

GRAND VARIABLE HERZ-MORREY TYPE BESOV SPACES AND TRIEBEL-LIZORKIN SPACES

MEHVISH SULTAN¹ AND BABAR SULTAN^{2*}

ABSTRACT. In the article, the boundedness of vector-valued sublinear operators in grand variable Herz-Morrey spaces $M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta}(\mathbb{R}^n)$ are obtained. Then grand variable Herz-Morrey type Besov and Triebel-Lizorkin spaces are defined. We will also prove the equivalent quasi-norms by Peetre's maximal operators in these spaces.

1. INTRODUCTION

In variable exponent spaces, the Hardy-Littlewood maximal operator's boundedness is crucial. For instance, it is well known that if the Hardy-Littlewood maximal operator is bounded in variable exponent Lebesgue space, then numerous conclusions from classical harmonic analysis and function theory also apply for the variable exponent case; see [5–7, 28]. Moreover, a variety of variable exponent spaces are presented, including: Bessel potential spaces, Besov and Triebel-Lizorkin spaces, Hardy spaces, Herz spaces, grand variable Herz spaces, grand variable weighted Herz spaces, Herz-Morrey spaces, grand variable Herz-Morrey spaces, Morrey spaces, Morrey type Besov and Triebel-Lizorkin spaces, Triebel-Lizorkin-Morrey spaces, Triebel-Lizorkin-Morrey spaces, and so forth; see [1–3, 8, 12, 13, 15, 18, 20, 20, 21, 21, 29, 31, 34, 35, 38–43, 54, 55] and references therein. As you can see from [14, 23–26], numerous conclusions about the boundedness of sublinear operators in these spaces have been established.

A sublinear operator T satisfy the size condition

$$|Tg(x)| \leq C \int_{\mathbb{R}^n} |x-y|^{-n} |g(y)| dy$$

for all $g \in L^1_{loc}(\mathbb{R}^n)$ with compact support and a.e. $x \notin \text{supp } g$. Then, T is bounded on the grand variable Herz-Morrey spaces and the homogeneous and non-homogeneous Herz spaces (see the monographs [27, 37]). L. Tang and D. Yang then expand these conclusions for the weighted vector-valued situation in [48]. Herz type Besov and Triebel-Lizorkin spaces with variable exponent $\dot{K}_{p(\cdot)}^{\eta,q}(\mathbb{R}^n)$ were introduced by C. Shi and the second author in [35]. $K_{p(\cdot)}^{\eta,q}(\mathbb{R}^n)$ and $B_\kappa^s \dot{K}_{p(\cdot)}^{\eta,q}(\mathbb{R}^n)$ and $B_\kappa^s K_{p(\cdot)}^{\eta,q}(\mathbb{R}^n)$ F_κ^s and F_κ^s and their corresponding quasi-norms. For the Besov and Triebel-Lizorkin spaces of constant exponent Herz type, we direct the reader to [50–53]. M. Izuki [16] used variable exponent $M\dot{K}_{q,p(\cdot)}^{\eta,\lambda}(\mathbb{R}^n)$ to get the vector-valued boundedness for certain sublinear operators that meet the size requirement on Herz-Morrey spaces. Sultan et al. [44] presented the concept of grand variable Herz-Morrey spaces; see [45–47] for additional findings on these spaces. The boundedness of vector-valued Hardy-Littlewood maximal operators in Herz spaces with variable exponents was established by the authors in [9]. Peetre's maximal operators were used to characterize Herz type Besov and Triebel-Lizorkin spaces with variable exponents.

The current research examines the boundedness of vector-valued Hardy-Littlewood maximal operators on grand variable Herz-Morrey type Besov and Triebel-Lizorkin spaces, drawing inspiration from the aforementioned publications. The paper is organised as follows. We provide some conventions in the remainder of the section. Our primary findings, which are a generalization of related findings in [16] and [9, 10], will be presented in Section 2. We provide evidence for our findings in Section 3.

2. MAIN RESULTS

The n -dimensional real Euclidean space is denoted as \mathbb{R}^n , as is customary. Let \mathcal{A} be a measurable subset of \mathbb{R}^n . Throughout this paper, C, c are always positive constants which may vary from line to line. For a

Key words and phrases. Grand variable Herz-Morrey space, Besov space, Triebel-Lizorkin space, maximal operator.

measurable set S , $|S|$ denote its Lebesgue measure and $\mathbf{1}_S$ denote its characteristic function. We write $u \leq v$, if $u \leq cv$, and if $u \leq v$ and $v \leq u$, then $u \sim v$. We assume a measurable function on \mathbb{R}^n by the variable exponents. For every $t \in \mathbb{Z}$, we denote $B_t = B(0, 2^t) = \{x \in \mathbb{R}^n : |x| < 2^t\}$. After deducting B_{t-1} from R_t , $\mathbf{1}_{R_t} = \mathbf{1}_t$. By $\mathcal{P}(\mathbb{R}^n)$ we denote the subset of variable exponents with range $[1, \infty]$. Let $q_- := \text{ess inf}_{y \in \mathcal{A}} q(y) > 1$ and $q_+ := \text{ess sup}_{y \in \mathcal{A}} q(y) < \infty$, then we have

$$1 \leq q_-(\mathcal{A}) \leq q(y) \leq q_+(\mathcal{A}) < \infty. \quad (2.1)$$

The Notation B is the ball such that $B(z, r) := \{y \in \mathcal{A} : |z - y| < r\}$. Now variable Lebesgue space $L^{q(\cdot)}(\mathcal{A})$ is given as

$$L^{p(\cdot)}(\mathcal{A}) = \left\{ g \text{ is measurable} : \int_{\mathcal{A}} \left(\frac{|g(z)|}{\lambda} \right)^{q(z)} dz < \infty \text{ where } \lambda \text{ is a constant} \right\}.$$

Lebesgue space is equipped with the norm

$$\|g\|_{L^{q(\cdot)}(\mathcal{A})} = \inf \left\{ \lambda > 0 : \int_{\mathcal{A}} \left(\frac{|g(z)|}{\lambda} \right)^{q(z)} dz \leq 1 \right\}.$$

The Hardy-Littlewood maximal operator M for $g \in L^1_{\text{loc}}(\mathcal{A})$ is defined as

$$Mg(z) := \sup_{0 < r} \frac{1}{r^n} \int_{B(z, r)} |g(z)| dz \quad (z \in \mathcal{A}).$$

The notion of $\mathcal{B}(\mathcal{A})$ denote the collection of $q(\cdot) \in \mathcal{P}(\mathcal{A})$ such that M is bounded on $L^{q(\cdot)}(\mathcal{A})$. Let $x, y \in \mathcal{A}$ with $|x - y| \leq \frac{1}{2}$ and $q : \mathcal{A} \mapsto (0, \infty)$. Now log-Hölder continuity condition (or Dini-Lipschitz condition) is given as

$$\frac{C}{-\ln|x - y|} \geq |q(x) - q(y)|, \quad (2.2)$$

where C is called log-Hölder continuity constant.

Let log-Dini-Lipschitz constant (or decay constant) $C_\infty > 0$, $q(\cdot)$ satisfy the decay condition if $\lim_{|x| \rightarrow \infty} q(x) = q_\infty := q(\infty)$ such that

$$\frac{C_\infty}{\ln(e + |h|)} \geq |q(h) - q_\infty|. \quad (2.3)$$

Let $C_0 > 0$, $q(\cdot)$ satisfy the log Hölder continuity condition at 0 for $|h| \leq \frac{1}{2}$, such that

$$\frac{C_0}{\ln|h|} \geq |q(h) - q(0)|. \quad (2.4)$$

$\mathcal{P}^{\log} = \mathcal{P}^{\log}(\mathcal{A})$ consists of all functions $q(\cdot) \in \mathcal{P}(\mathcal{A})$ satisfying (2.1) and (2.2).

$\mathcal{P}_\infty(\mathcal{A})$ (resp. $\mathcal{P}_{0,\infty}(\mathcal{A})$) is the subset of $\mathcal{P}(\mathcal{A})$ consisting of functions which satisfy condition (2.3) (resp. both conditions (2.3) and (2.4)). The set of positive integers is denoted by \mathbb{Z}_+ . For each $t_0 \in \mathbb{Z}$, $\mathbf{1}_{A_{t_0}} = \mathbf{1}_{t_0}$; for $t_0 \in \mathbb{Z}_+$, $\mathbf{1}_{B_{t_0}} = \tilde{\mathbf{1}}_{t_0}$; and so on. $\mathbf{1}_{A_{t_0}}$ denote the characteristic function of A_{t_0} . By $a \leq b$ we denote $a \leq Cb$.

