Abstract

We calculate *n*-point hard string scattering amplitudes (HSSA) with n-2 tachyons and 2 tensor states at arbitrary mass levels. We discover the stringy scaling behavior of these HSSA. It is found that for HSSA with more than 2 transverse directions, the degree of stringy scaling dim \mathcal{M}_2 decreases comparing to the degree of stringy scaling dim \mathcal{M}_1 of the n-1 tachyons and 1 tensor HSSA calculated previously. Moreover, we propose a set of K-identities which is the key to demonstrate the stringy scaling behavior of HSSA. We explicitly prove both the diagonal and off-diagonal K-identities for the 4-point HSSA and give numerical proofs of these K-identities for some higher point HSSA.

I. INTRODUCTION

Recently, it was discovered [1–3] that the degree of freedom or number of kinematic variables reduced for the *n*-point with n - 1 tachyons and 1 tensor hard string scattering amplitudes (*HSSA*) and the Regge string scattering amplitudes (*RSSA*). Historically, the first stringy scaling behavior was conjectured by Gross [4–7] for the 4-point *HSSA* and later explicitly proved in [8–11]. Indeed, all functional forms of 4-point *HSSA* at each fixed mass level are found to be proportional to each other with constant ratios (independent of the scattering angle ϕ , or the deficit of the kinematics variable dim $\mathcal{M}_1 = 1 - 0 = 1$). See the recent reviews [12, 13].

This stringy scaling behavior, similar to the QCD Bjorken scaling [14, 15] and its GLAP correction [16, 17], was recently generalized to arbitrary *n*-point $(n - 1 \text{ tachyons and } 1 \text{ tensor}) HSSA with <math>n \ge 5$ [1, 2]. As an example, the number of degree of freedom of 6-point HSSA (5 tachyons and 1 tensor) with 3 transverse directions reduced from 8 to 2, and $\dim \mathcal{M}_1 = 8 - 2 = 6$.

Since massive higher spin tensor string states receive more degree of freedom of spin polarizations, it is tempted to speculate that the degree of stringy scaling or dim \mathcal{M}_k $(k \leq n)$ for the *n*-point *k*-tensor *HSSA* with $k \geq 2$ may decrease and is smaller than dim \mathcal{M}_1 . In this paper, we calculate *n*-point $(n \geq 4)$ *HSSA* with n - 2 tachyons and 2 high energy tensor states at arbitrary mass levels. It is found that the degree of stringy scaling dim \mathcal{M}_2 for *HSSA* with more than 2 transverse directions or $r \geq 3$ (see Eq.(4.10)) indeed decreases comparing to that of the 1 tensor *HSSA* dim \mathcal{M}_1 calculated previously.

In the saddle-point calculation of the HSSA, the saddle-point of the integration can be exactly solved only for some lower point HSSA calculation. For the cases of general *n*-point saddle-point HSSA calculation, we propose a set of the so-called K-identities. Without directly solving the saddle-point equation, these K-identities can be used to simplify the HSSA calculation, and turn out to be the key step of the calculation to demonstrate the stringy scaling behavior.

Some of these K-identities were originally proposed for the calculation of n-point 1 tensor HSSA [1, 2]. They are the direct results of the identification of two different calculation of HSSA, namely, the saddle-point calculation and the decoupling of zero-norm state (ZNS) calculation [12, 13]. However, only K-identities for the 4-point HSSA with 1 and 2 ten-

sors will be analytically proved in this paper, other K-identities of higher point $(n \ge 5)$ HSSA calculation will be tested numerically. Presumably, these K-identities are results of conservation of momenta in the hard scattering limit at the saddle-point.

For the saddle-point calculation of *n*-point 2 tensor HSSA, in addition to the diagonal K-identities one obtained during the calculation of *n*-point 1 tensor HSSA, it turns out that one needs to introduce1 more off-diagonal K-identity. This off-diagonal K-identity will contribute to the degree of stringy scaling dim \mathcal{M}_2 for HSSA out of the scattering plane. It is conjectured that for general higher k tensor HSSA calculation ($k \leq n$), these off-diagonal K-identities are crucial to show the consistent result that dim $\mathcal{M}_k \geq 0$.

This paper is organized as following. In section II, we first calculate an example of 4point 2 tensor HSSA for mass level $M^2 = 2$. We then extend the calculation to arbitrary mass levels and obtain the ratios consistent with calculation from the method of decoupling of ZNS. In section III, we calculate general *n*-point 2 tensor HSSA. One key step is to propose both the diagonal and off-diagonal K-identities to simplify the calculation and obtain the consistent ratios calculated from the method of ZNS. In section IV, we discuss in details the K-identities and apply them to the calculation of the degree of stringy scaling dim \mathcal{M}_2 . We also explicitly verify all 4-point 1 and 2 tensors K-identities and discuss the numerical check of the higher point K-identities. A brief conclusion is given in section V.

II. THE FOUR-POINT TWO TENSOR HSSA

In this section, we will use the saddle-point method to calculate the 4-point HSSA with 2 tachyons and 2 tensors. We begin with a brief review of the calculation of HSSA with 3 tachyons and 1 tensor state [8–11]. For the 4-point HSSA, we first note that in the hard scattering limit, components of polarization orthogonal to the scattering plane are subleading order in energy. Defining $e^P = \frac{1}{M_2}(E_2, k_2, \vec{0}) = \frac{k_2}{M_2}$ the momentum polarization, $e^L = \frac{1}{M_2}(k_2, E_2, \vec{0})$ the longitudinal polarization and the transverse polarization $e^T = (0, 0, 1)$ on the scattering plane, it can then be shown that at each fixed mass level $M^2 = 2(N-1)$ only states of the following form [8–11] (in the hard scattering limit $e^P \simeq e^L$)

$$|N, 2m, q\rangle = \left(\alpha_{-1}^{T}\right)^{N-2m-2q} \left(\alpha_{-1}^{L}\right)^{2m} \left(\alpha_{-2}^{L}\right)^{q} |0; k\rangle$$
(2.1)

are leading order in energy. Note in particular that states with $(\alpha_{-1}^{L})^{2m+1}$ are of subleading order in energy. To achieve *BRST* invariance, it can be shown that states in the physical state basis (*PSB*) can be written as a linear combination of states in the oscillator state basis (*OSB*) in Eq.(2.1) [12, 13].

There are two different methods to calculate the stringy scaling behavior of HSSA, the method of decoupling of ZNS and the saddle-point method. Both methods lead to constant ratios among 4-point HSSA at each fixed mass level [8–11]

$$\frac{A^{(N,2m,q)}}{A^{(N,0,0)}} = \frac{(2m)!}{m!} \left(\frac{-1}{2M}\right)^{2m+q} . (\text{independent of } \phi !).$$
(2.2)

In Eq.(2.2), $A^{(N,m,q)}$ is the 4-point HSSA of any string vertex V_j with j = 1, 3, 4 and V_2 is the high energy state in Eq.(2.1). $A^{(N,0,0)}$ is the 4-point HSSA of any string vertex V_j with j = 1, 3, 4, and V_2 is the leading Regge trajectory string state at mass level N. Note that we have omitted the tensor indice of V_j with j = 1, 3, 4 and keep only those of V_2 in $\mathcal{T}^{(N,2m,q)}$.

For the j tensor cases with j = 2, 3 and 4, it is easy to argue from the method of the decoupling of ZNS that the ratios are j products of ratio in Eq.(2.2). However, it is highly nontrivial to calculate n-point multi-tensor HSSA at arbitrary mass levels. Moreover, as will will see in section IV that one important step of this saddle-point calculation is to introduce the K vectors and K-identities, and give information to calculate the degree of stringy scaling dim \mathcal{M} .

For later reference, we begin with a brief description of the 4-point saddle-point calculation with 3 tachyons and 1 tensor state here. The t - u channel of HSSA with 3 tachyons and 1 high energy state in Eq.(2.1) can be calculated to be (after SL(2, R) fixing)

$$A^{(N,2m,q)} = \int_{1}^{\infty} dz z^{(1,2)} (1-z)^{(2,3)} \left[\frac{e^{T} \cdot k_{1}}{z} - \frac{e^{T} \cdot k_{3}}{1-z} \right]^{N-2m-2q} \\ \cdot \left[\frac{e^{P} \cdot k_{1}}{z} - \frac{e^{P} \cdot k_{3}}{1-z} \right]^{2m} \left[-\frac{e^{P} \cdot k_{1}}{z^{2}} - \frac{e^{P} \cdot k_{3}}{(1-z)^{2}} \right]^{q}$$
(2.3)

where $(1,2) = k_1 \cdot k_2$ etc. We can rewrite the amplitude above into the following form

$$A^{(N,2m,q)}(K) = \int_{1}^{\infty} dz \ u(z)e^{-Kf(z)}$$
(2.4)

where

$$\Lambda \equiv -(1,2) \to \frac{s}{2} \to 2E^2, \tag{2.5}$$

$$\tau \equiv -\frac{(2,3)}{(1,2)} \to -\frac{t}{s} \to \sin^2 \frac{\phi}{2},\tag{2.6}$$

$$f(z) \equiv \ln z - \tau \ln(1-z), \tag{2.7}$$

$$u(z) \equiv \left[\frac{(1,2)}{M}\right]^{2m+q} (1-z)^{-N+2m+2q} \underbrace{(f')^{2m}}_{*} (f'')^q (-e^T \cdot k_3)^{N-2m-2q}.$$
 (2.8)

The saddle-point $z = \tilde{z}$, is defined by

$$f'(\tilde{z}) = 0, \tag{2.9}$$

which can be exactly solved to be

$$\tilde{z} = \frac{1}{1 - \tau} = \sec^2 \frac{\phi}{2}.$$
(2.10)

It is now easy to see that

$$u(\tilde{z}) = u'(\tilde{z}) = \dots = u^{(2m-1)}(\tilde{z}) = 0, \qquad (2.11)$$

and

$$u^{(2m)}(\tilde{z}) = \left[\frac{(1,2)}{M}\right]^{2m+q} (1-\tilde{z})^{-N+2m+2q} (2m)! (f_0'')^{2m+q} (-e^T \cdot k_3)^{N-2m-2q}.$$
(2.12)

It is important to note that in calculating HSSA containing high energy states in Eq.(2.1) with $(\alpha_{-1}^L)^{2m}$, the *naive* energy order of the amplitudes based on the naive mass counting vanishes [8–11], and the real leading energy order HSSA will in general drop by an even number of energy power as can be seen from Eq.(2.11). On the other hand, HSSA corresponding to states with $(\alpha_{-1}^L)^{2m+1}$ turn out to be of subleading order in energy.

