## DUALIZING INVOLUTIONS ON THE  $n$ -FOLD METAPLECTIC COVER OF  $GL(2)$

KUMAR BALASUBRAMANIAN, RENU JOSHI, SANJEEV KUMAR PANDEY, AND VARSHA VASUDEVAN

ABSTRACT. Let F be a non-Archimedean local field of characteristic zero and  $G = GL(2, F)$ . Let  $n \geq 2$ be a positive integer and  $\tilde{G} = \tilde{GL}(2, F)$  be the *n*-fold metaplectic cover of G. Let  $\pi$  be an irreducible smooth representation of G and  $\pi^{\vee}$  be the contragredient of  $\pi$ . Let  $\tau$  be an involutive anti-automorphism of G satisfying  $\pi^{\tau} \simeq \pi^{\vee}$ . In this case, we say that  $\tau$  is a dualizing involution. A well known theorem of Gelfand and Kazhdan says that the standard involution  $\tau$  on G is a dualizing involution. In this paper, we show that any lift of the standard involution to  $\widetilde{G}$  is a dualizing involution if and only if  $n = 2$ .

#### 1. Introduction

Let F be a non-Archimedean local field of characteristic 0 and  $G = GL(n, F)$ . For  $g \in G$ , we let  $g^{\top}$ denote the transpose of the matrix  $q$ , and  $w<sub>0</sub>$  to be the matrix with anti-diagonal entries equal to one. Let  $\tau: G \to G$  be the map  $\tau(g) = w_0 g^\top w_0$ . Clearly  $\tau$  is an anti-automorphism of G such that  $\tau^2 = 1$ . We call  $\tau$  the *standard involution* on G. Let  $(\pi, V)$  be an irreducible smooth complex representation of G. We write  $(\pi^{\vee}, V^{\vee})$  for the smooth dual or the contragredient of  $(\pi, V)$ . For  $\beta$  an anti-automorphism of G such that  $\beta^2 = 1$ , we let  $\pi^{\beta}$  to be the twisted representation defined by

$$
\pi^{\beta}(g) = \pi(\beta(g^{-1})).
$$

The following is an old result of Gelfand and Kazhdan.

Theorem 1.1 (Gelfand-Kazhdan). *Let* τ *be the standard involution on* G*. Then*

 $\pi^{\tau} \simeq \pi^{\vee}.$ 

We refer the reader to Theorem 2 in [\[4\]](#page-15-0) for a proof of the above result.

If  $\beta$  is any anti-automorphism of G such that  $\beta^2 = 1$ , and satisfies  $\pi^{\beta} \simeq \pi^{\vee}$ , then we call  $\beta$  a *dualizing involution*. The above result of Gelfand and Kazhdan says that the standard involution  $\tau$  on G is a dualizing involution.

Let  $r \geq 2$  be a positive integer. For  $n \geq 2$ , let  $\tilde{G}$  be the r-fold metaplectic cover of G (see Chapter 0) in  $[7]$  for the general definition). It is well known that (see Proposition 3.1 in  $[8]$ ) the standard involution  $\tau$  on G has at least one lift to the metaplectic group. A natural and an interesting question that arises is whether the lifts of the standard involution are themselves dualizing involutions. In the case when  $G$ is the 2-fold metaplectic cover of  $G = GL(2, F)$ , it is known that any lift of  $\tau$  to  $\tilde{G}$  is dualizing (see [\[1\]](#page-15-3), [\[2\]](#page-15-4)).

In this paper, we address this question when  $\tilde{G}$  is the *n*-fold metaplectic cover of  $G = GL(2, F)$  (explained later) for  $n \geq 2$ . It follows from Proposition 1 in [\[6\]](#page-15-5) that there are many lifts of the standard involution to  $\tilde{G}$ . In particular, for each  $\alpha \in F^{\times}$ , we have a lift  $\sigma_{\alpha}$  (see Section [4](#page-13-0) for the definition) of  $\tau$ to  $\tilde{G}$ . We show that the involutions  $\sigma_{\alpha}$  are dualizing if and only if  $n = 2$ . To be precise, we prove

**Theorem 1.2** (Main Theorem). Let  $\pi$  be any irreducible admissible genuine representation of  $\tilde{G}$ . For  $\alpha \in F^{\times}$ , let  $\sigma_{\alpha}$  be the lift of  $\tau$  to  $\tilde{G}$ *. Then* 

 $\pi^{\sigma_{\alpha}} \simeq \pi^{\vee}$ 

*if and only if*  $n = 2$ *.*

The above result raises the question, if a similar result holds for the r-fold covering  $\tilde{G}$  of  $G = GL(n)$ for  $r, n \geq 2$ . To be precise, a lift of the standard involution  $\tau$  of G to  $\tilde{G}$  is a dualizing involution if and only if  $r = 2$ . We hope to address some of these questions in future.

The paper is organized as follows. In Section [2,](#page-1-0) we recall the basic properties of the Hilbert symbol and use it to establish some more properties that we need. We give the definition of the metaplectic group that we work with and discuss its topology. We recall a result of Harish-Chandra about the character of an admissible representation and give references for analogous results in the setting of metaplectic groups. We prove some basic properties of the character that we need. We also mention a few results of Kable about the lifts of an automorphism. In Section [3,](#page-6-0) we explicitly define lifts of the standard involution and discuss some properties. In Section [4,](#page-13-0) we prove the main result of this paper.

#### 2. preliminaries

<span id="page-1-0"></span>In this section, we set up some preliminaries which we need and recall a few results which will be used throughout this paper.

2.1. *n*-th order Hilbert Symbol and its properties. Let F be a non-Archimedean local field of characterisic zero and  $F^{\times}$  be the group of non-zero elements in F. For  $n \in \mathbb{N}$ , let  $\mu_n = \{x \in F^{\times} \mid x^n = 1\}$ be the subset of *n*-th roots of unity in  $F^{\times}$ . Suppose also that  $|\mu_n| = n$ . We let

$$
\langle \, , \, \rangle : F^{\times} \times F^{\times} \to \mu_n
$$

denote the *n*-th order Hilbert symbol. In this section, we recall some fundamental properties of the *n*-th order Hilbert symbol and use it to derive some simple consequences that we need.

The following basic properties (see [\[7\]](#page-15-1)) of the Hilbert symbol are well known. We record them in the proposition below.

<span id="page-1-1"></span>**Proposition 2.1.** Let  $a, b, c \in F^{\times}$ . The Hilbert symbol satisfies

- 1)  $\langle ab, c \rangle = \langle a, c \rangle \langle b, c \rangle$ .
- 2)  $\langle a, b \rangle \langle b, a \rangle = 1$ .
- 3)  $\langle a, 1 a \rangle = 1$ , if  $1 a \in F^{\times}$ .
- 4)  $\{a \in F^\times \mid \langle a, x \rangle = 1 \text{ for all } x \in F^\times\} = (F^\times)^n$ , where  $(F^\times)^n = \{a^n \mid a \in F^\times\}$ .

The following properties of the Hilbert symbol can be derived easily from properties 1) to 4) mentioned in Proposition [2.1](#page-1-1) above.

**Proposition 2.2.** For  $a, b, c \in F^{\times}$ , the Hilbert symbol satisfies

- (i)  $\langle a, bc \rangle = \langle a, b \rangle \langle a, c \rangle$ *.*
- (ii)  $\langle a^m, b \rangle = \langle a, b \rangle^m = \langle a, b^m \rangle$  *for any*  $m \in \mathbb{N}$ *.*
- (iii)  $\langle 1 a, a \rangle = 1$  *if*  $a \neq 1$ *, and*  $\langle a, 1 \rangle = \langle 1, a \rangle = 1$ *.*
- (iv)  $\langle b, a \rangle = \langle a, b \rangle^{-1} = \langle a^{-1}, b \rangle = \langle a, b^{-1} \rangle.$
- (v)  $\langle -a, a \rangle = \langle a, -a \rangle = \langle a, a^2 \rangle = 1.$
- (vi) If  $\langle a, x \rangle = 1$  for all  $x \in F^\times$ , then  $a \in (F^\times)^n$ . In other words, if  $a \notin (F^\times)^n$ , there exists  $x_0 \in F^\times$ *such that*  $\langle a, x_0 \rangle \neq 1$ .

*Proof.*

(i) Using properties 1) and 2) in Proposition [2.1,](#page-1-1) we have

$$
\langle a, bc \rangle = \langle bc, a \rangle^{-1}
$$
  
=  $\langle b, a \rangle^{-1} \langle c, a \rangle^{-1}$   
=  $\langle a, b \rangle \langle a, c \rangle$ .

(ii) It follows from (i) and property 1).

(iii) We know that  $\langle 1 - a, a \rangle \langle a, 1 - a \rangle = 1$ , so the result follows from property 3). By (i), we have  $\langle a, 1 \rangle = \langle a, 1 \cdot 1 \rangle = \langle a, 1 \rangle \langle a, 1 \rangle.$ 

Hence  $\langle a, 1 \rangle = 1$ . Consequently,  $\langle 1, a \rangle = \langle a, 1 \rangle^{-1} = 1$ .

(iv) Since  $\langle a, b \rangle \langle b, a \rangle = 1$ , we obtain  $\langle b, a \rangle = \langle a, b \rangle^{-1}$ . Using (iii) and property 1), we have  $\langle a, b \rangle \langle a^{-1}, b \rangle = \langle a a^{-1}, b \rangle = \langle 1, a \rangle = 1.$ 

Similarly

$$
\langle a, b \rangle \langle a, b^{-1} \rangle = \langle a, bb^{-1} \rangle = \langle a, 1 \rangle = 1.
$$

(v) If  $a = 1$ , we are done using (iii). For  $a \neq 1$ , observe that  $-a = \frac{1-a}{1-a^{-1}}$ . Then

$$
\langle a, -a \rangle = \left\langle a, \frac{1-a}{1-a^{-1}} \right\rangle
$$
  
=  $\langle a, 1-a \rangle \langle a, (1-a^{-1})^{-1} \rangle$  (using (i))  
=  $\langle a, 1-a \rangle \langle a^{-1}, 1-a^{-1} \rangle$  (using (iv))  
= 1 (using property 3)).

