=\iint_{X\times X}|u(\mathbf{x})|^2|u(\mathbf{y})|^2w(\mathbf{x}-\mathbf{y})d\mathbf{x}d\mathbf{y}\geq 0
$$

and since  $\mu_{0,m}$  is a probability measure, we have  $z_m^r \leq 1$ . To see that  $z_m^r > 0$ , we use the Jensen inequality

$$
z_m^r \ge \exp\left(-\frac{1}{2}\int F_{\rm NL}(u)d\mu_{0,m}(u)\right).
$$

Thus the problem is reduced to showing that

$$
\int F_{\rm NL}(u)d\mu_{0,m}(u) < \infty.
$$

By Young's inequality, we have

$$
F_{\rm NL}(u) = \int_X (|u|^2 * w)|u(\mathbf{x})|^2 d\mathbf{x}
$$
  
\n
$$
= \int_X (|u|^2 * w_1)|u(\mathbf{x})|^2 d\mathbf{x} + \int_X (|u|^2 * w_2)|u(\mathbf{x})|^2 d\mathbf{x}
$$
  
\n
$$
\leq ||u|^2 ||_{L^2} |||u|^2 * w_1 ||_{L^2} + |||u|^2 ||_{L^r} |||u|^2 * w_2 ||_{L^{r'}}
$$
  
\n
$$
\leq ||w_1||_{L^1} |||u|^2 ||_{L^2}^2 + ||w_2||_{L^p} |||u|^2 ||_{L^r}^2
$$
  
\n
$$
= ||w_1||_{L^1} ||u||_{L^4}^4 + ||w_2||_{L^p} ||u||_{L^{2r}}^4,
$$
\n(A.1)

where  $\frac{2}{r} + \frac{1}{p} = 2$ . Since  $1 < p < \infty$ , we have  $r \in (1, 2)$ . By interpolation, we have

$$
||u||_{L^{2r}} \leq ||u||_{L^4}^{\theta} ||u||_{L^2}^{1-\theta}
$$

with

$$
\theta = 2\left(\frac{1}{r} - \frac{1}{2}\right) \in (0, 1).
$$

By the Young inequality

<span id="page-51-2"></span>
$$
a^{\theta}b^{1-\theta} \le a + C(\theta)b,
$$

we have

$$
||u||_{L^{2r}} \le ||u||_{L^4} + C(\theta)||u||_{L^2}.
$$

Since  $||u||_{L^2}^2 = m$  on the support of  $\mu_{0,m}$ , it is enough to prove that

$$
\int \|u\|_{L^4}^4 d\mu_{0,m}(u) < \infty. \tag{A.2}
$$

#### **Focusing part of the interaction**

For a non-positive interaction, we have  $z_m^r \geq 1$ . It remains to prove  $z_m^r < \infty$ . As in the defocusing case, we estimate

$$
-F_{\rm NL}(u) \leq \int_X |(|u|^2 * w)(\mathbf{x})||u(\mathbf{x})|^2 d\mathbf{x}
$$
  
\n
$$
\leq \int_X |(|u|^2 * w_1)(\mathbf{x})||u(\mathbf{x})|^2 d\mathbf{x} + \int_X |(|u|^2 * w_2)(\mathbf{x})||u(\mathbf{x})|^2 d\mathbf{x}
$$
  
\n
$$
\leq ||w_1||_{L^1} ||u||_{L^4}^4 + ||w_2||_{L^p} ||u||_{L^{2r}}^4.
$$

On the support of  $\mu_{0,m}$ , we have

$$
||u||_{L^{2r}}^4 \le ||u||_{L^4}^4 + C(\theta)||u||_{L^2}^4 \le C(m,\theta) + ||u||_{L^4}^4.
$$

<span id="page-52-4"></span>The problem is now reduced to proving

<span id="page-52-3"></span><span id="page-52-1"></span>
$$
\int e^{\|u\|_{L^4}^4} d\mu_{0,m}(u) < \infty. \tag{A.3}
$$

<span id="page-52-0"></span>A.2. **Exponential integrability of the** *L* <sup>4</sup> **norm.** As per the above, to make sense of the interacting measure it suffices to prove  $(A.3)$ , which implies  $(A.2)$ . The proof is done in two steps.

