CeRh₂As₂ is a newly discovered candidate of multiphase heavy-fermion
superconductor ($T_c \approx 0.3$ K) with intriguing physical properties. Here, we employ
soft point-contact spectroscopy to investigate its energ CeRh₂As₂ is a newly discovered candidate of multiphase heavy-fermion
superconductor ($T_c \approx 0.3$ K) with intriguing physical properties. Here, we employ
soft point-contact spectroscopy to investigate its energy gap beh examples are also the interplay and interplate and interplate and interperties. Here, we employ soft point-contact spectroscopy to investigate its energy gap behaviors in both the normal and superconducting states. The di soft point-contact spectroscopy to investigate is energy appear properties. There are not normal and superconducting states. The differential conductance below T_c reveals an estimated superconducting energy gap of $2\Delta_{$ reveals an estimated superconducting energy gap of $2\Delta_{SC} \approx 0.24$ meV and thus an extremely strong superconducting pairing strength $2\Delta_{SC}/k_B T_c \approx 8.8$, which is comparable to those of cuprates and iron-based high- T_c su extremely strong superconducting pairing strength $2A_{SC}/k_BT_c \approx 8.8$, which is
comparable to those of cuprates and iron-based high- T_c superconductors as well
as infinite-layer nickelates. Above T_c , a well-defined pseudo comparable to those of cuprates and iron-based high- T_c superconductors as well
as infinite-layer nickelates. Above T_c a well-defined pseudogap feature is
manifested as a V -shaped dip in the differential conductance as infinite-layer nickelates. Above T_0 a well-defined pseudogap feature is
manifested as a V -shaped dip in the differential conductance spanning an energy
scale of $2\Lambda_k \approx 0.95-3.0$ meV. The pseudogap feature persist manifested as a *V*-shaped dip in the differential conductance spanning an energy
scale of $2\Delta_E \approx 0.95-3.0$ meV. The pseudogap feature persists to the highest
characteristic temperature of $T_R \approx 8-9$ K and is gradually s

mannet evaluate the valuate phase scale of $2\Delta_g \approx 0.95-3.0$ meV. The pseudogap feature persists to the highest

platform to study the interplay of unconventional superconductivity and
Beechtly, CeRh₂A₅₂, a heavy-fermion superconductor (HFSC), has attracted** platform to study the interplay of unconventional superconductivity and

Recently, CeRh₂As₂, a heavy-fermion superconductor (HFSC), has attracted much

attention because its superconducting state below $T_c \approx 0.3$ K wa **Recently, CeRh**₂As₂, a heavy-fermion superconductor (HFSC), has attracted much
attention because its superconducting state below $T_c \approx 0.3$ K was found to undergo a
magnetic-field-induced phase transition^[1-3]. Thi Recently, CeRh2As₂, a heavy-fermion superconductor (HFSC), has attracted much
attention because its superconducting state below $T_c \approx 0.3$ K was found to undergo a
magnetic-field-induced phase transition^[1-3]. This in Recently, CeRh;As₂, a heavy-fermion superconductor (HFSC), has attracted much
attention because its superconducting state below $T_s \approx 0.3$ K was found to undergo a
magnetic-field-induced phase tarasition¹¹⁻³¹. This in attention because its superconducting state below $T_e \approx 0.3$ K was found to undergo a
magnetic-field-induced phase transition^[1-3]. This intriguing observation has been
attributed to a transition from low-field even-par magnetic-field-induced phase transition^[1-3]. This intriguing observation has been
attributed to a transition from low-field even-parity SC1 to high-field odd-parity SC2
phase ^{[2:10}]. This makes CeRh₂As₂ another e [11,12] .

Motivated by the above discovery, follow-up studies have uncovered more exotic
properties in the normal and superconducting states of CeRh₂As₂. For example, a
possible quadrupole density wave (QDW) order at $T_0 \approx 0.4$ Motivated by the above discovery, follow-up studies have uncovered more exotic
properties in the normal and superconducting states of CeRh₂As₂. For example, a

