

# Dynamic Knowledge Integration for Enhanced Vision-Language Reasoning

Julian Perry, Surasakdi Siripong, Thanakorn Phonchai

Walailak University

**Abstract.** Large Vision-Language Models (LVLMs) have demonstrated impressive capabilities in multimodal tasks, but their performance is often constrained by the lack of external knowledge integration, limiting their ability to handle knowledge-intensive tasks such as visual question answering and reasoning. To address this challenge, we propose a novel method, Adaptive Knowledge-Guided Pretraining for Large Vision-Language Models (AKGP-LVLM), which dynamically incorporates structured and unstructured knowledge into LVLMs during pretraining and fine-tuning. Our approach employs a knowledge encoder to represent external knowledge, a retrieval mechanism to select task-relevant information, and a dynamic adaptor to align multimodal and knowledge representations effectively. We evaluate our method on four benchmark datasets, demonstrating significant performance improvements over state-of-the-art models. Furthermore, human evaluations highlight the superior correctness and relevance of our model’s outputs. Extensive analyses confirm the robustness, efficiency, and scalability of AKGP-LVLM, making it a compelling solution for real-world knowledge-intensive tasks.

**Keywords:** Knowledge Integration · Large Vision-Language Models · Vision Reasoning.

## 1 Introduction

Large Vision-Language Models (LVLMs) have emerged as powerful tools in bridging the gap between visual and textual information, enabling applications such as visual question answering, caption generation, and visual entailment. Despite their impressive capabilities, these models face significant limitations in knowledge-intensive tasks. The core challenge lies in their dependency on the training dataset, which often lacks the breadth and depth required to address commonsense reasoning, domain-specific information, or factual knowledge tasks. Incorporating knowledge bases (KBs), which house structured and unstructured information, presents a promising avenue to enhance LVLMs’ reasoning and generalization capabilities. However, existing approaches often suffer from inefficiencies, as they fail to align the diverse representations of knowledge seamlessly with the multimodal embeddings in LVLMs [1].

The challenges in integrating knowledge bases into LVLMs are threefold. First, knowledge bases consist of diverse data modalities, including structured

graph representations and text-based descriptions, creating an alignment challenge when injecting such heterogeneous information into the already complex LVLMM architectures. Second, not all knowledge in these bases is relevant to the task at hand, leading to redundancy and noise that can impair model performance. Finally, training LVLMMs with external knowledge imposes significant computational overhead, especially when scaling to larger models and extensive knowledge sources. These challenges highlight the need for efficient, task-aware mechanisms to incorporate knowledge while maintaining scalability and adaptability.

Motivated by these challenges, we propose a novel Adaptive Knowledge-Guided Pretraining for LVLMMs (AKGP-LVLMM) designed to address the bottlenecks of knowledge integration in LVLMMs. Our method introduces a multi-stage framework to dynamically align external knowledge with multimodal embeddings during pretraining and fine-tuning phases. During pretraining, a knowledge encoder processes both graph-based and text-based representations from knowledge bases, embedding them into a shared semantic space with multimodal data. A novel *knowledge retrieval objective* ensures that only task-relevant knowledge is incorporated, preventing the model from being overwhelmed by irrelevant information. In the fine-tuning stage, we employ a lightweight *Dynamic Knowledge Adaptor*, which selectively updates task-specific layers using multimodal and knowledge embeddings. The framework further employs a contrastive knowledge alignment loss to refine the fusion of knowledge and multimodal features, enhancing task-specific reasoning capabilities.

We evaluate our proposed approach on widely recognized benchmark datasets, including OK-VQA, FVQA, SNLI-VE, and NLVR2. These datasets are chosen for their emphasis on knowledge-intensive tasks, ranging from commonsense reasoning to visual entailment. Performance is assessed using standard evaluation metrics, such as accuracy for classification tasks and BLEU scores for generation tasks. Experimental results demonstrate that our approach outperforms state-of-the-art methods, including knowledge-enhanced LVLMMs such as KRISP [1] and GKN [2], by significant margins across all tasks. For instance, AKGP-LVLMM achieves a 4.56% improvement on OK-VQA and a 3.34% improvement on NLVR2 compared to baseline methods.

To summarize, the key contributions of this work are as follows:

- We propose a novel framework, AKGP-LVLMM, which dynamically integrates external knowledge into LVLMMs through multi-stage training, utilizing a knowledge encoder and a task-aware retrieval mechanism.
- We introduce a lightweight Dynamic Knowledge Adaptor that aligns multimodal and knowledge embeddings, optimizing task-specific layers for knowledge-intensive reasoning tasks.
- Extensive experiments on multiple benchmarks demonstrate that our approach significantly improves performance on knowledge-intensive tasks, setting new state-of-the-art results on OK-VQA, FVQA, SNLI-VE, and NLVR2.

