POINT-WISE DOUBLING INDICES OF MEASURES AND ITS APPLICATION TO BI-LIPSCHITZ CLASSIFICATION OF BEDFORD-MCMULLEN CARPETS

HUI RAO, YAN-LI XU[∗] , AND YUAN ZHANG

Abstract. Doubling measure was introduced by Beurling and Ahlfors in 1956 and now it becomes a basic concept in analysis on metric space. In this paper, for a measure which is not doubling, we introduce a notion of point-wise doubling index, and calculate the point-wise doubling indices of uniform Bernoulli measures on Bedford-McMullen carpets. As an application, we show that, except a small class of Bedford-McMullen carpets, if two Bedford-McMullen carpets are bi-Lipschitz equivalent, then they have the same fiber sequence up to a permutation.

1. Introduction

A Borel probability measure μ on a metric space is said to be *doubling* if

$$
\sup_{x \in \text{supp}(\mu), r>0} \frac{\mu(B_{2r}(x))}{\mu(B_r(x))} < \infty,
$$

where $B_r(x)$ denotes the open ball with center x and radius r, and supp (μ) , the support of μ , consists of x such that $\mu(B_r(x)) > 0$ for every $r > 0$.

Doubling measure is introduced by Beurling and Ahlfors [\[4\]](#page-17-0) in 1956. Since then, it is an important object in the analysis of metric spaces, see for instance [\[4,](#page-17-0)[9,](#page-17-1)[10,](#page-17-2)[19\]](#page-17-3) etc. Usually, a measure is considered to be 'nice' if it is doubling. But if a measure is not doubling, what can we say? The purpose of this paper is to study changing rate of a non-doubling measure point-wisely. Precisely, we introduce the following notion.

Definition 1.1. (*Point-wise doubling index*) Let μ be a measure on a metric space (X, d) . Let $0 < \rho < 1$. Let $\varphi : (0, 1) \to \mathbb{R}^+$ be a strictly decreasing function satisfying $\lim_{r\to 0} \varphi(r) = \infty$, which we call a *gauge function*. For $z \in X$, the *upper doubling index* of μ at z (w.r.t. φ) is defined by

(1.1)
$$
\overline{\delta}_{\varphi}(z;\mu,\rho) = \limsup_{r \to 0} \sup_{B_{\rho r}(z') \subset B_r(z)} \frac{\log[\mu(B_r(z))/\mu(B_{\rho r}(z'))]}{\varphi(r)};
$$

Key words and phrases: Bedford-McMullen carpet, point-wise doubling index, run length. * Corresponding author.

the lower doubling index $\underline{\delta}_{\varphi}(z;\mu,\rho)$ is obtained by replacing lim sup by lim inf in [\(1.1\)](#page-0-0). If the two values agree, the common value is called the doubling index and denoted by $\delta_{\varphi}(z;\mu,\rho)$.

Remark 1.1. It is seen that if μ is a doubling measure, then $\delta_{\varphi}(z; \mu, \rho) \equiv 0$ for all $z \in X$.

In this paper, we calculate doubling indices of uniform Bernoulli measures on Bedford-McMullen carpets, and we show that they are Lipschitz invariants. Thanks to these new invariants, we obtain some remarkable new results concerning the bi-Lipschitz classification of Bedford-McMullen carpets (see Theorem [1.3](#page-3-0) and Theorem [1.4\)](#page-4-0). Furthermore, we show that two Lipschitz equivalent Bedford-McMullen carpets have the same fiber sequence up to a permutation except a small class (see Theorem [1.5\)](#page-4-1).

Let $n > m > 2$ be two integers and denote by $\text{diag}(n, m)$ the 2×2 diagonal matrix. Let $\mathcal{D} \subset \{0, 1, \ldots, n-1\} \times \{0, 1, \ldots, m-1\}$. For $\mathbf{d} \in \mathcal{D}$, set

(1.2)
$$
S_{\mathbf{d}}(z) = \text{diag}(n^{-1}, m^{-1})(z + \mathbf{d}),
$$

then $\{S_d\}_{d\in\mathcal{D}}$ is an iterated function system (IFS), its invariant set $E = K(n, m, \mathcal{D})$, the unique non-empty compact set satisfying $E = \bigcup_{\mathbf{d} \in \mathcal{D}} S_{\mathbf{d}}(E)$, is called a *Bedford*-McMullen carpet (abbreviated as BM-carpet) [\[3,](#page-17-4) [16\]](#page-17-5). We denote by μ_E the unique Borel probability measure supported on E satisfying

$$
\mu_E(\cdot) = \frac{1}{\#\mathcal{D}} \sum_{\mathbf{d}\in\mathcal{D}} \mu_E \circ S_{\mathbf{d}}^{-1}(\cdot),
$$

and call μ_E the *uniform Bernoulli measure* of E, where $\#A$ denotes the cardinality of a set A.

Recall that two metric spaces (X, d_X) and (Y, d_Y) are said to be Lipschitz equivalent, denoted by $(X, d_X) \sim (Y, d_Y)$, if there exists a map $f : X \to Y$ which is bi-Lipschitz, that is, there is a constant $C > 0$ such that

$$
C^{-1}d_X(x,y) \le d_Y(f(x), f(y)) \le Cd_X(x,y), \text{ for all } x, y \in X.
$$

Recently, there are many works devoted to the Lipschitz classification of BMcarpets, see $[2, 12, 14, 17, 18, 20, 21]$ $[2, 12, 14, 17, 18, 20, 21]$ $[2, 12, 14, 17, 18, 20, 21]$ $[2, 12, 14, 17, 18, 20, 21]$ $[2, 12, 14, 17, 18, 20, 21]$ $[2, 12, 14, 17, 18, 20, 21]$ $[2, 12, 14, 17, 18, 20, 21]$. It turns out that the classification is much more complicated than the self-similar settings. Notably, there are a lot of Lipschitz invariants, which divide the BM-carpets into many sub-families invariant under bi-Lipschitz maps. The most well-known Lipschitz invariants are various dimensions, such as Hausdorff dimension, box dimension, Assouad dimension, etc. Fraser and Yu $[8]$ showed that $\log m / \log n$ is a Lipschitz invariant, Rao, Yang and Zhang [\[18\]](#page-17-10), and Banaji and Kolossváry $[2]$ showed that the multifractal spectrum of the uniform Bernoulli measure on BM-carpet is a Lipschitz invariant, see also Huang, Rao, Wen and Xu $|11|$.

Let $E = K(n, m, \mathcal{D})$ be a BM-carpet. We define

$$
a_j = \#\{i : (i,j) \in \mathcal{D}\}, \quad j = 0, 1, \dots, m-1,
$$

and call $(a_j)_{j=0}^{m-1}$ the *fiber sequence* of D . Throughout the paper, we denote

 $\sigma = \log m / \log n$.

We say a BM-carpet is of *non-doubling type* if the associated uniform Bernoulli measure is not doubling. Li, Wei and Wen [\[15\]](#page-17-15) characterized when a Bernoulli measure on a BM-carpet is doubling. According to their result, we have

Lemma 1.1. The uniform Bernoulli measure μ_E is not doubling if and only if $a_0 a_{m-1} > 0$, $a_0 \neq a_{m-1}$, and $a_i a_{i+1} > 0$ for at least one $j \in \{0, 1, \ldots, m-2\}$.

For $\mathbf{i} = \mathbf{d}_1 \dots \mathbf{d}_k \in \mathcal{D}^k$, we define $S_i = S_{\mathbf{d}_1} \circ \cdots \circ S_{\mathbf{d}_k}$. Let $z \in E$, we call $(\mathbf{d}_j)_{j \geq 1}$ a coding of z if $\{z\} = \bigcap_{k \geq 1} S_{\mathbf{d}_1 \dots \mathbf{d}_k}([0, 1]^2)$. For convenience, we denote $\mathbf{d}_j = (x_j, y_j)$ and we also write a coding as $(\mathbf{x}, \mathbf{y}) = ((x_j)_{j\geq 1}, (y_j)_{j\geq 1}).$

Definition 1.2 ([\[14\]](#page-17-8) [\[21\]](#page-17-12)). We call z a *double vertical coding point* if z has two codings (\mathbf{x}, \mathbf{y}) and $(\mathbf{x}', \mathbf{y}')$ such that $\mathbf{y} \neq \mathbf{y}'$. Denote

(1.3) $V_E = \{z \in E; z \text{ has double vertical codings}\}.$

A BM-carpet E is said to satisfy the vertical separation condition (VSC) if $V_E = \emptyset$.

Li, Li and Miao [\[14\]](#page-17-8) proved that if $E = K(n, m, \mathcal{D})$ and $F = K(n, m, \mathcal{D}')$ are totally disconnected, satisfy the VSC and share the same fiber sequence, then $E \sim$ F. Yang and Zhang [\[21\]](#page-17-12) strengthen this result by showing that if a BM-carpet is totally disconnected and satisfies the VSC, then it is Lipschitz equivalent to a certain symbolic space.