possible quadrupole density wave (QDW) order at $T_0 \approx 0.40$ K was proposed based on
the measurements of flermal expansion, specific heat possible quadrupole density wave (QDW) order at $T_0 \approx 0.40$ K was proposed based on
the measurements of thermal expansion, specific heat and x-ray spectroscopy [5,13].
However, a recent study^[8] on the super-higher-qua the measurements of thermal expansion, specific heat and x-ray spectroscopy [^{5,15]}. However, a recent study^[8] on the super-higher-quality samples tends to attribute the features at T_0 to a long-range antiferromagn However, a recent study¹⁸¹ on the super-higher-quality samples tends to attribute the features at T_0 to a long-range antiferromagnetic (AFM) order in analogy to other HFSCs, such as CeRhh_as and Ce-Rhh_as^{1645,7}]. features at T_0 to a long-range antiferromagnetic (AFM) order in analogy to other HFSCs, such as CeRhln, and Ce₂Rhln,^[16,17]. It revealed a first-order transition within the superconducting state, which was attribut HFSCs, such as CcRhIns and Cc₂RhIng^{164.17}. It revealed a first-order transition within
the superconducting state, which was attributed to a metamagnetic transition, in
accordance with the earlier nuclear quadrupole re Ine superconducting state, when was authoused to a metalmagnetic transtituon, in
accordance with the earlier nuclear quadrupole resonance (NQR) and nuclear
magnetic resonance (NMR) measurements demonstrating the existence accoronative with the carrier nuclear quataryhope ressonance (NQK) and nuclear
magnetic resonance (NMR) measurements demonstrating the existence of the AFM
norder below $T_S \approx 0.25 \text{ K}^{12.0}$. Subsequent muon spin relaxat magnetic resonance (WWW) measurements demonstrating the extsince of the Ar M
confirmed the occisistnec of quasi-local AFM magnetism with bulk SC^(a). In turn,
confirmed the occisistnec of quasi-local AFM magnetism with b order below $I_N \approx 0.25$ K^{noso}. Subsequent muon spin relaxation (*usst*) experiments and expectience of quasi-local AFM magnetism with bulk SC⁽⁴⁾. In turn, confirmed the execsione of quasi-local AFM magnetic metrical t continue in ecosystence of quasi-local AFW magnetism with but SC¹⁵. In turn,
angle-resolved photoemission spectroscopy (ARPES) revealed the presence of Fermi
surface nesting^[10] and suggested a potential link to magne

any erests proton and supper-stores provided in the presente of remembershing surface not a symple phenomena. In contrast to the initially suggested scenario of a spin-triplet nature of the high-field odd-parity SC2 state striace nesmalle^{ros} and suggested a potential in the of nagnetic excludions of QD with the high-fried ode pairy tiple at the britically suggested seenatio of a spin-triplet nature of the bigh-fried odeparity SC2 state, the migrined ota-pair stock state, the stotics of supercolucturing spin sosceptome at a two nonequivalent As sites have argued a spin-singlet state for both SC1 and SC2 phases^[2,6]. They pointed out that the AFM order o at we nonequivarient as since are agreed as spin-singlet state for bout SC1 and SC2
phase with no sign of magnctic ordering in the SC2 phase^[24,6]. These
controversial results call for further studies on the superconduc phases¹²³. Interponded out that the AFW order only coestins within the ow-heted-
SC1 phase with no sign of magnetic ordering in the SC2 phase^{(2,61}). These
controversial results call for further studies on the supercon order omy coexists winnin the low-itend-
ing in the SC2 phase^[2,6]. These
son the superconducting and normal states
c level using spectroscopic properties of high-
ormal and superconducting states using soft
xtreme cond SCJ phase wint no sign of magnetic ontereming in its SC2 phase⁻⁻⁻⁻, riese
octroversial results call for further studies on the superconducting and normal states
of CeRh_AA₅, especially at the microscopic level using material. In this Letter, we report on our detailed study on the microscopic properties of high-
quality CcRh2As₂ single crystals in both normal and supcroonducting states using soft
point-contact spectroscopy (PCS) under extreme in this Lette, we report on our detailed sudto on the interoscopic properties of nigrality CeRhSAs single crystals in both normal and superconducting states using soft point-contact spectroscopy (PCS) under extreme condit quality certifix482 single crystals in boot normal and superconducting states using solutions of point-confact spectroscopy (PCS) under extreme conditions, at temperatures down to 50 mK and high magnetic fields up to 12 T point-connact spectroscopy ($r \in S$) under exterine conditions, at temperatures above in S0 onK and high magentic fields up to 12 T. Our results revealed the superconducting participal $2\Delta_{Sc}/k_B T_c \approx 8.8$, which is compara