**Step 1. Decay of**  $L^4$ **-norm in high frequency.** We first prove that there exist  $C, c > 0$  such that for all  $0 \le \rho < \frac{s-1}{2s}$ , all  $\Lambda$  sufficiently large and all  $R > 0$ ,

$$
\mu_{0,m}(\|P_{\Lambda}^{\perp}u\|_{L^{4}}>R)\leq Ce^{-c\Lambda^{p}R^{2}}.
$$
\n(A.4)

Since  $\mu_{\epsilon,m} \to \mu_{0,m}$  as  $\epsilon \to 0$  (cf Section [3\)](#page-6-1), it suffices to prove that for  $\epsilon > 0$  small enough,

<span id="page-52-2"></span>
$$
\mu_{\epsilon,m}(\|P_\Lambda^\perp u\|_{L^4} > R) \le Ce^{-c\Lambda^\rho R^2}.\tag{A.5}
$$

We have

$$
\mu_{\epsilon,m}(\|P_{\Lambda}^{\perp}u\|_{L^{4}} > R) \leq e^{-tR^{2}} \int e^{t\|P_{\Lambda}^{\perp}u\|_{L^{4}}^{2}} d\mu_{\epsilon,m}(u)
$$

$$
= e^{-tR^{2}} \sum_{k \geq 0} \frac{t^{k}}{k!} \int \|P_{\Lambda}^{\perp}u\|_{L^{4}}^{2k} d\mu_{\epsilon,m}(u).
$$

We write

$$
\int ||P_{\Lambda}^{\perp}u||_{L^{4}}^{2k} d\mu_{\epsilon,m}(u)
$$
\n
$$
= \frac{1}{z_{\epsilon,m}^{r}} \int ||P_{\Lambda}^{\perp}u||_{L^{4}}^{2k} \exp \left(-\frac{1}{\epsilon}(\langle u, u \rangle - m)^{2}\right) d\mu_{0}(u)
$$
\n
$$
= \frac{1}{z_{\epsilon,m}^{r}} \int ||P_{\Lambda}^{\perp}u||_{L^{4}}^{2k} \left(\exp \left(-\frac{1}{\epsilon}(\|P_{\Lambda}u\|^{2} + \|P_{\Lambda}^{\perp}u\|^{2} - m)^{2}\right) d\mu_{0,\Lambda}(u)\right) d\mu_{0,\Lambda}^{\perp}(u).
$$

Let  $g_{\Lambda}$  be the density function of  $||P_{\Lambda}u||^2$  with respect to  $\mu_{0,\Lambda}$ . As in the proof of Proposition [3.1,](#page-6-4) we have

$$
\frac{1}{\sqrt{\epsilon}} \int \exp\left(-\frac{1}{\epsilon}(\|P_\Lambda u\|^2 + \|P_\Lambda^{\perp} u\|^2 - m)^2\right) d\mu_{0,\Lambda}(u) = \frac{1}{\sqrt{\epsilon}} \int_0^{+\infty} \exp\left(-\frac{1}{\epsilon}(y - m + \nu_\Lambda)^2\right) g_\Lambda(y) dy
$$
  

$$
\leq \sqrt{\pi} \|g_\Lambda\|_{L^\infty}
$$
  

$$
\leq C,
$$

where  $\nu_{\Lambda} = ||P_{\Lambda}^{\perp}u||^2$ , where  $g_{\Lambda}$  is uniformly bounded as long as  $\Lambda$  is sufficiently large. Moreover, for  $\epsilon > 0$ small enough,

$$
\frac{1}{\sqrt{\epsilon}} z_{\epsilon,m}^r \ge \frac{1}{2} f_0(m) \sqrt{\pi}.
$$

It follows that

$$
\int \|P_\Lambda^\perp u\|_{L^4}^{2k} d\mu_{\epsilon,m}(u) \leq \frac{C}{f_0(m)} \int \|P_\Lambda^\perp u\|_{L^4}^{2k} d\mu_{0,\Lambda}^\perp(u).
$$

Arguing as in [\[22,](#page-56-24) Lemma 3.4], we obtain

$$
\int \|P_\Lambda^\perp u\|_{L^4}^{2k} d\mu_{0,\Lambda}^\perp(u) \le 2! k! B_\Lambda^k,
$$

where

$$
B_{\Lambda} := \left( \int_X \left( (P_\Lambda^\perp h)^{-1}(x, x) \right)^2 dx \right)^{1/2} \leq \Lambda^{-\rho} \left( \int_X \left( h^{\rho - 1}(x, x) \right)^2 dx \right)^{1/2} \leq C \Lambda^{-\rho},
$$

where  $0 \le \rho < \frac{s-1}{2s}$ . This shows that for  $\epsilon > 0$  small,

$$
\mu_{\epsilon,m}(\|P_\Lambda^{\perp}u\|_{L^4}>R))\leq 2!e^{-tR^2}\sum_{k\geq 0}(Ct\Lambda^{-\rho})^k
$$

Taking  $t = \nu \Lambda^{\rho}$  with  $\nu > 0$  small, we obtain [\(A.5\)](#page-52-2), hence [\(A.4\)](#page-52-3).