With these inputs, one can evaluate the Gaussian integral in Eq.(2.4) and show explicitly that the angular dependence of HSSA depends only on the level N but not m and q

$$A^{(N,2m,q)} = \sqrt{\frac{2\pi}{Kf_0''}} e^{-\Lambda f_0} \left[(-1)^{N-q} \frac{2^{N-2m-q}(2m)!}{m! \ M^{2m+q}} \ \tau^{-\frac{N}{2}} (1-\tau)^{\frac{3N}{2}} E^N + O(E^{N-2}) \right], \quad (2.13)$$

and we have [8-11]

$$\lim_{E \to \infty} \frac{A^{(N,2m,q)}}{A^{(N,0,0)}} = \frac{(-1)^q (2m)!}{m! (2M)^{2m+q}} = \left(-\frac{2m-1}{M}\right) \dots \left(-\frac{3}{M}\right) \left(-\frac{1}{M}\right) \left(-\frac{1}{2M}\right)^{m+q} \\ = \left(\frac{1}{2}\right)^{m+q} \left(-\frac{1}{M}\right)^{q+2m} (2m-1)!!,$$
(2.14)

which is remarkably consistent with calculation of decoupling of high energy ZNS obtained in Eq.(2.2).

We now turn to calculate the 4-point HSSA with 2 tachyons and 2 tensor states. We choose to put the 2 tensors on z_2 and z_3 . The kinematics of 4-points HSSA can be written as

$$k_{1} = \begin{pmatrix} E & -E & 0 \end{pmatrix},$$

$$k_{2} = \begin{pmatrix} E & E & 0 \end{pmatrix},$$

$$k_{3} = \begin{pmatrix} -E & -E\cos\phi & -E\sin\phi \end{pmatrix},$$

$$k_{4} = \begin{pmatrix} -E & E\cos\phi & E\sin\phi \end{pmatrix},$$
(2.15)

which imply

$$k_{12} = -2E^{2},$$

$$k_{13} = E^{2} (1 - \cos \phi),$$

$$k_{23} = E^{2} (1 + \cos \phi).$$
(2.16)

For the 2 tensor cases, we will use the following short notations for polarizations

$$T_{2} = \begin{pmatrix} 0 & 0 & 1 \end{pmatrix},$$

$$T_{3} = \begin{pmatrix} 0 & -\sin\phi & \cos\phi \end{pmatrix},$$

$$L_{2} = \frac{1}{M_{2}} \begin{pmatrix} E & E & 0 \end{pmatrix},$$

$$L_{3} = \frac{1}{M_{3}} \begin{pmatrix} -E & -E\cos\phi & -E\sin\phi \end{pmatrix}$$
(2.17)

where T_2 means e^{T_2} etc. One can easily calculate the following projections

$$k_1^{T_2} = 0, \ k_3^{T_2} = -E\sin\phi, \ k_1^{T_3} = E\sin\phi, \ k_2^{T_3} = -E\sin\phi;$$
 (2.18)

$$k_1^{L_2} = \frac{-2E^2}{M_2}, \ k_3^{L_2} = \frac{2E^2}{M_2}\tau, \ k_1^{L_3} = \frac{2E^2}{M_3}(1-\tau), \ k_2^{L_3} = \frac{2E^2}{M_3}\tau;$$
 (2.19)

and after SL(2, R) fixing

$$f_0'' = -\frac{1}{\tilde{z}^2} + \frac{\tau}{(1-\tilde{z})^2} = \frac{(1-\tau)^3}{\tau}.$$
 (2.20)

A. An example of mass level $M^2 = 2$

As a simple example of 4-point HSSA with 2 tachyons and 2 tensor states, we first calculate HSSA for tensor states at mass level N = 2. By Eq.(2.1), there are 3 high energy states in the OSB

$$\left(\alpha_{-1}^{T}\right)^{2}\left|0;k\right\rangle, \quad \left(\alpha_{-2}^{L}\right)\left|0;k\right\rangle, \quad \left(\alpha_{-1}^{L}\right)^{2}\left|0;k\right\rangle.$$

$$(2.1)$$

By Eq.(2.2), the ratios of HSSA with 3 tachyons and 1 tensor in Eq.(2.1) are

$$A^{T_2T_2}: A^{L_2}: A^{L_2L_2} = 4: \sqrt{2}: 1.$$
(2.2)

For the case of HSSA with 2 tachyons and 2 tensors, the calculation of the decoupling of zero-norm state (ZNS) gives

$$(T_2T_2 \oplus L_2 \oplus L_2L_2) \otimes (T_3T_3 \oplus L_3 \oplus L_3L_3)$$

= $(4:\sqrt{2}:1) \times (4:\sqrt{2}:1).$ (2.3)

We will recalculate the ratios by using the saddle-point method. In calculating the HSSA, one needs to pay attention to the state $(\alpha_{-1}^L)^2 |0;k\rangle$ with m = 1 in Eq.(2.1), as has been mentioned in the paragraph after Eq.(2.12). The calculation for HSSA with m = 0 are straightforward and we obtain

$$A^{T_2T_2;T_3T_3} = \int d^4 z e^{-\Lambda f} \left(\frac{k_1^{T_2}}{z_1 - z_2} + \frac{k_3^{T_2}}{z_3 - z_2} + \frac{k_4^{T_2}}{z_4 - z_2} \right)^2 \left(\frac{k_1^{T_3}}{z_1 - z_3} + \frac{k_2^{T_3}}{z_2 - z_3} + \frac{k_4^{T_3}}{z_4 - z_3} \right)^2 = e^{-\Lambda f_0} \left(4E^2 \frac{(1 - \tau)^3}{\tau} \right) \left(4E^2 \frac{1 - \tau}{\tau} \right) \sqrt{\frac{2\pi}{f_0''}},$$

$$(2.4)$$

$$A^{T_2T_2;L_3} = \int d^4 z e^{-\Lambda f} \left(\frac{k_1^{T_2}}{z_1 - z_2} + \frac{k_3^{T_2}}{z_3 - z_2} + \frac{k_4^{T_2}}{z_4 - z_2} \right)^2 \left(\frac{k_1^{L_3}}{(z_1 - z_3)^2} + \frac{k_2^{L_3}}{(z_2 - z_3)^2} + \frac{k_4^{L_3}}{(z_4 - z_3)^2} \right)^2 \right)$$
$$= e^{-\Lambda f_0} \left(4E^2 \frac{(1 - \tau)^3}{\tau} \right) \left(\frac{2E^2 (1 - \tau)}{M_3 \tau} \right) \sqrt{\frac{2\pi}{f_0''}}.$$
 (2.5)

With $M_3 = \sqrt{2}$, Eq.(2.4) and Eq.(2.5) give the consistent ratios in Eq.(2.2).

We now turn to calculate HSSA containing state $(\alpha_{-1}^L)^2 |0;k\rangle$. The saddle-point calculation gives

$$A^{T_2T_2;L_3L_3} = \int d^4 z e^{-\Lambda f} \left(\frac{k_1^{T_2}}{z_1 - z_2} + \frac{k_3^{T_2}}{z_3 - z_2} + \frac{k_4^{T_2}}{z_4 - z_2} \right)^2 \left(\frac{k_1^{L_3}}{z_1 - z_3} + \frac{k_2^{L_3}}{z_2 - z_3} + \frac{k_4^{L_3}}{z_4 - z_3} \right)^2 \\ = \int dz_2 e^{-\Lambda f} \left(-E \sin \phi \frac{\tau - 1}{\tau} \right)^2 \left(\frac{\frac{2E^2}{M_3} \cos^2 \frac{\phi}{2}}{-1} + \frac{\frac{2E^2}{M_3} \sin^2 \frac{\phi}{2}}{z_2 - 1} \right)^2.$$
(2.6)

We note that the above integrand vanish if we evaluate z_2 at the saddle point $z_2 = \tilde{z}_2$. To obtain the real energy order HSSA, we need to do Tayor expansion about the saddle point \tilde{z}_2 before performing the integration. By doing so, we obtain

$$A^{T_2T_2;L_3L_3} = \int dz_2 e^{-\Lambda f} \left(-2E\sqrt{\tau (1-\tau)} \frac{\tau-1}{\tau} + \cdots \right)^2$$

$$\cdot \left(-\frac{2E^2}{M_3} (1-\tau) + \frac{2E^2}{M_3} \tau \frac{1-\tau}{\tau} - \frac{\frac{2E^2}{M_3} \sin^2 \frac{\phi}{2}}{(z_{20}-1)^2} (z_2 - \tilde{z}_2) + \cdots \right)^2$$

$$= \int dz_2 e^{-\Lambda f} \left(-2E\sqrt{\tau (1-\tau)} \frac{\tau-1}{\tau} + \cdots \right)^2 \left(0 - \frac{\frac{2E^2}{M_3} \sin^2 \frac{\phi}{2}}{(z_{20}-1)^2} (z_2 - \tilde{z}_2) + \cdots \right)^2$$

$$= e^{-\Lambda f_0} \left(4E^2 \frac{(1-\tau)^3}{\tau} \right) \left(\frac{2E^2}{M_3^2} \frac{(1-\tau)}{\tau} \right) \sqrt{\frac{2\pi}{f_0''}}, \qquad (2.7)$$

which gives the ratio consistent with Eq.(2.2). Similar calculation can be performed for other HSSA in Eq.(2.2) and all consistent ratios can be obtained except the $A^{L_2L_2;L_3L_3}$ one which needs to be treated carefully.

We first note that in calculating HSSA in Eq.(2.3), contraction terms from $\partial_2 X_2 \cdots$ and $\partial_3 X_3 \cdots$ are considered to be of subleading order in energy and can be ignored. However, for the special case of $A^{L_2L_2;L_3L_3}$ amplitude, one encounters the naive energy order problem, and it turns out that one has to include contraction terms from $\partial_2 X_2 \cdots$ and $\partial_3 X_3 \cdots$ in order to achieve the consistent ratios calculated by the method of decoupling of ZNS in Eq.(2.3).

