Abstract

Achaete-scute complex homolog 2 (ASCL2) codes a part of the basic helix-loop-helix (BHLH) transcription factor family. WNTs have been found to directly affect the stemness of the tumor cells via regulation of ASCL2. Switching off the ASCL2 literally blocks the stemness process of the tumor cells and vice versa. In colorectal cancer (CRC) cells treated with ETC-1922159, ASCL2 was found to be down regulated along with other genes. A recently developed search engine ranked combinations of ASCL2-X (X, a particular gene/protein) at 2nd order level after drug administration. Some rankings confirm the already tested combinations, while others point to those that are untested/unexplored. These rankings reveal which ASCL2-X combinations might be working synergistically in CRC. In this research work, I cover combinations of ASCL2 with WNT, transforming growth factor β (TGF β), interleukin (IL), leucine rich repeat containing G protein-coupled receptor (LGR), NOTCH, solute carrier family (SLC), SRY-box transcription factor (SOX), small nucleolar RNA host gene (SNHG), KIAA, F-box protein (FBXO), family with sequence similarity (FAM), B cell CLL/lymphoma (BCL), autophagy related (ATG) and Rho GTPase activating protein (ARHGAP) family.

Keywords: ASCL2, Porcupine inhibitor ETC-1922159, Sensitivity analysis, Colorectal cancer.

1. Introduction

1.1. Stemness and intestine

Stemness is a property by which the cells proliferate, regenerate, sustain, propagation. It is the property by which the cells are known to maintain distinctive aspects over their lineage. Stemness is a property that is observed in both normal and cancer stem cells.

¹Aspects of unpublished work were presented in a poster session at (1) the recently concluded first ever Wnt Gordon Conference, from 6-11 August 2017, held in Stowe, VT 05672, USA.

Cancer stem cells show high self renewal, redundancy in self renewed pathways leading to pathological conditions, genomic instability due to altered DNA repair factors and epithelial mesenchymal transition as a measure of plasticity. Aponte and Caicedo [1] review the stemness in cancer cells in great detail.

The human intestine is broadly divided into small and large intestine for identification and study. The epithelium of the small intestine is composed of an array of villus and crypts (mountains and valleys for the uninitiated). The crypts are also termed as crypt of Lieberkuhn after his study of the intestine in this PhD thesis Lieberkuhn [2]. The large intestine or the colon, however does not contain the villi. The multiple types of cells available in the intestinal glands at the villus are : enterocytes for absorbing water and electrolytes, goblet cells for secreting mucus, enteroendocrine cells for secreting hormones, cup cells, tuft cells and at the crypt of the gland are : paneth cells for secreting anti-microbial peptides for maintenance of gastrointestinal tract and stem cells. These cells are not all present in the colon. The description of the functioning of the cells along the longitudinal axis from the histological perspective of the intestine has been explained elaborately in Potten et al. [3], Barker et al. [4], Clevers [5] and Noah et al. [6]. Briefly, the stem cells help in the production of the transit population of the progenitor cells that differentiate as they move towards the villus. Once the cells are committed for differentiation, they no longer have the property of stem cells.

The Wnt pathway is implicated in the control of stemness and cell fate in the intestine. A family of the WNT proteins, WNT10B, might be playing a crucial role in stemness. This is further confirmed by wet lab experiments in Reddy et al. [7], which show BVES deletion results in amplified stem cell activity and Wnt signaling after radiation. WNT10B has also been implicated in colorectal cancer Yoshikawa et al. [8].

1.2. Achaete-scute like 2 (ASCL2)

ASCL2 belongs to a family of ASCL genes that contain basic and helix-loop-helix domains in a conserved family of transcriptional regulators. ASCL2 is known to be genomically imprinted at the cluster location of chromosome 11p15.5. Genomic imprinting is the reversible epigenetic silencing of the parental specific inherited genes Schwienbacher et al. [9]. ASCL2 has been found to be maternally expressed and Miyamoto et al. [10] show the expression patterns of the human ASCL2 in the fetus at a stage between first and second trimesters and in the placental tissues. In addition, they demonstrate that the ASCL2 escapes genomic imprinting during the mentioned stages. In colorectal cancer, loss of this genomic imprinting (i.e silencing) has been found to cause overexpression of ASCL2 Cui et al. [11] & Stange et al. [12]. In intestinal neoplasia, ASCL2 is found to be a target of Wnt signaling Jubb et al. [13]. Jubb et al. [13] report that multiple strategies have been chosen to repress the Wnt signaling pathway and found that expression of ASCL2 was repressed. Also, ASCL2 was found not to be imprinted in neoplasia and knockdown of ASCL2 led to cell cycle (G2/M) arrest which affects the expression of Survivin and cdc25b, which are both found to be highly expressed in colorectal cancer. Jubb et al. [13] further show that ASCL2 expression controls G2/M checkpoint and promotes proliferation by initiating the transcriptional regulation of Survivin and cdc25b which are targets of Wnt signaling. This is further supported by ASCL2 knockdown experiments in Zhu et al. [14].