Thus, we also have  $\langle a, a^2 \rangle = \langle a, -a \rangle \langle a, -a \rangle = 1$ .

(vi) Follows from property 4).

2.2. The Metaplectic Group. Let  $F$  be a non-Archimedean local field of characteristic zero and  $G = GL(2, F)$ . For  $n \geq 2$ , let  $\mu_n \subset F^{\times}$  be the subset of *n*-th roots of unity in *F*. Suppose also that  $|\mu_n| = n$ . Throughout, we write  $\tilde{G} = \widetilde{GL}(2, F)$  for the *n*-fold metaplectic cover of G. In this section, we recall the definition of  $\tilde{G}$  and a few basic facts about its topology.

Throughout, we write  $\mathfrak o$  for the ring of integers in F,  $\mathfrak p$  for the unique maximal ideal in  $\mathfrak o$ ,  $\varpi$  for the generator of  $\mathfrak p$  and  $k_F$  for the finite residue field. We write *ord* for the valuation on F.

The first explicit construction of the n-fold metaplectic cover of  $G = GL(2, F)$  was given by Kubota in [\[9\]](#page-15-6) by concretely describing a 2-cocyle on G taking values in  $\mu_n$ . For  $g_1, g_2, m \in G$ , the following simpler version of the Kubota cocycle  $c: G \times G \to \mu_n$  defined as

$$
c(g_1, g_2) = \left\langle \frac{X(g_1g_2)}{X(g_1)}, \frac{X(g_1g_2)}{X(g_2)\Delta(g_1)} \right\rangle,
$$

where

$$
X(m) = \begin{cases} m_{21} & \text{if } m_{21} \neq 0 \\ m_{22} & \text{otherwise} \end{cases} \text{ and } \Delta(g_1) = \det(g_1)
$$

was given by Kazhdan and Patterson in [\[8\]](#page-15-2). Throughout this paper, we take  $\widetilde{G} = \widetilde{GL}(2, F)$  to be the central extension of G by  $\mu_n$  determined by the 2-cocycle c. Since G,  $\mu_n$  are locally compact groups, Mackey's theorem (see Theorem 2 in [\[11\]](#page-15-7)) implies that  $\tilde{G}$  is a locally compact topological group and defines a topological central extension of G by  $\mu_n$ . We call the group  $\tilde{G}$  constructed above as "the" metaplectic group.

It can be shown that the topology on  $\tilde{G}$  has a neighborhood base at the identity consisting of compact open subgroups (see Lemma 3 in  $[6]$ ). Before we give the construction of this basis, we recall a few preliminaries.

Let  $p : \widetilde{G} \to G$  be the projection of  $\widetilde{G}$  onto G. A map  $\ell : G \to \widetilde{G}$  is called a *section* if  $p \circ \ell = 1_G$ . Given a subgroup H of G, we say that  $\tilde{G}$  *splits* over H if there exists a homomorphism  $h : H \to \tilde{G}$  such that  $p \circ h = 1_H$ .

Let  $\ell: G \to \widetilde{G}$  be the map  $\ell(g) = (g, 1)$ . Then  $\ell$  is a section and is called the natural or preferred section. For  $g =$  $\begin{bmatrix} a & b \\ c & d \end{bmatrix} \in G$ , define  $s : G \to \mu_n$  as

$$
s(g) = \begin{cases} \langle c, d\Delta(g) \rangle, & \text{if } cd \neq 0 \text{ and } ord(c) \text{ is odd} \\ 1, & \text{otherwise.} \end{cases}
$$

Let  $K_0 = GL(2, \mathfrak{o})$  be the maximal compact subgroup in G, and for  $\lambda \geq 1$ , let  $K_{\lambda} = 1 + \omega^{\lambda} M(n, \mathfrak{o})$ . It is known that  ${K_{\lambda}}_{\lambda>0}$  is a neighborhood base at the identity element in G consisting of compact open subgroups. We can use this base to define a neighborhood base at the identity in  $\tilde{G}$ . For a suitable choice of  $\lambda_0$ , it can be shown that  $\tilde{G}$  splits over  $K_{\lambda}$ , where  $\lambda \geq \lambda_0$  (see Proposition 2.8 in [\[3\]](#page-15-8), Theorem 2 in [\[9\]](#page-15-6)). Define  $\kappa: K_{\lambda_0} \to \tilde{G}$  as  $\kappa(k) = (k, s(k))$ . Let  $K_{\lambda_0}^* = \kappa(K_{\lambda_0})$  and for  $\lambda > \lambda_0$ ,  $K_{\lambda}^* = K_{\lambda_0}^* \cap p^{-1}(K_{\lambda})$ . It can be shown that  $\{K^*_\lambda\}_{\lambda \geq \lambda_0}$  is a neighborhood base at the identity in  $\tilde{G}$ .

2.3. Character of an admissible representation. Let  $F$  be a non-Archimedean local field of characteristic 0 and  $G = G(F)$  be a connected reductive algebraic group defined over F. We let  $(\pi, V)$ be an irreducible smooth complex representation of G. It can be shown that such representations are always admissible. For an admissible representation  $(\pi, V)$ , we can define a suitable notion of a character. Before we proceed further, we set up some notation and recall an important result of Harish-Chandra.

Throughout we let  $G = G(F)$  and  $(\pi, V)$  to be an irreducible smooth representation of G. We let  $C_c^{\infty}(G)$  to be the space of all locally constant complex valued functions on G with compact support. For  $f \in C_c^{\infty}(G)$ , we let  $\pi(f): V \to V$  denote the linear operator given by

$$
\pi(f)v = \int_G f(g)\pi(g)v dg, \quad v \in V,
$$

where the integral is with respect to a Haar measure  $\mu_G$  on G which we fix throughout. If  $(\pi, V)$  is an admissible representation, it can be shown that the trace of the operator  $\pi(f)$  is finite for all  $f \in C_c^{\infty}(G)$ . The resulting linear functional

 $\Theta_{\pi}: C_c^{\infty}(G) \longrightarrow \mathbb{C}$ 

given by

$$
\Theta_{\pi}(f) = \text{Tr}(\pi(f))
$$

is called the *distribution character* of  $\pi$ . It determines the irreducible representation  $\pi$  up to equivalence, i.e., if  $\Theta_{\pi_1}(f) = \Theta_{\pi_2}(f)$ ,  $\forall f \in C_c^{\infty}(G)$ , then  $\pi_1 \simeq \pi_2$ .

We now state a theorem of Harish-Chandra which is used to define the character of the representation π.

Let  $G_{reg}$  be the subset of regular semi-simple elements in G. It can be shown that  $G_{reg}$  is an open dense subset of G whose complement has measure zero. The following is a deep result of Harish-Chandra.

<span id="page-3-0"></span>**Theorem 2.3** (Harish-Chandra). *There exists a locally integrable complex valued function*  $\Theta_{\pi}$  *on* G *such that* Θπ|Greg *is a locally constant function on* Greg *and satisfies*

$$
\Theta_{\pi}(f) = \int_{G} f(g) \Theta_{\pi}(g) dg, \quad \forall f \in C_c^{\infty}(G).
$$

*Also, for*  $x \in G_{\text{reg}}, y \in G$ *, we have* 

$$
\Theta_{\pi}(yxy^{-1}) = \Theta_{\pi}(x).
$$

We refer the reader to [\[5\]](#page-15-9) for a proof of the above result. The locally constant function  $\Theta_{\pi}$  on  $G_{\text{reg}}$  in the above theorem is called the *character* of  $\pi$ .

Let  $\widetilde{G}$  be a locally compact topological central extension of G by  $\mu_n$ . Let  $\xi:\mu_n\to\mathbb{C}^\times$  be any injective character of  $\mu_n$ . Let  $(\pi, V)$  be a representation of  $\tilde{G}$ .  $\pi$  is called a *genuine* representation, if for  $\epsilon \in \mu_n$ .  $q \in \widetilde{G}$ , we have

$$
\pi(\epsilon g) = \xi(\epsilon)\pi(g).
$$

The above result of Harish-Chandra also holds in this setting. To be more precise, it can be shown that the distribution character of an irreducible admissible genuine representation  $\pi$  of  $\tilde{G}$  is represented by a locally integrable function  $\Theta_{\pi}$  on  $\tilde{G}$  which is locally constant on  $\tilde{G}_{reg} = p^{-1}(G_{reg})$  (here  $p : \tilde{G} \to G$ is the projection) and satisfies

$$
\Theta_{\pi}(y^{-1}xy) = \Theta_{\pi}(x), \text{ for } x \in \widetilde{G}_{\text{reg}}, y \in \widetilde{G}.
$$

We refer the reader to Theorem 4.3.2 and Corollary 4.3.3 in [\[10\]](#page-15-10) where results about character theory for metaplectic groups are discussed. See also Theorem I.5.1 in [\[7\]](#page-15-1) where the result is only mentioned.

Before we proceed further, we set up some notation and record a few properties of the character. Throughout we write  $\mu = \mu_{\tilde{G}}$  for the Haar measure on G. For K a compact open subgroup of G, we let  $e_K \in C_c^{\infty}(\widetilde{G})$  to be the function

$$
e_K(g) = \begin{cases} \mu(K)^{-1}, & g \in K \\ 0, & g \notin K \end{cases}
$$

For  $g \in \tilde{G}$  and  $f \in C_c^{\infty}(\tilde{G})$ , the natural action of  $\tilde{G}$  on  $C_c^{\infty}(\tilde{G})$  is denoted as  $g.f$  where

$$
(g \cdot f)(x) := f(g^{-1}x).
$$

<span id="page-4-1"></span>**Lemma 2.4.** Let  $(\pi, V)$  be an irreducible admissible genuine representation of  $\widetilde{G}$ . Let z be an element *in the center of*  $\widetilde{G}$  *and*  $\omega_{\pi}$  *be the central character of*  $\pi$ *. Then, the following statements hold:* 

- 1)  $\pi(z \cdot f) = \omega_{\pi}(z) \pi(f)$ , for all  $f \in C_c^{\infty}(\widetilde{G})$ .
- 2)  $\Theta_{\pi}(zg) = \omega_{\pi}(z)\Theta_{\pi}(g)$ , *for all*  $g \in \widetilde{G}_{reg}$ .