c ecntral area having a cylinder-like shape. With increasing te temperature of 0.1, 0.5, and 1.7 K, Figs. 3(d)-(f), there is a significant enhancement of signal in the central area having a cylinder-like shape. With increasing temperature, B_E sightly decreases and $2\Delta_2$ shows a si signal in the central area having a cylinder-like shape. With increasing temperature, B_8
slightly decreases and $2\Delta_g$ shows a significant enlargement from ~0.95 meV at 0.1 K
to ~3 meV at 1.7 K. These characteristics a slightly decreases and $2\Delta_g$ shows a significant enlargement from ~ 0.95 meV at 0.1 K
to ~ 3 meV at 1.7 K. These characteristics are consistent with broadening of the *Y*-
shaped peak, as discussed above.
Based on the co to \sim 3 meV at 1.7 K. These characteristies are consistent with broadening of the *V*-
shaped peak, as discussed above.
Based on the collected PCS data, the magnetic field-temperature dependencies of the
superconducting shaped peak, as discussed above.
Based on the collected PCS data, the magnetic field-temperature dependencies of the
superconducting state and the pseudogap were integrated into the *B-T* phase diagrams
of CeRh2As₂, con Based on the collected PCS data, the magnetic field-temperature dependencies of the
superconducting state and the pseudogap were integrated into the *B*-*T* phase diagrams
of CcRh>As₂, constructed for *B*/ e , Fig. 4(a) Experimental and the pseudogap were integrated into the *B*-*T* phase diagrams of CeRh₂A₅₂, constructed for *B*/*c*, Fig. 4(a), and *B* ⊥*c*, Fig. 4(b), configurations. The colored regions represent the dip depth of CeRh₂As₂, constructed for *B*//*c*, Fig. 4(a), and $B \perp c$, Fig. 4(b), configurations. The
colored regions represent the dip depth of the dI/dV spectra. As seen clearly in Fig.
4(a), the critical temperature T_c^{zero zero lines determined for two CeRh₂As2 samples (PSI, exertingly the performancy of three samples (S1#, S2#, S3#) shows almost by consistent with the literature data derived from oundary, determined from the ZBCP(*T*), o colored regions represent the dip depth of the dI/dV spectra. As seen clearly in Fig. 4(a), the critical temperature T_c^{zero} of three samples (S1#, S2#, S3#) shows almost identical variations with field, fully consist 4(a), the critical temperature T_c^{zero} of three samples (S1#, S2#, S3#) shows almost
identical variations with field, fully consistent with the literature data derived from
 $C_b(T), \rho(T)$ and $\chi(T)$. The T_c^{ZBC} bounda identical variations with field, fully consistent with the literature data derived from $C_p(T)$, $\rho(T)$ and $\chi(T)$. The T_c^{ZBC} boundary, determined from the ZBCP(*T*), overlaps with T_c^{zero} for $B < 4$ T (SC1 phase) $C_p(T)$, $\rho(T)$ and $\chi(T)$. The $T_c^{\text{ZBC}}T$ boundary, determined from the ZBCP(T), overlaps
with T_c^{zero} for $B < 4$ T (SC1 phase), but decreases faster and deviates significantly
from the T_c^{zero} line in stronger from the T_c^{2cm} line in stronger fields (SC2 phase). In the latter region, $T_c^{\text{2cm}}r$ quickly
decreases and becomes undetectable above 7 T, which is only half of $B_c \approx 14$ T of the
SC2 phase. This finding suggests decreases and becomes undetectable above 7⁻¹, which is only half of $B_{c2} \approx 14$ T of the SCI phase. This finding suggests that the superconducting signal in the d/*dV* spectra
seen in the high-field region should rathe scen in the high-field region should rather be considered an extension of the SC1

phase showed no features in the d*I/dV* spectra, whi

phase showed no feature and the Dressence of the SCZ phase. It so, the SCZ
phase showed no features in the d//dV spectra, which might be attributed to its odd-
parity superconducting symmetry. To validate such hypothesis, phase showed no leatters him fer *laray* spectra, whinch might be attimeting to a sod-
partiy superconducting symmetry. To validate such hypothesis, further in-depth
experimental and theoretical studies are required. In t party supercolution and the exolution of T₈(B) and section of $R \perp c_s$ a perfect experimental and theoretical studies are required. In the case of $B \perp c_s$ a perfect overlap between the T_c^{ZBC} and T_c^{zero} lines Experimental and uncerelarial studies are required. in the case of $\Delta L \epsilon$, a perfect
overlap between the T_c^{ZBC} and T_c^{zero} lines determined for two CeRheAsy samples (S1#,
S2#) was found, Fig. 4(b), and the estim overlap oeweven the $t_2e^{2.06}$ and $t_2e^{2.06}$ and the estimate of two CeKn2As samples (51 π , strip) was found, Fig. 4(b), and the estimated value $B_{a2}=2.0$ T at $T=50$ mK is very similar to that obtained from the bu