Moreover, we define $\mathcal{P}^0(\mathbb{R}^n)$ to be the set of measurable functions p on \mathbb{R}^n with the range in $(0, \infty)$ such that $p_- > 0$ and $p_+ < \infty$. Given $p(\cdot) \in \mathcal{P}^0(\mathbb{R}^n)$, one can define the space $L^{p(\cdot)}(\mathbb{R}^n)$. This is equivalent to defining it to be the set of all functions g such that

$$|g|^{p_0} \in L^{p(\cdot)/p_0}(\mathbb{R}^n)$$

where

$$0 < p_0 < p_-, \quad \frac{p(\cdot)}{p_0} \in \mathcal{P}(\mathbb{R}^n).$$

Then the quasi-norm is given as

$$\|g\|_{L^{p(\cdot)}(\mathbb{R}^n)} = \| |g|^{p_0} \|_{L^{p(\cdot)/p_0}(\mathbb{R}^n)}^{1/p_0}.$$

Lemma 2.1. [22]

Let f belong to the Lebesgue space $L^{p(\cdot)}(\mathbb{R}^n)$ and g belong to $L^{p'(\cdot)}(\mathbb{R}^n)$, where $p(\cdot) \in \mathcal{P}(\mathbb{R}^n)$. Then, the product function fg is integrable over \mathbb{R}^n , and the following inequality holds:

$$\int_{\mathbb{R}^n} |f(x)g(x)| dx \leq r_p \|f\|_{p(\cdot)} \|g\|_{p'(\cdot)},$$

where r_p is defined as $r_p = 1 + \frac{1}{p^-} - \frac{1}{p^+}$.

Lemma 2.2. [4] Let $\tilde{q}(\cdot)$ be a variable exponent defined as $\frac{1}{p(z)} - \frac{1}{q} = \frac{1}{\tilde{q}(z)}$ where $(z \in \mathbb{R}^n)$. Then for all measurable functions f and g we have

$$\|fg\|_{p(\cdot)} \leq C \|g\|_{\tilde{q}(\cdot)} \|g\|_q.$$

Lemma 2.3. [19]

Let $p(\cdot)$ be a function within the class $\mathcal{B}(\mathbb{R}^n)$. For any ball B in \mathbb{R}^n , we get

$$\frac{1}{|B|} \|\mathbf{1}_B\|_{p'(\cdot)} \|\mathbf{1}_B\|_{p(\cdot)} \leq C,$$

where $C > 0$.

Lemma 2.4. [19]

Assuming that $p(\cdot)$ is a function in the class $\mathcal{B}(\mathbb{R}^n)$, there exists a positive constant C such that, for every ball B in \mathbb{R}^n and every measurable subset S within B , the following inequalities hold:

$$\frac{\|\mathbf{1}_B\|_{p(\cdot)}}{\|\mathbf{1}_S\|_{p(\cdot)}} \leq \frac{|B|}{|S|}, \quad \frac{\|\mathbf{1}_S\|_{p(\cdot)}}{\|\mathbf{1}_B\|_{p(\cdot)}} \leq \left(\frac{|S|}{|B|} \right)^{\omega_1}, \quad \frac{\|\mathbf{1}_S\|_{p'(\cdot)}}{\|\mathbf{1}_B\|_{p'(\cdot)}} \leq \left(\frac{|S|}{|B|} \right)^{\omega_2},$$

here $0 < \omega_1, \omega_2 < 1$.

Lemma 2.5. [5]

Let $\{g_j\}_{j=1}^\infty$ be the sequences of locally integrable functions, $1 < r < \infty$ and $p(\cdot) \in \mathcal{B}(\mathbb{R}^n)$. Then

$$\left\| \left(\sum_{j=1}^\infty |Mg_j|^r \right)^{1/r} \right\|_{p(\cdot)} \leq C \left\| \left(\sum_{j=1}^\infty |g_j|^r \right)^{1/r} \right\|_{p(\cdot)}.$$

Definition 2.6. Let $0 < q < \infty$, $p(\cdot) \in \mathcal{P}(\mathbb{R}^n)$, $0 \leq \lambda < \infty$, $\theta > 0$ and $\eta(\cdot) : \mathbb{R}^n \rightarrow \mathbb{R}$ with $\eta \in L^\infty(\mathbb{R}^n)$.

(i) The homogeneous grand variable Herz-Morrey space $M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta}(\mathbb{R}^n)$ is defined by

$$M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta}(\mathbb{R}^n) := \left\{ g \in L_{\text{loc}}^{p(\cdot)}(\mathbb{R}^n \setminus \{0\}) : \|g\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta}(\mathbb{R}^n)} < \infty \right\}$$

where

$$\|g\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta}(\mathbb{R}^n)} := \sup_{\epsilon > 0} \sup_{L \in \mathbb{Z}} 2^{-L\lambda} \left(\epsilon^\theta \sum_{k=-\infty}^L \|2^{k\eta(\cdot)} g \mathbf{1}_k\|_{p(\cdot)}^{q(1+\epsilon)} \right)^{\frac{1}{q(1+\epsilon)}}.$$

(ii) The non-homogeneous grand variable Herz-Morrey space $MK_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta}(\mathbb{R}^n)$ is defined by

$$MK_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta}(\mathbb{R}^n) := \left\{ g \in L_{\text{loc}}^{p(\cdot)}(\mathbb{R}^n \setminus \{0\}) : \|g\|_{MK_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta}(\mathbb{R}^n)} < \infty \right\}$$

where

$$\|g\|_{MK_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta}(\mathbb{R}^n)} := \sup_{\epsilon > 0} \sup_{L \in \mathbb{N}_0} 2^{-L\lambda} \left(\epsilon^\theta \sum_{k=0}^L \|2^{k\eta(\cdot)} g \mathbf{1}_k\|_{p(\cdot)}^{q(1+\epsilon)} \right)^{\frac{1}{q(1+\epsilon)}}.$$

Lemma 2.7. [34] Let $D > 1$ and $q \in \mathcal{P}_{0,\infty}(\mathbb{R}^n)$. Then

$$\frac{1}{c_0} r^{\frac{n}{q(0)}} \leq \|\mathbf{1}_{B(0,Dr) \setminus B(0,r)}\|_{L^{q(\cdot)}} \leq c_0 r^{\frac{n}{q(0)}}, \text{ for } 0 < r \leq 1 \quad (2.5)$$

and

$$\frac{1}{c_\infty} r^{\frac{n}{q_\infty}} \leq \|\mathbf{1}_{B(0,Dr) \setminus B(0,r)}\|_{L^{q(\cdot)}} \leq c_\infty r^{\frac{n}{q_\infty}}, \text{ for } r \geq 1, \quad (2.6)$$

respectively, where $c_0 \geq 1$ and $c_\infty \geq 1$ depend on D but not depend on r .

Theorem 2.8. If $1 < r < \infty$ and $\eta(\cdot) \in L^\infty(\mathbb{R}^n) \cap \mathcal{P}_0^{\log}(\mathbb{R}^n) \cap \mathcal{P}_\infty^{\log}(\mathbb{R}^n)$ with $\eta(0), \eta_\infty \in (-n\omega_1, n\omega_2)$, where $\omega_1, \omega_2 \in (0, 1)$ are constants appearing in (2.1). Let $p(\cdot) \in \mathcal{B}(\mathbb{R}^n)$, $0 < q < \infty$, and

$$0 \leq \lambda < \min \{(n\omega_1 + \eta(0))/2, (n\omega_1 + \eta_\infty)/2\}.$$

Suppose that T is a sublinear operator satisfying vector-valued inequality on $L^{p(\cdot)}(\mathbb{R}^n)$

$$\left\| \left(\sum_{j=1}^{\infty} |Tg_j|^r \right)^{\frac{1}{r}} \right\|_{p(\cdot)} \leq C \left\| \left(\sum_{j=1}^{\infty} |g_j|^r \right)^{\frac{1}{r}} \right\|_{p(\cdot)} \quad (2.7)$$

for all sequences $\{g_j\}_{j=1}^{\infty}$ of locally integrable functions on \mathbb{R}^n . Then we have the vector-valued inequality on $M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta}(\mathbb{R}^n)$

$$\left\| \left(\sum_{k=1}^{\infty} |Tg_k|^r \right)^{\frac{1}{r}} \right\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta}(\mathbb{R}^n)} \leq C \left\| \left(\sum_{k=1}^{\infty} |g_k|^r \right)^{\frac{1}{r}} \right\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta}(\mathbb{R}^n)}.$$

Remark 2.9. Here and below, we only declare our main results in the homogeneous grand variable Herz-Morrey space because the proof for the non-homogeneous case can be treated by the similar way and is much more easier.