*Proof.* Let  $f \in C_c^{\infty}(\widetilde{G})$ . We have,

<span id="page-4-0"></span>
$$
\pi(z \cdot f) = \int_{\widetilde{G}} (z \cdot f)(g)\pi(g) dg = \int_{\widetilde{G}} f(z^{-1}g)\pi(g) dg.
$$
\n(2.1)

.

By applying the change of variable  $g \mapsto zg$  in  $(2.1)$  and using  $\pi(z) = \omega_{\pi}(z)1_V$ , we get

$$
\pi(z \cdot f) = \omega_{\pi}(z) \int_{\widetilde{G}} f(g)\pi(g) dg = \omega_{\pi}(z)\pi(f).
$$

This proves 1). For 2), using the definition of the distribution character  $\Theta_{\pi}$  we have,

$$
\Theta_{\pi}(z \cdot f) = \text{Tr}(\pi(z \cdot f)) = \omega_{\pi}(z) \text{Tr}(\pi(f)) = \omega_{\pi}(z) \Theta_{\pi}(f).
$$

Thus we get

$$
\Theta_{\pi}(z \cdot f) = \omega_{\pi}(z)\Theta_{\pi}(f)
$$
  
= 
$$
\int_{\widetilde{G}} f(g)\omega_{\pi}(z)\Theta_{\pi}(g)dg
$$
  
= 
$$
\int_{\widetilde{G}} (z \cdot f)(g)\Theta_{\pi}(g)dg
$$
  
= 
$$
\int_{\widetilde{G}} f(z^{-1}g)\Theta_{\pi}(g)dg
$$
  
= 
$$
\int_{\widetilde{G}} f(g)\Theta_{\pi}(zg)dg.
$$

It follows that

$$
\Theta_{\pi}(zg) = \omega_{\pi}(z)\Theta_{\pi}(g).
$$

**Lemma 2.5.** Let  $(\pi, V)$  be an irreducible admissible genuine representation of  $\tilde{G}$ . Then

$$
\Theta_{\pi}(f) \neq 0
$$

*for some*  $f \in C_c^{\infty}(\widetilde{G})$ *.* 

*Proof.* Let  $0 \neq u \in V$ . Since  $\pi$  is a smooth representation, there exists a compact open subgroup K of  $\widetilde{G}$  such that  $u \in V^K$ , where  $V^K = \{v \in V \mid \pi(k)v = v, \forall k \in K\}$  is the subspace of K-fixed vectors in V. Let  $f = e_K \in C_c^{\infty}(\tilde{G})$ . It is easy to see that  $\pi(e_K) \neq 0$  and defines a projection of V onto  $V^K$ . Indeed,

$$
\pi(e_K)u = \int_{\widetilde{G}} e_K(g)\pi(g)u dg = \mu(K)^{-1}\int_K \pi(g)u dg = \mu(K)^{-1}\int_K u dg = u.
$$

It follows that  $\pi(e_K)$  fixes  $V^K$  and  $\pi(e_K) \neq 0$ . Let  $v \in V$  such that  $v \notin V^K$ . Take  $v_1 = \pi(e_K)v$ . For  $k \in K$ , we have

$$
\pi(k)v_1 = \int_{\widetilde{G}} e_K(g)\pi(kg)v dg
$$
  
=  $\mu(K)^{-1} \int_K \pi(kg)v dg$   
=  $\mu(K)^{-1} \int_K \pi(g)v dg$   $(g \mapsto k^{-1}g)$   
=  $\int_{\widetilde{G}} e_K(g)\pi(g)v dg$   
=  $v_1$ .

Hence  $\pi(e_K)$  defines a projection of V onto  $V^K$ . Thus we have

$$
\Theta_{\pi}(e_K) = \text{Tr}(\pi(e_K)) = \dim_{\mathbb{C}}(V^K) \neq 0.
$$

Since  $\pi$  is admissible, we have that  $\dim_{\mathbb{C}}(V^K)$  is finite and the result follows.

<span id="page-5-1"></span>**Lemma 2.6.** *Let*  $(\pi, V)$  *be an irreducible admissible genuine representation of*  $\tilde{G}$ *. There exists*  $g_0 \in G_{\text{res}}$ *such that*

$$
\Theta_{\pi}((g_0,1)) \neq 0.
$$

*Proof.* Suppose that  $\Theta_{\pi}((g,1)) = 0$  for all  $g \in G_{reg}$ . For  $x = (g, \eta) \in \widetilde{G}_{reg}$ , we have

$$
\Theta_{\pi}(x) = \Theta_{\pi}((g,\eta)) = \omega_{\pi}(\eta)\Theta_{\pi}((g,1)) = 0.
$$

Using Theorem [2.3,](#page-3-0) we have  $\Theta_{\pi}(f) = 0$  for every  $f \in C_c^{\infty}(\widetilde{G})$ . This is not possible.

2.4. Some results about lifts of an automorphism of G to  $\tilde{G}$ . We recall a few results from [\[6\]](#page-15-5) which we need in proving our main result. Let  $\tilde{G}$  be a central extension of a group G by an abelian group A. Let  $p : \widetilde{G} \to G$  be the projection map,  $s : G \to \widetilde{G}$  be a section of p and  $\tau$  be the 2-cocycle representing the class of this central extension in  $H^2(G, A)$  with respect to the section s. If  $f: G \to G$ is an automorphism (resp. anti-automorphism) of  $G$ , then a lift of  $f$  is an automorphism (resp. antiautomorphism)  $\tilde{f}: \tilde{G} \to \tilde{G}$  such that

$$
p(\tilde{f}(g)) = f(p(g)), \forall g \in \tilde{G}.
$$

Let  $\mathcal{L}(f)$  denote the set of all lifts of f. The group  $\text{Aut}(G)$  acts on  $\text{H}^2(G,A)$  by  $f[\sigma] = [\sigma \circ (f^{-1} \times f^{-1})]$ for any 2-cocycle  $\sigma$ .

<span id="page-5-0"></span>**Proposition 2.7.** *The set*  $\mathcal{L}(f)$  *is precisely described in terms of this action by the following:* 

- *1)* The set  $\mathcal{L}(f)$  *is non-empty if and only if*  $f[\tau] = [\tau]$ *.*
- 2) If  $\mathcal{L}(f)$  *is non-empty, then*  $\mathcal{L}(f)$  *is a principal homogeneous space for the group*  $Hom(G, A)$  *under the action*

$$
(\phi.\tilde{f})(g) = \phi(p(g))\tilde{f}(g).
$$

We also need the following result (see Corollary 1 in  $[6]$  for a proof) which discusses the continuity properties of the lift in the case when  $G = GL(m, F)$ . We state it below for clarity.

<span id="page-5-2"></span>**Proposition 2.8.** Let  $F$  be a non-Archimedean local field and suppose that the group of  $n^{th}$  roots of *unity in* F has order n. Let  $\langle , \rangle$  be the n<sup>th</sup> order Hilbert symbol on F and  $GL(m)$  the corresponding *metaplectic group. Then the lift of any topological automorphism of*  $GL(m)$  *to*  $\widetilde{GL}(m)$  *is also a topological automorphism.*

### 3. Lift of the standard involution

<span id="page-6-0"></span>Let  $G = GL(2, F)$  and  $\widetilde{G} = \widetilde{GL}(2, F)$  be the n-fold metaplectic cover of G. Let  $\tau$  be the standard involution on G. In this section, we define a lift  $\sigma$  of  $\tau$  and show that it is an involutive anti-automorphism of  $\tilde{G}$ . We also discuss an important property of this lift (see Theorem [3.9\)](#page-10-0) which is crucial in proving the main result of this paper.

For 
$$
\lambda \in F^{\times}
$$
 and  $g = \begin{bmatrix} a & b \\ c & d \end{bmatrix} \in G$ , we let  $u(\lambda) = \begin{bmatrix} \lambda & 0 \\ 0 & -\lambda \end{bmatrix}$  and  $\Delta(g) = \det(g)$ . It is easy to see that  $\tau(g) = w_0 g^\top w_0 = u(\Delta(g))g^{-1}u(1)$ .

For  $\epsilon \in \mu_n$ , we denote the element  $(I_2, \epsilon) \in \tilde{G}$  as  $\epsilon$ . Let  $\tilde{u}(\lambda) = (u(\lambda), 1)$  and  $\tilde{z}(\lambda) = (\lambda I_2, 1)$  where  $I_2$ is the 2 × 2 identity matrix. We extend  $\Delta$  to  $\widetilde{G}$  by  $\Delta((q, \epsilon)) = \Delta(q)$ . For  $h = (q, \epsilon) \in \widetilde{G}$  define

<span id="page-6-1"></span>
$$
\sigma(h) = \tilde{u}(\Delta(h))h^{-1}\tilde{u}(1).
$$
\n(3.1)

,

.

Before discussing the properties of  $\sigma$ , we first prove a proposition which is used to study the properties of σ.