<span id="page-53-1"></span>**Step 2. The exponential bound.** We have

$$
\int e^{\|u\|_{L^4}^4} d\mu_{0,m}(u) = \int_0^\infty \mu_{0,m}(e^{\|u\|_{L^4}^4} > \lambda) d\lambda
$$
  
= 
$$
\int_0^\infty \mu_{0,m} (\|u\|_{L^4}^4 > \lambda) e^{\lambda} d\lambda
$$
  
= 
$$
C(\lambda_0) + \int_{\lambda_0}^\infty \mu_{0,m} (\|u\|_{L^4} > \lambda^{1/4}) e^{\lambda} d\lambda
$$

for some  $\lambda_0 > 0$  to be fixed later. Using a Sobolev embedding and the fact that  $||u||_{L^2}^2 = m$  on the support of  $\mu_{0,m}$ , we have

$$
||P_{\Lambda}u||_{L^{4}} \leq C||\langle \nabla \rangle^{\frac{1}{4}} P_{\Lambda}u||_{L^{2}} \leq C||h^{1/8}P_{\Lambda}u||_{L^{2}}\leq C\Lambda^{1/8}||P_{\Lambda}u||_{L^{2}} \leq C\Lambda^{1/8}||u||_{L^{2}}\leq C\Lambda^{1/8}m^{1/2}.
$$

For  $\lambda > \lambda_0$ , we take

$$
\Lambda_0 = \left(\frac{1}{2C}\right)^8 \frac{\lambda^2}{m^4},
$$

we obtain

$$
||P_{\Lambda_0}u||_{L^4}\leq \frac{1}{2}\lambda^{1/4}.
$$

Using the triangle inequality, we have for  $u \in \text{supp}(\mu_{0,m})$  satisfying  $||u||_{L^4} > \lambda^{1/4}$ , we have

$$
||P_{\Lambda_0}^{\perp}u||_{L^4}\geq ||u||_{L^4}-||P_{\Lambda_0}u||_{L^4}>\frac{1}{2}\lambda^{1/4}.
$$

Thus

$$
\mu_{0,m} \left( \|u\|_{L^4} > \lambda \right) \leq \mu_{0,m} \left( \|P_{\Lambda_0}^{\perp} u\|_{L^4} > \frac{1}{2} \lambda^{1/4} \right).
$$

Increasing  $\lambda_0$  a bit if necessary, we can apply Step 1 to get

$$
\mu_{0,m} \left( \|u\|_{L^4} > \lambda^{1/4} \right) \leq Ce^{-c\Lambda_0^{\rho} \lambda^{1/2}} = Ce^{-c\lambda^{2\rho + 1/2}}
$$

for all  $0 \le \rho < \frac{s-1}{2s}$ . Since  $s > 2$ , we can choose  $\rho$  so that

$$
\frac{1}{4} < \rho < \frac{s-1}{2s}.
$$

With such a choice, we have  $2\rho + 1/2 > 1$ . In particular,

$$
\mu_{0,m}\left(\|u\|_{L^4} > \lambda^{1/4}\right)e^{\lambda} \in L^1((\lambda_0, +\infty))
$$

which conclude the proof of  $(A.3)$ .

#### Appendix B. Bounds on canonical density matrices

<span id="page-53-0"></span>We will need estimates on canonical density matrices to replace the extensive use of Wick's theorem in the grand-canonical case. We recall here bounds from  $[21,$  Appendix A] that relate canonical quantities in terms of their grand-canonical counterparts.