We thus follow the standard KLT [18] method to calculate the amplitude

$$\begin{aligned} A^{L_{2}L_{2};L_{3}L_{3}} &= \int d^{4}z e^{ik_{1}X_{1}} e^{ik_{2}X_{2} + i\xi_{2}^{2}\partial_{2}X_{2} + i\xi_{2}^{\prime}\partial_{2}X_{2}} e^{ik_{3}X_{3} + i\xi_{3}^{\prime}\partial_{3}X_{3} + i\xi_{3}^{\prime}\partial_{3}X_{3}} e^{ik_{4}X_{4}} \end{aligned} \tag{2.8} \\ &= \int d^{4}z e^{-\Lambda f} \exp \begin{cases} \left[\frac{k_{1}\cdot\xi_{2}}{z_{1}-z_{2}} + \frac{k_{3}\cdot\xi_{2}}{z_{3}-z_{2}} \right] + \left[\frac{k_{1}\cdot\xi_{2}}{z_{1}-z_{3}} + \frac{k_{2}\cdot\xi_{3}}{z_{2}-z_{3}} \right] + \left[\frac{k_{1}\cdot\xi_{2}}{z_{1}-z_{2}} + \frac{k_{3}\cdot\xi_{2}}{z_{3}-z_{2}} \right] \\ &+ \left[\frac{\xi_{2}\cdot\xi_{3}}{(z_{3}-z_{2})^{2}} + \frac{\xi_{2}\cdot\xi_{3}}{(z_{3}-z_{2})^{2}} + \frac{\xi_{2}^{\prime}\cdot\xi_{3}}{(z_{3}-z_{2})^{2}} \right] \\ &multilinear \end{aligned} \\ &= \int d^{4}z e^{-\Lambda f} \begin{cases} \left[\frac{k_{1}\cdot\xi_{2}}{z_{1}-z_{2}} + \frac{k_{3}\cdot\xi_{2}}{z_{3}-z_{2}} \right] \left[\frac{k_{1}\cdot\xi_{2}}{z_{1}-z_{2}} + \frac{k_{3}\cdot\xi_{2}}{z_{3}-z_{2}} \right] \left[\frac{k_{1}\cdot\xi_{3}}{z_{1}-z_{3}} + \frac{k_{2}\cdot\xi_{3}}{z_{2}-z_{3}} \right] \\ &+ \frac{\xi_{2}\cdot\xi_{3}}{(z_{3}-z_{2})^{2}} \left[\frac{k_{1}\cdot\xi_{2}}{z_{1}-z_{2}} + \frac{k_{3}\cdot\xi_{2}}{z_{3}-z_{2}} \right] \left[\frac{k_{1}\cdot\xi_{3}}{z_{1}-z_{3}} + \frac{k_{2}\cdot\xi_{3}}{z_{2}-z_{3}} \right] \\ &+ \frac{\xi_{2}\xi_{3}^{\prime}}{(z_{3}-z_{2})^{2}} \left[\frac{k_{1}\cdot\xi_{2}}{z_{1}-z_{2}} + \frac{k_{3}\cdot\xi_{2}}{z_{3}-z_{2}} \right] \left[\frac{k_{1}\cdot\xi_{3}}{z_{1}-z_{3}} + \frac{k_{2}\cdot\xi_{3}}{z_{2}-z_{3}} \right] \\ &+ \frac{\xi_{2}\xi_{3}^{\prime}}{(z_{3}-z_{2})^{2}} \left[\frac{k_{1}\cdot\xi_{2}}{z_{1}-z_{2}} + \frac{k_{3}\cdot\xi_{2}}{z_{3}-z_{2}} \right] \left[\frac{k_{1}\cdot\xi_{3}}{z_{1}-z_{3}} + \frac{k_{2}\cdot\xi_{3}}{z_{2}-z_{3}} \right] \\ &+ \frac{\xi_{2}\xi_{3}^{\prime}}{(z_{3}-z_{2})^{2}} \left[\frac{k_{1}\cdot\xi_{2}}{z_{1}-z_{2}} + \frac{k_{3}\cdot\xi_{2}}{z_{3}-z_{2}} \right] \left[\frac{k_{1}\cdot\xi_{3}}{z_{1}-z_{3}} + \frac{k_{2}\cdot\xi_{3}}{z_{2}-z_{3}} \right] \\ &+ \frac{\xi_{2}\xi_{3}^{\prime}}{(z_{3}-z_{2})^{2}} \left[\frac{k_{1}\cdot\xi_{2}}{z_{1}-z_{2}} + \frac{k_{3}\cdot\xi_{2}}{z_{3}-z_{2}} \right] \left[\frac{k_{1}\xi_{3}}}{z_{1}-z_{3}} + \frac{k_{2}\cdot\xi_{3}}{z_{2}-z_{3}} \right] \\ &+ \frac{\xi_{2}\xi_{3}^{\prime}}{(z_{3}-z_{2})^{2}} \left[\frac{k_{1}\xi_{2}}{z_{1}-z_{2}} + \frac{k_{3}\xi_{2}}{z_{3}-z_{2}} \right] \left[\frac{k_{1}\xi_{3}}}{z_{1}-z_{3}} + \frac{k_{2}\xi_{3}}{z_{2}-z_{3}} \right] \\ &+ \frac{\xi_{2}\xi_{3}}}{(z_{3}-z_{2})^{2}} \left[\frac{k_{1}\xi_{2}}{z_{1}-z_{2}} + \frac{k_{3}\xi_{2}}{z_{3}-z_{2}} \right] \left[\frac{k_{1}\xi_{3}}{z_{1}-z_{3}} + \frac{k_{2}\xi_{3}}{z_{2}-z_{3}} \right] \\ &+ \frac{\xi_{2}\xi_{3}\xi_{3}}}{(z_{3}-z_{2})^{2}} \left[\frac{k_{1}\xi_{2}} \xi_{3}}{(z_{3}-z_{2})^{2$$

The result in Eq.(2.10) includes contraction terms from $\partial_2 X_2 \cdots$ and $\partial_3 X_3 \cdots$. By setting $\xi_2 = \xi'_2 = L_2$ and $\xi_3 = \xi'_3 = L_3$ in Eq.(2.10), we obtain

$$A^{L_{2}L_{2};L_{3}L_{3}} = \int d^{4}z e^{-\Lambda f} \left\{ \begin{array}{l} \left[\frac{k_{1}^{L_{2}}}{z_{1}-z_{2}} + \frac{k_{3}^{L_{2}}}{z_{3}-z_{2}} \right]^{2} \left[\frac{k_{1}^{L_{3}}}{z_{1}-z_{3}} + \frac{k_{2}^{L_{3}}}{z_{2}-z_{3}} \right]^{2} \\ + \frac{4L_{2}\cdot L_{3}}{(z_{3}-z_{2})^{2}} \left[\frac{k_{1}^{L_{2}}}{z_{1}-z_{2}} + \frac{k_{3}^{L_{2}}}{z_{3}-z_{2}} \right] \left[\frac{k_{1}^{L_{3}}}{z_{1}-z_{3}} + \frac{k_{2}^{L_{3}}}{z_{2}-z_{3}} \right] \right\}$$

$$(2.11)$$

$$+ \frac{2(L_{2}\cdot L_{3})^{2}}{(z_{3}-z_{2})^{4}} \left\{ \begin{array}{l} \left(0 + \frac{2E^{2}}{M_{2}} \left(\frac{(1-\tau)^{3}}{\tau} \right) (z_{2} - z_{20}) + \cdots \right)^{2} \left(0 - \frac{2E^{2}}{M_{3}} \frac{(1-\tau)^{2}}{\tau} (z_{2} - z_{20}) + \cdots \right)^{2} \right\} \\ + \frac{4\left(\frac{2E^{2}\tau}{M_{2}M_{3}} \right)}{(1-\frac{1}{1-\tau})^{2}} \left(0 + \frac{2E^{2}}{M_{2}} \left(\frac{(1-\tau)^{3}}{\tau} \right) (z_{2} - z_{20}) + \cdots \right) \\ \cdot \left(0 - \frac{2E^{2}}{M_{3}} \frac{(1-\tau)^{2}}{\tau} (z_{2} - z_{20}) + \cdots \right) \\ + \frac{2\left(\frac{2E^{2}\tau}{M_{2}M_{3}} \right)^{2}}{(1-\frac{1}{1-\tau})^{4}} \right\}$$

$$(2.12)$$

In Eq.(2.12) we have done Taylor expansion about the saddle point z_{20} for the first two terms and have put 0 for each naive energy order amplitude [8–11]. Most importantly, the last two terms of Eq.(2.12) involve crossing contraction terms and will be seen soon that they are indeed of the same energy order as the first term in Eq.(2.12) which we have done Taylor expansion about the saddle point \tilde{z}_2 due to the naive energy order problem.

Finally, we perform the integration in Eq.(2.12) to obtain

$$A^{L_{2}L_{2};L_{3}L_{3}} \simeq \int dz_{2} e^{-\Lambda f} \left\{ \begin{array}{l} \left(\frac{2E^{2}}{M_{2}}\right)^{2} \left(\frac{2E^{2}}{M_{3}}\right)^{2} \frac{(1-\tau)^{10}}{\tau^{4}} \left(z_{2}-\tilde{z}_{2}\right)^{4} \\ -4 \left(\frac{2E^{2}}{M_{2}}\right)^{2} \frac{2E^{2}}{M_{3}^{2}} \frac{(1-\tau)^{7}}{\tau^{3}} \left(z_{2}-\tilde{z}_{2}\right)^{2} \\ +2\frac{2E^{2}}{M^{2}} \frac{2E^{2}}{M^{2}} \frac{(1-\tau)^{4}}{\tau^{2}} \end{array} \right\}$$
(2.13)

$$= e^{-\Lambda f_0} \left\{ \begin{array}{c} \left(\frac{2E^2}{M_2}\right)^2 \left(\frac{2E^2}{M_3}\right)^2 \frac{(1-\tau)^{10}}{\tau^4} \left(\frac{-2}{1}\right)^2 \left(\frac{-1}{2}\right) \left(\frac{-3}{2}\right) \left(\frac{1}{f_0''}\right)^2 \sqrt{\frac{2\pi}{f_0''}} \\ -4 \left(\frac{2E^2}{M_2}\right)^2 \frac{2E^2}{M_3^2} \frac{(1-\tau)^7}{\tau^3} \left(\frac{-2}{1}\right) \left(\frac{-1}{2}\right) \frac{1}{f_0''} \sqrt{\frac{2\pi}{f_0''}} \\ +2\frac{2E^2}{M_2^2} \frac{2E^2}{M_3^2} \frac{(1-\tau)^4}{\tau^2} \sqrt{\frac{2\pi}{f_0''}} \end{array} \right\}$$
(2.14)

$$=e^{-\Lambda f_0} \frac{2E^2}{M_2^2} \frac{2E^2}{M_3^2} \frac{(1-\tau)^4}{\tau^2} \sqrt{\frac{2\pi}{f_0''}}.$$
(2.15)

which gives the ratio consistent with Eq.(2.3). This completes the saddle-point calculation of HSSA in Eq.(2.3). We conclude that for the 4-point 2 tachyons 2 tensor HSSA, the degree of stringy scaling dim $\mathcal{M}_2 = 1$ is the same as that of 3 tachyons 1 tensor HSSAdim $\mathcal{M}_1 = 1$ calculated previously. However, as we will see in the next section, for the higher point HSSA, dim \mathcal{M}_2 will be in general smaller than dim \mathcal{M}_1 .