<span id="page-6-2"></span>**Proposition 3.1.** *Let*  $\lambda, \lambda_1, \lambda_2 \in F^{\times}$ *, and*  $h \in \tilde{G}$ *. Then* 

- (i)  $h\tilde{z}(\lambda) = \langle \Delta(h), \lambda \rangle \tilde{z}(\lambda)h$ . (ii)  $\tilde{z}(\lambda_1)\tilde{z}(\lambda_2) = \langle \lambda_1, \lambda_2 \rangle \tilde{z}(\lambda_1\lambda_2)$ . (iii)  $\tilde{u}(\lambda_1)\tilde{u}(\lambda_2) = \langle \lambda_1, -\lambda_2 \rangle \tilde{z}(\lambda_1\lambda_2)$ *.*
- 
- $(iv) \tilde{u}(\lambda)^{-1} = \tilde{u}(\lambda^{-1}).$

$$
(v) \tilde{u}(\lambda_1)\tilde{z}(\lambda_2) = \langle \lambda_1, \lambda_2 \rangle \tilde{u}(\lambda_1 \lambda_2).
$$

 $0 \lambda$ 

,

*Proof.*

(i) Let 
$$
h = \left( \begin{bmatrix} a & b \ c & d \end{bmatrix}, \epsilon \right)
$$
. It is easy to see that  
\n
$$
\tilde{z}(\lambda)h = \left( \begin{bmatrix} a\lambda & b\lambda \\ c\lambda & d\lambda \end{bmatrix}, c \left( \begin{bmatrix} \lambda & 0 \\ 0 & \lambda \end{bmatrix}, \begin{bmatrix} a & b \\ c & d \end{bmatrix} \right) \epsilon \right)
$$
\nand\n
$$
h\tilde{z}(\lambda) = \left( \begin{bmatrix} a\lambda & b\lambda \\ c\lambda & d\lambda \end{bmatrix}, c \left( \begin{bmatrix} a & b \\ c & d \end{bmatrix}, \begin{bmatrix} \lambda & 0 \\ 0 & \lambda \end{bmatrix} \right) \epsilon \right)
$$
\nNote that  $c \left( \begin{bmatrix} \lambda & 0 \\ 0 & \lambda \end{bmatrix}, \begin{bmatrix} a & b \\ c & d \end{bmatrix} \right) = \begin{cases} \langle \lambda, c \rangle, & c \neq 0 \\ \langle \lambda, d \rangle, & c = 0. \end{cases}$ 

Therefore

$$
\langle \Delta(h), \lambda \rangle c \left( \begin{bmatrix} \lambda & 0 \\ 0 & \lambda \end{bmatrix}, \begin{bmatrix} a & b \\ c & d \end{bmatrix} \right) = \begin{cases} \langle \Delta(h), \lambda \rangle \langle \lambda, c \rangle, & c \neq 0 \\ \langle \Delta(h), \lambda \rangle \langle \lambda, d \rangle, & c = 0 \end{cases}
$$

$$
= \begin{cases} \langle \lambda, \Delta(h)^{-1}c \rangle, & c \neq 0 \\ \langle \lambda, \Delta(h)^{-1}d \rangle, & c = 0 \end{cases}
$$

$$
= c \left( \begin{bmatrix} a & b \\ c & d \end{bmatrix}, \begin{bmatrix} \lambda & 0 \\ 0 & \lambda \end{bmatrix} \right).
$$

 $\langle \lambda, d \rangle, \quad c = 0.$ 

The result follows.

(ii) Since 
$$
c(z(\lambda_1), z(\lambda_2)) = c(\lambda_1 I_2, \lambda_2 I_2) = \langle \lambda_1, \lambda_2 \rangle
$$
, we have  
\n $\tilde{z}(\lambda_1)\tilde{z}(\lambda_2) = (\lambda_1 \lambda_2 I_2, \langle \lambda_1, \lambda_2 \rangle) = \langle \lambda_1, \lambda_2 \rangle \tilde{z}(\lambda_1 \lambda_2).$ 

(iii) Using

$$
c(u(\lambda_1), u(\lambda_2)) = c\left(\begin{bmatrix} \lambda_1 & 0 \\ 0 & -\lambda_1 \end{bmatrix}, \begin{bmatrix} \lambda_2 & 0 \\ 0 & -\lambda_2 \end{bmatrix}\right) = \langle \lambda_1, -\lambda_2 \rangle,
$$

 $\tilde{u}(\lambda_1)\tilde{u}(\lambda_2) = (\lambda_1\lambda_2I_2,\langle\lambda_1, -\lambda_2\rangle) = \langle\lambda_1, -\lambda_2\rangle\tilde{z}(\lambda_1\lambda_2).$ 7

we get

(iv) We have  $\tilde{u}(\lambda) = (u(\lambda), 1)$ . Thus,

$$
\tilde{u}(\lambda)^{-1} = (u(\lambda)^{-1}, c(u(\lambda), u(\lambda)^{-1})^{-1})
$$
  
\n
$$
= (u(\lambda)^{-1}, c(u(\lambda), u(\lambda^{-1}))^{-1})
$$
  
\n
$$
= (u(\lambda^{-1}), \langle -\lambda, \lambda \rangle^{-1})
$$
  
\n
$$
= (u(\lambda^{-1}), 1)
$$
  
\n
$$
= \tilde{u}(\lambda^{-1}).
$$

(v) It is easy to see that,

$$
c(u(\lambda_1), z(\lambda_2)) = c\left(\begin{bmatrix} \lambda_1 & 0 \\ 0 & -\lambda_1 \end{bmatrix}, \begin{bmatrix} \lambda_2 & 0 \\ 0 & \lambda_2 \end{bmatrix}\right) = \langle \lambda_2, \lambda_1^{-1} \rangle = \langle \lambda_1, \lambda_2 \rangle.
$$

Thus we have,

$$
\tilde{u}(\lambda_1)\tilde{z}(\lambda_2) = \begin{pmatrix} \begin{bmatrix} \lambda_1\lambda_2 & 0 \\ 0 & -\lambda_1\lambda_2 \end{bmatrix}, \langle \lambda_1, \lambda_2 \rangle \end{pmatrix} = \langle \lambda_1, \lambda_2 \rangle \tilde{u}(\lambda_1\lambda_2).
$$

 $\hfill \square$ 

Let  $\sigma : \widetilde{G} \to \widetilde{G}$  be defined as in [\(3.1\)](#page-6-1). We record some properties satisfied by  $\sigma$  in the proposition below.

<span id="page-7-0"></span>Lemma 3.2. *The map* σ *satisfies the following properties:*

- (1) σ *is an anti-automorphism.*
- (2)  $\sigma(\epsilon) = \epsilon^{-1}$  for any  $\epsilon \in \mu_n$ .
- (3)  $\sigma$  *is an involution.*
- (4)  $\sigma(h^{-1}) = \sigma(h)^{-1}$  for all  $h \in \tilde{G}$ .
- (5)  $\sigma$  *is a lift of*  $\tau$ *.*

*Proof.*

(1) We use properties (i), (iii), and (v) from Proposition [3.1.](#page-6-2) For  $h_1, h_2 \in \widetilde{G}$ , we have

$$
\sigma(h_1 h_2) = \tilde{u}(\Delta(h_1 h_2))(h_1 h_2)^{-1}\tilde{u}(1)
$$
  
\n
$$
= \tilde{u}(\Delta(h_2)\Delta(h_1))(h_1 h_2)^{-1}\tilde{u}(1)
$$
  
\n
$$
= \langle \Delta(h_1), \Delta(h_2) \rangle \tilde{u}(\Delta(h_2)) \tilde{z}(\Delta(h_1)) h_2^{-1} h_1^{-1} \tilde{u}(1)
$$
  
\n
$$
= \tilde{u}(\Delta(h_2)) h_2^{-1} \tilde{z}(\Delta(h_1)) h_1^{-1} \tilde{u}(1)
$$
  
\n
$$
= \tilde{u}(\Delta(h_2)) h_2^{-1} \tilde{u}(1) \tilde{u}(\Delta(h_1)) h_1^{-1} \tilde{u}(1)
$$
  
\n
$$
= \sigma(h_2) \sigma(h_1).
$$

(2) Let  $1 \neq \epsilon \in \mu_n$  be any non-trivial element in  $\mu_n$ . Identifying  $\epsilon$  with  $(I_2, \epsilon)$ , we obtain  $\Delta(\epsilon) = 1$ . We have

$$
\sigma(\epsilon) = \tilde{u}(\Delta(\epsilon))\epsilon^{-1}\tilde{u}(1)
$$
  
=  $(u(\Delta(\epsilon)), 1)(I_2, \epsilon)^{-1}(u(1), 1)$   
=  $(u(1), 1) (I_2, \epsilon^{-1}) (u(1), 1)$   
=  $(u(1), \epsilon^{-1}) (u(1), 1)$  (since  $c(u(1), I_2) = 1$ )  
=  $(I_2, \epsilon^{-1})$  (since  $c(u(1), u(1)) = 1$ )  
=  $\epsilon^{-1}$ .

(3) For  $h = (g, \epsilon) \in \tilde{G}$ , observe that  $\Delta(\sigma(h)) = \Delta(u(\Delta(g))g^{-1}u(1)) = \Delta(h)$ . Using the properties (i)-(iv) mentioned in Proposition [3.1,](#page-6-2) we obtain

$$
\sigma((\sigma(h))) = \sigma(\tilde{u}(\Delta(h))h^{-1}\tilde{u}(1))
$$
  
\n
$$
= \tilde{u}(\Delta(h))\tilde{u}(1)h\tilde{u}(\Delta(h)^{-1})\tilde{u}(1)
$$
  
\n
$$
= \langle \Delta(h), -1 \rangle \tilde{z}(\Delta(h))h \langle \Delta(h)^{-1}, -1 \rangle \tilde{z}(\Delta(h)^{-1})
$$
  
\n
$$
= \langle \Delta(h), \Delta(h) \rangle h\tilde{z}(\Delta(h))\tilde{z}(\Delta(h)^{-1})
$$
  
\n
$$
= \langle \Delta(h), \Delta(h) \rangle h \langle \Delta(h), \Delta(h)^{-1} \rangle
$$
  
\n
$$
= h.
$$

- (4) It follows directly from the fact that  $\sigma$  is an anti-automorphism.
- (5) It is enough to consider the case when  $h = (g, 1)$ , with  $g \in G$ . Indeed, if we have  $\sigma(g, 1) = (x, \xi)$ , then  $\sigma(g, \epsilon) = (x, \epsilon^{-1}\xi)$ , using (1) and (2). This implies that  $x = (p \circ \sigma)(g, \epsilon) = (p \circ \sigma)(g, 1)$ . To show that  $\sigma$  is a lift of  $\tau$ , it is enough to show that  $(p \circ \sigma)(h) = (\tau \circ p)(h)$  for  $h = (g, 1) \in \tilde{G}$ . We now evaluate  $\sigma$ , depending on whether c is non-zero or zero. If  $c \neq 0$ , we have

$$
\sigma(h) = \sigma(g, 1)
$$
  
=  $(u(\Delta(g)), 1)(g^{-1}, 1)(u(1), 1)$   
=  $(u(\Delta(g))g^{-1}, \langle \Delta(g), c \rangle)(u(1), 1)$   
=  $(u(\Delta(g)g^{-1}u(1), \langle \Delta(g), c \rangle)$   
=  $(\tau(g), \langle \Delta(g), c \rangle),$ 

and if  $c = 0$ , we have

$$
\sigma(h) = \sigma(g, 1)
$$
  
=  $(u(ad), 1)(g^{-1}, \langle a, d \rangle)(u(1), 1)$   
=  $(u(ad)g^{-1}, \langle d, a \rangle \langle d, d \rangle \langle a, d \rangle)(u(1), 1)$   
=  $(u(ad)g^{-1}, \langle d, d \rangle)(u(1), 1)$   
=  $(u(ad)g^{-1}u(1), \langle d, d \rangle \langle d, -1 \rangle)$   
=  $(\tau(g), 1).$ 

In both the cases, we see that  $(p \circ \sigma)(h) = \tau(g) = (\tau \circ p)(h)$ . Hence the result follows.