1.3. Combinatorial search problem and a possible solution

In a recently published work Sinha [15], a frame work of a search engine was developed which can rank combinations of factors (genes/proteins) in a signaling pathway. Readers are requested to go through the adaptation of the above mentioned work for gaining deeper insight into the working of the pipeline and its use of published data set generated after administration of ETC-1922159, Sinha [16]. The work uses SVM package by Joachims [17] in https://www.cs.cornell.edu/people/tj/svm_light/svm_rank.html. I use the adaptation to rank 2^{nd} order gene combinations.

2. Results & Discussion

2.1. ASCL2 related synergies

2.2. ASCL2 - WNT10B

ASCL2 has been found to play a major role in stemness in colon crypts and is implicated in colon cancer Zhu et al. [18]. Switching off the ASCL2 leads to a literal blockage of the stemness process and vice versa. At the downstream level, ASCL2 is regulated by TCF4/ β -catenin via non-coding RNA target named WnTRLINC1 Giakountis et al. [19]. Activation of ASCL2 leads to feedforward transcription of the non-coding RNA and thus a loop is formed which helps in the stemness and is highly effective in colon cancer. At the upstream level, ASCL2 is known act as a WNT/RSPONDIN switch that controls the stemness Schuijers et al. [20]. It has been shown that removal of RSPO1 lead to decrease in the Wnt signaling due to removal of the FZD receptors that led to reduced expression of ASCL2. Also, low levels of LGR5 were observed due to this phenomena. The opposite happened by increasing the RSPO1 levels. After the drug treatment, it was found that ASCL2 was highly suppressed pointing to the inhibition of stemness in the colorectal cancer cells. Also, Schuijers et al. [20] show that by genetically disrupting PORCN or inducing a PORCN inhibitor (like IWP-2), there is loss of stem cell markers like LGR5 and RNF43, which lead to disappearance of stem cells and moribund state of mice. A similar affect can be found with ETC-1922159, where there is suppression of RNF43 and LGR5 that lead to inhibition of the Wnt pathway and thus the ASCL2 regulation. These wet lab evidences are confirmed in the relatively low ranking of the combination ASCL2-RNF43 via the inhibition of PORCN-WNT that leads to blocking of the stemness that is induced by ASCL2. Since ASCL2 is directly mediated by the WNT proteins, the recorded ASCL2-WNT10B combination showed low priority ranking of 497, 321 and 488 for laplace, linear and rbf kernels, respectively, thus indicating a possible connection between WNT10B and ASCL2 activation (data not shown in tabular format).

2.2.1. ASCL2 - TGFB

Zhang et al. [21] showed that overexpression of ASCL2 increased TGFB levels thus stimulating local cancer associated fibroblasts activation. This induced an immune-excluded microenvironment. In colorectal cancer cells treated with ETC-1922159,

TGFB family and ASCL2, were found to be down regulated and recorded independently. I was able to rank 2nd order combination of TGFB family and ASCL2, that were down regulated.

Table 1 shows rankings of these combinations. Followed by this is the unexplored combinatorial hypotheses in table 2 generated from analysis of the ranks in table 1. The table 1 shows rankings of TGFB family w.r.t ASCL2. TGFBR3 - ASCL2 shows low ranking of 819 (laplace), 1072 (linear) and 1170 (rbf). These rankings point to the synergy existing between the two components, which have been down regulated after the drug treatment. Further, TGFB1 and TGFBRAP1 showed high ranking and might not be synergistically working with ASCL2, before treatment.

RANKING TGFB FAMILY VS ASCL2			
RANKING OF TGFB FAMILY W.R.T ASCL2			
	laplace	linear	rbf
TGFBR3 - ASCL2	819	1072	1170

TGFB family w.r.t ASCL2	
TGFB-R3	ASCL2

Table 2: 2nd order combinatorial hypotheses between ASCL2 and TGFB family members.