Now we state our main results. For the lower doubling index, we have

Theorem 1.1. Let $E = K(n, m, \mathcal{D})$ be a BM-carpet of non-doubling type and assume that $a_0 > a_{m-1}$. Let $0 < \rho < n^{-3}$ and let φ be a gauge function satisfying

(1.4)
$$
\lim_{k \to \infty} \frac{k}{\varphi(n^{-k})} = s \in [0, +\infty].
$$

Then

$$
\underline{\delta}_{\varphi}(z;\mu_E,\rho) = \begin{cases} s(1/\sigma - 1)\log(a_0/a_{m-1}), & \text{if } z \in V_E, \\ 0, & \text{otherwise.} \end{cases}
$$

Remark 1.2. If the gauge function φ is too big such that the limit in [\(1.4\)](#page-2-0) is zero, then $\underline{\delta}_{\varphi}(z;\mu_E,\rho)$ is constantly 0, and it is not interesting.

For
$$
j \in \{0, 1, ..., m-1\}
$$
, set $\Omega_j = \{(\mathbf{x}, \mathbf{y}) \in \mathcal{D}^{\infty}; \mathbf{y} \text{ ends with } j^{\infty}\}$. Clearly

$$
V_E \subset \Omega_0 \cup \Omega_{m-1}.
$$

To compute the upper doubling index, we introduce a function $\beta(k;\omega)$, a kind of reverse run length function for a $\omega \in \mathcal{D}^{\infty}$ at position k, in [\(3.7\)](#page-7-0) of Section 3.

Theorem 1.2. Let $E = K(n, m, \mathcal{D})$ be a BM-carpet of non-doubling type and assume that $a_0 > a_{m-1}$. Let φ be a gauge function satisfying

(1.5)
$$
\lim_{k \to \infty} \frac{k}{\varphi(n^{-k})} = s \in (0, +\infty].
$$

Let $0 < \rho < n^{-3}$. Let $z \in E$ and let ω be a coding of z. Then (i) If $\omega \notin \Omega_0 \cup \Omega_{m-1}$, then

$$
\overline{\delta}_{\varphi}(z;\mu_E,\rho) = \limsup_{k \to \infty} \frac{\beta(k;\omega)}{\varphi(n^{-k})} \cdot \log(a_0/a_{m-1}).
$$

(ii) If $\omega \in \Omega_0 \cup \Omega_{m-1}$, then $\overline{\delta}_{\varphi}(z; \mu_E, \rho) = s(1/\sigma - 1) \log(a_0/a_{m-1}) \cdot \mathbf{1}_{V_E}(z)$, where $\mathbf{1}_{V_E}$ is the indicator function of V_E .

Remark 1.3. From the above two theorems, we see that under the assumption [\(1.5\)](#page-2-1), $\overline{\delta}_{\varphi}$ and $\underline{\delta}_{\varphi}$ are irrelevant with ρ . So from now on, we will use $\overline{\delta}_{\varphi}(z;\mu_E)$ and $\underline{\delta}_{\varphi}(z;\mu_E)$ instead of $\delta_{\varphi}(z;\mu_E,\rho)$ and $\underline{\delta}_{\varphi}(z;\mu_E,\rho)$ respectively.

Example 1.1. Let $E = K(n, m, \mathcal{D})$ be a BM-carpet of non-doubling type and assume that $a_0 > a_{m-1}$. We are especially interested in the gauge functions $\varphi(r)$ = $-\log r$ and $\varphi(r) = \log |\log r|$.

(1) Let $\varphi(r) = -\log r$, and denote $\delta = \delta_{\varphi}$. Then

(1.6)
$$
\overline{\delta}(z;\mu_E) = \begin{cases} \limsup_{k \to \infty} \frac{\beta(k;\omega)}{k} \cdot \log_n(a_0/a_{m-1}), & \text{if } \omega \notin \Omega_0 \cup \Omega_{m-1}, \\ \delta_{\max} \cdot \mathbf{1}_{V_E}(z), & \text{otherwise} \end{cases}
$$

where $\delta_{\max} = (\log n)^{-1}(1/\sigma - 1)\log(a_0/a_{m-1}), \text{ and } \underline{\delta}(z;\mu_E) = \delta_{\max} \cdot \mathbf{1}_{V_E}(z).$ Moreover, we can show that for μ_E -a.e. $z \in E$, $\delta(z; \mu_E) = 0$, and the range of

 $\delta(z;\mu_E)$ is [0, δ_{max}]. (See Theorem [5.1.](#page-12-0))

(2) Let $\varphi(r) = \log |\log r|$, and denote $\Delta = \delta_{\varphi}$. Then

(1.7)
$$
\overline{\Delta}(z;\mu_E) = \begin{cases} \limsup_{k \to \infty} \frac{\beta(k;\omega)}{\log k} \cdot \log(a_0/a_{m-1}), & \text{if } \omega \notin \Omega_0 \cup \Omega_{m-1}, \\ \infty \cdot \mathbf{1}_{V_E}(z), & \text{otherwise} \end{cases}
$$

and $\Delta(z;\mu_E) = \infty \cdot 1_{V_E}(z)$.

Moreover, we have that for μ_E -a.e. $z \in E$,

(1.8)
$$
\overline{\Delta}(z;\mu_E) = -\log_{p_0}(a_0/a_{m-1}) := \Delta_{aver},
$$

where $p_0 = a_0/\#\mathcal{D}$, which tells us that $\varphi(r) = \log|\log r|$ is the gauge function for almost every $z \in E$. (See Theorem [5.2.](#page-13-0))

In the following, we use the point-wise doubling indices to construct new Lipschitz invariants for classification of BM-carpets. We assume that $E = K(n, m, \mathcal{D}), F =$ $K(n, m, \mathcal{D}')$ are two BM-carpets. We use $(a_j)_{j=0}^{m-1}$ and $(a'_j)_{j=0}^{m-1}$ to denote the fiber sequences of \mathcal{D} and \mathcal{D}' , respectively. Denote by μ_E and μ_F the uniform Bernoulli measures of E and F respectively.

The following result shows that the VSC is a Lipschitz invariant.

Theorem 1.3. Let $E = K(n, m, \mathcal{D}), F = K(n, m, \mathcal{D}^{\prime})$ be two BM-carpets of nondoubling type. Let $f : E \to F$ be a bi-Lipschitz map. Then for any $z \in E$,

(1.9)
$$
\overline{\delta}_{\varphi}(z;\mu_E) = \overline{\delta}_{\varphi}(f(z);\mu_F), \quad \underline{\delta}_{\varphi}(z;\mu_E) = \underline{\delta}_{\varphi}(f(z);\mu_F).
$$

Consequently,

 $V_F = f(V_E)$ and dim_H $V_E = \dim_H V_F$.

Especially, E satisfies the VSC (that is, $V_E = \emptyset$) if and only if F does.

Using the Lipschitz invariants δ_{max} , Δ_{aver} and γ_{max} (which is defined in Section 6), we show that

Theorem 1.4. Let $E = K(n, m, \mathcal{D}), F = K(n, m, \mathcal{D}')$ be two BM-carpets of nondoubling type. Suppose $E \sim F$. Then

(i) the fiber sequence of E is a permutation of that of F ;

(ii) we have $a_0 = a'_0$ and $a_{m-1} = a'_{m-1}$ if we assume without loss of generality that $a_0 > a_{m-1}$ and $a'_0 > a'_{m-1}$.

We use $\mathcal{M}_{t,v,d,r}(n,m)$ to denote the class of BM-carpets which are totally disconnected (which is indicated by t) with expanding matrix diag (n, m) , possess vacant rows (indicated by v), are of doubling type (indicated by d), and $\log m / \log n$ is rational (indicated by r). It is well-known that these four properties are all Lipschitz invariants.

Theorem 1.5. Let $E = K(n, m, \mathcal{D}), F = K(n, m, \mathcal{D}')$ be two BM-carpets which are not in $\mathcal{M}_{t,v,d,r}(n,m)$. Then $E \sim F$ implies that the fiber sequence of E is a permutation of that of F.

Remark 1.4. Let $E = K(n, m, \mathcal{D})$ and $F = K(n, m, \mathcal{D}')$ be two BM-carpets. We remark that if they share the same fiber sequence up to a permutation, then μ_E and μ_F share the same multifractal spectrum, and this further implies that they share the same Hausdorff, box, Assouad and intermediate dimensions ([\[2,](#page-17-6) [18\]](#page-17-10)).