<span id="page-8-0"></span>*Remark* 3.3. We have used the following computations in part (5) of Lemma [3.2.](#page-7-0) Let  $g =$  $\begin{bmatrix} a & b \\ c & d \end{bmatrix} \in G$ and  $h = (g, 1) \in \widetilde{G}$ . Then,

 $\Box$ 

.

(1) 
$$
c(g, g^{-1}) = c(g^{-1}, g) = \begin{cases} 1, & \text{if } c \neq 0 \\ \langle d, a \rangle, & \text{if } c = 0 \end{cases}
$$
  
\n(2)  $h^{-1} = (g^{-1}, c(g, g^{-1})^{-1}) = \begin{cases} (g^{-1}, 1), & \text{if } c \neq 0 \\ (g^{-1}, \langle a, d \rangle), & \text{if } c = 0 \end{cases}$   
\n(3)  $\sigma(h) = \begin{cases} (\tau(g), \langle \Delta(h), c \rangle), & \text{if } c \neq 0 \\ (\tau(g), 1), & \text{if } c = 0 \end{cases}$ 

The involution  $\sigma$  satisfies a certain conjugation property which plays an important role in the proof of our main result. Before we proceed further, we record a few more lemmas that we need to establish this property of  $\sigma$ .

<span id="page-8-1"></span>Lemma 3.4. *For*  $x, g \in G$ , *let* 

$$
\lambda = c(xg, x^{-1})c(x, g)c(x, x^{-1})^{-1},
$$

*and*

$$
\beta = c(x, x^{-1})c(g^{-1}x^{-1}, x)c(g, x^{-1})^{-1}c(x, gx^{-1})^{-1}c(x, g^{-1}x^{-1})^{-1}
$$

*Then,*

(1) 
$$
c(xg^{-1}x^{-1}, xgx^{-1}) = c(g^{-1}, g)\beta.
$$

(2) 
$$
\lambda \beta = c(g^{-1}x^{-1}, x)c(x, g^{-1}x^{-1})^{-1}
$$

*Proof.* Using the cocycle property, we have for  $g_1, g_2, g_3 \in G$ 

<span id="page-9-0"></span>
$$
c(g_1g_2, g_3)c(g_1, g_2) = c(g_1, g_2g_3)c(g_2, g_3). \tag{3.2}
$$

For (1), taking  $g_1 = x, g_2 = g^{-1}x^{-1}$  and  $g_3 = xgx^{-1}$  in [\(3.2\)](#page-9-0), we get

<span id="page-9-2"></span><span id="page-9-1"></span>.

$$
c(xg^{-1}x^{-1}, xgx^{-1}) = c(x, x^{-1})c(g^{-1}x^{-1}, xgx^{-1})c(x, g^{-1}x^{-1})^{-1}.
$$
\n(3.3)

Applying [\(3.2\)](#page-9-0) again with  $g_1 = g^{-1}x^{-1}$ ,  $g_2 = x$  and  $g_3 = gx^{-1}$  and then again with  $g_1 = g^{-1}$ ,  $g_2 = g$  and  $g_3 = x^{-1}$  we get the following equalities:

$$
c(g^{-1}x^{-1}, xgx^{-1}) = c(g^{-1}, gx^{-1})c(g^{-1}x^{-1}, x)c(x, gx^{-1})^{-1}
$$
  
=  $[c(g^{-1}, g)c(g, x^{-1})^{-1}]c(g^{-1}x^{-1}, x)c(x, gx^{-1})^{-1}.$  (3.4)

Now,  $(1)$  follows by  $(3.3)$  and  $(3.4)$ .

Proof of (2) is a direct application of (3.2) with 
$$
g_1 = x, g_2 = g
$$
 and  $g_3 = x^{-1}$ .

<span id="page-9-5"></span> ${\bf Lemma~3.5.} \ \ Let \ g=$  $\begin{bmatrix} \alpha & \beta \end{bmatrix}$  $0 \delta$  $\Big] \in G$ . Then, g is conjugate to either  $\begin{bmatrix} \alpha & 0 \\ 0 & s \end{bmatrix}$  $0 \delta$  $\int$  *or*  $\begin{bmatrix} \alpha & 1 \\ 0 & 0 \end{bmatrix}$  $0 \alpha$ . *Proof.* If  $\alpha \neq \delta$ , taking  $x =$  $\lceil 1 \quad \beta/(\alpha - \delta) \rceil$ 0  $-1$ we get  $xgx^{-1} = \begin{bmatrix} \alpha & 0 \\ 0 & s \end{bmatrix}$  $0 \delta$ 1 . Suppose that  $\alpha = \delta$ . If  $\beta = 0$ , then we have  $g = \alpha I_2$ . On the other hand, if  $\beta \neq 0$ , choosing  $x =$  $\begin{bmatrix} 1 & 0 \end{bmatrix}$ 0 β we have  $xgx^{-1} = \begin{bmatrix} \alpha & 1 \\ 0 & \alpha \end{bmatrix}$  $0 \alpha$  $].\;\; \Box$ 

Let  $\sigma$  be defined as in [\(3.1\)](#page-6-1). Consider the set

<span id="page-9-6"></span>
$$
S := \{ h = (g, \eta) \in \tilde{G} : \sigma(h) = c(g^{-1}, g)^{-2} \eta^{-2} x h x^{-1}, \text{for some } x \in \tilde{G} \}. \tag{3.5}
$$

<span id="page-9-3"></span>**Lemma 3.6.** *Let*  $h \in S$  *and*  $\epsilon \in \mu_n$ *. Then* 

That is, S is closed under multiplication by 
$$
\epsilon \in \mu_n
$$
.

*Proof.* Consider  $e = (I_2, 1) \in \tilde{G}$ . Since  $c(I_2, I_2) = 1$ , we have  $e \in S$ . Thus, S is non-empty. Let  $h = (g, \eta) \in S$ . Choose  $z \in \tilde{G}$  such that  $\sigma(h) = c(g^{-1}, g)^{-2} \eta^{-2} z h z^{-1}$ . Then, we have

 $\epsilon h \in S$ .

$$
\sigma(\epsilon h) = \epsilon^{-1} \sigma(h) \n= \epsilon^{-1} [c(g^{-1}, g)^{-2} \eta^{-2} z h z^{-1}] \n= c(g^{-1}, g)^{-2} (\eta \epsilon)^{-2} z(\epsilon h) z^{-1}.
$$

<span id="page-9-4"></span>**Lemma 3.7.** *Consider the matrices*  $g_1, g_2, g_3$  *in* G *defined as follows:* 

$$
g_1 = \begin{bmatrix} 0 & v \\ 1 & w \end{bmatrix} : v \in F^\times, w \in F, \, g_2 = \begin{bmatrix} a & 0 \\ 0 & d \end{bmatrix} : a \neq d, a, d \in F^\times \text{ and } g_3 = \begin{bmatrix} b & 1 \\ 0 & b \end{bmatrix} : b \in F^\times.
$$
\n
$$
For \, \epsilon \in \mu_n, \, and \, i \in \{1, 2, 3\}, \, we \, have \, \left(g_i, \epsilon\right) \in S.
$$

*Proof.* For  $i \in \{1, 2, 3\}$ , write  $h_i = (g_i, 1)$ . By Lemma [3.6,](#page-9-3) it is enough to show that  $h_i \in S$ . Consider  $h_1 = (g_1, 1)$ . Let  $y =$  $\begin{bmatrix} 1 & 0 \\ 0 & 0 \end{bmatrix}$  $-w/v$  1 1 and  $\widetilde{y} = (y, 1)$ . It is easy to see that

$$
\tau(g_1) = \begin{bmatrix} w & v \\ 1 & 0 \end{bmatrix} = yg_1y^{-1}.
$$

A simple calculation gives  $c(yg_1, y^{-1}) = 1$  and  $c(y, g_1) = 1$ . Since  $\langle \triangle(h_1), 1 \rangle = c(g_1^{-1}, g_1) = 1$ , using (3) of Remark [3.3,](#page-8-0) it follows that

$$
\widetilde{y}h_1\widetilde{y}^{-1} = (\tau(g_1), 1) = \sigma(h_1)
$$

and  $h_1 \in S$ .

Consider  $h_2 = (g_2, 1)$ . Let  $z =$  $\begin{bmatrix} 0 & d \\ 1 & 0 \end{bmatrix}$  and set  $\widetilde{z} = (z, 1)$ . Clearly we have  $\sqrt{ }$ 1

$$
zg_2z^{-1} = \begin{bmatrix} d & 0 \\ 0 & a \end{bmatrix} = \tau(g_2).
$$

It is easy to see that  $c(zy_2, z^{-1}) = c(z, z^{-1}) = 1$ ,  $c(g_2^{-1}, g_2) = \langle d, a \rangle$  and  $c(z, g_2) = \langle d, a \rangle^2$ . Using (3) of Remark [3.3,](#page-8-0) we get

$$
\widetilde{z}h_2\widetilde{z}^{-1} = (\tau(g_2), \langle d, a \rangle^2) = c(g_2^{-1}, g_2)^2(\tau(g_2), 1) = c(g_2^{-1}, g_2)^2\sigma(h_2).
$$

Thus  $h_2 \in S$ .