2.2.2. ASCL2 - IL

Evaluation of ASCL2 bound promoters by Murata et al. [22] in regenerating cells, showed that interleukin-11 receptor gene IL-11RA1 as a transcriptional target, and respective organoid cultures demonstrated IL-11 activity in intestinal stem cell regeneration. In colorectal cancer cells treated with ETC-1922159, IL family and ASCL2, were found to be down regulated and recorded independently. I was able to rank 2nd order combination of IL family and ASCL2, that were down regulated.

Table 3 shows rankings of these combinations. Followed by this is the unexplored combinatorial hypotheses in table 4 generated from analysis of the ranks in table 3. The table 3 shows rankings of IL family w.r.t ASCL2. IL17D - ASCL2 shows low ranking of 279 (laplace), 805 (linear) and 1318 (rbf). IL17RB - ASCL2 shows low ranking of 519 (laplace), 609 (linear) and 1026 (rbf). IL33 - ASCL2 shows low ranking of 754 (laplace), 417 (linear) and 119 (rbf). IL1RL2 - ASCL2 shows low ranking of 1342 (laplace) and 1563 (rbf). ILF3 - ASCL2 shows low ranking of 1397 (laplace) and 1421 (linear). These rankings point to the synergy existing between the two components, which have been down regulated after the drug treatment. Further, ILF3-AS1, IL17RD and ILF2 showed high ranking and might not be synergistically working with ASCL2, before treatment.

RANKING IL FAMILY VS ASCL2			
RANKING OF IL FAMILY W.R.T ASCL2

One can also interpret the results of the table 3 graphically, with the following influences - • IL family w.r.t ASCL2 with ASCL2 – > IL-17DR3/17RB/33/1RL2/F3.

2.2.3. ASCL2 - LGR

In gastric cancer, Kwon et al. [23] show that ASCL2 upregulates LGR5 expression at transcriptional level. In colorectal cancer cells treated with ETC-1922159, LGR family and ASCL2, were found to be down regulated and recorded independently. I was able to rank 2nd order combination of LGR family and ASCL2, that were down regulated.

Table 5 shows rankings of these combinations. Followed by this is the unexplored combinatorial hypotheses in table 6 generated from analysis of the ranks in table 5.

with ETC-1922159, NOTCH family and ASCL2, were found to be down regulated and recorded independently. I was able to rank 2nd order combination of NOTCH family and ASCL2, that were down regulated.

Table 7 shows rankings of these combinations. Followed by this is the unexplored combinatorial hypotheses in table 8 generated from analysis of the ranks in table 7. The table 7 shows rankings of NOTCH family w.r.t ASCL2. NOTCH1 - ASCL2 shows low ranking of 748 (laplace) and 898 (rbf). NOTCH4 - ASCL2 shows low ranking of 1021 (laplace), 378 (linear) and 873 (rbf). These rankings point to the synergy existing between the two components, which have been down regulated after the drug treatment.

2.2.5. ASCL2 - SLC

Wang et al. [25] indicate that syncytin-1 interacts with the SLC1A5 receptor on cells. Varberg et al. [26] found that knockdown of ASCL2 down regulated syncytin-1 receptor SLC1A5. In colorectal cancer cells treated with ETC-1922159, SLC family and ASCL2, were found to be down regulated and recorded independently. I was able to rank 2nd order combination of SLC family and ASCL2, that were down regulated.

Table 9 shows rankings of these combinations. Followed by this is the unexplored combinatorial hypotheses in table 10 generated from analysis of the ranks in table 9. The table 9 shows rankings of SLC family w.r.t ASCL2. SLC39A8 - ASCL2 shows low ranking of 59 (laplace), 357 (linear) and 54 (rbf). SLC43A1 - ASCL2 shows low ranking of 62 (laplace), 99 (linear) and 117 (rbf). SLC25A27 - ASCL2 shows low