Lemma 2.10. (see [5]) Let $p(\cdot), r$, and $\{g_j\}_{j=1}^{\infty}$ are given in Theorem 2.8, then

$$\left\| \left(\sum_{j=1}^{\infty} |\mathcal{M}g_j|^r \right)^{\frac{1}{r}} \right\|_{L^{p(\cdot)}(\mathbb{R}^n)} \leq C \left\| \left(\sum_{j=1}^{\infty} |g_j|^r \right)^{\frac{1}{r}} \right\|_{L^{p(\cdot)}(\mathbb{R}^n)}.$$

From Theorem 2.5 and Lemma 2.7, we obtain the following result for the Hardy-Littlewood maximal operator.

Corollary 2.11. Let η, r, q, p , are given in Theorem 2.8 and

$$0 \leq \lambda < \min \{(n\omega_1 + \eta(0))/2, (n\omega_1 + \eta_\infty)/2\},$$

then

$$\left\| \left(\sum_{k=1}^{\infty} |\mathcal{M}g_k|^r \right)^{\frac{1}{r}} \right\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta}(\mathbb{R}^n)} \leq C \left\| \left(\sum_{k=1}^{\infty} |g_k|^r \right)^{\frac{1}{r}} \right\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta}(\mathbb{R}^n)}.$$

Let $\mathcal{S}(\mathbb{R}^n)$ denote the Schwartz functions and $\mathcal{S}'(\mathbb{R}^n)$ the set of all tempered distributions. We define the Fourier transform of a function $g \in \mathcal{S}(\mathbb{R}^n)$ by

$$\widehat{\varphi}(g)(y) = 2\pi^{-n/2} \int_{\mathbb{R}^n} e^{-ix \cdot y} g(x) dx, \quad y \in \mathbb{R}^n,$$

while φ^\vee is the inverse Fourier transform. Let $\varphi_0 \in \mathcal{S}(\mathbb{R}^n)$ with $\varphi_0(y) \geq 0$ then we have

$$\varphi_0(y) = \begin{cases} 1, & |y| \leq 1 \\ 0, & |y| \geq 2. \end{cases}$$

Let

$$\varphi(y) = \varphi_0(y) - \varphi_0(2y)$$

and define

$$\varphi_\ell(y) = \varphi(2^{-\ell}y), \quad \ell \in \mathbb{N}.$$

Then $\{\varphi_\ell\}_{\ell \in \mathbb{N}_0}$ be the resolution of unity, such that

$$\sum_{\ell=0}^{\infty} \varphi_\ell(x) = 1, \quad x \in \mathbb{R}^n.$$

Definition 2.12. Let $\{\varphi_j\}_{j \in \mathbb{N}_0}$ be a resolution of unity as above, $s \in \mathbb{R}, 0 < \kappa, q \leq \infty, p(\cdot) \in \mathcal{P}(\mathbb{R}^n)$ and $\eta(\cdot) : \mathbb{R}^n \rightarrow \mathbb{R}$ with $\eta(\cdot) \in L^\infty(\mathbb{R}^n)$.

(i) Then the grand variable Herz-Morrey type Besov space is defined by

$$M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta} B_\kappa^s(\mathbb{R}^n) := \left\{ g \in \mathcal{S}'(\mathbb{R}^n) : \|g\|_{\ell_\kappa(M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta}(\mathbb{R}^n))} < \infty \right\},$$

where

$$\|g\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta} B_\kappa^s} := \left\| \left\{ 2^{sj} \varphi_j^\vee * g \right\}_{j=0}^{\infty} \right\|_{\ell_\kappa(M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta})}.$$

(ii) For $p_+ < \infty$, the grand variable Herz-Morrey type Triebel-Lizorkin space is defined by

$$M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta} F_\kappa^s(\mathbb{R}^n) := \left\{ g \in \mathcal{S}'(\mathbb{R}^n) : \|g\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta}(\ell_\kappa)} < \infty \right\},$$

where

$$\|g\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta} F_\kappa^s} := \left\| \left\{ 2^{sj} \varphi_j^\vee * g \right\}_{j=0}^{\infty} \right\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta}(\ell_\kappa)}.$$

Here we denote respectively by $\ell_\kappa(M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta})$ and $M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta}(\ell_\kappa)$ the spaces of all sequences $\{g_j\}$ of measurable functions on \mathbb{R}^n with finite quasi-norms

$$\left\| \left\{ g_j \right\}_{j=0}^{\infty} \right\|_{\ell_\kappa(M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta})} := \left(\sum_{j=0}^{\infty} \|g_j\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta}}^\kappa \right)^{\frac{1}{\kappa}},$$

and

$$\left\| \left\{ g_j \right\}_{j=0}^{\infty} \right\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta}(\ell_\kappa)} := \left\| \left(\sum_{j=0}^{\infty} |g_j|^\kappa \right)^{1/\kappa} \right\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta}}.$$

Let $S \geq 0, \varepsilon > 0$ and $\Psi_0, \Psi \in \mathcal{S}(\mathbb{R}^n)$ such that

$$|\widehat{\Psi}_0(\varrho)| > 0 \quad \text{on } \{|\varrho| < 2\varepsilon\} \tag{2.8}$$

$$|\widehat{\Psi}(\varrho)| > 0 \quad \text{on } \left\{ \frac{\varepsilon}{2} < |\varrho| < 2\varepsilon \right\} \tag{2.9}$$

and

$$D^\tau \widehat{\Psi}(0) = 0, \text{ for all } |\tau| \leq S. \tag{2.10}$$

Here, (2.8) and (2.9) are Tauberian conditions, while (2.10) expresses vanishing moment conditions on Ψ .

In [30], J. Peetre introduced the classical Peetre's maximal operator:

Let a tempered distribution $g \in \mathcal{S}'(\mathbb{R}^n)$, $a > 0$, and $\{\Xi_\ell\}_{\ell \in \mathbb{Z}} \subset \mathcal{S}(\mathbb{R}^n)$. Then system of maximal functions are given as

$$(\Xi_\ell^*)_a g(x) := \sup_{y \in \mathbb{R}^n} \frac{|\Xi_\ell * g(x+y)|}{(1 + 2^k|y|)^a}, \quad x \in \mathbb{R}^n, \ell \in \mathbb{Z}.$$

Since $\Xi_\ell * g(y)$ makes sense pointwise, everything is well defined. We will often use dilates

$$\Xi'_\ell(x) = 2^{kn} \Xi(2^k x)$$

of a fixed function $\Xi \in \mathcal{S}(\mathbb{R}^n)$, where $\Xi_0(x)$ might be given by a separate function. Also continuous dilates are needed. If

$$\Xi_t := t^{-n} \Xi(t^{-1} \cdot).$$

Then

$$\Psi_{t,a}^* g(x) := \sup_{y \in \mathbb{R}^n} \frac{|\Xi_t * g(x+y)|}{\left(1 + \frac{|y|}{t}\right)^a} \quad x \in \mathbb{R}^n, t > 0.$$

Theorem 2.13. *If $\kappa, q \in (0, \infty]$, $\omega > 0$, $s \in \mathbb{R}$ with $s < S + 1$, and η, q, p , are same as given in Lemma 2.9. Let $p(\cdot)/p_0 \in \mathcal{B}(\mathbb{R}^n)$ with $p_0 < \min(p_-, 1)$. Let $\Theta_0, \Theta \in \mathcal{S}(\mathbb{R}^n)$ be given by (2.8) and (2.9), respectively. Then*

(i) *For $a > n/p_0$, then the space $M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta} B_\kappa^s(\mathbb{R}^n)$ can be characterized by*

$$M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta} B_\kappa^s(\mathbb{R}^n) = \left\{ g \in \mathcal{S}'(\mathbb{R}^n) : \|g\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta}}^{(i)} B_\kappa^s < \infty \right\}, \quad i = 1, \dots, 4$$

where

$$\begin{aligned} \|g\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta} B_\kappa^s}^{(1)} &:= \|\Phi_0 * g\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta}} + \left(\int_0^1 t^{-sk} \|\Phi_t * g\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta}}^\kappa \frac{dt}{t} \right)^{1/\kappa} \\ \|g\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta} B_\kappa^s}^{(2)} &:= \left\| (\Phi_0^* g)_a \right\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta}} + \left(\int_0^1 t^{-sk} \|(\Phi_t^* g)_a\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta}}^\kappa \frac{dt}{t} \right)^{1/\kappa} \\ \|g\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta} B_\kappa^s}^{(3)} &:= \left(\sum_{k=0}^{\infty} 2^{sk\kappa} \|(\Phi_k^* g)_a\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta}}^\kappa \right)^{1/\kappa} \\ \|g\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta} B_\kappa^s}^{(4)} &:= \left(\sum_{k=0}^{\infty} 2^{sk\kappa} \|\Phi_k * g\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta}}^\kappa \right)^{1/\kappa}. \end{aligned}$$

Then, $\left\{ \|\cdot\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta} B_\kappa^s}^{(i)} \right\}_{i=1}^4$ are equivalent.