B. General mass levels

In this subsection, we extend our previous result to two general mass levels $M_i^2 = 2(N_i - 1)$, i = 2, 3. We first define the K-vectors

$$K_{i} = \sum_{j \neq i} \frac{-k_{j}}{z_{j} - z_{i}} = (K_{i}^{L_{i}}, K_{i}^{T_{i}}), \qquad (2.16)$$

which will be important in our following discussion. By setting $z_1 = 0, z_4 = \infty$ in

$$k_{12}f = \sum_{i>j} k_{ij} \ln \left(z_i - z_j \right), \qquad (2.17)$$

we obtain

$$k_{12}f = k_{12}\ln z_2 + k_{13}\ln z_3 + k_{23}\ln (z_3 - z_2).$$
(2.18)

At the saddle point

$$k_{12}\frac{\partial f}{\partial z_2} = \frac{k_{12}}{z_2} - \frac{k_{23}}{z_3 - z_2} = M_2 K_2^{L_2} = 0, \qquad (2.19)$$

$$k_{12}\frac{\partial f}{\partial z_3} = \frac{k_{13}}{z_3} + \frac{k_{23}}{z_3 - z_2} = M_3 K_3^{L_3} = 0.$$
(2.20)

After setting $z_3 = 1$, we get

$$K_2^{L_2} = -\frac{2E^2}{M_2} \frac{(1-\tau)^3}{\tau} \left(z_2 - \tilde{z}_2\right), \qquad (2.21)$$

$$K_3^{L_3} = \frac{2E^2}{M_3} \frac{(1-\tau)^2}{\tau} \left(z_2 - \tilde{z}_2\right).$$
(2.22)

One important property of the K_j vector is that its longitudinal component $K_j^{L_j}$ is proportional to $\frac{\partial f}{\partial z_j}$ and thus vanishes at the saddle point

$$\tilde{K}_j^{L_j} = 0, (2.23)$$

The K-identities [1-3] can then be written as

$$\tilde{K}_j^2 + 2M_j \partial_j \tilde{K}_j^{L_j} = 0. aga{2.24}$$

We will discuss these K-identities in section IV.

The 4-point HSSA with 2 tachyons and 2 tensors of Eq.(2.1),

$$|p_{i}, 2m_{i}, q_{i}\rangle = \left(\alpha_{-1}^{T_{i}}\right)^{p_{i}} \left(\alpha_{-1}^{L_{i}}\right)^{2m_{i}} \left(\alpha_{-2}^{L_{i}}\right)^{q_{i}} |0, k\rangle, i = 2, 3$$
(2.25)

with the mass levels

$$N_i = p_i + 2m_i + 2q_i \text{ and } N = N_2 + N_3,$$
 (2.26)

can be calculated to be

$$A^{(p_i,2m_i,q_i)} = \int d^4 z_2 e^{-\Lambda f} \left(K_2^{T_2}\right)^{p_2} \left(K_3^{T_3}\right)^{p_3} \left(-\partial_2 K_2^{L_2}\right)^{q_2} \left(-\partial_3 K_3^{L_3}\right)^{q_3} \cdot \exp\left\{\sum_{j_2=1}^{2m_2} K_2 \cdot \xi_{2,j_2} + \sum_{j_3=1}^{2m_3} K_3 \cdot \xi_{3,j_3} + \sum_{j_2=1}^{2m_2} \sum_{j_3=1}^{2m_3} \left[\frac{\xi_{2,j_2} \cdot \xi_{3,j_3}}{(z_3 - z_2)^2}\right]\right\}_{multilinear} = \int d^4 z e^{-\Lambda f} \left(K_2^{T_2}\right)^{p_2} \left(K_3^{T_3}\right)^{p_3} \left(-\partial_2 K_2^{L_2}\right)^{q_2} \left(-\partial_3 K_3^{L_3}\right)^{q_3} \sum_{j=0}^{2m} j! C_j^{2m_2} C_j^{2m_3} \left[\frac{L_2 \cdot L_3}{(z_3 - z_2)^2}\right]^j \left(K_2^{L_2}\right)^{2m_2 - j} \left(K_3^{L_3}\right)^{2m_3 - j}$$
(2.27)

where in the last line we have set $\xi_{2,j} = L_2, \xi_{3,j} = L_3$ and $m = \min(m_2, m_3)$. Plugging in the kenematics, we have

$$A^{(p_i,2m_i,q_i)} = \left(\frac{4E^2 (1-\tau)^3}{\tau}\right)^{N_2/2+m_2+m_3} \left(\frac{4E^2 (1-\tau)}{\tau}\right)^{N_3/2} \sum_{j=0}^{2m} j! C_j^{2m_2} C_j^{2m_3} \left[\frac{-\tau}{2E^2 (1-\tau)^3}\right]^{j} \cdot \left(\frac{-1}{2M_2}\right)^{2m_2+q_2} \left(\frac{-1}{2M_3}\right)^{2m_3+q_3} \int dz_2 e^{-\Lambda f} (z_2 - \tilde{z}_2)^{2m_2+2m_3-2j}.$$
(2.28)

We can now perform the integration to get

$$A^{(p_i,2m_i,q_i)} = \left(\frac{4E^2 \left(1-\tau\right)^3}{\tau}\right)^{N_2/2+m_2+m_3} \left(\frac{4E^2 \left(1-\tau\right)}{\tau}\right)^{N_3/2} \sum_{j=0}^{2m} j! C_j^{2m_2} C_j^{2m_3} \left[\frac{-\tau}{2E^2 \left(1-\tau\right)^3}\right]^j \\ \cdot \left(\frac{-1}{2M_2}\right)^{2m_2+q_2} \left(\frac{-1}{2M_3}\right)^{2m_3+q_3} \left(\frac{-2d}{df_0''}\right)^{m_2+m_3-j} \sqrt{\frac{2\pi}{f_0''}}.$$
(2.29)

After differentiation, we obtain

$$A^{(p_i,2m_i,q_i)} = \left(\frac{4E^2(1-\tau)^3}{\tau}\right)^{N_2/2+m_2+m_3} \left(\frac{4E^2(1-\tau)}{\tau}\right)^{N_3/2} \sum_{j=0}^{2m} j! C_j^{2m_2} C_j^{2m_3} \left[\frac{-\tau}{2E^2(1-\tau)^3}\right]^j$$

$$\cdot \left(\frac{-1}{2M_2}\right)^{2m_2+q_2} \left(\frac{-1}{2M_3}\right)^{2m_3+q_3} \sqrt{\frac{2\pi}{f_0''}} \frac{\left[2\left(m_2+m_3-j\right)\right]!}{2^{m_2+m_3-j}\left(m_2+m_3-j\right)!} \left(f_0''\right)^{-\left(m_2+m_3-j\right)}$$

$$= \sqrt{\frac{2\pi}{f_0''}} \left(\frac{4E^2\left(1-\tau\right)^3}{\tau}\right)^{N_2/2} \left(\frac{4E^2\left(1-\tau\right)}{\tau}\right)^{N_3/2} \left(\frac{-1}{2M_2}\right)^{2m_2+q_2} \left(\frac{-1}{2M_3}\right)^{2m_3+q_3}$$

$$\cdot \sum_{j=0}^{2m} j! C_j^{2m_2} C_j^{2m_3} \left(-2\right)^j \frac{\left[2\left(m_2+m_3-j\right)\right]!}{\left(m_2+m_3-j\right)!}.$$
(2.30)

Surprisingly, the summation in the last equation of Eq.(2.30) can be calculated to be

$$\sum_{j=0}^{2m} j! C_j^{2m_2} C_j^{2m_3} \left(-2\right)^j \frac{\left[2\left(m_2 + m_3 - j\right)\right]!}{(m_2 + m_3 - j)!} = \Gamma\left(m_2 + \frac{1}{2}\right) \Gamma\left(m_3 + \frac{1}{2}\right), \quad (2.31)$$

and finally the 4-point 2 tensor HSSA is

$$A^{(p_i,2m_i,q_i)} = \sqrt{\frac{2\pi}{f_0''}} \left(\frac{4E^2 (1-\tau)^3}{\tau}\right)^{N_2/2} \left(\frac{4E^2 (1-\tau)}{\tau}\right)^{N_3/2} \\ \cdot \left(\frac{-1}{2M_2}\right)^{2m_2+q_2} \left(\frac{-1}{2M_3}\right)^{2m_3+q_3} \Gamma\left(m_2 + \frac{1}{2}\right) \Gamma\left(m_3 + \frac{1}{2}\right) \\ = \sqrt{\frac{2\pi}{f_0''}} \left(\frac{4E^2 (1-\tau)^3}{\tau}\right)^{N_2/2} \left(\frac{4E^2 (1-\tau)}{\tau}\right)^{N_3/2} \\ \cdot \left[\left(\frac{1}{2}\right)^{m_2+q_2} \left(\frac{-1}{M_2}\right)^{2m_2+q_2} (2m_2 - 1)!!\right] \left[\left(\frac{1}{2}\right)^{m_3+q_3} \left(\frac{-1}{M_3}\right)^{2m_3+q_3} (2m_3 - 1)!!\right].$$

$$(2.32)$$

One can now easily calculate the ratio

$$\frac{A^{(\{p_2,p_3\},2m_2,2m_3,q_2,q_3)}}{A^{(\{N_1,N_2\},0,0)}} = \left[\left(\frac{1}{2}\right)^{m_2+q_2} \left(-\frac{1}{M_1}\right)^{q_2+2m_2} (2m_2-1)!! \right] \\ \cdot \left[\left(\frac{1}{2}\right)^{m_3+q_3} \left(-\frac{1}{M_2}\right)^{q_3+2m_3} (2m_3-1)!! \right], \quad (2.33)$$

which is consistent with the calculation of ZNS method in Eq.(2.2).

III. THE *n*-POINT TWO TENSOR *HSSA*

In this section, we calculate the general *n*-point HSSA with n-2 tachyons and 2 tensors of Eq.(2.1). For the cases of $n \ge 5$, one needs to consider scattering processes out of the scattering plane with *r*-dimensional transverse space. We begin with the case of HSSAwith n-1 tachyons and 1 tensor. The general high energy states at each fixed mass level $M^2 = 2(N-1)$ can be written as

$$|\{p_i\}, 2m, q\rangle = \left(\alpha_{-1}^{T_1}\right)^{N+p_1} \left(\alpha_{-1}^{T_2}\right)^{p_2} \cdots \left(\alpha_{-1}^{T_r}\right)^{p_r} \left(\alpha_{-1}^L\right)^{2m} \left(\alpha_{-2}^L\right)^q |0; k\rangle$$
(3.1)

where $\sum_{i=1}^{r} p_i = -2(m+q)$ with $r \le 24$.

One generalizes the transverse polarization $e^T = (0, 0, 1)$ to $e^{\hat{T}} = (0, 0, \vec{\omega})$ where

$$\omega_j = \cos \theta_j \prod_{\sigma=1}^{j-1} \sin \theta_\sigma, \text{ with } j = 1, \cdots, r, \ \theta_r = 0$$
(3.2)

are the solid angles in the transverse space spanned by r transverse directions e^{T_i} . For this case, the method of decoupling of ZNS leads to the ratios of n-point HSSA [1–3]

$$\frac{A^{(\{p_i\},2m,q)}}{A^{(\{0_i\},0,0)}} = \frac{(2m)!}{m!} \left(\frac{-1}{2M}\right)^{2m+q} \prod_{j=1}^r \omega_j^{p_j} \ (\# \text{ of kinematic variables dependence reduced !}).$$
(3.3)

These ratios are valid to all string loop orders, and for the string-tree level case, Eq.(3.3) can be rederived from the saddle-point calculation [1–3].