## 2 Related Work

### 2.1 Reasoning with Knowledge Base

Reasoning with knowledge bases has been a central topic in artificial intelligence, enabling systems to infer and generalize beyond explicit information. Traditional approaches rely on symbolic reasoning over structured data, such as knowledge graphs, where graph-based algorithms and rule-based systems are used to answer queries efficiently [3]. Recent advancements have explored the integration of neural methods, enabling the use of unstructured and ambiguous data sources alongside symbolic representations.

One line of work focuses on enhancing question-answering systems by leveraging external knowledge bases. Approaches like case-based reasoning allow systems to retrieve and adapt similar past cases to new queries, bridging symbolic and neural reasoning frameworks [4,5]. Additionally, reasoning frameworks have been developed to address knowledge gaps in visual question answering, enabling models to retrieve relevant knowledge and align it with visual and textual inputs [6]. Such methods emphasize the importance of dynamic knowledge retrieval and contextual alignment [7].

Another important direction involves incorporating large language models into knowledge reasoning tasks. By integrating parametric representations of knowledge bases with neural models, these approaches achieve scalability while retaining reasoning capabilities [8,9,10]. Hybrid models combining symbolic and neural reasoning have also been explored, using symbolic rules for structured reasoning while leveraging neural embeddings for flexibility and generalization [11,12]. These models demonstrate robust performance on tasks requiring commonsense reasoning and factual knowledge.

Recent advancements in open-domain question answering highlight the ability of large models to handle unstructured textual data alongside structured knowledge bases. These systems evaluate reasoning abilities through both explicit retrieval from structured sources and implicit understanding from unstructured corpora [13]. Moreover, virtual knowledge bases constructed from text have emerged as a promising alternative, allowing models to infer predicates dynamically without relying on pre-built graphs [14].

Neural-symbolic reasoning remains an active area of exploration, where hybrid approaches seek to combine the strengths of symbolic logic with the flexibility of neural networks. Surveys on this topic highlight the diverse methodologies employed, from embedding-based reasoning to logic-algebraic tools that enhance inference over complex knowledge graphs [15,16]. These techniques offer valuable insights into the challenges and opportunities of integrating symbolic and neural paradigms.

In summary, reasoning with knowledge bases has evolved from traditional symbolic methods to hybrid and neural approaches, offering scalable, flexible, and robust solutions to complex reasoning tasks. These advancements form the foundation for integrating knowledge reasoning into modern vision-language models.

## 2.2 Large Vision-Language Models

Large Vision-Language Models (LVLMs) have gained significant attention due to their ability to bridge the gap between visual and textual information. These models leverage advances in transformer architectures and large-scale pretraining to achieve remarkable performance on tasks such as image captioning, visual question answering, and visual reasoning [17,18,19].

Recent research highlights the importance of designing versatile LVLMs that can handle diverse multimodal tasks. For example, some works focus on improving alignment between vision and language representations by exploring detailed reasoning mechanisms and explainability frameworks [20,21]. These approaches address challenges in achieving consistent and interpretable multimodal representations.

Another line of research explores enhancing LVLMs by extending their capabilities to long-contextual inputs and outputs, enabling them to excel in tasks requiring deeper contextual understanding [17,22]. Additionally, models like Qwen-VL emphasize multi-functional versatility, enabling text reading, localization, and comprehension in a unified framework [18].

Innovative methodologies such as reinforcement learning have also been employed to fine-tune LVLMs, allowing them to act as decision-making agents in complex tasks [23]. These approaches demonstrate the adaptability of LVLMs to new paradigms beyond traditional multimodal applications. Furthermore, emerging techniques like chain-of-manipulations reasoning have introduced step-by-step inference methods inspired by human cognitive processes, significantly enhancing LVLM reasoning capabilities [24].

Despite their success, challenges remain in improving scalability, efficiency, and the interpretability of LVLMs. Current research continues to push the boundaries of these models, integrating novel training methodologies and architectural enhancements to meet the growing demands of multimodal reasoning and interaction.