We now show that  $h_3 = (g_3, 1) \in S$ . It is clear that  $\tau(g_3) = g_3$ . By (3) of Remark [3.3,](#page-8-0) we have  $\sigma(h_3) = (g_3, 1)$ . Since  $c(g_3^{-1}, g_3) = \langle b, b \rangle$  and  $\langle b, b \rangle^2 = 1$ , we get  $\sigma(h_3) = c(g_3^{-1}, g_3)^{-2}h_3$ .

<span id="page-10-6"></span>**Lemma 3.8.** *Let*  $g_1$ ,  $g_2$  *and*  $g_3$  *be as in Lemma [3.7.](#page-9-4) Let*  $g \in G$ *, and let*  $h = (g, 1) \in G$ *. Suppose that there exists*  $x \in G$  *such that*  $xgx^{-1} = g_i$ , for some  $i \in \{1, 2, 3\}$ . Let  $A = c(x^{-1}g_i^{-1}, x)c(x, x^{-1}g_i^{-1})^{-1}$ . *Then, for*  $s \in F^{\times}$  *there exists*  $z \in \tilde{G}$  *such that* 

$$
\sigma(h) = \langle s, \triangle(h) \rangle A^{-2} c(g^{-1}, g)^{-2} z h z^{-1}.
$$

*Proof.* Let  $\tilde{x} = (x, 1)$  and  $\lambda = c(xg, x^{-1})c(x, g)c(x, x^{-1})^{-1}$ . Since  $xgx^{-1} = g_i$ , we have

<span id="page-10-4"></span>
$$
\widetilde{x}h\widetilde{x}^{-1} = (xgx^{-1}, \lambda) = (g_i, \lambda). \tag{3.6}
$$

Let  $s \in F^{\times}$ . Using (i) of Proposition [3.1,](#page-6-2) we have

$$
(g_i, \lambda) = \tilde{x}\tilde{z}(s)^{-1}\tilde{z}(s)h\tilde{z}(s)^{-1}\tilde{z}(s)\tilde{x}^{-1}
$$
  
\n
$$
= \langle s, \triangle(h) \rangle \tilde{x}\tilde{z}(s)^{-1}h\tilde{z}(s)\tilde{x}^{-1}
$$
  
\n
$$
= \langle s, \triangle(h) \rangle uhu^{-1}; \text{ where } u = \tilde{x}\tilde{z}(s)^{-1}. \tag{3.7}
$$

By Lemma [3.7,](#page-9-4)  $(g_i, \lambda) \in S$ . Choose  $y \in G$  such that

<span id="page-10-2"></span>
$$
\sigma((g_i, \lambda)) = c(g_i^{-1}, g_i)^{-2} \lambda^{-2} y(g_i, \lambda) y^{-1}.
$$
\n(3.8)

.

Applying  $\sigma$  on both sides to [\(3.7\)](#page-10-1), and using Lemma [3.2](#page-7-0) and [\(3.8\)](#page-10-2), we get

<span id="page-10-3"></span>
$$
c(g_i^{-1}, g_i)^{-2} \lambda^{-2} y(g_i, \lambda) y^{-1} = \langle s, \triangle(h) \rangle^{-1} \sigma(u)^{-1} \sigma(h) \sigma(u). \tag{3.9}
$$

Simplifying [\(3.9\)](#page-10-3), we have

$$
\sigma(h) = \langle s, \triangle(h) \rangle c(g_i^{-1}, g_i)^{-2} \lambda^{-2} \sigma(u) y(g_i, \lambda) y^{-1} \sigma(u)^{-1}
$$
  
=\langle s, \triangle(h) \rangle c(g\_i^{-1}, g\_i)^{-2} \lambda^{-2} \sigma(u) y \tilde{x} \left[ \tilde{x}^{-1}(g\_i, \lambda) \tilde{x} \right] \tilde{x}^{-1} y^{-1} \sigma(u)^{-1}. \tag{3.10}

Write  $z = \sigma(u)y\tilde{x}$ . By [\(3.6\)](#page-10-4),  $\tilde{x}^{-1}(g_i, \lambda)\tilde{x} = h$ . Thus, [\(3.10\)](#page-10-5) gives:

$$
\sigma(h) = \langle s, \triangle(h) \rangle c(g_i^{-1}, g_i)^{-2} \lambda^{-2} z h z^{-1}
$$

Applying Lemma [3.4,](#page-8-1) the result follows.

<span id="page-10-0"></span>**Theorem 3.9.** For  $h = (g, \eta) \in \widetilde{G}$ , we have

$$
\sigma(h) = c(g^{-1}, g)^{-2} \eta^{-2} z h z^{-1},
$$

*for some*  $z \in \widetilde{G}$ .

*Proof.* Let  $g \in G$  and set  $h = (g, 1)$ . By Lemma [3.6,](#page-9-3) it is enough to show that  $h \in S$ . Suppose that  $g =$  $\begin{bmatrix} \alpha & 0 \end{bmatrix}$  $0 \alpha$ T , for some  $\alpha \in F^{\times}$ . Take  $u = \begin{bmatrix} 0 & \alpha \\ 1 & 0 \end{bmatrix}$ , and write  $\widetilde{u} = (u, 1)$ . Since  $\tau(g) = g$ , by (3) of Remark [3.3,](#page-8-0) we get  $\sigma(h) = h$ . It is easy to see that  $c(ug, u^{-1}) = 1 = c(u, u^{-1})$  and  $c(u, g) = \langle \alpha, \alpha \rangle^2 = 1$ . Hence,  $\widetilde{u}h\widetilde{u}^{-1} = h.$  Observe that  $c(g^{-1}, g) = \langle \alpha, \alpha \rangle$ . Thus,

$$
\sigma(h) = c(g^{-1}, g)^{-2} \tilde{u} h \tilde{u}^{-1}.
$$

Suppose that g is not a scalar matrix. Let  $g_1, g_2$  and  $g_3$  be as in Lemma [3.7.](#page-9-4) Using the rational canonical form, it follows that g is conjugate to a matrix of the type either  $g_1$ ,  $g_2$ , or  $g_3$ . We discuss these cases separately.

<span id="page-10-5"></span><span id="page-10-1"></span>

**Case (1):** Assume that g is conjugate to  $g_1$ , where  $g_1$  =  $\begin{bmatrix} 0 & v \end{bmatrix}$ 1 w 1 . Suppose  $g =$  $\begin{bmatrix} \alpha & \beta \\ \gamma & \delta \end{bmatrix}$ . Since g is conjugate to  $g_1$ , we have

$$
v = -\Delta(g) = -\det(g)
$$
 and  $w = \text{Tr}(g) = \alpha + \delta$ .

Also,  $\gamma \neq 0$  by Lemma [3.5.](#page-9-5) Consider  $x =$  $\begin{bmatrix} 0 & v\gamma^{-1} \end{bmatrix}$ 1  $\delta \gamma^{-1}$ . It is easy to verify that  $xgx^{-1} = g_1$ . By Lemma [3.8,](#page-10-6) there exists  $z \in \widetilde{G}$  such that

<span id="page-11-0"></span>
$$
\sigma(h) = A^{-2}c(g^{-1}, g)^{-2}zhz^{-1},
$$
\n(3.11)

where  $A = c(x^{-1}g_1^{-1}, x)c(x, x^{-1}g_1^{-1})^{-1}$ . We now compute  $c(x^{-1}g_1^{-1}, x)$  and  $c(x, x^{-1}g_1^{-1})$ . These are as follows:

$$
c(x^{-1}g_1^{-1},x) = \begin{cases} \langle 1, -\triangle(g) \rangle, & w = 0\\ \langle w^{-1}, -\triangle(g) \rangle, & w \neq 0 \end{cases} \text{ and } c(x, x^{-1}g_1^{-1}) = \begin{cases} \langle -\triangle(g)^{-1}, \triangle(g)^{-1} \rangle, & w = 0\\ \langle -\triangle(g), w \rangle, & w \neq 0. \end{cases}
$$

This implies that  $c(x^{-1}g_1^{-1}, x)c(x, x^{-1}g_1^{-1})^{-1} = 1$  irrespective of w is zero or non-zero. Hence,  $A = 1$ . Thus,  $(3.11)$  reduces to

$$
\sigma(h) = c(g^{-1}, g)^{-2} z h z^{-1}.
$$

**Case (2):** Assume that g is conjugate to  $g_2$ , where  $g_2$  =  $\begin{bmatrix} a & 0 \\ 0 & 0 \\ 0 & 0 \\ 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0$  $0 \t d$ 1 with  $a \neq d$ . Choose  $x \in G$  such that  $xgx^{-1} = g_2$ . We claim the following:

<span id="page-11-1"></span>There exists  $y \in G$  such that  $ygy^{-1} = g_2$  and  $c(y^{-1}g_2^{-1}, y)c(y, y^{-1}g_2^{-1})^{-1} = 1.$  (3.12) Suppose that [\(3.12\)](#page-11-1) is true. Hence, in this case result follows by applying Lemma [3.8](#page-10-6) with  $ygy^{-1} = g_2$ . We now prove the claim  $(3.12)$ . Write  $x =$  $\begin{bmatrix} f & p \\ q & r \end{bmatrix}$ , and consider the following cases:

(i) Suppose that  $q = 0$ . Take  $y = tx$ , where  $t =$  $\int f^{-1}$  0 0  $r^{-1}$ . Clearly,  $ygy^{-1} = g_2$ . Also, we have  $c(y^{-1}g_2^{-1}, y) = \langle 1, a \rangle$  and  $c(y, y^{-1}g_2^{-1}) = \langle d, 1 \rangle$ . Thus,  $c(y^{-1}g_2^{-1}, y)c(y, y^{-1}g_2^{-1})^{-1} = 1.$ 

(ii) Suppose that  $q \neq 0$ . Let  $y = tx$ , where  $t =$  $\lceil p^{-1} \rceil$  0 0  $q^{-1}d^{-1}$ 1 if  $f = 0$  and  $t =$  $\int \frac{d}{(d-a)f}$  0 0  $q^{-1}d^{-1}$ 1 if  $f \neq 0$ . It is clear that  $ygy^{-1} = g_2$ . Also,  $c(y^{-1}g_2^{-1}, y) = \langle 1, -d \rangle$  and  $c(y, y^{-1}g_2^{-1}) = \langle 1, -a \rangle$ . Thus,  $c(y^{-1}g_2^{-1}, y)c(y, y^{-1}g_2^{-1})^{-1} = 1.$ 