We are now ready to discuss the 2 tensor case. We first define

$$L_i = \frac{k_i}{M_i}, i = 1, 2.$$
(3.4)

For simplicity of the amplitude calculation, we choose to put 2 tensors at z_1 and z_2 . We consider 2 high energy states of Eq.(2.1) at vertex *i*

$$|2m_{i}\rangle = \prod_{j=1}^{r} \left(\alpha_{-1}^{T_{ij}}\right)^{p_{ij}} \left(\alpha_{-1}^{L_{i}}\right)^{2m_{i}} \left(\alpha_{-2}^{L_{i}}\right)^{q_{i}} |0,k\rangle$$
(3.5)

with the total mass level

$$N_i = \sum_{j=1}^r p_{ij} + 2m_i + 2q_i \tag{3.6}$$

where i = 1, 2 and $j = 1 \cdots r$.

The K_i vectors can be similarly defined as in the 4-point case in Eq.(2.16)

$$K_1 = \sum_{j \neq 1} \frac{-k_j}{z_j - z_1} = (K_1^{L_1}, K_1^{T_{11}}, K_1^{T_{12}}, \cdots, K_1^{T_{1r}}),$$
(3.7)

$$K_2 = \sum_{j \neq 2} \frac{-k_j}{z_j - z_2} = (K_2^{L_2}, K_2^{T_{21}}, K_2^{T_{22}}, \cdots, K_2^{T_{2r}}).$$
(3.8)

Since the longitudinal component $K_i^{L_i}$ vanishes at the saddle point as in Eq.(2.23), we can formally use two set of Eq.(3.2), ω_1^j and ω_2^j to parametrize the K vectors

$$\tilde{K}_i^{T_{ij}} = \left| \tilde{K}_i \right| \omega_i^j , \ i = 1, 2 \text{ and } j = 1 \cdots r.$$

$$(3.9)$$

We stress that not all kinematic variables of ω_1^j and ω_2^j are independent due to the various *K*-identities which put constraints on ω_i^j . We will discuss this issue in section IV.

For the kinematics of *n*-point amplitudes in the hard scattering limit, $p = E \rightarrow \infty$, we define the 26-dimensional momenta in the CM frame to be

$$k_{1} = (E, -E, 0^{r}),$$

$$k_{2} = (E, +E, 0^{r}),$$

$$k_{j} = (-q_{j}, -q_{j}\Omega_{1}^{j}, \dots - q_{j}\Omega_{25}^{j})$$
(3.10)

where $j = 3, 4, \cdots, n$, and

$$\Omega_i^j = \cos \phi_i^j \prod_{\sigma=1}^{i-1} \sin \phi_\sigma^j \text{ with } \phi_{j-1}^j = 0, \ \phi_{i>r}^j = 0 \text{ and } r \le \min\{n-3, 24\}$$
(3.11)

are the solid angles in the (j-2)-dimensional spherical space with $\sum_{i=1}^{j-2} (\Omega_i^j)^2 = 1$. In Eq.(3.10), 0^r denotes the *r*-dimensional null vector. The condition $\phi_{j-1}^j = 0$ in Eq.(3.11) was chosen to fix the frame by using the rotational symmetry. The independent kinematics variables can be chosen to be some φ_i^j and some fixed ratios of infinite q_j . See section IV for the example of n = 5.

The HSSA of *n*-point string scattering with 2 general tensors at z_2 and z_1 can be expressed as

$$A^{(\{p_{ij}\},2m_i,q_i)} = \int_0^1 dz_{n-2} \cdots \int_0^{z_4} dz_3 \int_0^{z_3} dz_2 \ ue^{-\Lambda f}$$
(3.12)

where

$$u = \left[\prod_{j=1}^{r} \left(K_{2}^{T_{2j}}\right)^{p_{2j}} \left(K_{1}^{T_{1j}}\right)^{p_{1j}}\right] \left(-\partial_{2}K_{2}^{L_{2}}\right)^{q_{2}} \left(-\partial_{1}K_{1}^{L_{1}}\right)^{q_{1}} \cdot \exp\left\{\sum_{j_{2}=1}^{2m_{2}} \left(K_{2}\right) \cdot \xi_{2,j_{2}} + \sum_{j_{1}=1}^{2m_{1}} \left(K_{1}\right) \cdot \xi_{1,j_{1}} + \sum_{j_{2}=1}^{2m_{2}} \sum_{j_{1}=1}^{2m_{1}} \left[\frac{\xi_{2,j_{2}} \cdot \xi_{1,j_{1}}}{\left(z_{1}-z_{2}\right)^{2}}\right]\right\}_{multilinear}.$$
 (3.13)

In the second line of the above equation, we can set $\xi_{2,k} = L_2, \xi_{1,k} = L_1$ and $m = \min(m_2, m_1)$ to obtain

$$u = (-1)^{q_1+q_2} \sum_{k=0}^{2m} \left[\prod_{j=1}^r \left(K_2^{T_{2j}} \right)^{p_{2j}} \left(K_1^{T_{1j}} \right)^{p_{1j}} \right] \left(\partial_2 K_2^{L_2} \right)^{q_2} \left(\partial_1 K_1^{L_1} \right)^{q_1} \cdot \left(K_2^{L_2} \right)^{2m_2-k} \left(K_1^{L_1} \right)^{2m_1-k} k! C_k^{2m_2} C_k^{2m_1} \left[\frac{k_{21}}{M_2 M_1 \left(z_1 - z_2 \right)^2} \right]^k = (-1)^{q_1+q_2} \sum_{k=0}^{2m} u_k.$$
(3.14)

Since $\tilde{K}_i^{L_i} = 0, \ i = 1, 2$ at the saddle-point, the leading order term in each term of the summation is

$$\partial_{2}^{2m_{2}+2m_{1}-2k}\tilde{u}_{k} = C_{2m_{1}-k}^{2m_{2}+2m_{1}-2k} \left[\prod_{j=1}^{r} \left(\tilde{K}_{2}^{T_{2j}} \right)^{p_{2j}} \left(\tilde{K}_{1}^{T_{1j}} \right)^{p_{1j}} \right] \left(\partial_{2}\tilde{K}_{2}^{L_{2}} \right)^{q_{2}+2m_{2}-k} \\ \left(\partial_{1}\tilde{K}_{1}^{L_{1}} \right)^{q_{1}} \left(\partial_{2}\tilde{K}_{1}^{L_{1}} \right)^{2m_{1}-k} (2m_{2}-k)! (2m_{1}-k)!k! C_{k}^{2m_{2}} C_{k}^{2m_{1}} \left[\frac{k_{21}}{M_{2}M_{1} \left(\tilde{z}_{1} - \tilde{z}_{2} \right)^{2}} \right]^{k}$$
(3.15)

where we have used

$$\partial^{n} (fg) = \sum_{k=0}^{n} C_{k}^{n} f^{k} g^{n-k}.$$
 (3.16)

The next important step is to apply the diagonal and the off-diagonal K-identities

$$\tilde{K}_i \tilde{K}_j + 2M_i \partial_j \tilde{K}_i^{L_i} = 0 \Rightarrow \begin{cases} \tilde{K}_i^2 + 2M_i \partial_i \tilde{K}_i^{L_i} = 0, \ i = j \\ \tilde{K}_i \tilde{K}_j + \frac{2k_{ij}}{(\tilde{z}_i - \tilde{z}_j)^2} = 0 \ i \neq j \end{cases}$$
(3.17)

to obtain

$$\partial_{2}^{2m_{2}+2m_{1}-2k}\tilde{u}_{k} = \left[\prod_{j=1}^{r} \left(\left|\tilde{K}_{2}\right|\omega_{2}^{j}\right)^{p_{2j}} \left(\left|\tilde{K}_{1}\right|\omega_{1}^{j}\right)^{p_{1j}}\right] \left(-\frac{\tilde{K}_{2}^{2}}{2M_{2}}\right)^{q_{2}+2m_{2}-k} \left(-\frac{\tilde{K}_{1}^{2}}{2M_{1}}\right)^{q_{1}} \left(-\frac{\tilde{K}_{2}\tilde{K}_{1}}{2M_{1}}\right)^{2m_{1}-k} (2m_{2}+2m_{1}-2k)!k!C_{k}^{2m_{2}}C_{k}^{2m_{1}} \left(-\frac{\tilde{K}_{2}\tilde{K}_{1}}{2M_{2}M_{1}}\right)^{k}.$$

$$(3.18)$$

One can now use

$$\tilde{K}_i^{T_{ij}} = \left| \tilde{K}_i \right| \omega_i^j, \tag{3.19}$$

$$N_i = \sum_{j=1}^r p_{ij} + 2m_i + 2q_i \text{ with } i = 1, 2 \text{ and } j = 1 \cdots r$$
 (3.20)

to get

$$\partial_{2}^{2m_{2}+2m_{1}-2k}\tilde{u}_{k} = \left[\prod_{j=1}^{r} \left(\left|\tilde{K}_{2}\right|\omega_{2}^{j}\right)^{p_{2j}} \left(\left|\tilde{K}_{1}\right|\omega_{1}^{j}\right)^{p_{1j}}\right] \left(-\frac{\tilde{K}_{2}^{2}}{2M_{2}}\right)^{q_{2}+2m_{2}} \cdot \left(-\frac{\tilde{K}_{1}^{2}}{2M_{1}}\right)^{q_{1}} \left(-\frac{\tilde{K}_{2}\tilde{K}_{1}}{2M_{1}}\right)^{2m_{1}} (2m_{2}+2m_{1}-2k)!k!C_{k}^{2m_{2}}C_{k}^{2m_{1}} \left(-\frac{\tilde{K}_{2}^{2}}{2}\right)^{-k} \right)^{q_{2}+2m_{2}} \left(3.21\right)$$

$$= \left[\prod_{j=1}^{r} \left(\omega_{2}^{j}\right)^{p_{2j}} \left(\omega_{1}^{j}\right)^{p_{1j}}\right] \tilde{K}_{2}^{N_{2}+2m_{2}+2m_{1}} \tilde{K}_{1}^{N_{1}} \left(-\frac{1}{2M_{2}}\right)^{q_{2}+2m_{2}} \left(-\frac{1}{2M_{1}}\right)^{q_{1}+2m_{1}} \cdot (2m_{2}+2m_{1}-2k)!k!C_{k}^{2m_{2}}C_{k}^{2m_{1}} \left(-\frac{\tilde{K}_{2}^{2}}{2}\right)^{-k} .$$

$$(3.22)$$

Finally, we can use the saddle-point method to evaluate the integral to obtain

$$A^{(\{p_{ij}\},2m_{i},q_{i}\}} \simeq \int dz^{n-3} \sum_{k=0}^{2m} \frac{(-1)^{q_{1}+q_{2}} \partial_{2}^{2m_{2}+2m_{1}-2k} \tilde{u}_{k}}{(2m_{2}+2m_{1}-2k)!} (z_{2}-\tilde{z}_{2})^{2m_{2}+2m_{1}-2k} e^{-\Lambda \tilde{f}}$$
$$\simeq e^{-\Lambda \tilde{f}} \sum_{k=0}^{2m} \frac{(-1)^{q_{1}+q_{2}} \partial_{2}^{2m_{2}+2m_{1}-2k} \tilde{u}_{k}}{(2m_{2}+2m_{1}-2k)!} \int_{0}^{1} dz_{2} (z_{2}-\tilde{z}_{2})^{2m_{2}+2m_{1}-2k} e^{-\frac{1}{4}\tilde{K}_{2}^{2}(z_{2}-\tilde{z}_{2})^{2}}$$
$$= e^{-\Lambda f_{0}} \sum_{k=0}^{2m} \frac{(-1)^{q_{1}+q_{2}} \partial_{2}^{2m_{2}+2m_{1}-2k} \tilde{u}_{k}}{(2m_{2}+2m_{1}-2k)!} \left(-4\frac{d}{d\tilde{K}_{2}^{2}}\right)^{m_{2}+m_{1}-k} \sqrt{\frac{4\pi}{\tilde{K}_{2}^{2}}}.$$
(3.23)