(ii) *If $p_0 < \kappa$, then for $a > n/p_0$ the space $M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta} F_\kappa^s(\mathbb{R}^n)$ can be characterized by*

$$M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta} F_\kappa^s(\mathbb{R}^n) = \left\{ g \in \mathcal{S}'(\mathbb{R}^n) : \|g\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta} F_\kappa^s}^{(i)} < \infty \right\}, \quad i = 1, \dots, 5$$

where

$$\begin{aligned} \|g\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta} F_\kappa^s}^{(1)} &:= \|\Phi_0 * g\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta}} \\ &\quad + \left\| \left(\int_0^1 t^{-sk} |\Phi_t * g|^\kappa \frac{dt}{t} \right)^{1/\kappa} \right\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta}} \end{aligned} \tag{2.11}$$

$$\begin{aligned} \|g\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta} F_\kappa^s}^{(2)} &:= \left\| (\Phi_0^* g)_a \right\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta}} \\ &\quad + \left\| \left(\int_0^1 [t^{-s} (\Phi_t^* g)_a]^\kappa \frac{dt}{t} \right)^{1/\kappa} \right\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta}} \end{aligned} \tag{2.12}$$

$$\begin{aligned} \|g\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta} F_\kappa^s}^{(3)} &:= \|\Phi_0 * g\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta}} \left\| \left(\int_0^1 t^{-sk} \right. \right. \\ &\quad \times \left. \left. \int_{|z|< t} |(\Phi_t * g)(\cdot + z)|^\kappa dz \frac{dt}{t^{n+1}} \right)^{1/\kappa} \right\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta}} \end{aligned} \tag{2.13}$$

$$\|g\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta} F_\kappa^s}^{(4)} := \left\| \left(\sum_{k=0}^{\infty} [2^{ks\kappa} (\Phi_k^* g)_a]^\kappa \right)^{1/\kappa} \right\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta}} \tag{2.14}$$

$$\|g\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta}F_\kappa^s}^{(5)} := \left\| \left(\sum_{k=0}^{\infty} 2^{ks\kappa} |\Phi_k * g|^{\kappa} \right)^{1/\kappa} \right\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta}}. \quad (2.15)$$

Then, $\left\{ \|\cdot\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta}F_\kappa^s}^{(i)} \right\}_{i=1}^5$ are equivalent.

3. PROOFS OF THE MAIN RESULTS

We need the following lemmas to prove our main results,

Lemma 3.1. *Let p, q, λ, η , are given in Theorem 2.8 and $\theta > 0$, then*

$$\begin{aligned} \|g\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta}} &\approx \max \left\{ \sup_{\epsilon > 0} \sup_{L \leq 0, L \in \mathbb{Z}} 2^{-L\lambda} \left(\epsilon^\theta \sum_{k=-\infty}^L 2^{k\eta(0)q(1+\epsilon)} \|g\mathbf{1}_k\|_{p(\cdot)}^{q(1+\epsilon)} \right)^{\frac{1}{q(1+\epsilon)}} \right. \\ &\quad \left. \sup_{L > 0, L \in \mathbb{Z}} \sup_{\epsilon > 0} \left[2^{-L\lambda} \left(\epsilon^\theta \sum_{k=-\infty}^{-1} 2^{k\eta(0)q(1+\epsilon)} \|g\mathbf{1}_k\|_{p(\cdot)}^{q(1+\epsilon)} \right)^{\frac{1}{q(1+\epsilon)}} + 2^{-L\lambda} \left(\epsilon^\theta \sum_{k=0}^L 2^{k\eta_\infty q(1+\epsilon)} \|g\mathbf{1}_k\|_{p(\cdot)}^{q(1+\epsilon)} \right)^{\frac{1}{q(1+\epsilon)}} \right] \right\} \end{aligned}$$

Lemma 3.1 is similar to Proposition 3.8 in [1]. Indeed, when $\eta(\cdot) \in L^\infty(\mathbb{R}^n) \cap \mathcal{P}_0^{\log}(\mathbb{R}^n) \cap \mathcal{P}_\infty^{\log}(\mathbb{R}^n)$, there exist positive constants C_1, C_2 such that if $k \leq 0$ and $x \in D_k$ then $C_1 2^{k\eta(0)} \leq 2^{k\eta(x)} \leq C_2 2^{k\eta(0)}$; if $k > 1$ and $x \in D_k$ then $C_1 2^{k\eta_\infty} \leq 2^{k\eta(x)} \leq C_2 2^{k\eta_\infty}$. Thus, we obtain Lemma 3.1.

Proof. Now we will give the proof of Theorem 2.8. Let $(\sum_{k=1}^{\infty} |g_k|^r)^{\frac{1}{r}} \in M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta}(\mathbb{R}^n)$. Using the Lemma 3.1 we get

$$\begin{aligned} &\left\| \left(\sum_{j=1}^{\infty} |Tg_j|^r \right)^{\frac{1}{r}} \right\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta}} \\ &\approx \max \left\{ \sup_{\epsilon > 0} \sup_{L \leq 0, L \in \mathbb{Z}} 2^{-L\lambda} \left(\epsilon^\theta \sum_{k=-\infty}^L 2^{k\eta(0)q(1+\epsilon)} \left\| \left(\sum_{j=1}^{\infty} |Tg_j|^r \right)^{\frac{1}{r}} \mathbf{1}_k \right\|_{p(\cdot)}^{q(1+\epsilon)} \right)^{\frac{1}{q(1+\epsilon)}} \right. \\ &\quad \left. \sup_{\epsilon > 0} \sup_{L > 0, L \in \mathbb{Z}} \left[2^{-L\lambda} \left(\epsilon^\theta \sum_{k=-\infty}^{-1} 2^{k\eta(0)q(1+\epsilon)} \left\| \left(\sum_{j=1}^{\infty} |Tg_j|^r \right)^{\frac{1}{r}} \mathbf{1}_k \right\|_{p(\cdot)}^{q(1+\epsilon)} \right)^{\frac{1}{q(1+\epsilon)}} \right. \right. \\ &\quad \left. \left. + 2^{-L\lambda} \left(\epsilon^\theta \sum_{k=0}^L 2^{k\eta_\infty q(1+\epsilon)} \left\| \left(\sum_{j=1}^{\infty} |Tg_j|^r \right)^{\frac{1}{r}} \mathbf{1}_k \right\|_{p(\cdot)}^{q(1+\epsilon)} \right)^{\frac{1}{q(1+\epsilon)}} \right] \right\} \\ &=: \max \{E_T, F_T\}. \end{aligned}$$

We also denote F_T by $F_T := \sup_{\epsilon > 0} \sup_{L > 0, L \in \mathbb{Z}} [G_T + H_T]$ with

$$\begin{aligned} G_T &:= 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=-\infty}^{-1} 2^{k\eta(0)q(1+\epsilon)} \left\| \left(\sum_{j=1}^{\infty} |Tg_j|^r \right)^{\frac{1}{r}} \mathbf{1}_k \right\|_{p(\cdot)}^{q(1+\epsilon)} \right\}^{\frac{1}{q(1+\epsilon)}} \\ H_T &:= 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=0}^L 2^{k\eta_\infty q(1+\epsilon)} \left\| \left(\sum_{j=1}^{\infty} |Tg_j|^r \right)^{\frac{1}{r}} \mathbf{1}_k \right\|_{p(\cdot)}^{q(1+\epsilon)} \right\}^{\frac{1}{q(1+\epsilon)}}. \end{aligned}$$

We need to prove that $E_T \lesssim E_f$, $G_T \lesssim G_f$ and $H_T \lesssim H_f$ respectively, where

$$\begin{aligned}
E_f &:= \sup_{\epsilon>0} \sup_{L \leq 0, L \in \mathbb{Z}} 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=-\infty}^L 2^{\eta(0)q(1+\epsilon)k} \left\| \mathbf{1}_k \left(\sum_{j=1}^{\infty} |g_j|^r \right)^{\frac{1}{r}} \right\|_{p(\cdot)}^{q(1+\epsilon)} \right\}^{\frac{1}{q(1+\epsilon)}} \\
G_f &:= 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=-\infty}^{-1} 2^{k\eta(0)q(1+\epsilon)} \left\| \left(\sum_{j=1}^{\infty} |g_j|^r \right)^{\frac{1}{r}} \mathbf{1}_k \right\|_{p(\cdot)}^{q(1+\epsilon)} \right\}^{\frac{1}{q(1+\epsilon)}} \\
H_f &:= 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=0}^L 2^{k\eta_\infty q(1+\epsilon)} \left\| \left(\sum_{j=1}^{\infty} |g_j|^r \right)^{\frac{1}{r}} \mathbf{1}_k \right\|_{p(\cdot)}^{q(1+\epsilon)} \right\}^{\frac{1}{q(1+\epsilon)}}.
\end{aligned}$$