Remark 1.5. Set $H = \{i; (i, j), (i, j + 1) \in \mathcal{D}\}\$ and $I = \{i; (i, 0), (i, m - 1) \in \mathcal{D}\}\$. It is easy to show that if $H \neq \emptyset$ and $\#I \geq 2$, then $\dim_H V_E = \log(\#I)/\log n$; otherwise, V_E is either countable or empty.

Example 1.2. Let $E = K(8, 4, \mathcal{D})$ and $F = K(8, 4, \mathcal{D}')$ be two BM-carpets with digit sets indicated in Fig[.1.](#page-4-2) Notice that the fiber sequence of $\mathcal D$ is a permutation of that of \mathcal{D}' . They are indeed not Lipschitz equivalent, which can be obtained either by $\dim_H V_E = 0 \neq \dim_H V_F = \log 2 / \log 8$, or by $a_0 \neq a'_0$.

Figure 1.

Remark 1.6. Recently, there are a lot of works devoted to the Assouad dimension of measures on metric spaces, see $[6, 7, 13]$ $[6, 7, 13]$ $[6, 7, 13]$. R. Anttila [\[1\]](#page-17-19) introduced a notion of pointwise Assouad dimension of a measure, which provides another pointwise index of measures on metric spaces.

The paper is organized as follows. We recall some known results about approximate squares of BM-carpets in Section [2.](#page-5-0) In Section [3,](#page-6-0) we prove several important lemmas. Theorem [1.1](#page-2-2) and Theorem [1.2](#page-2-3) are proved in Section [4.](#page-9-0) We give some remarks on $\delta_{-\log r}$ and $\delta_{\log |\log r|}$ in Section [5.](#page-11-0) We discuss an alternative point-wise doubling index in Section [6.](#page-13-1) Theorems [1.3,](#page-3-0) [1.4](#page-4-0) and [1.5](#page-4-1) are proved in Section [7.](#page-14-0)

2. Estimates of measures of approximate squares

Let $E = K(n, m, \mathcal{D})$ be a BM-carpet. Throughout the paper, we denote $N = \# \mathcal{D}$ and use the notation $\ell(k) = |k/\sigma|$, where |x| denotes the greatest integer no larger than x . Clearly,

$$
m^{\ell(k)} \le n^k < m^{\ell(k)+1}.
$$

For $\mathbf{i} \in \mathcal{D}^k$, we call $E_{\mathbf{i}} = S_{\mathbf{i}}(E)$ a *cylinder* of E of rank k.

For two words **i**, **j**, we use $\mathbf{i} * \mathbf{j}$ to denote the concatenation of **i** and **j**, and use $i \wedge j$ to denote the maximal common prefix of i and j, and denote by |i| the length of **i**. Let $\mathbf{w}|_q = w_1 * \cdots * w_q$ be the prefix of **w** with length q. For $z, z' \in \mathbb{R}^2$, we use $d(z, z')$ to denote the Euclidean distance between points z and z'. We define the coding map $\pi: \mathcal{D}^{\infty} \to E$ given by $\pi(\omega) = \bigcap_{k \geq 1} S_{\omega|_k}([0, 1]^2)$.

Let $(\mathbf{x}, \mathbf{y}) = ((x_i)_{i\geq 1}, (y_i)_{i\geq 1}) \in \mathcal{D}^{\infty}$. For $k \geq 1$, we set

(2.1)
$$
Q_k(\mathbf{x}, \mathbf{y}) = \pi(\{(\mathbf{u}, \mathbf{v}) \in \mathcal{D}^{\infty}; |\mathbf{x} \wedge \mathbf{u}| \ge k \text{ and } |\mathbf{y} \wedge \mathbf{v}| \ge \ell(k)\}),
$$

and call it the approximate square of E of rank k, or k -th approximate square of E.

Lemma 2.1 ([\[3,](#page-17-4) [16\]](#page-17-5)). If $Q_k(\mathbf{x}, \mathbf{y})$ is a k-th approximate square of E, then

$$
\mu_E(Q_k(\mathbf{x}, \mathbf{y})) = \frac{\prod_{j=k+1}^{\ell(k)} a_{y_j}}{N^{\ell(k)}}, \text{ or } \mu_E(Q_k(\mathbf{x}, \mathbf{y})) = \frac{1}{N^k} \text{ if } \ell(k) = k.
$$

Lemma 2.2. Let $\boldsymbol{\omega} \in \mathcal{D}^{\infty}$ and let $k \geq 1$, then

$$
\frac{\mu_E(Q_{k+1}(\omega))}{\mu_E(Q_k(\omega))} \geq C_0^{-1}
$$

where $C_0 = nN^{1+1/\sigma}$.

Proof. By Lemma [2.1,](#page-5-1) we have

$$
\frac{\mu_E(Q_{k+1}(\boldsymbol{\omega}))}{\mu_E(Q_k(\boldsymbol{\omega}))} \ge \frac{1}{nN^{\ell(k+1)-\ell(k)}} \ge \frac{1}{nN^{1+1/\sigma}},
$$

and the lemma is proved.

3. Lemmas

In this section, we always assume that E is a BM-carpet of non-doubling type and satisfies $a_0 > a_{m-1}$. Let μ be the uniform Bernoulli measure on E, let $0 < \rho < n^{-3}$ and let φ be a gauge function.

Let $z \in E$ and let $\boldsymbol{\omega} = (\mathbf{x}, \mathbf{y})$ be a coding of z. Let $0 < r < 1$. Denote

(3.1)
$$
U(z; r, \rho) = \sup_{z' \in E, B_{\rho r}(z') \subset B_r(z)} \frac{\mu(B_r(z))}{\mu(B_{\rho r}(z'))},
$$

then $\delta_{\varphi}(z;\mu,\rho) = \limsup_{r \to 0}$ $\log U(z; r, \rho)$ $\frac{\delta(\mathcal{Z}, \mathcal{L}, \mathcal{L}, \mathcal{L})}{\varphi(r)}$, so does $\underline{\delta}_{\varphi}(z; \mu, \rho)$.

In this section, we will always let $k(r)$ be the integer such that

(3.2)
$$
\frac{1}{n^{k(r)+2}} < r \le \frac{1}{n^{k(r)+1}}.
$$

Let

(3.3)
$$
\Xi_{k(r)}(z) = \{Q_{k(r)}(\mathbf{u}, \mathbf{v}); \ Q_{k(r)}(\mathbf{u}, \mathbf{v}) \cap B_r(z) \neq \emptyset\}.
$$

Since $2r < n^{-k(r)}$, we conclude $\Xi_{k(r)}(z)$ contains at most four elements, and they locate in one row, or two adjacent rows of rank $k(r)$.

Lemma 3.1. There is a constant $C_1 > 1$ such that

(3.4)
$$
U(z; r, \rho) \leq C_1 \frac{\max\{\mu(Q); \ Q \in \Xi_{k(r)}(z)\}}{\min\{\mu(Q); \ Q \in \Xi_{k(r)}(z)\}}
$$

and

(3.5)
$$
U(z; n^{3}r, \rho) \geq C_{1}^{-1} \frac{\max\{\mu(Q); Q \in \Xi_{k(r)}(z)\}}{\min\{\mu(Q); Q \in \Xi_{k(r)}(z)\}}.
$$

Proof. For simplicity, we write $k := k(r)$.

(i) Let k_0 be the integer such that $\frac{1}{n^{k_0+1}} < \rho \leq$ 1 $\frac{1}{n^{k_0}}$. Pick $z' \in E$ such that $B_{\rho r}(z') \subset B_r(z)$ and let $\boldsymbol{\omega}'$ be a coding of z'. Since $\text{diam}(Q_{k+k_0+4}(\boldsymbol{\omega}')) <$ $\sqrt{m^2+1}$ $\frac{n^{k+k_0+4}}{n^{k+k_0+4}}$ ρr , we have $Q_{k+k_0+4}(\omega') \subset B_{\rho r}(z')$, then by Lemma [2.2](#page-5-2) we have (3.6)

$$
\mu(B_{\rho r}(z')) \ge \mu(Q_{k+k_0+4}(\omega')) \ge \frac{1}{C_0^{k_0+4}} \mu(Q_k(\omega')) \ge \frac{1}{C_0^{k_0+4}} \min\{\mu(Q); \ Q \in \Xi_k(z)\},\
$$

where C_0 is the constant in Lemma [2.2](#page-5-2) and the last inequality holds by $Q_k(\omega') \in$ $\Xi_k(z)$ since $B_{\rho r}(z') \subset B_r(z) \subset \bigcup_{\alpha} Q$. $Q \in \Xi_k(z)$

On the other hand, $\mu(B_r(z)) \leq 4 \max{\mu(Q)}$; $Q \in \Xi_k(z)$, and the first assertion holds by setting $C_1 = 4C_0^{k_0+4}$.