After doing differentiation and putting in Eq.(3.22), we obtain

$$A^{(\{p_{ij}\},2m_{i},q_{i})} = e^{-\Lambda f_{0}} \sum_{k=0}^{2m} \frac{(-1)^{q_{1}+q_{2}} \partial_{2}^{2m_{2}+2m_{1}-2k} \tilde{u}_{k}}{(2m_{2}+2m_{1}-2k)!} \sqrt{\frac{4\pi}{\tilde{K}_{2}^{2}}} \frac{(2m_{2}+2m_{1}-2k)!}{(m_{2}+m_{1}-k)!} \left(\tilde{K}_{2}^{2}\right)^{-(m_{2}+m_{1}-k)} = (-1)^{q_{1}+q_{2}} e^{-\Lambda f_{0}} \sqrt{\frac{4\pi}{\tilde{K}_{2}^{2}}} \tilde{K}_{2}^{N_{2}} \tilde{K}_{1}^{N_{1}} \left[\prod_{j=1}^{r} \left(\omega_{2}^{j}\right)^{p_{2j}} \left(\omega_{1}^{j}\right)^{p_{1j}}\right] \cdot \left(-\frac{1}{2M_{2}}\right)^{q_{2}+2m_{2}} \left(-\frac{1}{2M_{1}}\right)^{q_{1}+2m_{1}} \sum_{k=0}^{2m} k! C_{k}^{2m_{2}} C_{k}^{2m_{1}} \left(-2\right)^{k} \frac{[2(m_{2}+m_{1}-k)]!}{(m_{2}+m_{1}-k)!}.$$
(3.24)

We can now calculate the summation to get

$$A^{(\{p_{ij}\},2m_{i},q_{i})} = e^{-\Lambda f_{0}} \sqrt{\frac{4}{\pi \tilde{K}_{2}^{2}}} \tilde{K}_{2}^{N_{2}} \tilde{K}_{1}^{N_{1}} \left[\prod_{j=1}^{r} \left(\omega_{2}^{j} \right)^{p_{2j}} \left(\omega_{1}^{j} \right)^{p_{1j}} \right]$$

$$\cdot \left(\frac{1}{2} \right)^{q_{1}+q_{2}} \left(-\frac{1}{M_{2}} \right)^{q_{2}+2m_{2}} \left(-\frac{1}{M_{1}} \right)^{q_{1}+2m_{1}} \Gamma \left(m_{2} + \frac{1}{2} \right) \Gamma \left(m_{1} + \frac{1}{2} \right)$$

$$= e^{-\Lambda f_{0}} \sqrt{\frac{4\pi}{\tilde{K}_{2}^{2}}} \tilde{K}_{2}^{N_{2}} \tilde{K}_{1}^{N_{1}} \left[\left(\frac{1}{2} \right)^{m_{1}+q_{1}} \left(-\frac{1}{M_{1}} \right)^{q_{1}+2m_{1}} \left(2m_{1} - 1 \right) !! \prod_{j=1}^{r} \left(\omega_{1}^{j} \right)^{p_{1j}} \right]$$

$$\cdot \left[\left(\frac{1}{2} \right)^{m_{2}+q_{2}} \left(-\frac{1}{M_{2}} \right)^{q_{2}+2m_{2}} \left(2m_{2} - 1 \right) !! \prod_{j=1}^{r} \left(\omega_{2}^{j} \right)^{p_{2j}} \right]. \qquad (3.25)$$

At last, the ratio can be easily calculated to be

$$\frac{A^{(\{p_{1j}, p_{2j}\}, 2m_1, 2m_2, q_1, q_2)}}{A^{(\{N_1, N_2\}, 0, 0)}} = \left[\left(\frac{1}{2}\right)^{m_1 + q_1} \left(-\frac{1}{M_1}\right)^{q_1 + 2m_1} (2m_1 - 1)!! \prod_{j=1}^r \left(\omega_1^j\right)^{p_{1j}} \right] \\ \cdot \left[\left(\frac{1}{2}\right)^{m_2 + q_2} \left(-\frac{1}{M_2}\right)^{q_2 + 2m_2} (2m_2 - 1)!! \prod_{j=1}^r \left(\omega_2^j\right)^{p_{2j}} \right], \quad (3.26)$$

which is consistent with the calculation of ZNS method in Eq.(2.2).

IV. THE K-IDENTITIES AND THE DEGREE OF STRINGY SCALING

In the general *n*-point multi-tensor HSSA calculation, one key step is to introduce the diagonal and off-diagonal K-identities propsed in Eq.(3.17). The K-identities were originally proposed only for the diagonal ones for the calculation of *n*-point 1 tensor HSSA calculation [1–3]. They are the direct results of the identification of two different calculation of HSSA, namely, the saddle-point calculation and the decoupling of zero-norm state (ZNS) calculation [1–3].

We will show in this section that both diagonal and off-diagonal K-identities for the 4-point HSSA with 1 and 2 tensor can be analytically proved. For the 5-point HSSA calculation, although the saddle-point equation is quadratic and can be exactly solved, the explicit proof of the K-identities is too lengthy, and we will only prove them numerically. We have also used maple to numerically prove the K-identities for the 6-point HSSA. Presumably, these K-identities are direct results of conservation of momenta in the hard scattering limit at the saddle-point.

It is important to point out that the diagonal K-identities put constraints on the number of independent ω_i^j , and the off-diagonal K-identities put further constraints on the number of independent ω_i^j . So studying K-identities is crucial to calculate the degree of stringy scaling dim \mathcal{M}_k .

A. The *K*-identities

We begin our discussion of the K-identity with one example of 6-point 1 tensor HSSA calculation. For n = 6 and r = 3, the ratio of HSSA can be calculated by using saddle-point method to be [1–3]

$$\frac{A^{(p_1,p_2,p_3,2m,q)}}{A^{(N,0,0,0)}} = \frac{(2m)!}{m!} \left(\frac{-1}{2M}\right)^{2m+q} \frac{\left(\frac{\sum_{i\neq 2,n=6}\frac{k_i^{T_2}}{\bar{z}_i - \bar{z}_2}}{\sum_{i\neq 2,n=6}\frac{k_i^{T_1}}{\bar{z}_i - \bar{z}_2}}\right)^{p_2} \left(\frac{\sum_{i\neq 2,n=6}\frac{k_i^{T_3}}{\bar{z}_i - \bar{z}_2}}{\sum_{i\neq 2,n=6}\frac{k_i^{T_1}}{\bar{z}_i - \bar{z}_2}}\right)^{p_3}}{\left(\frac{\sum_{i\neq 2,n}\frac{k_i^{T_1}}{\bar{z}_i - \bar{z}_2}}{\sqrt{2K\tilde{f}_{22}}}\right)^{2m+2q}}.$$
(4.1)

On the other hand, the decoupling of ZNS method gives [1-3]

$$\frac{A^{(p_1,p_2,2m,q)}}{A^{(N,0,0,0)}} = \frac{(2m)!}{m!} \left(\frac{-1}{2M}\right)^{2m+q} \omega_1^{p_1} \omega_2^{p_2} \omega_3^{p_3} = \frac{(2m)!}{m!} \left(\frac{-1}{2M}\right)^{2m+q} \frac{(\tan\theta_1 \cos\theta_2)^{p_2} (\tan\theta_1 \sin\theta_2)^{p_3}}{(\cos\theta_1)^{2m+2q}}.$$
(4.2)

Eq.(??) and Eq.(4.2) can be identified for any p_2 , p_3 , m and q if

$$\sum_{i \neq 2, n=6} \frac{k_i^{T_1}}{\tilde{z}_i - \tilde{z}_2} = \sqrt{2\Lambda \tilde{f}_{22}} \cos \theta_1, \tag{4.3}$$

$$\frac{\sum_{i \neq 2, n=6} \frac{k_i^{T_1}}{\tilde{z}_i - \tilde{z}_2}}{\sum_{i \neq 2, n=6} \frac{k_i^{T_1}}{\tilde{z}_i - \tilde{z}_2}} = \sqrt{2\Lambda \tilde{f}_{22}} \tan \theta_1 \cos \theta_2, \tag{4.4}$$

$$\frac{\sum_{i \neq 2, n=6} \frac{k_i^{T_3}}{\tilde{z}_i - \tilde{z}_2}}{\sum_{i \neq 2, n=6} \frac{k_i^{T_1}}{\tilde{z}_i - \tilde{z}_2}} = \sqrt{2\Lambda \tilde{f}_{22}} \tan \theta_1 \sin \theta_2.$$
(4.5)

which allow us to formally express θ_1 and θ_2 defined in Eq.(3.2) in terms of kinematics variables defined in Eq.(3.10) as

$$\theta_1 = \arctan \frac{\sqrt{\left(\tilde{k}_{\perp}^{T_2}\right)^2 + \left(\tilde{k}_{\perp}^{T_3}\right)^2}}{\tilde{k}_{\perp}^{T_1}}, \ \theta_2 = \arctan \frac{\tilde{k}_{\perp}^{T_3}}{\tilde{k}_{\perp}^{T_2}}.$$
(4.6)

It is important to note from Eq.(??) that the ratios of 6-point HSSA with r = 3 depends only on 2 kinematics variables θ_1 and θ_2 instead of 8. We see that Eq.(4.3), Eq.(4.4) and Eq.(4.5) gives the K-identity

$$\tilde{K}_2^2 + 2M_2 \partial_2 \tilde{K}_2^{L_2} = 0 (4.7)$$

in Eq.(2.24) for the case of n = 6 and r = 3. We note that the K-identity puts 1 constraint on ω_1, ω_2 and ω_3 . Thus there are only r-1 = 3-1 = 2 angles θ_1 and θ_2 , and dim $\mathcal{M} = 8-2 = 6$.