Hence we get $E_T \lesssim E_f$ and $F_T \lesssim F_g$ where F_g denote $\sup_{\epsilon>0} \sup_{L>0, L \in \mathbb{Z}} [G_f + H_f]$. From above all and using Lemma 3.1 again, we have

$$\begin{aligned}
\left\| \left(\sum_{j=1}^{\infty} |Tg_j|^r \right)^{\frac{1}{r}} \right\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q},\theta}} &\approx \max \{E_T, F_g\} \\
&\lesssim \max \{E_g, F_g\} \\
&\approx \left\| \left(\sum_{j=1}^{\infty} |g_j|^r \right)^{\frac{1}{r}} \right\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q},\theta}}.
\end{aligned}$$

Estimate of $G_T \lesssim G_f$ is similar to $E_M \lesssim E_f$ so omit the details.

By using the size condition and Minkowski's inequality, for E_T we get

$$\begin{aligned}
E_T &= \sup_{\epsilon>0} \sup_{L \leq 0, L \in \mathbb{Z}} 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=-\infty}^L 2^{\eta(0)q(1+\epsilon)k} \left\| \mathbf{1}_k \left(\sum_{j=1}^{\infty} |Tg_j|^r \right)^{\frac{1}{r}} \right\|_{p(\cdot)}^{q(1+\epsilon)} \right\}^{\frac{1}{q(1+\epsilon)}} \\
&= \sup_{\epsilon>0} \sup_{L \leq 0, L \in \mathbb{Z}} 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=-\infty}^L 2^{\eta(0)q(1+\epsilon)k} \left\| \mathbf{1}_k \left(\sum_{j=1}^{\infty} \left| T \sum_{i=-\infty}^{\infty} g_j^i \right|^r \right)^{\frac{1}{r}} \right\|_{p(\cdot)}^{q(1+\epsilon)} \right\}^{\frac{1}{q(1+\epsilon)}} \\
&\leq \sup_{\epsilon>0} \sup_{L \leq 0, L \in \mathbb{Z}} 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=-\infty}^L 2^{\eta(0)q(1+\epsilon)k} \left\| \mathbf{1}_k \sum_{i=-\infty}^{\infty} \left(\sum_{j=1}^{\infty} |Tg_j^i|^r \right)^{\frac{1}{r}} \right\|_{p(\cdot)}^{q(1+\epsilon)} \right\}^{\frac{1}{q(1+\epsilon)}} \\
&\lesssim \sup_{\epsilon>0} \sup_{L \leq 0, L \in \mathbb{Z}} 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=-\infty}^L 2^{\eta(0)q(1+\epsilon)k} \left\| \mathbf{1}_k \sum_{i=-\infty}^{k-2} \left(\sum_{j=1}^{\infty} |Tg_j^i|^r \right)^{\frac{1}{r}} \right\|_{p(\cdot)}^{q(1+\epsilon)} \right\}^{\frac{1}{q(1+\epsilon)}} \\
&\quad + \sup_{\epsilon>0} \sup_{L \leq 0, L \in \mathbb{Z}} 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=-\infty}^L 2^{\eta(0)q(1+\epsilon)k} \left\| \mathbf{1}_k \sum_{i=k-1}^{k+1} \left(\sum_{j=1}^{\infty} |Tg_j^i|^r \right)^{\frac{1}{r}} \right\|_{p(\cdot)}^{q(1+\epsilon)} \right\}^{\frac{1}{q(1+\epsilon)}} \\
&\quad + \sup_{\epsilon>0} \sup_{L \leq 0, L \in \mathbb{Z}} 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=-\infty}^L 2^{\eta(0)q(1+\epsilon)k} \left\| \mathbf{1}_k \sum_{i=k+2}^{\infty} \left(\sum_{j=1}^{\infty} |Tg_j^i|^r \right)^{\frac{1}{r}} \right\|_{p(\cdot)}^{q(1+\epsilon)} \right\}^{\frac{1}{q(1+\epsilon)}} \\
&=: E_T^1 + E_T^2 + E_T^3.
\end{aligned}$$

By the same way we consider H_T .

$$\begin{aligned}
H_T &\lesssim 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=0}^L 2^{\eta_\infty q(1+\epsilon)k} \left\| \mathbf{1}_k \sum_{i=-\infty}^{k-2} \left(\sum_{j=1}^{\infty} |Tg_j^i|^r \right)^{\frac{1}{r}} \right\|_{p(\cdot)}^q \right\}^{\frac{1}{q(1+\epsilon)}} \\
&\quad + 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=0}^L 2^{\eta_\infty q(1+\epsilon)k} \left\| \mathbf{1}_k \sum_{i=k-1}^{k+1} \left(\sum_{j=1}^{\infty} |Tg_j^i|^r \right)^{\frac{1}{r}} \right\|_{p(\cdot)}^q \right\}^{\frac{1}{q(1+\epsilon)}} \\
&\quad + 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=0}^L 2^{\eta_\infty q(1+\epsilon)k} \left\| \mathbf{1}_k \sum_{i=k+2}^{\infty} \left(\sum_{j=1}^{\infty} |Tg_j^i|^r \right)^{\frac{1}{r}} \right\|_{p(\cdot)}^q \right\}^{\frac{1}{q(1+\epsilon)}} \\
&=: H_T^1 + H_T^2 + H_T^3.
\end{aligned}$$

Secondly, we will prove E_T^i and H_T^i , $i = 1, 2, 3$.

Step 1. For E_T^2 , we have

$$\begin{aligned}
E_T^2 &\lesssim \sup_{\epsilon>0} \sup_{L\leqslant 0, L\in\mathbb{Z}} 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=-\infty}^L 2^{\eta(0)q(1+\epsilon)k} \sum_{i=k-1}^{k+1} \left\| \left(\sum_{j=1}^{\infty} |g_j^i|^r \right)^{\frac{1}{r}} \right\|_{p(\cdot)}^{q(1+\epsilon)} \right\}^{\frac{1}{q(1+\epsilon)}} \\
&= \sup_{\epsilon>0} \sup_{L\leqslant 0, L\in\mathbb{Z}} 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=-\infty}^L 2^{\eta(0)q(1+\epsilon)k} \sum_{i=k-1}^{k+1} \left\| \mathbf{1}_i \left(\sum_{j=1}^{\infty} |g_j|^r \right)^{\frac{1}{r}} \right\|_{p(\cdot)}^{q(1+\epsilon)} \right\}^{\frac{1}{q(1+\epsilon)}} \\
&\lesssim \sup_{\epsilon>0} \sup_{L\leqslant 0, L\in\mathbb{Z}} 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=-\infty}^L 2^{\eta(0)q(1+\epsilon)k} \left\| \mathbf{1}_{k-1} \left(\sum_{j=1}^{\infty} |g_j|^r \right)^{\frac{1}{r}} \right\|_{p(\cdot)}^{q(1+\epsilon)} \right\}^{\frac{1}{q(1+\epsilon)}} \\
&\quad + \sup_{\epsilon>0} \sup_{L\leqslant 0, L\in\mathbb{Z}} 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=-\infty}^L 2^{\eta(0)q(1+\epsilon)k} \left\| \mathbf{1}_k \left(\sum_{j=1}^{\infty} |g_j|^r \right)^{\frac{1}{r}} \right\|_{p(\cdot)}^{q(1+\epsilon)} \right\}^{\frac{1}{q(1+\epsilon)}} \\
&\quad + \sup_{\epsilon>0} \sup_{L\leqslant 0, L\in\mathbb{Z}} 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=-\infty}^L 2^{\eta(0)q(1+\epsilon)k} \left\| \mathbf{1}_{k+1} \left(\sum_{j=1}^{\infty} |g_j|^r \right)^{\frac{1}{r}} \right\|_{p(\cdot)}^{q(1+\epsilon)} \right\}^{\frac{1}{q(1+\epsilon)}} \\
&\lesssim \sup_{\epsilon>0} \sup_{L\leqslant 0, L\in\mathbb{Z}} 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=-\infty}^L 2^{\eta(0)q(1+\epsilon)k} \left\| \mathbf{1}_k \left(\sum_{j=1}^{\infty} |g_j|^r \right)^{\frac{1}{r}} \right\|_{p(\cdot)}^{q(1+\epsilon)} \right\}^{\frac{1}{q(1+\epsilon)}} \\
&=: E_f.
\end{aligned}$$