Let *h* be a non-negative operator with compact, trace-class resolvent and  $\nu > 0$  be a fixed real number. Consider the free grand canonical Gibbs state

$$
\Gamma_T^{\nu} = \frac{1}{Z_T^{\nu}} \exp\left(-\frac{1}{T} d\Gamma(h+\nu)\right).
$$

The quantum Wick theorem (cf e.g. [\[37,](#page-57-12) Section 2, Appendix A]) gives

$$
(\Gamma_T^{\nu})^{(k)} = P_{\text{sym}}^k \left( \frac{1}{e^{(h+\nu)/T} - 1} \right)^{\otimes k} P_{\text{sym}}^k.
$$

Here  $P_{sym}^k$  is the bosonic symmetrizer

$$
P_{\text{sym}}^k = \frac{1}{k!} \sum_{\sigma \in \Sigma^k} U_{\sigma}
$$

where the sum is over the permutation group and  $U_{\sigma}$  permutes particle labels according to  $\sigma$ .

<span id="page-54-4"></span>In particular, we have

$$
(\Gamma_T^{\nu})^{(k)} \le C_k \left(\frac{T}{h+\nu}\right)^{\otimes k} \tag{B.1}
$$

as operators. In fact, it suffices to prove for  $k = 1$ , i.e.,

$$
\langle u_j | (\Gamma_T^{\nu})^{(1)} | u_j \rangle \le \frac{T}{\lambda_j + \nu},
$$

where  $(\lambda_j, u_j)_{j \geq 1}$  are eigenvalues and (normalized) eigenfunctions of *h*. We have

$$
\langle u_j | (\Gamma_T^{\nu})^{(1)} | u_j \rangle = \left\langle u_j \Big| \frac{1}{e^{(h+\nu)/T} - 1} \Big| u_j \right\rangle = \frac{1}{e^{(\lambda_j + \nu)/T} - 1} \le \frac{T}{\lambda_j + \nu}.
$$

We need similar bounds for canonical density matrices:

**Lemma B.1** (**Canonical density matrices** [\[21,](#page-56-13) Proposition A.2])**.** *Let*  $\nu > -\lambda_1$  *be such that* 

<span id="page-54-3"></span><span id="page-54-1"></span>
$$
N = \text{Tr} \left[ \mathcal{N} \Gamma_T^{\nu} \right] = \sum_{j \ge 1} \frac{1}{e^{(\lambda_j + \nu)/T} - 1}.
$$
 (B.2)

*If* we set  $N = mT$  with  $m > 0$  fixed,  $\nu$  is bounded above and below independently of  $T$  when  $T \to \infty$ . *For*  $n \leq N$ , let  $\Gamma_{n,T,0}^c$  the free *n*-particles canonical Gibbs case be defined as in Section [5.1.](#page-38-1) We have *that*

$$
(\Gamma_{n,T,0}^{c})^{(1)}(x,x) \le \frac{40}{1.8} (\Gamma_{T}^{\nu})^{(1)}(x,x), \quad n = 0,...,N
$$
 (B.3)

*and*

$$
(\Gamma_{n,T,0}^{c})^{(2)}(x,y;x,y) \le 4\left(\frac{40}{1.8}\right)^{2} (\Gamma_{T}^{\nu})^{(1)}(x,x) (\Gamma_{T}^{\nu})^{(1)}(y,y), \quad n = 0,...,N
$$
 (B.4)

*almost everywhere. In addition, we have*

$$
(\Gamma_{n,T,0}^{c})^{(1)} \le \frac{40}{1.8} (\Gamma_{T}^{\nu})^{(1)}, \quad n = 0, ..., N
$$
 (B.5)

*as operators.*

*Proof.* The map

<span id="page-54-2"></span><span id="page-54-0"></span>
$$
\nu\mapsto N(\nu)={\rm Tr}\left[{\cal N}\Gamma_T^\nu\right]
$$

is easily seen to be decreasing on  $(-\lambda_1, \infty)$ . It tends to  $+\infty$  when  $\nu \to -\lambda_1$  and to 0 when  $\nu \to +\infty$ . Hence for all *N* there exists a unique  $\nu \in (-\lambda_1, \infty)$  such that  $(B.2)$  holds. Since

$$
T^{-1}\mathrm{Tr}\left[\mathcal{N}\Gamma_T^{\nu}\right]\xrightarrow[T\to\infty]{}\mathrm{Tr}\frac{1}{h+\nu}
$$

one can see that, given  $m > 0$ , there exists  $\nu_1 < \nu_2$  such that for *T* large enough  $T^{-1}N(\nu) \leq m/2$  if  $\nu < \nu_1$  and  $T^{-1}N(\nu) \geq 2m$  if  $\nu > \nu_2$ . Hence indeed if  $N = mT$ , the unique  $\nu$  satisfying [\(B.2\)](#page-54-1) is bounded as a function of *m* alone.