For the second example of the K-identities, we consider n-point 2 tensor with general r HSSA calculated in section III. For this multi-tensor case, in addition to the diagonal K-identities, we proposed the off-diagonal K-identity

$$\tilde{K}_{i}\tilde{K}_{j} + 2M_{i}\partial_{j}\tilde{K}_{i}^{L_{i}} = 0 \Rightarrow \begin{cases} \tilde{K}_{i}^{2} + 2M_{i}\partial_{i}\tilde{K}_{i}^{L_{i}} = 0, \ i = 1, 2, \\ \tilde{K}_{1}\tilde{K}_{2} + \frac{2k_{12}}{(\tilde{z}_{1} - \tilde{z}_{2})^{2}} = 0 \end{cases}$$
(4.8)

in Eq.(3.17). The diagonal and off-diagonal K-identities proposed for the calculation of 2 tensor HSSA are generalization of the diagonal K-identity proposed for the calculation of 1 tensor HSSA. They are the key step to obtain the consistent multi-tensor HSSA in the saddle-point calculation.

B. The degree of stringy scaling

For the general *n*-point 1 tensor HSSA, it was shown that [1-3]

$$\dim \mathcal{M}_1 = \frac{(r+1)(2n-r-6)}{2}.$$
 (4.9)

For a given (n, r), we have [1-3]

$\dim \mathcal{M}_1$	r = 1	r = 2	r = 3	r = 4
n = 4	1			
n = 5	3	3		
n = 6	5	6	6	
n = 7	7	9	10	10

For the general *n*-point 2 tensor *HSSA*, the off-diagonal *K*-identity in Eq.(3.17) puts 1 further constraint except for the cases of r = 1 which contain only trivial $\omega_1^1 = \omega_2^1 = 1$ according to Eq.(3.2). We thus have

$$\dim M_2 = \frac{(r+1)(2n-r-6)}{2} - (r-1) + (1-\delta_{r1})$$
$$= \dim M_1 - (r-1) + (1-\delta_{r1})$$
(4.10)

where $\max r = \min (n - 3, 24)$. The (r - 1) factor in Eq.(4.10) is the number of angles of ω_2^j , $j = 1, 2, \dots, r$, and $(1 - \delta_{r1})$ factor is the effect of the off-diagonal K-identity.

For a given (n, r), we have

${\rm dim}\mathcal{M}_2$	r = 1	r = 2	r = 3	r = 4
n = 4	1			
n = 5	3	3		
n = 6	5	6	5	
n = 7	7	9	9	8

We note that for r = 1, 2, dim $\mathcal{M}_2 = \dim \mathcal{M}_1$. For $r \ge 3$, dim $\mathcal{M}_2 = \dim \mathcal{M}_1 - r + 2$. It is interesting to see that the off-diagonal K-identity contributes to the degree of scaling dim \mathcal{M}_2 for HSSA out of the scattering plane with $r \ge 2$. We see that for HSSA with more than 2 transverse directions or $r \ge 3$, the degree of scaling dim \mathcal{M}_2 decreases as one would have expected.

On the other hand, for a consistent check, for the case of r = 24 and $n \ge 27$, one can show that dim $\mathcal{M}_2 \ge 0$. For the case of r = n - 3 and $n \le 27$, we also have the consistent result

dim
$$\mathcal{M}_2 = \frac{(n-2)(n-3)}{2} - (n-3) + (2-\delta_{r1})$$

= $\left(\frac{n}{2} - 2\right)(n-3) + (2-\delta_{r1}) \ge 0.$ (4.11)

For the general *n*-point *k* tensor *HSSA*, it will be a challenge to calculate dim \mathcal{M}_k . It is conjectured that for general higher *k* tensor *HSSA* calculation ($k \leq n$), the off-diaganal *K*-identities similar to Eq.(3.17) are crucial to show the consistent result that dim $\mathcal{M}_k \geq 0$.

C. Checking the *K*-identities

In this subsection, we will explicitly prove the K-identities of HSSA for the 4-point 1 and 2 tensor cases. We will also discuss K-identities of some higher point HSSA. We begin with the 4-point kinematics in the hard scattering limit

$$k_{1} = (E, -E, 0),$$

$$k_{2} = (E, +E, 0),$$

$$k_{3} = (-E, -E\cos\phi, -E\sin\phi),$$

$$k_{4} = (-E, E\cos\phi, E\sin\phi),$$
(4.12)

which can be used to calculate

$$k_1 \cdot k_2 = -2E^2, \quad k_2 \cdot k_3 = 2E^2\tau, \quad k_1 \cdot k_3 = 2E^2(1-\tau).$$
 (4.13)

For the 4-point case, the saddle-point equation is linear, and the saddle-point can be easily solved to be

$$\tau = \sin^2 \frac{\phi}{2}, \ \tilde{x}_2 = \frac{1}{1 - \tau}.$$
 (4.14)

For the 4-point 1 tensor case, we want to show that

$$\tilde{K}_2^2 + 2M_2 \partial_2 \tilde{K}_2^{L_2} = 0 (4.15)$$

where

$$K_2(z_2) = \frac{k_1}{z_2} - \frac{k_3}{1 - z_2}.$$
(4.16)

In the hard scattering limit

$$\tilde{K}_{2} = (1 - \tau) \left(k_{1} + \frac{k_{3}}{\tau} \right),$$

$$\tilde{K}_{2}^{2} = (1 - \tau)^{2} \left(k_{1}^{2} + \frac{k_{3}^{2}}{\tau^{2}} + 2\frac{k_{1} \cdot k_{3}}{\tau} \right) = (1 - \tau)^{2} \left(0 + \frac{0}{\tau^{2}} + \frac{4E^{2} (1 - \tau)}{\tau} \right)$$

$$= 4E^{2} \frac{(1 - \tau)^{3}}{\tau}.$$

$$(4.17)$$

On the other hand

$$\partial_2 K_2(z_2) = -\frac{k_1}{z_2^2} - \frac{k_3}{(1-z_2)^2},\tag{4.19}$$

 \mathbf{SO}

$$\partial_2 \tilde{K}_2 = -(1-\tau)^2 \left(k_1 + \frac{k_3}{\tau^2}\right)$$
(4.20)

and

$$\partial_2 \tilde{K}_2^{L_2} = -(1-\tau)^2 \left(k_1 + \frac{k_3}{\tau^2}\right) \cdot \frac{k_2}{M_2}$$
$$= -2E^2 \frac{(1-\tau)^3}{\tau} \frac{1}{M_2}.$$
(4.21)

The K-identity in Eq.(4.15) is thus proved.

For the 4-point 2 tensor cases, we define

$$K_1(z_2) = -\frac{k_2}{z_2 - z_1} - \frac{k_3}{z_3 - z_1}, \quad K_2(z_2) = -\frac{k_1}{z_1 - z_2} - \frac{k_3}{z_3 - z_2}.$$
 (4.22)

It is straightforward to calculate

$$\frac{\tilde{K}_{1}}{-k_{2}\left(1-\tau\right)-k_{3}}\frac{\tilde{K}_{2}}{\left(k_{1}+\frac{k_{3}}{\tau}\right)\left(1-\tau\right)} \\
\frac{\tilde{\partial}_{1}-k_{2}\left(1-\tau\right)^{2}-k_{3}k_{1}\left(1-\tau\right)^{2}}{\tilde{\partial}_{2}k_{2}\left(1-\tau\right)^{2}-\left(k_{1}+\frac{k_{3}}{\tau^{2}}\right)\left(1-\tau\right)^{2}}$$
(4.23)

and

$$\frac{\tilde{K}_{1}^{L_{1}}}{0} \frac{\tilde{K}_{2}^{L_{2}}}{0} \\
\frac{\partial_{1} \frac{-2E^{2}}{M_{1}} (1-\tau) \tau}{2E^{2} (1-\tau)^{2}} \\
\frac{\partial_{2} - \frac{2E^{2}}{M_{1}} (1-\tau)^{2} - (k_{1} + \frac{k_{3}}{\tau^{2}}) (1-\tau)^{2}}{2E^{2} (1-\tau)^{2}}.$$
(4.24)

One can now check the diagonal $K\mbox{-}\mbox{identities}$

$$\begin{aligned} \left| \tilde{K}_{1} \right| \left| \tilde{K}_{1} \right| + 2M_{1}\partial_{1}\tilde{K}_{1}^{L_{1}} &= \left| \tilde{K}_{1} \right|^{2} + 2M_{1}\partial_{1}\tilde{K}_{1}^{L_{1}} \\ &= \left(-k_{2}\left(1 - \tau \right) - k_{3} \right)^{2} + 2M_{1}\left(-k_{2}\left(1 - \tau \right)^{2} - k_{3} \right) \cdot \frac{k_{1}}{M_{1}} \\ \tilde{K}_{2}^{2} \cdot k_{3}\left(1 - \tau \right) - 2\left(k_{1} \cdot k_{2}\left(1 - \tau \right)^{2} + k_{1} \cdot k_{3} \right) \\ &= 4E^{2}\tau\left(1 - \tau \right) - 2\left(-2E^{2}\left(1 - \tau \right)^{2} + 2E^{2}\left(1 - \tau \right) \right) = 0 \end{aligned}$$
(4.25)

and

$$\begin{aligned} \left| \tilde{K}_{2} \right| \left| \tilde{K}_{2} \right| + 2M_{2}\partial_{2}\tilde{K}_{2}^{L_{2}} &= \tilde{K}_{2}^{2} + 2M_{2}\partial_{2}\tilde{K}_{2}^{L_{2}} \\ &= \left(k_{1} + \frac{k_{3}}{\tau} \right)^{2} (1 - \tau)^{2} - 2M_{2} \left(k_{1} + \frac{k_{3}}{\tau^{2}} \right) \cdot \frac{k_{2}}{M_{2}} (1 - \tau)^{2} \\ \tilde{K}_{1} \cdot k_{3} \frac{(1 - \tau)^{2}}{\tau} - 2k_{1} \cdot k_{2} (1 - \tau)^{2} - 2k_{2} \cdot k_{3} \frac{(1 - \tau)^{2}}{\tau^{2}} \\ &= (1 - \tau)^{2} \left[\frac{4E^{2} (1 - \tau)}{\tau} + 4E^{2} - \frac{4E^{2}\tau}{\tau^{2}} \right] = 0. \end{aligned}$$
(4.26)

Similarly, the off-diagonal K-identity is

$$\begin{aligned} \left| \tilde{K}_{1} \right| \left| \tilde{K}_{2} \right| + 2M_{1}\partial_{2}\tilde{K}_{1}^{L_{1}} &= \left| \tilde{K}_{2} \right| \left| \tilde{K}_{1} \right| + 2M_{2}\partial_{1}\tilde{K}_{2}^{L_{2}} \\ &= \sqrt{\left(-k_{2}\left(1 - \tau \right) - k_{3} \right)^{2}} \sqrt{\left(\left(k_{1} + \frac{k_{3}}{\tau} \right) \left(1 - \tau \right) \right)^{2}} + 2M_{1}\left(1 - \tau \right)^{2} \frac{k_{2} \cdot k_{1}}{M_{1}} \\ &\tilde{k}_{1} - \sqrt{2k_{2} \cdot k_{3}\left(1 - \tau \right)} \sqrt{2k_{1} \cdot k_{3} \frac{\left(1 - \tau \right)^{2}}{\tau}} + 2\left(1 - \tau \right)^{2} k_{1} \cdot k_{2} \\ &= \sqrt{4E^{2}\tau \left(1 - \tau \right)} \sqrt{4E^{2} \left(1 - \tau \right) \frac{\left(1 - \tau \right)^{2}}{\tau}} - 4E^{2} \left(1 - \tau \right)^{2} = 0. \end{aligned}$$
(4.27)