platform to elucidate its poorly understood microscopic mechanism and the
relationship between this phenomenon and unconvertional supercond platform to elucidate its poorly understood microscopic mechanism and the
relationship between this phenomenon and unconventional superconductivity in
strongly correlated electron systems. So far, the energence of pseudoge relationship between this phenomenon and unconventional superconductivity in
strongly correlated electron systems. So far, the emergence of pseudogap has been
observed in high-7_c currents/⁵³¹ with appreciable energy ga strongy correlate electron systems. So lar, the emergence of pseudogap has been
behaved in high-7c cuprates^[33] with appreciable energy apps persisting in a wide
temperature range above T_c . The interplay between pseud observed in mgn-*i*-couplinates^{23, w} will appreciation energy gaps perissiming in a wollow terepretion a subject of extensive investigations over the past decades. Now, it is generally believed that the pseudogap can or emperature range above t_c . Ine interptay between pseudogap and nigh- t_c SC nas
beheaved that the pseudogap can originate from two mechanisms^[34], i.e., (i) the electron pre-pairing above T_c in the Bardeen-Cooper-Sc mject of extensive investigations over the past decades. Now, it is generatly
that the pseudogre can originate from two mechanisms¹³⁴¹, i.e., (i) the
pre-pairing above T_6 in the Bardcen-Cooper-Schrieffer (BCS) to Bos believe that the pseudogap can orgunate from two mechanisms²⁰, i.e., (i) the electron pre-pairing above T_c in the Bardeen-Cooper-Schrieffer (BCS) to Bose-Einstein condensation (BEC) crossover picture, or (ii) the pre

 $URu_2Si_2^{[36]}$ can be excluded because there are no obvious anomalies in the physical etectrom pre-parming above r_c in the bareter-Coper-Scortenbere (bCS) to bose-
Einstein condensation (BEC) crossover picture, or (ii) the presence of various
competing quantum electronic orders, such as the striped AFM o $CeCoIn₅^[18]$. However, the observed strong variations of pseudogap with temperature conders attom (BEC) crossover picture, or (ii) the presence of various
g quartum electronic orders, such as the stripped AFM order or paried density
DW) order. However, due to the complexity of high- T_c cuprates and poss completing quantim electronic orders, such as the simpled $ATNn$ order or parted density
wave (PDW) order. However, due to the complexity of high- T_c cupres and possible
intertwining of these two mechanisms, the underlyin wave (*FD* w) order. However, due to the complexity of nigh-1_c edprates and possible
intertwining of these two mechanisms, the underlying origin of the pesudogap
remains clustive. In addition to the unconventional SCs, nterwinning of tresc two mecnantisms, the underlying origin of the pseudogap
remains elustive. In addition to the unconvertional SCs, some recent studies proposed
rew candidates for pseudogap phenomena, including uniform remains eusive. In addition to the thencorentional SCs, some recents studies proposed
new candidates for pseudogap phenomena, including uniform Fermi gases with strong
interactions^[35] and magnetic transition materials. new candiates tor peetiation material, including unitrim retrin gases with strong
interactions^[35] and magnetic transition materials. This makes it even more complex to
unveil the principal mechanism of the pseudogap f the procedure and magnetic transition materials. I this mass it even thore complex to
unveil the principal mechanism of the pseudogap formation
In an attempt to identify a possible mechanism for the opening of pseudogap i Invertime principal mechanism of the psettiogap iormation.

In an attempt to identify a possible mechanism for the opening of pseudogap in

CeRh₂As₂, it secons worthwhile to compare its bulk physical properties with t In an attempt to identify a possible mechanism for the opening of pseudogap in
CeRh₂As₂, it seems worthwhile to compare its bulk physical properties with those of
other heavy fermion systems. At first, the presence of CeRh₂As₂, it scens worthwhile to compare its bulk physical properties with those of other heavy fermion systems. At first, the presence of a hidden order (HO) as seen in URus§j²⁵⁶ sm be excluded because there are no Drugsh₂²²⁻² can be extituate necause inter are no obvious anomalnes in the puty
properties of $C_F(T)$, $\rho(T)$ and $\chi(T)$ around T_k . In the absence of obvious phase
transition, the pseudogap can be caused by Kondo hyb properties or $C_p(t)$, $p(t)$ and $\chi(t)$ at domestion, the absente of orovins pirace or the CCoIng¹¹⁸⁾. However, the observed strong variations of pseudogap with temperature and magnetic field don't comply with the latter Irlansition, the pseudogap can be caused by Nontol nybrid/21dion as proposed in
CeCoIn₅418). However, the observed strong variations of pseudogap with temperature
and magnetic field don't comply with the latter scenario cocomist^{oro}. Thowever, the observed study variations to pseudoglap with denperature and magnetic field don't comply with the latter scenario. Instead, previous studies have suggested that CeRh₂As₂ approaches quantum

width of the superconducting energy gap $2\Delta_{SC} \approx 0.24$ meV at 50 mK. This value
implies an extremely strong superconducting pairing strength $2\Delta_{SC}/k_B T_c \approx 8.8$, which