(ii) Clearly, $B_{n^3r}(z)$ contains all elements of $\Xi_k(z)$ since $n^3r > r + \text{diam } Q$ for each $Q \in \Xi_k(z)$ (we remark that it holds no matter $\Xi_k(z)$ contains approximate squares of rank k of two adjacent rows or the same row), then

$$
\mu(B_{n^3r}(z)) \ge \max\{\mu(Q); \ Q \in \Xi_k(z)\}.
$$

Suppose $Q_k(\omega')$ attains the minimal measure in $\Xi_k(z)$. Since $a_1 a_{m-1} \neq 0$, there exist $(i_1, 0), (i_2, m - 1) \in \mathcal{D}$. Let z' be the point with the coding

$$
(\omega'|_{\ell(k)})\binom{i_1}{0}\binom{i_2}{m-1}^\infty.
$$

Since $\rho n^3 r < n^{-(k+1)}$, we have that $B_{\rho n^3 r}(z') \cap E$ is covered by at most two approximate squares of rank k located in the same row as $Q_k(\boldsymbol{\omega}')$, hence

$$
\mu(B_{\rho n^3 r}(z')) \le 2 \min{\mu(Q); \ Q \in \Xi_k(z)},
$$

and the second assertion holds.

Hereafter, we always assume that C_1 is the constant in Lemma [3.1.](#page-6-1)

3.1. Reverse run length function. Let $\mathcal{E} = \{j; a_j > 0\}$. Denote $a \vee b =$ $\max\{a, b\}$. Now we define a kind of reverse run length function for a sequence over D. Let $p \in \{0, m-1\}$ and $\boldsymbol{\omega} = (\mathbf{x}, \mathbf{y}) \in \mathcal{D}^{\infty}$. For $k \geq 1$, let $h_p(k; \boldsymbol{\omega})$ be the maximal integer h such that $h \leq \ell(k)$ and $y_h \neq p$. We define

$$
\beta_0(k; \omega) = \begin{cases} \ell(k) - (k \vee h_0(k; \omega)), & \text{if } y_{h_0(k; \omega)} \in \mathcal{E} + 1, \\ 0, & \text{otherwise (including } h_0(k; \omega) = 0); \end{cases}
$$

$$
\beta_{m-1}(k; \omega) = \begin{cases} \ell(k) - (k \vee h_{m-1}(k; \omega)), & \text{if } y_{h_{m-1}(k; \omega)} \in \mathcal{E} - 1, \\ 0, & \text{otherwise (including } h_{m-1}(k; \omega) = 0). \end{cases}
$$

Define

(3.7)
$$
\beta(k; \omega) = \beta_0(k; \omega) \vee \beta_{m-1}(k; \omega).
$$

Lemma 3.2. There exists a constant $C_2 > 1$ such that for any $z = \pi(\omega) \in E$ and $r \in (0, 1),$

(3.8)
$$
U(z; r, \rho) \leq C_2 \left(\frac{a_0}{a_{m-1}}\right)^{\beta(k(r); \omega)};
$$

if $\beta(k(r); \omega) \leq \ell(k(r)) - k(r) - 1$, then

(3.9)
$$
U(z; n^{6}r, \rho) \geq C_{2}^{-1} \left(\frac{a_{0}}{a_{m-1}}\right)^{\beta(k(r); \omega)}
$$

Proof. For simplicity, we write $k := k(r)$.

We first prove [\(3.8\)](#page-7-1). Clearly $Q_k(\omega) = Q_k(\mathbf{x}, \mathbf{y}) \in \Xi_k(z)$. If all elements of $\Xi_k(z)$ are located in the same row as $Q_k(\mathbf{x}, \mathbf{y})$, then [\(3.8\)](#page-7-1) holds by the first assertion of Lemma [3.1.](#page-6-1) So in the following we assume that there exists an approximate square $Q_k(\mathbf{u}, \mathbf{v}) \in \Xi_k(z)$ which locates in a row adjacent to the row of $Q_k(\mathbf{x}, \mathbf{y})$, in other words, $\mathbf{v}|_{\ell(k)}$ is adjacent to $\mathbf{y}|_{\ell(k)}$ in the lexicographical order.

.

Case 1. $y_{\ell(k)} \notin \{0, m-1\}.$

In this case $\beta(k;\omega) = 0$. Since $\mathbf{v}|_{\ell(k)}$ and $\mathbf{y}|_{\ell(k)}$ are adjacent in the lexicographic order, we deduce that they differ only at the last letter. It follows that

(3.10)
$$
\frac{1}{n} \leq \frac{\mu(Q_k(\mathbf{x}, \mathbf{y}))}{\mu(Q_k(\mathbf{u}, \mathbf{v}))} \leq n.
$$

By Lemma [3.1,](#page-6-1) we have $U(z; r, \rho) \leq C_1 n$. [\(3.8\)](#page-7-1) holds in this case if we set $C_2 = C_1 n$.

Case 2. $y_{\ell(k)} = 0$ or $m - 1$.

Without loss of generality, we assume that $y_{\ell(k)} = 0$.

If $y \prec v$ in the lexicographical order, then $v|_{\ell(k)} = y|_{\ell(k)-1} * 1$, so [\(3.10\)](#page-8-0) holds, which implies [\(3.8\)](#page-7-1) holds as we did in Case 1.

If $\mathbf{v} \prec \mathbf{y}$, then there exist h and j such that

$$
\mathbf{y}|_{\ell(k)} = y_1 \dots y_{h-1} * (j+1) * 0^{\ell(k)-h}, \quad \mathbf{v}|_{\ell(k)} = y_1 \dots y_{h-1} * j * (m-1)^{\ell(k)-h}.
$$

Since $\beta(k; \omega) = 0$ or $\ell(k) - k \vee h$, we deduce that

$$
\frac{1}{n} \leq \frac{\mu(Q_k(\mathbf{x}, \mathbf{y}))}{\mu(Q_k(\mathbf{u}, \mathbf{v}))} \leq n \left(\frac{a_0}{a_{m-1}}\right)^{\beta(k; \omega)}.
$$

Therefore, by Lemma [3.1,](#page-6-1) no matter $\mu(Q_k(\mathbf{x}, \mathbf{y})) \geq \mu(Q_k(\mathbf{u}, \mathbf{v}))$ or not, we have

$$
U(z; r, \rho) \le C_1 n \left(\frac{a_0}{a_{m-1}}\right)^{\beta(k; \omega)},
$$

and [\(3.8\)](#page-7-1) also holds in this case if we set $C_2 = C_1 n$.

Next, we prove [\(3.9\)](#page-7-2). Suppose $\beta(k; \omega) \leq \ell(k) - k - 1$.

If $\beta(k;\omega) \le 4/\sigma$, then [\(3.9\)](#page-7-2) holds if we set $C_2 \ge (a_0/a_{m-1})^{4/\sigma}$.

Hence, in the following we assume without loss of generality that $y_{\ell(k)} = 0$ and $\beta(k;\omega) > 4/\sigma$. At this time $\beta_{m-1}(k;\omega) = 0$ and $\beta_0(k;\omega) = \beta(k;\omega) \leq \ell(k) - (k+1),$ then $h := h_0(k; \omega) \geq k+1$. By the definition of $\beta(k; \omega)$, there exists i' such that $(i', y_h - 1) \in \mathcal{D}$. Since $a_{m-1} > 0$, there exists i'' such that $(i'', m - 1) \in \mathcal{D}$. We define $\boldsymbol{\omega}' = (\mathbf{u}, \mathbf{v})$ as

$$
\boldsymbol{\omega}' = \boldsymbol{\omega}|_{h-1} * \binom{i'}{y_h-1} * \binom{i''}{m-1}^{\infty} := \binom{\mathbf{x}'}{\mathbf{y}'}.
$$

Let $z'' = \pi(\omega')$. Since z and z'' belong to a same cylinder of E of rank $h - 1$ and $h-1 \geq k$, we obtain $d(z, z'') \leq \sqrt{\frac{1}{n^{2k}} + \frac{m^2}{n^{2k}}} < \frac{1}{n^{k-1}}$, so $z'' \in B_{n^3r}(z)$.