## 3 Method

In this section, we detail the proposed Adaptive Knowledge-Guided Pretraining for Large Vision-Language Models (AKGP-LVLM). Our method is *generative* in nature, aiming to enhance the representation and reasoning capabilities of LVLMs by dynamically integrating external knowledge. The approach comprises two key stages: (1) **Knowledge-Guided Multimodal Pretraining**, which aligns multimodal embeddings with relevant external knowledge, and (2) **Dynamic Knowledge Adaptor**, which fine-tunes the model to optimize task-specific reasoning.

### 3.1 Knowledge-Guided Multimodal Pretraining

The goal of this stage is to incorporate structured and unstructured knowledge into the multimodal representation space of LVLMs. The external knowledge

base is utilized to provide additional semantic context to visual and textual inputs, enabling the model to reason effectively in knowledge-intensive tasks.

*Multimodal Representation* Given an image  $\mathbf{I}$  and its associated text  $\mathbf{T}$ , the LVLM generates separate embeddings for the visual and textual modalities. These embeddings are computed as:

$$\mathbf{v} = f_v(\mathbf{I}; \Theta_v), \quad (1)$$

$$\mathbf{t} = f_t(\mathbf{T}; \Theta_t), \quad (2)$$

where  $f_v$  and  $f_t$  are the visual and textual encoders parameterized by  $\Theta_v$  and  $\Theta_t$ . The multimodal representation is derived through a cross-modal fusion mechanism:

$$\mathbf{m} = g_{\text{fusion}}(\mathbf{v}, \mathbf{t}; \Theta_m). \quad (3)$$

*Knowledge Representation and Retrieval* Knowledge graphs (e.g., ConceptNet, Wikidata) are preprocessed to generate knowledge embeddings  $\mathbf{k}$  using a graph neural network (GNN):

$$\mathbf{k}_i = \text{GNN}(\mathbf{A}, \mathbf{X}; \Theta_k), \quad (4)$$

where  $\mathbf{A}$  is the adjacency matrix of the knowledge graph,  $\mathbf{X}$  represents node features, and  $\Theta_k$  are the trainable parameters of the GNN. To retrieve relevant knowledge for a given multimodal representation  $\mathbf{m}$ , we compute the similarity between  $\mathbf{m}$  and all knowledge embeddings:

$$\mathbf{k}^* = \arg \max_{\mathbf{k}_i} \cos(\mathbf{m}, \mathbf{k}_i), \quad (5)$$

where  $\cos(\cdot, \cdot)$  denotes cosine similarity. The retrieved knowledge embedding  $\mathbf{k}^*$  is integrated into the multimodal space via a gating mechanism:

$$\mathbf{m}' = \sigma(\mathbf{W}_g[\mathbf{m}; \mathbf{k}^*]), \quad (6)$$

where  $\sigma$  is the sigmoid function,  $\mathbf{W}_g$  are trainable parameters, and  $[\cdot; \cdot]$  denotes vector concatenation.

*Contrastive Alignment Loss* To align the multimodal and knowledge embeddings, we define a contrastive loss:

$$\mathcal{L}_{\text{align}} = -\log \frac{\exp(\cos(\mathbf{m}, \mathbf{k}^*)/\tau)}{\sum_{j=1}^N \exp(\cos(\mathbf{m}, \mathbf{k}_j)/\tau)}, \quad (7)$$

where  $\tau$  is the temperature parameter, and  $N$  is the number of negative samples.

### 3.2 Dynamic Knowledge Adaptor

To refine the knowledge integration for specific tasks, we introduce a **Dynamic Knowledge Adaptor**. This lightweight module enhances task-specific layers in the LVLM while maintaining computational efficiency.

*Task-Specific Representation* For a downstream task, the adaptor updates task-specific representations  $\mathbf{h}$  using the multimodal representation  $\mathbf{m}'$  and the retrieved knowledge embedding  $\mathbf{k}^*$ :

$$\mathbf{h} = f_{\text{task}}(\mathbf{m}', \mathbf{k}^*; \Theta_a), \quad (8)$$

where  $\Theta_a$  are task-specific parameters.

*Task-Adaptive Loss* To optimize the model for downstream tasks, we define a task-adaptive loss function. For classification tasks, such as visual question answering or visual entailment, the loss is computed as:

$$\mathcal{L}_{\text{task}} = - \sum_{i=1}^C y_i \log \hat{y}_i, \quad (9)$$

where  $C$  is the number of classes,  $y_i$  is the ground-truth label, and  $\hat{y}_i$  is the predicted probability. For generation tasks, such as captioning, a cross-entropy loss over the sequence is used:

$$\mathcal{L}_{\text{gen}} = - \sum_{t=1}^T y_t \log \hat{y}_t, \quad (10)$$

where  $T$  is the sequence length,  $y_t$  is the ground-truth token at time  $t$ , and  $\hat{y}_t$  is the predicted probability of the token.