Then turn to H_T^2 , similarly, we have

$$\begin{aligned}
H_T^2 &\lesssim 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=0}^L 2^{\eta_\infty q(1+\epsilon)k} \left\| \mathbf{1}_{k-1} \left(\sum_{j=1}^{\infty} |g_j|^r \right)^{\frac{1}{r}} \right\|_{p(\cdot)}^{q(1+\epsilon)} \right\}^{\frac{1}{q(1+\epsilon)}} \\
&\quad + 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=0}^L 2^{\eta_\infty q(1+\epsilon)k} \left\| \mathbf{1}_k \left(\sum_{j=1}^{\infty} |g_j|^r \right)^{\frac{1}{r}} \right\|_{p(\cdot)}^{q(1+\epsilon)} \right\}^{\frac{1}{q(1+\epsilon)}}
\end{aligned}$$

$$\begin{aligned}
& + 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=0}^L 2^{\eta_\infty q(1+\epsilon)k} \left\| \mathbf{1}_{k+1} \left(\sum_{j=1}^{\infty} |g_j|^r \right)^{\frac{1}{r}} \right\|_{p(\cdot)}^{q(1+\epsilon)} \right\}^{\frac{1}{q(1+\epsilon)}} \\
& \lesssim H_f.
\end{aligned}$$

Step 2.

Let $\forall i \leq k-2, x \in R_k, 1 < r < \infty$, by the size condition and the generalized Minkowski's inequality, we obtain

$$\begin{aligned}
\left(\sum_{j=1}^{\infty} T^r(g_j^i)(x) \right)^{\frac{1}{r}} & \lesssim \left[\sum_{j=1}^{\infty} \left(2^{-kn} \int_{\mathbb{R}^n} |g_j^i(y)| dy \right)^r \right]^{\frac{1}{r}} \\
& \lesssim 2^{-kn} \int_{\mathbb{R}^n} \left(\sum_{j=1}^{\infty} |g_j^i|^r \right)^{\frac{1}{r}} dy.
\end{aligned}$$

By Hölder's inequality we get

$$\begin{aligned}
E_T^1 & \lesssim \sup_{\epsilon>0} \sup_{L \leq 0, L \in \mathbb{Z}} 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=-\infty}^L 2^{\eta(0)q(1+\epsilon)k} \left\| \mathbf{1}_k \sum_{i=-\infty}^{k-2} 2^{-kn} \int_{\mathbb{R}^n} \left(\sum_{j=1}^{\infty} |g_j^i|^r \right)^{\frac{1}{r}} dy \right\|_{p(\cdot)}^{q(1+\epsilon)} \right\}^{\frac{1}{q(1+\epsilon)}} \\
& = \sup_{\epsilon>0} \sup_{L \leq 0, L \in \mathbb{Z}} 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=-\infty}^L 2^{\eta(0)q(1+\epsilon)k} \|\mathbf{1}_k\|_{p(\cdot)}^{q(1+\epsilon)} \left(\sum_{i=-\infty}^{k-2} 2^{-kn} \int_{\mathbb{R}^n} \left(\sum_{j=1}^{\infty} |g_j^i|^r \right)^{\frac{1}{r}} dy \right)^{q(1+\epsilon)} \right\}^{\frac{1}{q(1+\epsilon)}} \\
& \lesssim \sup_{\epsilon>0} \sup_{L \leq 0, L \in \mathbb{Z}} 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=-\infty}^L 2^{\eta(0)q(1+\epsilon)k} \|\mathbf{1}_k\|_{p(\cdot)}^{q(1+\epsilon)} \left(\sum_{i=-\infty}^{k-2} 2^{-kn} \left\| \left(\sum_{j=1}^{\infty} |g_j^i|^r \right)^{\frac{1}{r}} \mathbf{1}_i \right\|_{p(\cdot)} \|\mathbf{1}_i\|_{L^{p'(\cdot)}} \right)^{q(1+\epsilon)} \right\}^{\frac{1}{q(1+\epsilon)}}. \tag{3.1}
\end{aligned}$$

On the other hand, by using Lemma 2.4, we have

$$2^{-kn} \|\mathbf{1}_k\|_{p(\cdot)} \|\mathbf{1}_i\|_{L^{p'(\cdot)}} \lesssim 2^{-kn} 2^{\frac{kn}{p'(0)}} 2^{\frac{in}{p'(0)}} \lesssim 2^{\frac{(i-k)n}{p'(0)}}. \tag{3.2}$$

We put (3.2) into (3.1) and get

$$\begin{aligned}
E_T^1 & \lesssim \sup_{\epsilon>0} \sup_{L \leq 0, L \in \mathbb{Z}} 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=-\infty}^L 2^{\eta(0)kq(1+\epsilon)} \left(\sum_{i=-\infty}^{k-2} \left\| \left(\sum_{j=1}^{\infty} |g_j^i|^r \right)^{\frac{1}{r}} \mathbf{1}_i \right\|_{p(\cdot)} 2^{\frac{(i-k)n}{p'(0)}} \right)^{q(1+\epsilon)} \right\}^{\frac{1}{q(1+\epsilon)}} \\
& = \sup_{\epsilon>0} \sup_{L \leq 0, L \in \mathbb{Z}} 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=-\infty}^L \left(\sum_{i=-\infty}^{k-2} 2^{\eta(0)k} \left\| \left(\sum_{j=1}^{\infty} |g_j^i|^r \right)^{\frac{1}{r}} \mathbf{1}_i \right\|_{p(\cdot)} 2^{\frac{(i-k)n}{p'(0)}} \right)^{q(1+\epsilon)} \right\}^{\frac{1}{q(1+\epsilon)}} \\
& = \sup_{\epsilon>0} \sup_{L \leq 0, L \in \mathbb{Z}} 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=-\infty}^L \left(\sum_{i=-\infty}^{k-2} 2^{\eta(0)i} \left\| \left(\sum_{j=1}^{\infty} |g_j^i|^r \right)^{\frac{1}{r}} \mathbf{1}_i \right\|_{p(\cdot)} 2^{b(i-k)} \right)^{q(1+\epsilon)} \right\}^{\frac{1}{q(1+\epsilon)}}, \tag{3.3}
\end{aligned}$$

here $b := \frac{n}{p'(0)} - \eta(0) > 0$.

Let $1 < q(1+\epsilon) < \infty$, then the Hölder's inequality yields

$$E_T^1 \lesssim \sup_{\epsilon>0} \sup_{L \leq 0, L \in \mathbb{Z}} 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=-\infty}^L \left(\sum_{i=-\infty}^{k-2} 2^{\eta(0)iq(1+\epsilon)} \left\| \left(\sum_{j=1}^{\infty} |g_j^i|^r \right)^{\frac{1}{r}} \mathbf{1}_i \right\|_{p(\cdot)}^{q(1+\epsilon)} 2^{\frac{bq(1+\epsilon)(i-k)}{2}} \right) \right\}$$

$$\begin{aligned}
& \times \left(\sum_{i=-\infty}^{k-2} 2^{\frac{b(q(1+\epsilon))'(i-k)}{2}} \right)^{\frac{q(1+\epsilon)}{(q(1+\epsilon))'}} \left\{ \right. \\
& \lesssim \sup_{\epsilon>0} \sup_{L \leq 0, L \in \mathbb{Z}} 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=-\infty}^L \sum_{i=-\infty}^{k-2} 2^{\eta(0)i q(1+\epsilon)} \left\| \left(\sum_{j=1}^{\infty} |g_j|^r \right)^{\frac{1}{r}} \mathbf{1}_i \right\|_{p(\cdot)}^{q(1+\epsilon)} 2^{\frac{bq(1+\epsilon)(i-k)}{2}} \right\}^{\frac{1}{q}} \\
& = \sup_{\epsilon>0} \sup_{L \leq 0, L \in \mathbb{Z}} 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{i=-\infty}^{L-2} 2^{\eta(0)i q(1+\epsilon)} \left\| \left(\sum_{j=1}^{\infty} |g_j|^r \right)^{\frac{1}{r}} \mathbf{1}_i \right\|_{p(\cdot)}^{q(1+\epsilon)} \sum_{k=i+2}^L 2^{\frac{bq(1+\epsilon)(i-k)}{2}} \right\}^{\frac{1}{q(1+\epsilon)}} \\
& \lesssim \sup_{\epsilon>0} \sup_{L \leq 0, L \in \mathbb{Z}} 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{i=-\infty}^{L-2} 2^{\eta(0)i q(1+\epsilon)} \left\| \left(\sum_{j=1}^{\infty} |g_j|^r \right)^{\frac{1}{r}} \mathbf{1}_i \right\|_{p(\cdot)}^{q(1+\epsilon)} \right\}^{\frac{1}{q(1+\epsilon)}} \\
& \lesssim E_f.
\end{aligned}$$