**Case (3):** Assume that g is conjugate to  $g_3$ , where  $g_3 =$  $\begin{bmatrix} b & 1 \end{bmatrix}$  $0 \quad b$ ]. Let  $x \in G$  such that  $xgx^{-1} = g_3$ . Given  $s \in F^{\times}$ , there exists  $z \in \tilde{G}$  (see Lemma [3.8\)](#page-10-6) such that

<span id="page-11-2"></span>
$$
\sigma(h) = \langle s, \triangle(h) \rangle A^{-2} c(g^{-1}, g)^{-2} z h z^{-1}.
$$
\n(3.13)

Here,  $A = c(x^{-1}g_3^{-1}, x)c(x, x^{-1}g_3^{-1})^{-1}$ . Write  $x =$  $\begin{bmatrix} f & p \\ q & r \end{bmatrix}$ . Then, we have

$$
c(x^{-1}g_3^{-1}, x) = \begin{cases} \langle r, f b \rangle, & q = 0 \\ \langle q, b \rangle, & q \neq 0 \end{cases} \text{ and } c(x, x^{-1}g_3^{-1}) = \begin{cases} \langle br, f \rangle, & q = 0 \\ \langle b, -q \rangle, & q \neq 0. \end{cases}
$$

Thus,

$$
A = \begin{cases} \langle fr, b \rangle, & q = 0 \\ \langle -q^2, b \rangle, & q \neq 0. \end{cases}
$$

Note that  $\Delta(h) = b^2$ . If  $q = 0$ , taking  $s = fr$  we get  $\langle s, \Delta(h) \rangle A^{-2} = 1$ . Thus,  $\sigma(h) = c(g^{-1}, g)^{-2}zhz^{-1},$ 

<span id="page-11-3"></span>for some  $z \in \tilde{G}$  via [\(3.13\)](#page-11-2). Also,  $s = -q^2$  works when  $q \neq 0$ . Proof of the theorem is complete.  $\Box$ Corollary 3.10. *Let* S *be defined as in* [\(3.5\)](#page-9-6)*. We have*

$$
\widetilde{G}=S.
$$

*Proof.* Clearly  $S \subset \tilde{G}$ . Using Theorem [3.9,](#page-10-0) it follows that  $\tilde{G} \subset S$ . Hence the result.

In the following remark, we make some pertinent observations about the proof of  $\tilde{G} = S$  (Corollary [3.10\)](#page-11-3) comparing it with the case when  $\tilde{G}$  is the 2-fold metaplectic cover of G considered in [\[1\]](#page-15-3). *Remark* 3.11*.*

(1) For  $n \geq 3$ , let  $\epsilon \in \mu_n$  such that  $\epsilon^2 \neq 1$ . Put  $h = (g, \epsilon)$ , where  $g = \begin{bmatrix} 1 & 1 \\ 0 & 1 \end{bmatrix}$ . We will show that  $\sigma(h)$  and h are not conjugate in  $\tilde{G}$ . Since  $\tau(g) = g$ , we get  $\sigma(h) = (g, \epsilon^{-1})$  by Lemma [3.2](#page-7-0) and Remark [3.3.](#page-8-0) Let  $z = (x, \eta) \in \tilde{G}$ . Then,

$$
zhz^{-1} = (xgx^{-1}, \lambda \epsilon),
$$

where  $\lambda = c(xg, x^{-1})c(x, g)c(x, x^{-1})^{-1}$ . For  $\sigma(h) = zhz^{-1}$ , we must have  $g = xgx^{-1}$ , i.e.,  $x \in$  $C_G(g)$ . Note that  $C_G(g) = \begin{cases} \begin{bmatrix} a & b \\ 0 & a \end{bmatrix}$ T :  $a \in F^{\times}, b \in F$ , For any  $x \in C_G(g)$ , we have  $c(xg, x^{-1}) =$  $\langle a, a \rangle = c(x, x^{-1})$  and  $c(x, g) = 1$  yielding  $\lambda = 1$ . Thus,  $\sigma(h) \neq zhz^{-1},$ 

for any  $z \in \widetilde{G}$ . Hence, the set S considered in [\[1\]](#page-15-3) does not work for  $n \geq 3$ , i.e.,  $\widetilde{G} \neq S$ .

- (2) It is clear that the set S defined in [\(3.5\)](#page-9-6) and considered in [\[1\]](#page-15-3) agree when  $n = 2$ . Also, conjugacy invariance of S was used to show that  $\tilde{G} = S$  in the case when  $n = 2$  (see [\[1,](#page-15-3) Lemma 4.10 & Theorem 4.11]).
- (3) In the current context, it is not immediate to see whether S is conjugation invariant or not. However, once Corollary [3.10](#page-11-3) is established then it is clear that  $S$  is conjugation invariant.

3.1. Other lifts of the standard involution and their properties. In this section, we define other lifts of the standard involution and show that they also satisfy analogous properties like the lift  $\sigma$  of  $\tau$ .

<span id="page-12-0"></span>**Lemma 3.12.** *For each*  $\alpha \in F^{\times}$  *and*  $h \in \tilde{G}$ *, let* 

<span id="page-12-1"></span>
$$
\sigma_{\alpha}(h) = \langle \alpha, \Delta(h) \rangle \sigma(h). \tag{3.14}
$$

*Then*

- (1)  $\sigma_{\alpha}$  *is an anti-automorphism.* (2)  $\sigma_{\alpha}$  *is an involution.*
- (3)  $\sigma_{\alpha}$  *is a lift of*  $\tau$ *.*

*Proof.*

(1) For  $q, h \in \widetilde{G}$ , we have

$$
\sigma_{\alpha}(gh) = \langle \alpha, \Delta(gh) \rangle \sigma(gh)
$$
  
\n
$$
= \langle \alpha, \Delta(g) \Delta(h) \rangle \sigma(h) \sigma(g)
$$
  
\n
$$
= \langle \alpha, \Delta(g) \rangle \langle \alpha, \Delta(h) \rangle \sigma(h) \sigma(g)
$$
  
\n
$$
= \langle \alpha, \Delta(h) \rangle \sigma(h) \langle \alpha, \Delta(g) \rangle \sigma(g)
$$
  
\n
$$
= \sigma_{\alpha}(h) \sigma_{\alpha}(g).
$$

(2) Let  $\sigma_{\alpha}(h) = y$ . We have

$$
\sigma_{\alpha}(\sigma_{\alpha}(h)) = \sigma_{\alpha}(y)
$$
  
=  $\langle \alpha, \Delta(y) \rangle \sigma(y)$   
=  $\langle \alpha, \Delta(h) \rangle \sigma(\langle \alpha, \Delta(h) \rangle \sigma(h))$   
=  $\langle \alpha, \Delta(h) \rangle \langle \alpha, \Delta(h) \rangle^{-1} \sigma(\sigma(h))$   
= h.

(3) Let  $h = (g, \epsilon) \in \tilde{G}$ . Suppose that  $\sigma((g, 1)) = (\tau(g), \xi)$ . We have

$$
\tau(p(h)) = \tau(p((g, \epsilon))) = \tau(g)
$$

and

$$
p(\sigma(h)) = p(\sigma((g, \epsilon))) = p((\tau(g), \epsilon^{-1}\xi)) = \tau(g).
$$

Thus  $\sigma_{\alpha}$  is a lift of  $\tau$ .

*Remark* 3.13. We have used the following observation in part (2) of Lemma [3.12.](#page-12-0) Let  $h = (x, \epsilon)$  and  $y = \sigma_{\alpha}(h)$ . Then we get

$$
y = (\tau(x), *).
$$

Using the extension of  $\Delta$  to  $\widetilde{G}$  as defined earlier, we see that

$$
\Delta(y) = \Delta(\tau(x)) = \Delta(h).
$$

It follows from Proposition [2.7](#page-5-0) that any lift of  $\tau$  is of the form  $\sigma_{\alpha}$  for  $\alpha \in F^{\times}$ . We now show that all the lifts  $\sigma_{\alpha}$  also satisfy a similar conjugacy property like  $\sigma$ . To be precise, we have

<span id="page-13-2"></span>**Theorem 3.14.** Let  $h = (g, \eta) \in \tilde{G}$ . We have

$$
\sigma_{\alpha}(h) = c(g^{-1}, g)^{-2} \eta^{-2} z h z^{-1},
$$

*for some*  $z \in \widetilde{G}$ *.* 

*Proof.* Suppose  $\Delta(h) \in (F^{\times})^n$ . Then  $\langle \alpha, \Delta(h) \rangle = 1$  and  $\sigma_{\alpha}(h) = \sigma(h)$ . Thus, the theorem holds in this case. Suppose  $\Delta(h) \notin (F^\times)^n$ . Taking  $\lambda = \alpha^{-1}$  in (i) of Proposition [3.1,](#page-6-2) and  $u = \tilde{z}(\alpha^{-1})$  we get

$$
\langle \alpha, \Delta(h) \rangle^{-1} h = uhu^{-1}
$$

.

Indeed,

$$
hu = h\tilde{z}(\alpha^{-1}) = \langle \alpha^{-1}, \Delta(h) \rangle^{-1} \tilde{z}(\alpha^{-1})h = \langle \alpha, \Delta(h) \rangle uh.
$$

Thus,

$$
\sigma_{\alpha}(h) = \langle \alpha, \Delta(h) \rangle \sigma(h)
$$
  
=  $\sigma(\langle \alpha, \Delta(h) \rangle^{-1}h)$   
=  $\sigma(uhu^{-1})$   
=  $\sigma(u)^{-1}\sigma(h)\sigma(u)$ .

Since  $\tilde{G} = S$ , we have  $\sigma(h) = c(g^{-1}, g)^{-2} \eta^{-2} v h v^{-1}$ , for some  $v \in \tilde{G}$ .