ranking of 67 (laplace), 48 (linear) and 74 (rbf). SLC12A2 - ASCL2 shows low ranking of 91 (laplace), 451 (linear) and 318 (rbf). SLC7A2 - ASCL2 shows low ranking of 218 (laplace), 367 (linear) and 209 (rbf). SLC19A3 - ASCL2 shows low ranking of 292 (laplace), 136 (linear) and 87 (rbf). SLC19A1 - ASCL2 shows low ranking of 317 (laplace), 139 (linear) and 210 (rbf). SLC43A3 - ASCL2 shows low ranking of 520 (laplace), 150 (linear) and 382 (rbf). SLC1A4 - ASCL2 shows low ranking of 569 (laplace), 603 (linear) and 1301 (rbf). SLC25A26 - ASCL2 shows low ranking of 601 (laplace), 1035 (linear) and 745 (rbf). SLC4A7 - ASCL2 shows low ranking of 864 (laplace), 1185 (linear) and 915 (rbf). SLC28A3 - ASCL2 shows low ranking of 904 (laplace), 739 (linear) and 366 (rbf). SLC39A10 - ASCL2 shows low ranking of 1208 (laplace), 458 (linear) and 909 (rbf). SLC25A35 - ASCL2 shows low ranking of 1309 (laplace) and 1009 (rbf). SLC28A2 - ASCL2 shows low ranking of 1363 (laplace), 625 (linear) and 876 (rbf). SLC2A11 - ASCL2 shows low ranking of 1442 (laplace), 1343 (linear) and 1351 (rbf). SLC25A38 - ASCL2 shows low ranking of 1493 (laplace) and 1068 (linear). SLC35G1 - ASCL2 shows low ranking of 1522 (laplace) and 1506 (linear). SLC17A9 - ASCL2 shows low ranking of 1528 (laplace) and 1414 (linear). SLC7A8 - ASCL2 shows low ranking of 1268 (linear) and 1001 (rbf). SLC41A1 - ASCL2 shows low ranking of 1152 (linear) and 1016 (rbf). These rankings point to the synergy existing between the two components, which have been down regulated after the drug treatment.

Further, SLC25A15, SLC25A14, SLC18B1, SLC5A6, SLC12A8, SLC25A40, SLC35F2, SLC25A19, SLC26A2, SLC35E3, SLC25A32, SLC38A5 and SLC6A6 showed high ranking and might not be synergistically working with ASCL2, before treatment.

2.2.6. ASCL2 - SOX

Allan et al. [27] demonstrated that HIF1A activated a unique set of genes in oligodendrocyte progenitor cells (OPCs) through interaction with the transcription factor OLIG2 (which target ASCL2 and DLX3). These in turn, suppressed the oligodendrocyte regulator SOX10. ChIP-seq for HA-tagged ASCL2 in OPCs revealed that ASCL2 binds to upstream enhancers of SOX10 and reduce expression of SOX10 compared with control OPCs. In colorectal cancer cells treated with ETC-1922159, SOX family and ASCL2, were found to be down regulated and recorded independently. I was able to rank 2nd order combination of SOX family and ASCL2, that were down regulated.

Table 11 shows rankings of these combinations. Followed by this is the unexplored combinatorial hypotheses in table 12 generated from analysis of the ranks in table 11. The table 11 shows rankings of SOX family w.r.t ASCL2. SOX8 - ASCL2 shows low ranking of 49 (laplace), 29 (linear) and 38 (rbf). SOX12 - ASCL2 shows low ranking of 203 (laplace), 590 (linear) and 405 (rbf). SOX1 - ASCL2 shows low ranking of 254 (laplace), 310 (linear) and 241 (rbf). These rankings point to the synergy existing between the two components, which have been down regulated after the drug treatment.

2.2.7. ASCL2 - SNHG

In colorectal cancer, Christensen et al. [28] show that SNHG16 is regulated by the WNT pathway. SNHG16 was found to be positively correlated to the expression of the WNT targets like ASCL2. In colorectal cancer cells treated with ETC-1922159, SNHG family and ASCL2, were found to be down regulated and recorded independently. I was able to rank 2nd order combination of SNHG family and ASCL2, that were down regulated.

Table 13 shows rankings of these combinations. Followed by this is the unexplored combinatorial hypotheses in table 14 generated from analysis of the ranks in table 13. The table 13 shows rankings of SNHG family w.r.t ASCL2. SNHG3 - ASCL2 shows low ranking of 593 (laplace), 1415 (linear) and 1203 (rbf). SNHG15 - ASCL2 shows low ranking of 915 (laplace) and 1491 (rbf). SNHG10 - ASCL2 shows low ranking of 933 (laplace), 478 (linear) and 717 (rbf). SNHG17 - ASCL2 shows low ranking of 1108 (laplace) and 1388 (linear). SNHG16 - ASCL2 shows low ranking of 1398 (laplace) and 1011 (rbf). These rankings point to the synergy existing between the two components, which have been down regulated after the drug treatment.