We now turn to discuss the 5-point K-identities. The 5-point kinematics can be written as

$$k_{1} = \left(\sqrt{p^{2} + M_{1}^{2}}, -p, 0, 0\right),$$

$$k_{2} = \left(\sqrt{p^{2} + M_{2}^{2}}, p, 0, 0\right),$$

$$k_{3} = \left(-\sqrt{q_{3}^{2} + M_{3}^{2}}, -q_{3}\cos\phi_{32}, -q_{3}\sin\phi_{32}, 0\right),$$

$$k_{4} = \left(-\sqrt{q_{4}^{2} + M_{4}^{2}}, -q_{4}\cos\phi_{42}, -q_{4}\sin\phi_{42}\cos\phi_{43}, -q_{4}\sin\phi_{42}\sin\phi_{43}\right),$$

$$k_{5} = \left(-\sqrt{q_{5}^{2} + M_{5}^{2}}, -q_{5}\cos\phi_{52}, -q_{5}\sin\phi_{52}\cos\phi_{53}, -q_{5}\sin\phi_{52}\sin\phi_{53}\right).$$
(4.28)

The energy-momentum conservation laws imply

$$\sqrt{p^2 + M_1^2} + \sqrt{p^2 + M_2^2} = \sqrt{q_3^2 + M_3^2} + \sqrt{q_4^2 + M_4^2} + \sqrt{q_5^2 + M_5^2},$$

$$0 = q_3 \cos \phi_{32} + q_4 \cos \phi_{42} + q_5 \cos \phi_{52},$$

$$0 = q_3 \sin \phi_{32} + q_4 \sin \phi_{42} \cos \phi_{43} + q_5 \sin \phi_{52} \cos \phi_{53},$$

$$0 = 0 + q_4 \sin \phi_{42} \sin \phi_{43} + q_5 \sin \phi_{52} \sin \phi_{53}.$$

(4.29)

The energy conservation gives

$$2p + \left(\frac{M_1^2}{2p} + \frac{M_2^2}{2p}\right) + \dots = q_3 + q_4 + q_5 + \left(\frac{M_3^2}{2q_3} + \frac{M_4^2}{2q_4} + \frac{M_5^2}{2q_5}\right) + \dots,$$
(4.30)

which in the hard scattering limit means

$$2p = q_3 + q_4 + q_5. \tag{4.31}$$

We assume

$$q_3: q_4: q_5 = 1: r_1: r_2 \tag{4.32}$$

to get

$$q_3 = \frac{2E}{1+r_1+r_2}, q_4 = \frac{2Er_1}{1+r_1+r_2}, q_5 = \frac{2Er_2}{1+r_1+r_2}.$$
(4.33)

On the other hand, the momentum conservation laws become

$$0 = \cos \phi_{32} + r_1 \cos \phi_{42} + r_2 \cos \phi_{52},$$

$$0 = \sin \phi_{32} + r_1 \sin \phi_{42} \cos \phi_{43} + r_2 \sin \phi_{52} \cos \phi_{53},$$

$$0 = r_1 \sin \phi_{42} \sin \phi_{43} + r_2 \sin \phi_{52} \sin \phi_{53},$$

(4.34)

which can be used to solve r_2 , ϕ_{53} and ϕ_{52} . They are

$$r_{2}(\phi_{32},\phi_{42},\phi_{43},r_{1}) = \sqrt{\left(\cos\phi_{32} + r_{1}\cos\phi_{42}\right)^{2} + \left(\sin\phi_{32} + r_{1}\sin\phi_{42}\cos\phi_{43}\right)^{2} + \left(r_{1}\sin\phi_{42}\sin\phi_{43}\right)^{2}},$$

= $\sqrt{1 + r_{1}^{2} + 2r_{1}\left(\cos\phi_{32}\cos\phi_{42} + \sin\phi_{32}\sin\phi_{42}\cos\phi_{43}\right)},$ (4.35)

$$\phi_{53} (\phi_{32}, \phi_{42}, \phi_{43}, r_1) = \arctan\left(\frac{r_1 \sin \phi_{42} \sin \phi_{43}}{\sin \phi_{32} + r_1 \sin \phi_{42} \cos \phi_{43}}\right)$$
(4.36)

and

$$\phi_{52}(\phi_{32},\phi_{42},\phi_{43},r_1) \tag{4.37}$$

$$= \arctan\left(\pm\sqrt{\frac{\left(r_{1}\sin\phi_{42}\sin\phi_{43}\right)^{2} + \left(\sin\phi_{32} + r_{1}\sin\phi_{42}\cos\phi_{43}\right)^{2}}{\left(\cos\phi_{32} + r_{1}\cos\phi_{42}\right)^{2}}}\right).$$
 (4.38)

Now, all parameters can be express in terms of the following 5 ones

$$E, \phi_{32}, \phi_{42}, \phi_{43}, r_1. \tag{4.39}$$

The 5-point kinematics in the hard scattering limit can thus be written as

$$k_{1} = (E, -E, 0, 0),$$

$$k_{2} = (E, E, 0, 0),$$

$$k_{3} = (-q_{3}, -q_{3} \cos \phi_{32}, -q_{3} \sin \phi_{32}, 0),$$

$$k_{4} = (-q_{4}, -q_{4} \cos \phi_{42}, -q_{4} \sin \phi_{42} \cos \phi_{43}, -q_{4} \sin \phi_{42} \sin \phi_{43}),$$

$$k_{5} = (-q_{5}, -q_{5} \cos \phi_{52}, -q_{5} \sin \phi_{52} \cos \phi_{53}, -q_{5} \sin \phi_{52} \sin \phi_{53}),$$
(4.40)

which can be used to calculate in the hard scattering limit

$$k_{12} = -2E^{2},$$

$$k_{13} = \frac{2E^{2}}{1+r_{1}+r_{2}} \left(1+\cos\phi_{32}\right),$$

$$k_{23} = \frac{2E^{2}}{1+r_{1}+r_{2}} \left(1-\cos\phi_{32}\right),$$

$$k_{24} = \frac{2E^{2}r_{1}}{1+r_{1}+r_{2}} \left(1-\cos\phi_{42}\right),$$

$$k_{34} = \frac{4E^{2}r_{1}r_{2}}{\left(1+r_{1}+r_{2}\right)^{2}} \left(-1+\cos\phi_{32}\cos\phi_{42}+\sin\phi_{32}\sin\phi_{42}\cos\phi_{43}\right).$$
(4.41)

We are now ready to discuss the 5-point K-identities. We first discuss 5-point 1 tensor K-identity. The saddle-point equation are

$$\frac{\partial f\left(z_2, z_3\right)}{\partial z_2} = 0, \tag{4.42}$$

$$\frac{\partial f\left(z_2, z_3\right)}{\partial z_3} = 0, \tag{4.43}$$

which can be expanded as

$$\frac{1}{z_2} + \frac{k_{23}}{k_{12}} \frac{1}{z_2 - z_3} + \frac{k_{24}}{k_{12}} \frac{1}{z_2 - 1} = 0, \qquad (4.44)$$

$$\frac{k_{13}}{k_{12}}\frac{1}{z_3} + \frac{k_{23}}{k_{12}}\frac{1}{z_3 - z_2} + \frac{k_{34}}{k_{12}}\frac{1}{z_3 - 1} = 0.$$
(4.45)

After some lengthy calculation, we end up with two quadratic equations for z_2 and z_3

$$(k_{12} + k_{24} + k_{23}) (k_{12} + k_{13} + k_{23} + k_{24} + k_{34}) z_2^2 - [(k_{12} + k_{13} + k_{24} + k_{23} + k_{34})k_{12} + (k_{12} + k_{24} + k_{23})(k_{12} + k_{23} + k_{13}) + k_{23}k_{34}] z_2 + (k_{12} + k_{23} + k_{13})k_{12} = 0, (4.46)$$

$$(k_{13} + k_{34} + k_{23}) (k_{12} + k_{13} + k_{23} + k_{24} + k_{34}) z_3^2$$

- [(k₁₂ + k₁₃ + k₂₄ + k₂₃ + k₃₄) k₁₃ + (k₁₃ + k₃₄ + k₂₃) (k₁₃ + k₂₃ + k₁₂) + k₂₃k₂₄] z₃
+ (k₁₂ + k₂₃ + k₁₃) k₁₃ = 0.
(4.47)

Although the saddle-point equation is exactly solvable, it turns out to be too lengthy to explicitly calculate it. We have instead successfully used maple to check the 5-point 1 and 2

tensor diagonal K-identities. The 5-point 2 tensor off-diagonal K-identity can be similarly checked within the error range. In addition, we have also numerically checked the validity of 6-point 1 tensor diagonal K-identity.

V. CONCLUSION

In this paper, we use the saddle-point method to calculate *n*-point HSSA with n-2 tachyons and 2 tensor states at arbitrary mass levels. During the multi-tensor saddle-point calculation, one encounters the naive energy order problem, and it turns out that one has to include contraction terms from $\partial_2 X_2 \cdots$ and $\partial_3 X_3 \cdots$ in order to achieve the consistent ratios calculated by the method of decoupling of ZNS in Eq.(2.3).

More importantly, we discover the stringy scaling [19] behavior of these HSSA. For HSSA with r = 1,2, we found that $\dim \mathcal{M}_2 = \dim \mathcal{M}_1$. However, for HSSA with more than 2 transverse directions or $r \geq 3$, we found that the degree of stringy scaling $\dim \mathcal{M}_2$ decreases comparing to the degree of scaling $\dim \mathcal{M}_1$ of the n - 1 tachyons and 1 tensor HSSA calculated previously.

In the saddle-point calculation of the multi-tensor HSSA, we propose a set of diagonal and off-diagonal K-identities which is the key to demonstrate the stringy scaling behavior of HSSA. We explicitly prove both the diagonal and off-diagonal K-identities for the 4-point HSSA and give a numerical proof of these K-identities for the higher point HSSA.

For the general *n*-point *k* tensor *HSSA*, we expect that there exist more types of *K*identities, and it will be a challenge to calculate the degree of stringy scaling dim \mathcal{M}_k . It is conjectured that for general higher *k* tensor *HSSA* calculation ($k \leq n$), the off-diaganal *K*-identities similar to Eq.(3.17) are crucial to show the consistent result that dim $\mathcal{M}_k \geq 0$.