Thus, we get

$$
\sigma_{\alpha}(h) = c(g^{-1}, g)^{-2} \eta^{-2} \sigma(u)^{-1} v h v^{-1} \sigma(u).
$$

Now taking  $z = \sigma(u)^{-1}v$ , we get

$$
\sigma_{\alpha}(h) = c(g^{-1}, g)^{-2} \eta^{-2} z h z^{-1}.
$$

<span id="page-13-0"></span>Hence the result.  $\Box$ 

# 4. Main Theorem

Throughout, we let  $\mu_{\tilde{G}}$  denote the Haar measure on  $\tilde{G}$ . We write  $Aut_c(\tilde{G})$  for the group of continuous automorphisms of  $\widetilde{G}$  and  $\mathbb{R}^{\times}_{>0}$  for the multiplicative group of positive real numbers.

<span id="page-13-1"></span>**Lemma 4.1.** *Let*  $\gamma \in \text{Aut}_c(\widetilde{G})$ *. Then, the following statements hold:* 

- (1) *There exists*  $c_{\gamma} > 0$  *such that*  $\mu_{\widetilde{G}} \circ \gamma = c_{\gamma} \mu_{\widetilde{G}}$ .
- (2) *The map*  $\gamma \mapsto c_{\gamma}$  *from*  $\text{Aut}_{c}(\widetilde{G})$  *to*  $\mathbb{R}^{\times}_{>0}$  *is a homomorphism.*
- (3) If  $\gamma^2 = 1$ , then  $\mu_{\widetilde{G}} \circ \gamma = \mu_{\widetilde{G}}$ .

<span id="page-13-3"></span>*Proof.* We refer the reader to Section 5 (Lemma 5.7, Lemma 5.8 and Lemma 5.9) in [\[1\]](#page-15-3) for the proof.  $\square$ 

**Lemma 4.2.** Let  $(\pi, V)$  be an irreducible smooth genuine representation of  $\tilde{G}$ . Let  $\omega_{\pi}$  be the central *character of* π. *Then, the following statements hold:*

- (1) The restriction  $\omega_{\pi}|\mu_n$  of  $\omega_{\pi}$  to  $\mu_n$  is injective.
- (2)  $\omega_{\pi}(\eta^2) = 1$ , for every  $\eta \in \mu_n$  if and only if  $n = 2$ .

*Proof.* Let  $\eta \in \mu_n$ . Since  $\pi$  is a genuine representation, we have  $\pi(\eta) = \xi(\eta)1_V$ . Also, we have that  $\mu_n$ is contained in the center of  $\tilde{G}$ . Thus applying Schur's lemma, we get  $\pi(\eta) = \omega_{\pi}(\eta)1_V$ . It follows that  $\omega_{\pi}(\eta) = \xi(\eta)$ . This proves (1). If  $n = 2$ , clearly we have  $\omega_{\pi}(\eta^2) = 1$ . Suppose that  $\omega_{\pi}(\eta^2) = 1$ . This implies that  $\omega_{\pi}(\eta) = \pm 1$ . If  $n \geq 3$ , there exist  $\eta_1, \eta_2$  in  $\mu_n$  with  $\eta_1 \neq \eta_2$  such that  $\omega_{\pi}(\eta_1) = \omega_{\pi}(\eta_2)$ , which contradicts part (1). This completes the proof of (2).

<span id="page-14-1"></span>**Lemma 4.3.** *For*  $q \in \widetilde{G}_{\text{res}}$ *, we have* 

$$
\Theta_{\pi^{\vee}}(g) = \Theta_{\pi}(g^{-1}).
$$

*Proof.* We refer the reader to Section 5 (Lemma 5.11) in [\[1\]](#page-15-3) for the proof.  $\square$ 

**Lemma 4.4.** Let  $\rho \in \text{Aut}_c(\widetilde{G})$  such that it is a lift of the automorphism  $h \mapsto \tau(h^{-1})$  of G. Then,

$$
\rho(g)
$$
 and  $\eta^2 g^{-1}$  are in  $\widetilde{G}_{\text{reg}}$ ,

*for any*  $g \in \widetilde{G}_{\text{reg}}$  *and*  $\eta \in \mu_n$ .

*Proof.* Let  $\eta \in \mu_n$  and  $g = (x, \epsilon) \in \tilde{G}_{reg}$ . Since  $x \in G_{reg}$  and  $p(\eta^2 g^{-1}) = x^{-1}$ , it follows that  $\eta^2 g^{-1} \in \tilde{G}_{reg}$ . Since  $\rho$  is a lift of the automorphism  $h \mapsto \tau(h^{-1})$ , clearly we have  $p(\rho(g)) = \tau(x^{-1}) \in G_{\text{reg}}$ . Thus  $\rho(g) \in \widetilde{G}_{\text{reg}}.$ 

Let  $\pi$  be an irreducible admissible genuine representation of  $\tilde{G}$ . For  $f \in C_c^{\infty}(\tilde{G})$ ,  $\rho \in \text{Aut}(\tilde{G})$  we define

$$
f^{\rho}(g) = f(\rho(g)) \text{ and } \pi^{\rho}(g) = \pi(\rho(g)).
$$

<span id="page-14-5"></span>**Proposition 4.5.** Let  $\rho \in \text{Aut}_c(\widetilde{G})$  such that  $\rho^2 = 1$  and  $\rho(g)$  is conjugate to  $\eta^2 g^{-1}$ , for any  $g = (x, \eta) \in$  $\widetilde{G}$ . Also, assume that  $\rho$  is a lift of the automorphism  $h \mapsto \tau(h^{-1})$  of  $G$ . Let  $\pi$  be an irreducible admissible  $genuine representation of \tilde{G} and \omega_{\pi}$  *be the central character of*  $\pi$ . *Suppose that*  $\pi^{\rho}$  *is isomorphic to*  $\pi^{\vee}$ . *Then*

<span id="page-14-0"></span>
$$
\omega_{\pi}(\eta^2)=1,
$$

*for all*  $\eta \in \mu_n$ *.* 

*Proof.* Let  $f \in C_c^{\infty}(\widetilde{G})$ . Since  $\pi^{\rho} \cong \pi^{\vee}$ , it follows that  $\Theta_{\pi^{\rho}}(f) = \Theta_{\pi^{\vee}}(f)$ . It is straightforward to verify that  $\Theta_{\pi^{\rho}}(f) = \Theta_{\pi}(f^{\rho})$ . We have,

$$
\Theta_{\pi}(f^{\rho}) = \int_{\widetilde{G}} f^{\rho}(g) \Theta_{\pi}(g) dg
$$
  
= 
$$
\int_{\widetilde{G}} f(\rho(g)) \Theta_{\pi}(g) dg
$$
  
= 
$$
\int_{\widetilde{G}} f(g) \Theta_{\pi}(\rho(g)) dg \qquad (g \mapsto \rho(g) \text{ and using (3) of Lemma 4.1}).
$$
 (4.1)

Let  $g = (x, \eta) \in \tilde{G}_{reg}$ . Since  $\rho(g)$  is conjugate to  $\eta^2 g^{-1}$  and  $\Theta_{\pi}$  is constant on (regular semi-simple) conjugacy classes, [\(4.1\)](#page-14-0) yields

<span id="page-14-2"></span>
$$
\Theta_{\pi}(f^{\rho}) = \int_{\widetilde{G}} f(g) \Theta_{\pi}(\eta^2 g^{-1}) dg.
$$
\n(4.2)

Also,

$$
\Theta_{\pi^{\vee}}(f) = \int_{\widetilde{G}} f(g) \Theta_{\pi^{\vee}}(g) dg
$$
  
= 
$$
\int_{\widetilde{G}} f(g) \Theta_{\pi}(g^{-1}) dg \qquad \text{(by Lemma 4.3).}
$$
 (4.3)

It follows from  $(4.2)$  and  $(4.3)$  that

<span id="page-14-4"></span><span id="page-14-3"></span>
$$
\Theta_{\pi}(\eta^2 g^{-1}) = \Theta_{\pi}(g^{-1}).
$$
\n(4.4)

By Lemma [2.6,](#page-5-1)  $\Theta_{\pi}((g_0, 1)) \neq 0$  for some  $g_0 \in G_{reg}$ . For  $\eta \in \mu_n$ , we have  $(g_0, \eta) \in \widetilde{G}_{reg}$ . By [\(4.4\)](#page-14-4),  $\Theta_{\pi}(\eta^2(g_0^{-1}, \eta)^{-1}) = \Theta_{\pi}((g_0^{-1}, \eta)^{-1})$ . Using (2) of Lemma [2.4](#page-4-1) proof follows.

4.1. **Proof of the Main Theorem.** Let  $g = (x, \eta) \in \tilde{G}$ . For  $\alpha \in F^{\times}$ , let  $\rho_{\alpha}(g) = \sigma_{\alpha}(g^{-1})$ , where  $\sigma_{\alpha}$  is given as in [\(3.14\)](#page-12-1). Clearly,  $\rho_{\alpha}^2 = 1$ . Since  $\sigma_{\alpha}$  is continuous (see Proposition [2.8\)](#page-5-2), it follows that  $\rho_{\alpha} \in \text{Aut}_{c}(\widetilde{G})$  for all  $\alpha \in F^{\times}$ . Using Theorem [3.14,](#page-13-2) it follows that there exists  $z \in \widetilde{G}$  such that  $\rho_{\alpha}(g)$  is a conjugate of  $\eta^2 g^{-1}$ . Indeed, we have

$$
\rho_{\alpha}(g) = \sigma_{\alpha}((x^{-1}, c(x, x^{-1})^{-1}\eta^{-1}))
$$
  
=  $c(x, x^{-1})^{-2}(c(x, x^{-1})^{-1}\eta^{-1})^{-2}zg^{-1}z^{-1}$   
=  $z(\eta^{2}g^{-1})z^{-1}$ .

By Proposition [4.5](#page-14-5) and part (2) of Lemma [4.2,](#page-13-3) we have  $n = 2$ . Conversely, if  $n = 2$  then for each  $\alpha \in F^{\times}$ ,  $\sigma_{\alpha}$  is a dualizing involution of  $\tilde{G}$  (see [\[1\]](#page-15-3) and [\[2\]](#page-15-4)).