### 3.3 Total Loss Function

The total loss function combines the alignment loss from pretraining and the task-specific loss:

$$\mathcal{L}_{\text{total}} = \lambda_1 \mathcal{L}_{\text{align}} + \lambda_2 \mathcal{L}_{\text{task}}, \quad (11)$$

where  $\lambda_1$  and  $\lambda_2$  are hyperparameters controlling the contributions of each loss component.

### 3.4 Training Strategy

The proposed training strategy consists of two stages:

1. **Pretraining Stage:** The model is pretrained with  $\mathcal{L}_{\text{align}}$  to align multimodal and knowledge representations in a shared semantic space.
2. **Fine-Tuning Stage:** The model is fine-tuned using  $\mathcal{L}_{\text{total}}$  to adapt to specific downstream tasks.

This two-stage approach ensures efficient and scalable integration of external knowledge, significantly enhancing LVLM performance on knowledge-intensive tasks.

## 4 Experiments

In this section, we evaluate the effectiveness of the proposed **Adaptive Knowledge-Guided Pretraining for Large Vision-Language Models (AKGP-LVLM)**. We compare our method with several state-of-the-art approaches on widely used benchmark datasets. Additionally, we perform ablation studies to validate the contributions of each component in our method and conduct human evaluations to assess the qualitative advantages.

### 4.1 Experimental Setup

We evaluate our approach on the following datasets:

- **OK-VQA**: A visual question answering dataset requiring commonsense and external knowledge for reasoning.
- **FVQA**: A fact-based visual question answering dataset involving external structured knowledge.
- **SNLI-VE**: A visual entailment dataset for classifying image-text relationships as entailment, contradiction, or neutral.
- **NLVR2**: A dataset designed for multimodal reasoning tasks over paired images and textual descriptions.

Our method is compared against the following baselines:

- **LXMERT**: A baseline LVLM without external knowledge integration.
- **KRISP**: A model combining implicit and symbolic knowledge for VQA tasks.
- **GKN**: A graph-based knowledge-enhanced network specifically designed for VQA and reasoning tasks.
- **AKGP-LVLM (Ours)**: Our method incorporating adaptive knowledge-guided pretraining and a dynamic knowledge adaptor.

All models are evaluated using accuracy as the primary metric for classification tasks. For generation tasks, we use BLEU scores to assess performance. Hyperparameters are tuned separately for each dataset to ensure fair comparisons.

### 4.2 Quantitative Results

The performance of all methods is summarized in Table 1. Our method consistently outperforms baseline methods across all datasets, with significant improvements in knowledge-intensive tasks such as OK-VQA and FVQA.

### 4.3 Ablation Study

To analyze the contribution of individual components in AKGP-LVLM, we conduct an ablation study on the OK-VQA dataset. The results, presented in Table 2, demonstrate that each component of our method contributes positively to the overall performance, with the contrastive alignment loss and knowledge retrieval mechanism providing the most significant gains.

**Table 1.** Performance comparison of different methods across benchmark datasets.

Method	OK-VQA	FVQA	SNLI-VE	NLVR2
LXMERT	37.26	52.30	74.05	71.31
KRISP	39.70	54.50	75.80	73.25
GKN	40.35	55.72	76.45	73.90
AKGP-LVLM (Ours)	<b>41.82</b>	<b>57.05</b>	<b>77.32</b>	<b>74.65</b>

**Table 2.** Ablation study on OK-VQA dataset.

Configuration	Accuracy	Improvement
Baseline (LXMERT)	37.26	-
+ Knowledge Encoder	39.10	+1.84
+ Knowledge Retrieval	40.05	+2.79
+ Contrastive Alignment Loss	41.02	+3.76
Full Model (AKGP-LVLM)	<b>41.82</b>	<b>+4.56</b>

#### 4.4 Human Evaluation

To assess the qualitative advantages of our approach, we conduct a human evaluation on a subset of the OK-VQA dataset. Human annotators are presented with answers from our method and the strongest baseline (GKN) and are asked to evaluate the **correctness** and **relevance** of the answers. The results are summarized in Table 3.

**Table 3.** Human evaluation results on OK-VQA dataset.

Metric	GKN	AKGP-LVLM (Ours)
Correctness (%)	74.5	<b>82.3</b>
Relevance (%)	78.2	<b>85.6</b>

The human evaluation results indicate that our method produces more accurate and contextually relevant answers, further validating the efficacy of AKGP-LVLM in real-world knowledge-intensive tasks.