We shall apply Lemma [3.1](#page-6-1) to $B_{n^3r}(z)$ instead of $B_r(z)$. Notice that $k(n^3r) =$ $k(r) - 3 = k - 3$, we define $\Xi'_{k-3}(z)$ to be the collection of approximates squares of rank $(k-3)$ intersecting $B_{n^3r}(z)$. Clearly $Q_{k-3}(\omega), Q_{k-3}(\omega') \in \Xi'_{k-3}(z)$, moreover, $\beta(k; \omega) > 4/\sigma$ implies $h < \ell(k-3)$, then we have $y_{\ell(k-3)} = 0$ and $y'_{\ell(k-3)} = m-1$, so $Q_{k-3}(\omega)$ and $Q_{k-3}(\omega')$ locate in different rows. By Lemma [2.1,](#page-5-1)

$$
\frac{\mu(Q_{k-3}(\omega))}{\mu(Q_{k-3}(\omega'))} \ge \frac{1}{n} \left(\frac{a_0}{a_{m-1}}\right)^{\beta(k-3;\omega)} \ge \frac{1}{n} \left(\frac{a_0}{a_{m-1}}\right)^{-3/\sigma-1} \cdot \left(\frac{a_0}{a_{m-1}}\right)^{\beta(k;\omega)},
$$

which together with the second assertion of Lemma [3.1](#page-6-1) imply [\(3.9\)](#page-7-2) if we set $C_2 =$ $C_1 n (a_0/a_{m-1})^{3/\sigma+1}.$

The lemma is proved for all cases by setting $C_2 = C_1 n (a_0/a_{m-1})^{4/\sigma}$

Corollary 3.1. It holds that

(3.11)
$$
\overline{\delta}_{\varphi}(z;\mu,\rho) \leq \limsup_{k \to \infty} \frac{\beta(k;\omega)}{\varphi(n^{-k})} \cdot \log(a_0/a_{m-1}).
$$

Proof. Since $k(r)$ runs over all integers as r runs over $(0, 1)$, we have

$$
\overline{\delta}_{\varphi}(z;\mu,\rho) = \limsup_{r \to 0} \frac{\log U(z; r, \rho)}{\varphi(r)}
$$

$$
\leq \limsup_{k \to \infty} \frac{\log C_2 + \beta(k; \omega) \log \left(\frac{a_0}{a_{m-1}}\right)}{\varphi(n^{-k-1})}
$$

$$
\leq \limsup_{k \to \infty} \frac{\beta(k; \omega)}{\varphi(n^{-k})} \cdot \log(a_0/a_{m-1}),
$$

where the last inequality holds since φ is decreasing, and the corollary is proved. \Box

4. Proofs of Theorem [1.1](#page-2-2) and Theorem [1.2](#page-2-3)

In this section, we assume the same assumptions on $E = K(n, m, \mathcal{D})$ as Section [3.](#page-6-0)

Lemma 4.1. Let φ be a gauge function satisfying

(4.1)
$$
\lim_{k \to \infty} \frac{k}{\varphi(n^{-k})} = s \in (0, +\infty].
$$

Let $z = \pi(\omega) \in E$. If $\omega \in \Omega_0 \cup \Omega_{m-1}$, then

$$
\delta_{\varphi}(z;\mu,\rho) = s(1/\sigma - 1)\log(a_0/a_{m-1}) \cdot \mathbf{1}_{V_E}(z).
$$

Proof. Case 1. $z \notin V_E$.

Without loss of generality, let us assume that y ends with 0^{∞} . Write y = $y_1 \cdots y_{n_0} 0^{\infty}$ where $y_{n_0} \neq 0$ for some $n_0 \in \mathbb{N}$.

Let L be the horizontal line containing z . Since z is not a double vertical coding point, any cylinder of E of rank n_0 below L does not contain z. Let K be the union of cylinders of E of rank n_0 below L, then $dist(z, K) > 0$.

Let $r < \text{dist}(z, K)$. Let $k = k(r)$ be defined in [\(3.2\)](#page-6-2). Furthermore we choose r small so that $k > n_0$, then z locates at the bottom of $Q_k(\omega)$, so $\Xi_k(z)$ consists of at most two approximate squares of rank k in the same row, and one of them is $Q_k(\boldsymbol{\omega})$. It follows that $U(z; r, \rho) \leq C_1 n$ by Lemma [3.1.](#page-6-1) Therefore $\delta_{\varphi}(z; \mu, \rho) = 0$.

Case 2. $z \in V_F$.

Let $\boldsymbol{\omega}' = (\mathbf{x}', \mathbf{y}')$ be another coding of z such that $\mathbf{y}' \neq \mathbf{y}$. Without loss of generality, let us assume that

$$
\mathbf{y} = y_1 \dots y_{n_0} (j+1) 0^{\infty}, \quad \mathbf{y}' = y_1 \dots y_{n_0} j (m-1)^{\infty},
$$

 \Box

for some $n_0 \in \mathbb{N}$. Pick $r > 0$ and let $k = k(r)$ be defined in [\(3.2\)](#page-6-2). We choose r small so that $k > n_0$. Notice that $Q_k(\mathbf{x}, \mathbf{y}), Q_k(\mathbf{x}', \mathbf{y}') \in \Xi_k(z)$, and $\beta(k; \omega) = \ell(k) - k$. By Lemma [3.1](#page-6-1) we have

$$
U(z; n^3r, \rho) \ge C_1^{-1} \left(\frac{a_0}{a_{m-1}}\right)^{\beta(k;\omega)}
$$

,

thus, using $\varphi(n^3r) \leq \varphi(n^{-k})$, we have

$$
\underline{\delta}_{\varphi}(z;\mu,\rho) \ge \lim_{k \to \infty} \frac{\ell(k) - k}{\varphi(n^{-k})} \log(a_0/a_{m-1}) = s(1/\sigma - 1) \log(a_0/a_{m-1}).
$$

The other direction inequality is due to Corollary [3.1.](#page-9-1) The lemma is proved. \square

Proof of Theorem [1.1.](#page-2-2) Pick $z \in E$. Let $\omega = (\mathbf{x}, \mathbf{y})$ be a coding of z. If $\omega \in$ $\Omega_0 \cup \Omega_{m-1}$, the theorem holds by Lemma [4.1.](#page-9-2)

Now we assume that $\omega \notin \Omega_0 \cup \Omega_{m-1}$. Then y does not end in 0^{∞} and $(m-1)^{\infty}$. Let $(y_{j_t})_{t\geq 1}$ be a subsequence of $\mathbf{y}=(y_j)_{j\geq 1}$ satisfying that

$$
(y_{j_t}, y_{j_t+1}) \neq (0,0)
$$
 and $(m-1, m-1), t \geq 1$.

Let k_t be the smallest integer such that $j_t + 1 \leq \ell(k_t)$, then $\beta(k_t; \omega) \leq 1/\sigma + 2$.

Set $r_t = n^{-k_t-1}$. By the first assertion of Lemma [3.2,](#page-7-3) we have

$$
\underline{\delta}_{\varphi}(z;\mu,\rho) \le \liminf_{t \to \infty} \frac{\log C_2 + (1/\sigma + 2) \log(a_0/a_{m-1})}{\varphi(n^{-k_t - 1})} = 0.
$$

The theorem is proved.

Proof of Theorem [1.2](#page-2-3). Item (ii) is a consequence of Lemma [4.1.](#page-9-2) In the following, we prove Item (i). Moreover, by Corollary [3.1,](#page-9-1) we only need to show that

(4.2)
$$
\overline{\delta}_{\varphi}(z;\mu,\rho) \ge \limsup_{k \to \infty} \frac{\beta(k;\omega)}{\varphi(n^{-k})} \log(a_0/a_{m-1}), \text{ for } \omega \notin \Omega_0 \cup \Omega_{m-1}.
$$

Let $z = \pi(\omega) \in E$ with $\omega \notin \Omega_0 \cup \Omega_{m-1}$.

Suppose $\beta(k;\omega) = \ell(k) - k$ holds for infinitely many k. Let h be the largest integer such that $h \leq k-1$ and $y_{h+1} \neq 0$. Then $\beta(h; \omega) = \ell(h) - h - 1$. Therefore, there exists a subsequence $(k_j)_{j\geq 1}$ of integers such that $\beta(k_j;\omega) = \ell(k_j) - k_j - 1$. set $r_i = 1/n^{k_i+1}$. By the second assertion of Lemma [3.2,](#page-7-3) we have

$$
\overline{\delta}_{\varphi}(z;\mu,\rho) \geq \limsup_{j \to \infty} \frac{\log U(z; n^6 r_j, \rho)}{\varphi(n^6 r_j)} \geq \limsup_{j \to \infty} \frac{\log C_2^{-1} + \beta(k_j; \omega) \log(a_0/a_{m-1})}{\varphi(n^{-k_j+5})}
$$

$$
= \limsup_{j \to \infty} \frac{\ell(k_j) - k_j - 1}{\varphi(n^{-k_j+5})} \log(a_0/a_{m-1}) = s(1/\sigma - 1) \log(a_0/a_{m-1}),
$$

so the lemma holds in this case since lim sup $k\rightarrow\infty$ $\frac{\beta(k;\omega)}{\varphi(n^{-k})} \leq s(1/\sigma - 1).$

Suppose there exists $k_0 \in \mathbb{N}$ such that $\beta(k; \omega) \leq \ell(k) - k - 1$ holds for $k \geq k_0$. Set $r_k = 1/n^{k+1}$. Similar as above, applying Lemma [3.2](#page-7-3) to $k \geq k_0$ instead of k_j , we have

$$
\overline{\delta}_{\varphi}(z;\mu,\rho) \ge \limsup_{k \to \infty} \frac{\beta(k;\omega)}{\varphi(n^{-k+5})} \log(a_0/a_{m-1}) \ge \limsup_{k \to \infty} \frac{\beta(k;\omega)}{\varphi(n^{-k})} \log(a_0/a_{m-1}).
$$

(The last equality holds since φ is decreasing.) This proves [\(4.2\)](#page-10-0) as well as the item $(i).$

5. Remarks on $\delta_{-\log r}$ and $\delta_{\log |\log r|}$

Recall that $\delta = \delta_{-\log r}$ and $\Delta = \delta_{\log |\log r|}$ (See Example [1.1\)](#page-3-1).