The inequalities  $(B.3)$  and  $(B.4)$  are proven in [\[21,](#page-56-13) Proposition A.2] when  $n = N$ , based on input from [\[66\]](#page-57-34). The cases  $n \leq N$  follow because the maps  $n \mapsto \langle f(\mathcal{N}_j) \rangle_{\Gamma^c_{n,T,0}}$  are non-decreasing for all non-negative non-decreasing functions *f*, where  $\mathcal{N}_j = a_j^{\dagger} a_j = a^{\dagger} (u_j) a(u_j)$  ([\[21,](#page-56-13) Proposition A.1]). Here  $(u_i)_{i\geq 1}$  are normalized eigenfunctions of h which forms an orthonormal basis of h. The proof of [\(B.5\)](#page-54-0) follows from similar arguments. It suffices to prove for any  $j \geq 1$ ,

$$
\langle u_j | (\Gamma_{n,T,0}^c)^{(1)} | u_j \rangle \le \frac{40}{1.8} \langle u_j | (\Gamma_T^{\nu})^{(1)} | u_j \rangle, \quad n = 0, ..., N.
$$

Observe that

$$
\langle u_j | (\Gamma_{n,T,0}^c)^{(1)} | u_j \rangle = \text{Tr} \left[ a_j^{\dagger} a_j \Gamma_{n,T,0}^c \right] = \langle \mathcal{N}_j \rangle_{\Gamma_{n,T,0}^c}.
$$

Since  $n \mapsto \langle \mathcal{N}_j \rangle_{\Gamma^c_{n,T,0}}$  is non-decreasing, we get

$$
\langle u_j | (\Gamma_{n,T,0}^c)^{(1)} | u_j \rangle \le \langle \mathcal{N}_j \rangle_{\Gamma_{N,T,0}^c} \le \langle u_j | (\Gamma_{N,T,0}^c)^{(1)} | u_j \rangle, \quad n = 0, ..., N.
$$

Therefore, we only consider the case  $n = N$ . We write

$$
\Gamma_T^{\nu} = \bigoplus_{n=0}^{\infty} \frac{1}{Z_T^{\nu}} \exp\left(-\nu \frac{n}{T}\right) \exp\left(-\frac{1}{T} \sum_{j=1}^n h_j\right) = \bigoplus_{n=0}^{\infty} \frac{Z_{n,T,0}^c}{Z_T^{\nu}} \exp\left(-\nu \frac{n}{T}\right) \Gamma_{n,T,0}^c = \bigoplus_{n=0}^{\infty} c_n \Gamma_{n,T,0}^c,
$$

<span id="page-55-0"></span>where

$$
c_n = \frac{Z_{n,T,0}^c}{Z_T^{\nu}} \exp\left(-\nu \frac{n}{T}\right).
$$

We observe that  $c_n \geq 0$  for all  $n \geq 0$  and  $\sum_{n=0}^{\infty} c_n = 1$ . It follows that

$$
\langle u_j | (\Gamma_T^{\nu})^{(1)} | u_j \rangle = \text{Tr} \left[ a_j^{\dagger} a_j \Gamma_T^{\nu} \right] = \langle \mathcal{N}_j \rangle_{\Gamma_T^{\nu}} = \sum_{n=0}^{\infty} c_n \langle \mathcal{N}_j \rangle_{\Gamma_{n,T,0}^c},
$$

Since  $\langle \mathcal{N}_j \rangle_{\Gamma^c_{n,T}} \geq \langle \mathcal{N}_j \rangle_{\Gamma^c_{N,T,0}}$  for all  $n \geq N$ , we get

$$
\langle u_j | (\Gamma_T^{\nu})^{(1)} | u_j \rangle \ge \left( \sum_{n=N}^{\infty} c_n \right) \langle \mathcal{N}_j \rangle_{\Gamma_{N,T,0}^c} = \left( \sum_{n=N}^{\infty} c_n \right) \langle u_j | (\Gamma_{N,T,0}^c)^{(1)} | u_j \rangle.
$$

The desired inequality follows from the fact (see  $[21, \text{ between } (A.7) \text{ and } (A.8)]$  $[21, \text{ between } (A.7) \text{ and } (A.8)]$ ) that

$$
\sum_{n=N}^{\infty} c_n \ge \frac{1.8}{40}.
$$