Further, SNHG6, SNHG1, SNHG18, SNHG5, SNHG8 and SNHG7 showed high ranking and might not be synergistically working with ASCL2, before treatment.

One can also interpret the results of the table 13 graphically, with the following influences - • SNHG family w.r.t ASCL2 with ASCL2 – > SNHG-3/15/10/17/16.

2.2.8. ASCL2 - KIAA

In colon cancer, Birkenkamp-Demtroder et al. [29] showed by immunofluorescence microscopy and western blotting that there was decreased protein expression of β -catenin and the WNT related stem cell marker ASCL2, upon KIAA1199 knockdown with construct KIAA1199-sh3303. In colorectal cancer cells treated with ETC-1922159, KIAA family and ASCL2, were found to be down regulated and recorded independently. I was able to rank 2nd order combination of KIAA family and ASCL2, that were down regulated.

Table 15 shows rankings of these combinations. Followed by this is the unexplored combinatorial hypotheses in table 16 generated from analysis of the ranks in table 15. The table 15 shows rankings of KIAA family w.r.t ASCL2. KIAA0101 - ASCL2 shows low ranking of 73 (laplace), 350 (linear) and 178 (rbf). KIAA1524 - ASCL2 shows low

Table 16: 2^{nd} order combinatorial hypotheses between ASCL2 and KIAA family members.

2.2.9. ASCL2 - FBXO

Through various in vivo and in vitro assays, Tan et al. [30] show that FBXO22 is the substrate recognition subunit of the SCF^{FBXO22} complex that polyubiquitylates KDM4A. They show that changes in FBXO22 levels can affect KDM4A protein levels. These then lead to changes in histone marks and changes in transcriptional levels of

KDM4A's target gene, ASCL2. In colorectal cancer cells treated with ETC-1922159, FBXO family and ASCL2, were found to be down regulated and recorded independently. I was able to rank 2^{nd} order combination of FBXO family and ASCL2, that were down regulated.

Table 17 shows rankings of these combinations. Followed by this is the unexplored combinatorial hypotheses in table 18 generated from analysis of the ranks in table 17. The table 17 shows rankings of FBXO family w.r.t ASCL2. FBXO5 - ASCL2 show low rankings of 351 (laplace), 316 (linear) and 105 (rbf). FBXO4 - ASCL2 show low rankings of 1466 (laplace), 710 (linear) and 347 (rbf). These rankings point to the synergy existing between the two components, which have been down regulated after the drug treatment. Further, FBXO41 showed high ranking and might not be synergistically working with ASCL2, before treatment.

RANKING FBXO FAMILY VS ASCL2

2.2.10. ASCL2 - FAM

Liang et al. [31], via electrophoretic mobility shift assay, validated the regulatory role of ACSL1 and ASCL2 in the regulation of FAM13A. There are range of family with sequence similarity members. In colorectal cancer cells treated with ETC-1922159, FAM family and ASCL2, were found to be down regulated and recorded independently.

I was able to rank 2nd order combination of FAM family and ASCL2, that were down regulated.