5.1. **Run length.** Let $\theta \in \{0, 1, \ldots, m-1\}$. Set $\boldsymbol{\omega} = (\mathbf{x}, \mathbf{y}) \in \mathcal{D}^{\infty}$ with $\mathbf{y} = (y_i)_{i \geq 1}$, and let $l_{\theta}(k; y)$ be the run length of the letter θ in y at the position k, i.e., $l_{\theta}(k; y) = t$ if $y_k = \cdots = y_{k+t-1} = \theta$ and $y_{k+t} \neq \theta$. By convention we set $l_\theta(k; \mathbf{y}) = 0$ if $y_k \neq \theta$. It is well known that

Lemma 5.1 (Billingsley [\[5\]](#page-17-20)). Let $\Sigma = \{0, 1, \ldots, m-1\}$. Let $\mathbf{p} = (p_0, \ldots, p_{m-1})$ be a probability weight which allows $p_j = 0$. Let ν_p be the Bernoulli measure on Σ^{∞} associated with **p**, then for all $p_{\theta} \neq 0$,

$$
\nu_{\mathbf{p}}\left(\left\{\mathbf{y}\in\Sigma^{\infty};\ \limsup_{k\to\infty}\frac{l_{\theta}(k;\mathbf{y})}{-\log_{p_{\theta}}k}=1\right\}\right)=1.
$$

Definition 5.1 (Modified run length). Let $\theta_0 \in \Sigma$ be a fixed letter. Define $l_{\theta_0,\theta}(k,\mathbf{y}) = t$ if $y_{k-1} = \theta_0$, $y_k = \cdots = y_{k+t-1} = \theta$ and $y_{k+t} \neq \theta$; otherwise, set $l_{\theta_0,\theta}(k, \mathbf{y}) = 0.$

By the same argument as the proof of Lemma [5.1,](#page-11-1) one can show that

Lemma 5.2. Let $\Sigma = \{0, 1, ..., m-1\}$. Let $\mathbf{p} = (p_0, ..., p_{m-1})$ be a probability weight which allows $p_j = 0$. Let ν_p be the Bernoulli measure on Σ^{∞} associated with **p**. If $p_{\theta_0} \neq 0$ and $p_{\theta} \neq 0$, then

$$
\nu_{\mathbf{p}}\left(\left\{\mathbf{y}\in\Sigma^{\infty};\ \limsup_{k\to\infty}\frac{l_{\theta_0,\theta}(k;\mathbf{y})}{-\log_{p_{\theta}}k}=1\right\}\right)=1.
$$

Let $\mathbb P$ be the uniform Bernoulli measure on $\mathcal D^{\infty}$.

Lemma 5.3. Let $E = K(n, m, \mathcal{D})$ be a BM-carpet of non-doubling type. Assume that $a_0 > a_{m-1}$. Then

$$
\mathbb{P}\left(\left\{\boldsymbol{\omega}\in\mathcal{D}^{\infty};\ \limsup_{k\to\infty}\frac{\beta(k;\boldsymbol{\omega})}{-\log_{p_0}k/\sigma}=1\right\}\right)=1,
$$

where $p_0 = a_0 / \# \mathcal{D}$.

Proof. Pick θ_0 such that θ_0 , $\theta_0 - 1 \in \mathcal{E}$. Let $L \geq 1$ be an integer and set $\epsilon = 1/L$. Denote

$$
H_{L,1} = \left[(\mathbf{x}, \mathbf{y}) \in \mathcal{D}^{\infty} : l_0(k; \mathbf{y}) + l_{m-1}(k; \mathbf{y}) < (1+\epsilon) \log k / (-\log p_0) \text{ eventually} \right],
$$

 $H_{L,2} = [(\mathbf{x}, \mathbf{y}) \in \mathcal{D}^{\infty} : l_{\theta_0,0}(k; \mathbf{y}) \ge (1 - \epsilon) \log k / (- \log p_0) \text{ infinitely often}].$ Since $p_0 > p_{m-1}$, by Lemma [5.1](#page-11-1) we have $\mathbb{P}(H_{L,1}) = 1$. On the other hand, we have $\mathbb{P}(H_{L,2}) = 1$ by Lemma [5.2.](#page-11-2) Let $H_L = H_{L,1} \cap H_{L,2}$, then $\mathbb{P}(H_L) = 1$.

Fix $\boldsymbol{\omega} = (\mathbf{x}, \mathbf{y}) \in H_L$. For k large enough, we have

$$
\beta(k; \omega) \le l_0(\ell(k) - \beta(k; \omega) + 1; \mathbf{y}) + l_{m-1}(\ell(k) - \beta(k; \omega) + 1; \mathbf{y}) \le (1+\epsilon) \log \ell(k) / (-\log p_0)
$$

eventually since $\boldsymbol{\omega} \in H_{L,1}$. It follows that

(5.1)
$$
\limsup_{k \to \infty} \frac{\beta(k; \omega)}{-\log_{p_0} k/\sigma} \leq 1 + \epsilon.
$$

On the other hand, by $\boldsymbol{\omega} \in H_{L,2}$, there exists infinite many h such that

$$
l_{\theta_0,0}(h; \mathbf{y}) \ge (1 - \epsilon) \log h / (-\log p_0).
$$

Set $k = \sigma(h-1+(1-\epsilon)(-\log_{p_0} h))$, we obtain $\beta(k;\omega) \ge (1-\epsilon)\log h/(-\log p_0)) - 1$. It follows that

(5.2)
$$
\limsup_{k \to \infty} \frac{\beta(k; \omega)}{-\log_{p_0} k/\sigma} \ge 1 - \epsilon.
$$

Set $H = \bigcap_{L \geq 1} H_L$, then H has full measure, and each $\omega \in H$,

$$
\limsup_{k \to \infty} \frac{\beta(k; \omega)}{-\log_{p_0} k/\sigma} = 1.
$$

The lemma is proved.

5.2. Remarks on δ and Δ .

Theorem 5.1. Let $E = K(n, m, \mathcal{D})$ be a BM-carpet of non-doubling type. Assume that $a_0 > a_{m-1}$. Then for μ_E -a.e. $z \in E$, $\delta(z; \mu_E) = 0$, and the range of $\overline{\delta}(z; \mu_E)$ is $[0, \delta_{\text{max}}].$

Proof. By Lemma [5.3,](#page-11-3)

$$
\limsup_{k\to\infty}\frac{\beta(k;\pmb\omega)}{k}=0
$$

for P-a.e. $\omega \in \mathcal{D}^{\infty}$, hence $\delta(z; \mu_E) = 0$ for μ_E -a.e. $z \in E$ by [\(1.6\)](#page-3-2) in Example [1.1](#page-3-1) and Theorem [1.1.](#page-2-2)

Next, we prove that $\{\overline{\delta}(z;\mu_E); z \in E\} = [0,\delta_{\max}]$. Pick $t \in [0,\delta_{\max}]$, let $t' =$ $t/\log_n(a_0/a_{m-1})$. Since E is of non-doubling type, there exist $(i', j), (i, j + 1) \in \mathcal{D}$ and $(i_0, 0) \in \mathcal{D}$.

Take an integer $p_1 > \sigma/(1 - \sigma)$, and set $p_{k+1} = \ell(p_k)$ for $k \ge 1$. Then $p_k \to \infty$ as $k \to \infty$. Set

(5.3)
$$
\omega = \begin{pmatrix} i_0 \\ 0 \end{pmatrix}^{p_1} \prod_{k=1}^{\infty} \left[\begin{pmatrix} i \\ j+1 \end{pmatrix}^{\ell(p_k)-p_k-\lfloor t'p_k \rfloor} \begin{pmatrix} i_0 \\ 0 \end{pmatrix}^{\lfloor t'p_k \rfloor} \right],
$$

and let $z = \pi(\omega)$. Then for $k \geq p_1$,

$$
\beta(k; \omega) \leq t'k
$$
 and $\beta(p_k; \omega) = \lfloor t' p_k \rfloor$.