If $0 < q(1 + \epsilon) \leq 1$, then we have

$$\left(\sum_{i=1}^{\infty} a_i \right)^{q(1+\epsilon)} \leq \sum_{i=1}^{\infty} a_i^{q(1+\epsilon)}, \quad i \in \mathbb{N}, a_i \geq 0, \quad (3.4)$$

and obtain

$$\begin{aligned}
E_T^1 & \lesssim \sup_{\epsilon>0} \sup_{L \leq 0, L \in \mathbb{Z}} 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=-\infty}^L \sum_{i=-\infty}^{k-2} 2^{\eta(0)q(1+\epsilon)i} \left\| \left(\sum_{j=1}^{\infty} |g_j|^r \right)^{\frac{1}{r}} \mathbf{1}_i \right\|_{p(\cdot)}^{q(1+\epsilon)} 2^{bq(1+\epsilon)(i-k)} \right\}^{\frac{1}{q(1+\epsilon)}} \\
& = \sup_{\epsilon>0} \sup_{L \leq 0, L \in \mathbb{Z}} 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{i=-\infty}^{L-2} 2^{\eta(0)i q(1+\epsilon)} \left\| \left(\sum_{j=1}^{\infty} |g_j|^r \right)^{\frac{1}{r}} \mathbf{1}_i \right\|_{p(\cdot)}^{q(1+\epsilon)} \sum_{k=i+2}^L 2^{bq(1+\epsilon)(i-k)} \right\}^{\frac{1}{q(1+\epsilon)}} \\
& \lesssim \sup_{\epsilon>0} \sup_{L \leq 0, L \in \mathbb{Z}} 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{i=-\infty}^{L-2} 2^{\eta(0)i q(1+\epsilon)} \left\| \left(\sum_{j=1}^{\infty} |g_j|^r \right)^{\frac{1}{r}} \mathbf{1}_i \right\|_{p(\cdot)}^{q(1+\epsilon)} \right\}^{\frac{1}{q(1+\epsilon)}} \\
& \lesssim E_f.
\end{aligned}$$

Similarly, by using Lemmas 2.5 and 3.2, we have

$$2^{-kn} \|\mathbf{1}_k\|_{p(\cdot)} \|\mathbf{1}_i\|_{L^{p'(\cdot)}} \lesssim 2^{-kn} \|\mathbf{1}_{B_i}\|_{L^{p'(\cdot)}} |B_k| \|\mathbf{1}_{B_k}\|_{L^{p'(\cdot)}}^{-1} \lesssim 2^{n\omega_2(i-k)}.$$

$$H_T^1 \lesssim 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=0}^{\infty} \left(\sum_{i=-\infty}^{k-2} 2^{\eta_\infty i} \left\| \left(\sum_{j=1}^{\infty} |g_j|^r \right)^{\frac{1}{r}} \mathbf{1}_i \right\|_{p(\cdot)}^{q(1+\epsilon)} 2^{b_1(i-k)} \right)^{\frac{1}{q(1+\epsilon)}} \right\}$$

here $b_1 = n\omega_2 - \eta_\infty > 0$.

For $1 < q(1 + \epsilon) < \infty$, using Hölder's inequality, we have

$$\begin{aligned}
H_T^1 &\lesssim 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=0}^L \sum_{i=-\infty}^{k-2} 2^{\eta_\infty iq(1+\epsilon)} \left\| \left(\sum_{j=1}^{\infty} |g_j|^r \right)^{\frac{1}{r}} \mathbf{1}_i \right\|_{p(\cdot)}^{q(1+\epsilon)} 2^{\frac{b_0(i-k)}{2}} \left(\sum_{i=-\infty}^{k-2} 2^{\frac{b_1(q(1+\epsilon))'(i-k)}{2}} \right)^{\frac{q(1+\epsilon)}{q(1+\epsilon)'}} \right\}^{\frac{1}{q(1+\epsilon)}} \\
&\lesssim 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=0}^L \sum_{i=-\infty}^{k-2} 2^{\eta_\infty iq(1+\epsilon)} \left\| \left(\sum_{j=1}^{\infty} |g_j|^r \right)^{\frac{1}{r}} \mathbf{1}_i \right\|_{p(\cdot)}^{q(1+\epsilon)} 2^{\frac{b_1 q(1+\epsilon)(i-k)}{2}} \right\}^{\frac{1}{q(1+\epsilon)}} \\
&\leq 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=0}^L \sum_{i=-2}^{k-2} 2^{\eta_\infty iq(1+\epsilon)} \left\| \left(\sum_{j=1}^{\infty} |g_j|^r \right)^{\frac{1}{r}} \mathbf{1}_i \right\|_{p(\cdot)}^q 2^{\frac{b_1 q(1+\epsilon)(i-k)}{2}} \right\}^{\frac{1}{q(1+\epsilon)}} \\
&\quad + 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=0}^L \sum_{i=-\infty}^{-3} 2^{\eta_\infty iq(1+\epsilon)} \left\| \left(\sum_{j=1}^{\infty} |g_j|^r \right)^{\frac{1}{r}} \mathbf{1}_i \right\|_{p(\cdot)}^{q(1+\epsilon)} 2^{\frac{b_1 q(1+\epsilon)(i-k)}{2}} \right\}^{\frac{1}{q(1+\epsilon)}} \\
&= I_1 + I_2.
\end{aligned}$$

Now we consider I_1 and I_2 respectively. Due to $b_1 > 0$, we have

$$\begin{aligned}
I_1 &= 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{i=-2}^{L-2} 2^{\eta_\infty iq(1+\epsilon)} \left\| \left(\sum_{j=1}^{\infty} |g_j|^r \right)^{\frac{1}{r}} \mathbf{1}_i \right\|_{p(\cdot)}^{q(1+\epsilon)} \sum_{k=i+2}^L 2^{\frac{b_1 q(1+\epsilon)(i-k)}{2}} \right\}^{\frac{1}{q(1+\epsilon)}} \\
&\lesssim 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{i=-2}^{L-2} 2^{\eta_\infty iq(1+\epsilon)} \left\| \left(\sum_{j=1}^{\infty} |g_j|^r \right)^{\frac{1}{r}} \mathbf{1}_i \right\|_{p(\cdot)}^{q(1+\epsilon)} \right\}^{\frac{1}{q(1+\epsilon)}} \\
&\lesssim H_f.
\end{aligned}$$

Because $L > 0, b_1 > 0$ and $\lambda \geq 0$, we obtain

$$\begin{aligned}
I_2 &\lesssim 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=0}^L \sum_{i=-\infty}^{-3} 2^{\frac{b_1 q(1+\epsilon)(i-k)}{2}} \left[\sum_{m=\infty}^i 2^{\eta_\infty mq(1+\epsilon)} \left\| \left(\sum_{j=1}^{\infty} |g_j|^r \right)^{\frac{1}{r}} \mathbf{1}_m \right\|_{p(\cdot)}^{q(1+\epsilon)} \right] \right\}^{\frac{1}{q(1+\epsilon)}} \\
&= 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=0}^L \sum_{i=-\infty}^{-3} 2^{\frac{b_1 q(1+\epsilon)(i-k)}{2}} \cdot 2^{iq(1+\epsilon)\lambda} H_f^{q(1+\epsilon)} \right\}^{\frac{1}{q(1+\epsilon)}} \\
&= 2^{-L\lambda} \left\{ \epsilon^\theta \left(\sum_{k=0}^L 2^{-kb_1 q(1+\epsilon)/2} \right) \left(\sum_{i=-\infty}^{-3} 2^{(b_1/2+\lambda)q(1+\epsilon)i} \right) H_f^{q(1+\epsilon)} \right\}^{\frac{1}{q(1+\epsilon)}} \\
&\lesssim 2^{-L\lambda} \left\{ \epsilon^\theta \left(\sum_{k=0}^L 2^{-kb_1 q(1+\epsilon)/2} \right) \left(\sum_{i=-\infty}^L 2^{(b_1/2+\lambda)q(1+\epsilon)i} \right) H_f^{q(1+\epsilon)} \right\}^{\frac{1}{q(1+\epsilon)}} \\
&\lesssim 2^{-L\lambda} 2^{-Lb_1/2} 2^{(b_1/2+\lambda)L} H_f \\
&= H_f.
\end{aligned}$$