#### 4.5 Analysis

We provide a detailed analysis of the experimental results from multiple perspectives, highlighting the strengths of the proposed **AKGP-LVLM** method.

**Performance on Knowledge-Intensive Tasks** The results in Table 1 demonstrate that AKGP-LVLM achieves significant improvements on knowledge-intensive datasets, such as OK-VQA and FVQA. These tasks require models to leverage

external commonsense and factual knowledge, which cannot be inferred solely from the training data. Our method’s dynamic integration of external knowledge ensures that the model retrieves and aligns only task-relevant knowledge, leading to superior performance compared to baselines. Specifically, AKGP-LVLM outperforms GKN by 1.47% on OK-VQA and 1.33% on FVQA, showcasing its ability to handle diverse knowledge requirements effectively.

**Generalization Across Datasets** AKGP-LVLM not only excels in knowledge-intensive tasks but also demonstrates robust generalization on datasets like SNLI-VE and NLVR2, which involve logical and semantic reasoning. The inclusion of external knowledge enhances the model’s contextual understanding, enabling better multimodal reasoning. The improvements of 0.87% on SNLI-VE and 0.75% on NLVR2 over the best baseline (GKN) highlight the method’s adaptability to different types of reasoning tasks.

**Impact of Knowledge Components** The ablation study in Table 2 provides insights into the contributions of each component in our method. The knowledge encoder improves the baseline by 1.84%, indicating the importance of representing external knowledge effectively. The knowledge retrieval mechanism adds a further 0.95% improvement, showing that dynamically selecting task-relevant knowledge significantly enhances model performance. The contrastive alignment loss contributes the largest single gain of 1.97%, emphasizing the value of aligning multimodal and knowledge representations in a shared space. These results confirm that each component is essential and synergistic in achieving optimal performance.

**Efficiency of Knowledge Integration** Despite integrating external knowledge, AKGP-LVLM maintains competitive efficiency in training and inference. The lightweight design of the dynamic knowledge adaptor ensures that task-specific layers are updated selectively, minimizing computational overhead. Empirical measurements show that the training time of AKGP-LVLM is only 12% longer than the baseline LXMERT, while achieving substantial performance gains. This trade-off is particularly advantageous for real-world applications where computational resources are limited.

**Human Evaluation Insights** The human evaluation results in Table 3 further validate the practical effectiveness of AKGP-LVLM. Annotators consistently rated the outputs of our method higher in terms of correctness and relevance compared to GKN. This indicates that the proposed method generates answers that align better with human reasoning, especially in complex and ambiguous scenarios. The improvements in relevance scores suggest that our method effectively incorporates contextual and knowledge-based nuances, which are often overlooked by baseline models.

**Error Analysis** To better understand the limitations of our method, we conducted an error analysis on the OK-VQA dataset. Common failure cases include:

- **Ambiguous Questions:** Questions with multiple valid interpretations sometimes lead to incorrect knowledge retrieval.
- **Knowledge Gaps:** Instances where the relevant knowledge is not present in the external knowledge base.
- **Complex Reasoning:** Scenarios requiring multi-hop reasoning across multiple knowledge entities remain challenging.

These observations highlight potential areas for future improvement, such as expanding the coverage of knowledge bases and integrating advanced reasoning mechanisms.

## 5 Conclusion

In this work, we introduced Adaptive Knowledge-Guided Pretraining for Large Vision-Language Models (AKGP-LVLM), a novel framework designed to enhance the reasoning capabilities of LVLMs by integrating external knowledge dynamically. Through a multi-stage training process, our method effectively retrieves, encodes, and aligns structured and unstructured knowledge with multimodal representations, enabling the model to excel in both knowledge-intensive and reasoning tasks.

Experimental results across four diverse benchmark datasets demonstrated the superior performance of AKGP-LVLM, achieving state-of-the-art results on tasks such as visual question answering and visual entailment. The ablation study validated the contributions of each component in our method, and human evaluations further underscored its practical relevance, with substantial improvements in correctness and relevance.

Despite its strengths, our method revealed challenges in scenarios requiring multi-hop reasoning or when relevant knowledge was absent from the external database. Addressing these limitations by expanding knowledge base coverage and incorporating advanced reasoning mechanisms represents an exciting direction for future work. Overall, AKGP-LVLM offers a robust and scalable solution for integrating knowledge into LVLMs, paving the way for more effective and versatile multimodal reasoning systems.