So by (1.6) , we have

(5.4)
$$
\bar{\delta}(z;\mu_E) = \left(\limsup_{k \to \infty} \frac{\beta(k;\omega)}{k}\right) \log_n(a_0/a_{m-1}) = t' \log_n(a_0/a_{m-1}) = t.
$$

Theorem 5.2. Let $E = K(n, m, \mathcal{D})$ be a BM-carpet of non-doubling type. Assume that $a_0 > a_{m-1}$. Then for μ_E -a.e. $z \in E$,

(5.5)
$$
\overline{\Delta}(z;\mu_E,\rho) = -\log_{p_0}(a_0/a_{m-1})
$$

where $p_0 = a_0/\#D$.

Proof. Clearly $\mu_E(\{z \in E; z = \pi(\boldsymbol{\omega}) \text{ with } \boldsymbol{\omega} \in \Omega_0 \cup \Omega_{m-1}\}) = 0$. So the theorem is a direct consequence of Lemma [5.3](#page-11-3) and [\(1.7\)](#page-3-3).

6. A point-wise doubling index γ

In this section, we define an alternative point-wise doubling index.

Let μ be a measure on a metric space X. Fix $0 < \rho < 1$. For $z \in X$, the upper doubling index of μ at z is defined by

$$
\overline{\gamma}(z;\mu,\rho) = \limsup_{r \to 0} \sup_{B_{\rho r}(z') \subset B_r(z)} \frac{\log \mu(B_{\rho r}(z'))}{\log \mu(B_r(z))};
$$

similarly, we define $\gamma(z; \mu, \rho)$. If the two values agree, we denote it by $\gamma(z; \mu, \rho)$.

Let $E = K(n, m, \mathcal{D})$ be a BM-carpet, and μ be the uniform Bernoulli measure on E. Denote $N = #D$, and denote

$$
\gamma_{\max} = \frac{\log N - (1 - \sigma) \log a_{m-1}}{\log N - (1 - \sigma) \log a_0}.
$$

Theorem 6.1. Let $E = K(n, m, \mathcal{D})$ be a BM-carpet of non-doubling type. Assume that $a_0 > a_{m-1}$. Let $0 < \rho < n^{-3}$. Then $\overline{\gamma}(z; \mu, \rho) \in [1, \gamma_{\text{max}}]$ and γ_{max} is attainable.

Proof. Let $z \in E$ and let ω be a coding of z. Pick $0 < r < 1$. Let $k = k(r)$ be the integer such that $\frac{1}{\sqrt{1-\frac{1}{n}}}$ $\frac{1}{n^{k(r)+2}} < r \leq$ 1 $\frac{1}{n^{k(r)+1}}$ and let

(6.1)
$$
\Xi_k(z) := \{Q_k(\mathbf{u}, \mathbf{v}); \ Q_k(\mathbf{u}, \mathbf{v}) \cap B_r(z) \neq \emptyset\}
$$

as in Section [3.](#page-6-0)

Let $z' \in E$ and $B_{\rho r}(z') \subset B_r(z)$. By the first assertion of Lemma [3.2,](#page-7-3) we have

$$
(6.2) \quad \frac{\log \mu(B_{\rho r}(z'))}{\log \mu(B_r(z))} \le \frac{-\log U(z; r, \rho)}{\log \mu(B_r(z))} + 1 \le \frac{-\log C_2 - \beta(k; \omega) \log(a_0/a_{m-1})}{\log(4 \cdot \max\{\mu(Q); Q \in \Xi_k(z)\})} + 1
$$

where the last inequality holds since $\Xi_k(z)$ is a cover of $B_r(z)$.

Let $Q_k(\mathbf{u}, \mathbf{v})$ be an approximate square located in a row adjacent to the row of $Q_k(\boldsymbol{\omega})$. By analysing the three cases that $\mathbf{v}|_{\ell(k)}$ equals to $\mathbf{y}|_{\ell(k)-1} * v_{\ell(k)}, \mathbf{y}|_{h-1} * v_h *$ $0^{\ell(k)-h}$, or $y|_{h-1} * v_h * (m-1)^{\ell(k)-h}$, we have

$$
\mu(Q_k(\mathbf{u}, \mathbf{v})) \le \frac{n(a^*)^{\ell(k)-k-\beta(k;\boldsymbol{\omega})} a_0^{\beta(k;\boldsymbol{\omega})}}{N^{\ell(k)}},
$$

where $a^* = \max_{j \in \mathcal{E}} a_j$. It follows that

(6.3)
$$
\frac{\log \mu(B_{\rho r}(z'))}{\log \mu(B_r(z))} \le \frac{-\log C_2 + \log \left(\frac{a_{m-1}}{a_0}\right)^{\beta(k;\omega)}}{\log(4n) + \log \frac{(a^*)^{\ell(k)-k-\beta(k;\omega)}a_0^{\beta(k;\omega)}}{N^{\ell(k)}}} + 1.
$$

It is easy to show that after removing the unimportant constants $-\log C_2$ and $log(4n)$, the right hand side of the above formula attains maximum when $\beta(k;\omega)$ = $\ell(k) - k$. Hence

(6.4)
$$
\overline{\gamma}(z;\mu,\rho) \le \limsup_{k \to \infty} \left[\log \left(\frac{a_{m-1}}{a_0} \right)^{\ell(k)-k} \left(\log \frac{a_0^{\ell(k)-k}}{N^{\ell(k)}} \right)^{-1} + 1 \right] = \gamma_{\max}.
$$

By the second assertion of Lemma [3.2,](#page-7-3) if $\beta(k; \omega) \leq \ell(k) - k - 1$, we have

$$
(6.5) \quad \sup_{z' \in E, B_{\rho n^{6}r}(z') \subset B_{n^{6}r}(z)} \frac{\log \mu(B_{\rho n^{6}r}(z'))}{\log \mu(B_{n^{6}r}(z))} = \frac{-\log U(z; n^{6}r, \rho)}{\log \mu(B_{n^{6}r}(z))} + 1
$$

$$
\geq \frac{\log C_2 - \beta(k; \omega) \log(a_0/a_{m-1})}{\log(\max\{\mu(Q); Q \in \Xi_k(z)\})} + 1
$$

where the last inequality holds since $B_{n^3r}(z)$ covers every element of $\Xi_k(z)$.

Let ω be a point in \mathcal{D}^{∞} such that $\beta(k; \omega) = \ell(k) - k - 1$ for infinitely many k. For example, the ω in [\(5.3\)](#page-12-1) will do with a slight adjustment for $t' = 1/\sigma - 1$. Let $z = \pi(\omega)$. By [\(6.5\)](#page-14-1) we have

(6.6)
$$
\overline{\gamma}(z;\mu,\rho) \ge \lim_{j \to \infty} \left(\frac{\log C_2 + \log \left(\frac{a_{m-1}}{a_0} \right)^{\ell(k_j) - k_j - 1}}{\log (a^*) + \log \frac{a_0}{N^{\ell(k_j) - k_j - 1}} + 1} \right) = \gamma_{\max}.
$$

The theorem is proved.

Remark 6.1. Under the assumption of Theorem [6.1,](#page-13-2) one can show that

- (i) If $\omega \in \Omega_0 \cup \Omega_{m-1}$, then $\gamma(z; \mu, \rho) = \max\{\gamma_{\max} \cdot \mathbf{1}_{V_E}(z), 1\}.$ (ii) $\underline{\gamma}(z;\mu,\rho) = \max\{\gamma_{\text{max}} \cdot \mathbf{1}_{V_E}(z), 1\}.$
- (iii) For μ -a.e. $z \in E$, $\overline{\gamma}(z; \mu, \rho) = 1$.

7. Proofs of Theorems [1.3,](#page-3-0) [1.4](#page-4-0) and [1.5](#page-4-1)

In this section, we always assume that $E = K(n, m, \mathcal{D}), F = K(n, m, \mathcal{D}')$ are two BM-carpets and $f : E \to F$ is a bi-Lipschitz map with Lipschitz constant c_0 . We use $(a_j)_{j=0}^{m-1}$ and $(a'_j)_{j=0}^{m-1}$ to denote the fiber sequences of $\mathcal D$ and $\mathcal D'$, respectively. Denote $N = #\mathcal{D}$ and $N' = #\mathcal{D}'$. Denote $s = #\{j; a_j > 0\}$ and $s' = #\{j; a'_j > 0\}$. Let

(7.1)
$$
a_1^* > a_2^* > \cdots > a_{\tilde{p}}^*
$$

be the distinct non-zero terms of $(a_j)_{j=0}^{m-1}$, and let M_i be the occurrence of a_i^* , let

$$
(7.2) \t\t b_1^* > b_2^* > \cdots > b_{\tilde{q}}^*
$$

be the distinct non-zero terms of $(a'_j)_{j=0}^{m-1}$, and let M'_i be the occurrence of b_i^* .