Table 19 shows rankings of these combinations. Followed by this is the unexplored combinatorial hypotheses in table 20 generated from analysis of the ranks in table 19. The table 19 shows rankings of FAM family w.r.t ASCL2. FAM111B - ASCL2 show low rankings of 9 (laplace), 71 (linear) and 16 (rbf). FAM161A - ASCL2 show low rankings of 106 (laplace), 86 (linear) and 93 (rbf). FAM72D - ASCL2 show low rankings of 112 (laplace), 284 (linear) and 161 (rbf). FAM201A - ASCL2 show low rankings of 162 (laplace), 398 (linear) and 341 (rbf). FAM216A - ASCL2 show low rankings of 265 (laplace), 453 (linear) and 198 (rbf). FAM169A - ASCL2 show low rankings of 379 (laplace), 164 (linear) and 650 (rbf). FAM83D - ASCL2 show low rankings of 407 (laplace), 422 (linear) and 175 (rbf). FAM86A - ASCL2 show low rankings of 563 (laplace) and 1048 (rbf). FAM72A - ASCL2 show low rankings of 622 (laplace), 174 (linear) and 129 (rbf). FAM120C - ASCL2 show low rankings of 626 (laplace), 283 (linear) and 289 (rbf). FAM86C2P - ASCL2 show low rankings of 627 (laplace), 1279 (linear) and 1298 (rbf). FAM81A - ASCL2 show low rankings of 710 (laplace), 716 (linear) and 1124 (rbf). FAM227A - ASCL2 show low rankings of 717 (laplace), 327 (linear) and 254 (rbf). FAM86B1 - ASCL2 show low rankings of 757 (laplace), 1020 (linear) and 1466 (rbf). FAM96AP2 - ASCL2 show low rankings of 780 (laplace), 814 (linear) and 272 (rbf). FAM96A - ASCL2 show low rankings of 805 (laplace) and 1359 (linear). FAM98B - ASCL2 show low rankings of 889 (laplace), 951 (linear) and 277 (rbf). FAM117B - ASCL2 show low rankings of 1007 (laplace), 1114 (linear) and 867 (rbf). FAM131B - ASCL2 show low rankings of 1224 (laplace), 1289 (linear) and 295 (rbf). FAM221A - ASCL2 show low rankings of 1393 (laplace), 1158 (linear) and 1675. FAM86JP - ASCL2 show low rankings of 1249 (linear) and 884 (rbf). These rankings point to the synergy existing between the two components, which have been down regulated after the drug treatment. Further, FAM41 showed high ranking and might not be synergistically working with ASCL2, before treatment.

Further, FAM89A, FAM185A, FAM117A, FAM136A, FAM86C1, FAM173B, FAM149B1, FAM210B, FAM208B, FAM178A, FAM122B and FAM98A showed high ranking and might not be synergistically working with ASCL2, before treatment.

One can also interpret the results of the table 19 graphically, with the following influences - ● FAM family w.r.t ASCL2 with ASCL2 – > FAM-111B / 161A / 72D / 201A / 216A / 169A / 83D / 86A / 72A / 120C / 86C2P / 81A / 227A / 86B1 / 96AP2 / 96A / 98D / 117B / 131B / 221A / 86JP.

2.2.11. ASCL2 - BCL

In colorectal cancer cell lines, Legge et al. [32] show for the first time that BCL3 acts as a co-activator of β -catenin/TCF-mediated transcriptional activity. They demonstrate that targeting BCL3 expression reduced β -catenin/TCF-dependent transcription and the expression of LGR5 and ASCL2. In colorectal cancer cells treated with ETC-1922159, BCL family and ASCL2, were found to be down regulated and recorded independently. I was able to rank 2nd order combination of BCL family and ASCL2, that were down regulated.

Table 21 shows rankings of these combinations. Followed by this is the unexplored

2.2.13. ASCL2 - ARHGAP

In breast cancer, Han et al. [34] identified a feedback loop that downregulated ARHGAP25, which can promote activation of the WNT/ β -catenin pathway. Because of this there is an increase in ASCL2 expression, which negatively regulates ARHGAP25 expression at transcriptional level and contributes to breast cancer progression. In colorectal cancer cells treated with ETC-1922159, ARHGAP family and ASCL2, were found to be down regulated and recorded independently. I was able to rank 2nd order combination of ARHGAP family and ASCL2, that were down regulated.

Table 25 shows rankings of these combinations. Followed by this is the unexplored combinatorial hypotheses in table 26 generated from analysis of the ranks in table 25. The table 25 shows rankings of ARHGAP family w.r.t ASCL2. ARHGAP11A - ASCL2 shows low ranking of 31 (laplace), 10 (linear) and 15 (rbf). ARHGAP11B - ASCL2 shows low ranking of 306 (laplace), 640 (linear) and 270 (rbf). ARHGAP33 - ASCL2 shows low ranking of 1048 (laplace), 1007 (linear) and 535 (rbf). These rankings point to the synergy existing between the two components, which have been down regulated after the drug treatment. Further, ARHGAP19 showed high ranking and might not be synergistically working with ASCL2, before treatment.

One can also interpret the results of the table 25 graphically, with the following influences - ● ARHGAP family w.r.t ASCL2 with ASCL2 – > ARHGAP-11A/11B/33.

3. Conclusion

Presented here are a range of multiple synergistic ASCL2 2nd order combinations that were ranked via a machine learning based search engine. Via majority voting across the ranking methods, it was possible to find plausible unexplored synergistic combinations of ASCL2-X that might be prevalent in CRC cells after treatment with ETC-1922159 drug.

Conflict of interest