Denote by μ_E and μ_F the uniform Bernoulli measures of E and F respectively. Huang *et al.* [\[11\]](#page-17-14) obtained the following Theorem, see also Rao *et al.* [\[18\]](#page-17-10).

Theorem 7.1 ([\[11,](#page-17-14) [18\]](#page-17-10)). Let E and F be two BM-carpets. If $f : E \rightarrow F$ is a bi-Lipschitz map, then $\mu_F \circ f$ is equivalent to μ_E , namely, there exists $\zeta > 0$ such that

(7.3)
$$
\zeta^{-1} \mu_E(A) \leq \mu_F(f(A)) \leq \zeta \mu_E(A)
$$

for any Borel set $A \subset E$. Consequently, μ_E and μ_F have the same multifractal spectrum.

By the above result, Rao *et al.* [\[18\]](#page-17-10) characterized when μ_E and μ_F have the same multifractal spectrum, see also Banaji et al. [\[2\]](#page-17-6).

Theorem 7.2 ([\[2,](#page-17-6) [18\]](#page-17-10)). Let $E = K(n, m, \mathcal{D})$ and $F = K(n, m, \mathcal{D}')$ be two BMcarpets. Then μ_E and μ_F have the same multifractal spectrum if and only if

(7.4)
$$
\tilde{p} = \tilde{q}
$$
 and $\frac{a_i^*}{b_i^*} = \left(\frac{M_i'}{M_i}\right)^{1/\sigma} = \left(\frac{s'}{s}\right)^{1/\sigma} = \left(\frac{N}{N'}\right)^{1/(1-\sigma)}$, for $i = 1, ..., \tilde{p}$.

Proof of Theorem [1.3](#page-3-0). Without loss of generality, we assume that $a_0 > a_{m-1} > 0$ and $a'_0 > a'_{m-1} > 0$. Let ζ be the constant in Theorem [7.1](#page-15-0) with respect to E and F. Let $f : E \to F$ be a bi-Lipschitz map with a Lipschitz constant c_0 .

Firstly, we prove [\(1.9\)](#page-3-4). Pick any $z \in E$. Let $0 < r < 1$. Then

$$
f(B_{c_0^{-1}r}(z)) \subset B_r(f(z)) \subset f(B_{c_0r}(z)).
$$

By Theorem [7.1,](#page-15-0) we have

(7.5)
$$
\zeta^{-1} \mu_E(B_{c_0^{-1}r}(z)) \leq \mu_F(B_r(f(z))) \leq \zeta \mu_E(B_{c_0r}(z)).
$$

Let $0 < \rho < n^{-3}c_0^{-2}$. Pick any $\omega' \in F$ satisfying $B_{\rho r}(\omega') \subset B_r(f(z))$. Similar as [\(7.5\)](#page-15-1), we have

$$
(7.6) \qquad \zeta^{-1} \mu_E(B_{c_0^{-1}\rho r}(f^{-1}(\omega'))) \leq \mu_F(B_{\rho r}(\omega')) \leq \zeta \mu_E(B_{c_0\rho r}(f^{-1}(\omega'))).
$$

By (7.5) and (7.6) , we have

$$
\log \left(\frac{\mu_F(B_r(f(z)))}{\mu_F(B_{\rho r}(\omega'))} \right) \leq \log \zeta^2 + \log \left(\frac{\mu_E(B_{c_0 r}(z))}{\mu_E(B_{c_0^{-1}\rho r}(f^{-1}(\omega')))} \right).
$$

Since $B_{\rho r}(\omega') \subset B_r(f(z))$, we have $B_{c_0^{-1}\rho r}(f^{-1}(\omega')) \subset B_{c_0r}(z)$, so

$$
\overline{\delta}_{\varphi}(f(z); \mu_F, \rho) \leq \overline{\delta}_{\varphi}(z; \mu_E, c_0^{-2} \rho);
$$

by symmetry, we have $\overline{\delta}_{\varphi}(z;\mu_E,\rho c_0^2) \leq \overline{\delta}_{\varphi}(f(z);\mu_F,\rho)$. Finally, since $\overline{\delta}_{\varphi}$ is irrelevant with ρ , we obtain

$$
\overline{\delta}_{\varphi}(z;\mu_E) = \overline{\delta}_{\varphi}(f(z); \mu_F).
$$

Clearly, the above equality also holds if we replace δ_{φ} by $\underline{\delta}_{\varphi}$. [\(1.9\)](#page-3-4) is proved.

Let $\delta = \delta_{-\log r}$, then $\underline{\delta}(z;\mu_E) = \delta_{\max} \cdot \mathbf{1}_{V_E}(z)$. Hence, $z \in V_E$ if and only if $\underline{\delta}(z;\mu_E) > 0$, if and only if $\underline{\delta}(f(z);\mu_F) > 0$, if and only if $f(z) \in V_F$. This proves $V_F = f(V_F)$. In particular, $V_E = \emptyset$ if and only if $V_F = \emptyset$, that is, E satisfies the VSC if and only if F does. VSC if and only if F does.

Remark 7.1. Under the assumption of Theorem [1.3,](#page-3-0) we also have

(7.7)
$$
\overline{\gamma}(z;\mu_E) = \overline{\gamma}(f(z);\mu_F).
$$

Proof of Theorem [1.4](#page-4-0). Without loss of generality, we assume that $a_0 > a_{m-1} > 0$ and $a'_0 > a'_{m-1} > 0$. By Theorem [5.1](#page-12-0) and Theorem [1.3,](#page-3-0) we have $\delta_{E,\text{max}} = \delta_{F,\text{max}}$, then

(7.8)
$$
\frac{a_0}{a_{m-1}} = \frac{a'_0}{a'_{m-1}}.
$$

Similarly, by Theorem [6.1](#page-13-2) and Remark [7.1](#page-16-0) we have $\gamma_{E,\text{max}} = \gamma_{F,\text{max}}$, thus

$$
\frac{(1-\sigma)\log(a_0/a_{m-1})}{\log N - (1-\sigma)\log a_0} = \frac{(1-\sigma)\log(a'_0/a'_{m-1})}{\log N' - (1-\sigma)\log a'_0}
$$

by using $\gamma_{E,\text{max}} - 1 = \gamma_{F,\text{max}} - 1$, summing up with [\(7.8\)](#page-16-1) implies that

(7.9)
$$
\frac{a_0}{a'_0} = \frac{a_{m-1}}{a'_{m-1}} = \left(\frac{N}{N'}\right)^{\frac{1}{1-\sigma}}.
$$

By Theorem [5.2,](#page-13-0) we have

$$
\overline{\Delta}(z;\mu_E,\rho) = -\log_{p_0}(a_0/a_{m-1}) \text{ for } \mu_E\text{-a.e. } z \in E,
$$

$$
\overline{\Delta}(f(z);\mu_F,\rho) = -\log_{p'_0}(a'_0/a'_{m-1}) \text{ for } \mu_F\text{-a.e. } f(z) \in F,
$$

where $p'_0 = a'_0/N'$. So $\log_{p_0}(a_0/a_{m-1}) = \log_{p'_0}(a'_0/a'_{m-1})$ by [\(1.9\)](#page-3-4) with $\overline{\Delta} = \overline{\delta}_{\log|\log r|}$ and it follows that

$$
\frac{a_0}{N} = p_0 = p'_0 = \frac{a'_0}{N'},
$$

which together with [\(7.9\)](#page-16-2) imply $N = N'$. By [\(7.4\)](#page-15-3) and (7.9), the theorem is proved. \Box

Proof of Theorem [1.5](#page-4-1). Let E and F be two BM-carpets and $E \sim F$.

If E and F are of non-doubling type, the theorem holds by Theorem [1.4.](#page-4-0) If E and F do not possess vacant rows, then $s = s' = m$, thus $N = N'$ by [\(7.4\)](#page-15-3) in Theorem [7.2,](#page-15-4) the theorem holds in this case. Hence, in the following, we always assume that $E, F \in \mathcal{M}_{v,d}.$

If E and F are not totally disconnected, since both E and F possess vacant rows, all connected components of E and F are horizontal line segments of length 1, then $a_1^* = (a_1')^* = n$, thus $N = N'$ by [\(7.4\)](#page-15-3) in Theorem [7.2,](#page-15-4) and the theorem holds in this case. This proves that the theorem holds provided $E, F \notin \mathcal{M}_{t,v,d}$.

Finally, by [\[18,](#page-17-10) Theorem 1.4], the theorem holds in the case that $E, F \in \mathcal{M}_{t,v,d}$
d log m/log n is irrational. The theorem is proved and $\log m / \log n$ is irrational. The theorem is proved.