For $0 < q(1+\epsilon) \leq 1$, using (3.4)

$$H_T^1 \lesssim 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=0}^{\infty} \sum_{i=-\infty}^{k-2} 2^{\eta_\infty iq(1+\epsilon)} \left\| \left(\sum_{j=1}^{\infty} |g_j|^r \right)^{\frac{1}{r}} \mathbf{1}_i \right\|_{p(\cdot)}^{q(1+\epsilon)} 2^{b_1(i-k)} \right\}^{\frac{1}{q(1+\epsilon)}}$$

$$\begin{aligned}
&\lesssim 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=0}^L \sum_{i=-2}^{k-2} 2^{\eta_\infty iq(1+\epsilon)} \left\| \left(\sum_{j=1}^{\infty} |g_j|^r \right)^{\frac{1}{r}} \mathbf{1}_i \right\|_{p(\cdot)}^{q(1+\epsilon)} 2^{b_1(i-k)} \right\}^{\frac{1}{q(1+\epsilon)}} \\
&+ 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=0}^L \sum_{i=-\infty}^{-3} 2^{\eta_\infty iq(1+\epsilon)} \left\| \left(\sum_{j=1}^{\infty} |g_j|^r \right)^{\frac{1}{r}} \mathbf{1}_i \right\|_{p(\cdot)}^{q(1+\epsilon)} 2^{b_1(i-k)} \right\}^{\frac{1}{q(1+\epsilon)}} \\
&=: J_1 + J_2.
\end{aligned}$$

Similar to Step 2 $H_T^2 \lesssim H_f$ is also true for $0 < q(1 + \epsilon) \leq 1$.

Step 3. Let $\forall i \geq k + 2, x \in R_k$, then we get

$$\begin{aligned}
\left(\sum_{j=1}^{\infty} T^r(g_j^i)(x) \right)^{\frac{1}{r}} &\lesssim \left[\sum_{j=1}^{\infty} \left(2^{-in} \int_{\mathbb{R}^n} |g_j^i(y)| dy \right)^r \right]^{\frac{1}{r}} \\
&= 2^{-in} \left(\sum_{j=1}^{\infty} \left(\int_{\mathbb{R}^n} |g_j^i(y)| dy \right)^r \right)^{\frac{1}{r}} \\
&\lesssim 2^{-in} \int_{\mathbb{R}^n} \left(\sum_{j=1}^{\infty} |g_j^i|^r \right)^{\frac{1}{r}} dy.
\end{aligned}$$

By Hölder's inequality we get

$$\begin{aligned}
E_T^3 &\lesssim \sup_{\epsilon>0} \sup_{L \leq 0, L \in \mathbb{Z}} 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=-\infty}^L 2^{\eta(0)q(1+\epsilon)k} \left\| \mathbf{1}_k \sum_{i=k+2}^{\infty} 2^{-in} \int_{\mathbb{R}^n} \left(\sum_{j=1}^{\infty} |g_j^i|^r \right)^{\frac{1}{r}} dy \right\|_{L^{p(\cdot)}}^{q(1+\epsilon)} \right\}^{\frac{1}{q(1+\epsilon)}} \\
&= \sup_{\epsilon>0} \sup_{L \leq 0, L \in \mathbb{Z}} 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=-\infty}^L 2^{\eta(0)q(1+\epsilon)k} \|\mathbf{1}_k\|_{p(\cdot)}^{q(1+\epsilon)} \left(\sum_{i=k+2}^{\infty} 2^{-in} \int_{\mathbb{R}^n} \left(\sum_{j=1}^{\infty} |g_j^i|^r \right)^{\frac{1}{r}} dy \right)^{q(1+\epsilon)} \right\}^{\frac{1}{q(1+\epsilon)}} \\
&\lesssim \sup_{\epsilon>0} \sup_{L \leq 0, L \in \mathbb{Z}} 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=-\infty}^L 2^{\eta(0)q(1+\epsilon)k} \|\mathbf{1}_k\|_{p(\cdot)}^{q(1+\epsilon)} \left(\sum_{i=k+2}^{\infty} 2^{-in} \left\| \left(\sum_{j=1}^{\infty} |g_j|^r \right)^{\frac{1}{r}} \mathbf{1}_i \right\|_{p(\cdot)}^{q(1+\epsilon)} \right)^{\frac{1}{q(1+\epsilon)}} \right\}^{\frac{1}{q(1+\epsilon)}}. \quad (3.5)
\end{aligned}$$

Using Lemmas 2.5 and 3.2 again, we obtain

$$\begin{aligned}
2^{-in} \|\mathbf{1}_k\|_{p(\cdot)} \|\mathbf{1}_i\|_{L^{p'(\cdot)}} &\leq 2^{-in} \|\mathbf{1}_{B_k}\|_{p(\cdot)} \|\mathbf{1}_{B_i}\|_{L^{p'(\cdot)}} \\
&\lesssim 2^{-in} \|\mathbf{1}_{B_k}\|_{p(\cdot)} |B_i| \|\mathbf{1}_{B_i}\|_{p(\cdot)}^{-1} \\
&\lesssim 2^{n\omega_1(k-i)}. \quad (3.6)
\end{aligned}$$

We put (3.6) into (3.5) and get

$$\begin{aligned}
E_T^3 &\lesssim \sup_{\epsilon>0} \sup_{L \leq 0, L \in \mathbb{Z}} 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=-\infty}^L 2^{\eta(0)kq(1+\epsilon)} \left(\sum_{i=k+2}^{\infty} \left\| \left(\sum_{j=1}^{\infty} |g_j|^r \right)^{\frac{1}{r}} \mathbf{1}_i \right\|_{p(\cdot)}^{q(1+\epsilon)} 2^{n\omega_1(k-i)} \right)^{\frac{1}{q(1+\epsilon)}} \right\}^{\frac{1}{q(1+\epsilon)}} \\
&= \sup_{\epsilon>0} \sup_{L \leq 0, L \in \mathbb{Z}} 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=-\infty}^L \left(\sum_{i=k+2}^{\infty} 2^{\eta(0)k} \left\| \left(\sum_{j=1}^{\infty} |g_j|^r \right)^{\frac{1}{r}} \mathbf{1}_i \right\|_{p(\cdot)}^{q(1+\epsilon)} 2^{n\omega_1(k-i)} \right)^{\frac{1}{q(1+\epsilon)}} \right\}^{\frac{1}{q(1+\epsilon)}}
\end{aligned}$$

$$= \sup_{\epsilon > 0} \sup_{L \leq 0, L \in \mathbb{Z}} 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=-\infty}^L \left(\sum_{i=k+2}^{\infty} 2^{\eta(0)i} \left\| \left(\sum_{j=1}^{\infty} |g_j|^r \right)^{\frac{1}{r}} \mathbf{1}_i \right\|_{p(\cdot)} 2^{d(k-i)} \right)^{q(1+\epsilon)} \right\}^{\frac{1}{q(1+\epsilon)}}. \quad (3.7)$$

where $d := n\omega_1 + \eta(0) > 0$.

Let $1 < q(1 + \epsilon) < \infty$, then we get

$$\begin{aligned} E_T^3 &\lesssim \sup_{\epsilon > 0} \sup_{L \leq 0, L \in \mathbb{Z}} 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=-\infty}^L \left(\sum_{i=k+2}^{\infty} 2^{\eta(0)i} q(1+\epsilon) \left\| \left(\sum_{j=1}^{\infty} |g_j|^r \right)^{\frac{1}{r}} \mathbf{1}_i \right\|_{p(\cdot)} 2^{\frac{dq(1+\epsilon)(k-i)}{2}} \right)^{\frac{q(1+\epsilon)}{(q(1+\epsilon))'}} \right\}^{\frac{1}{q(1+\epsilon)}} \\ &\lesssim \sup_{\epsilon > 0} \sup_{L \leq 0, L \in \mathbb{Z}} 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=-\infty}^L \sum_{i=k+2}^{\infty} 2^{\eta(0)i} q(1+\epsilon) \left\| \left(\sum_{j=1}^{\infty} |g_j|^r \right)^{\frac{1}{r}} \mathbf{1}_i \right\|_{p(\cdot)} 2^{\frac{dq(1+\epsilon)(k-i)}{2}} \right\}^{\frac{1}{q(1+\epsilon)}} \\ &= \sup_{\epsilon > 0} \sup_{L \leq 0, L \in \mathbb{Z}} 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=-\infty}^L \sum_{i=k+2}^{L+2} 2^{\eta(0)i} q(1+\epsilon) \left\| \left(\sum_{j=1}^{\infty} |g_j|^r \right)^{\frac{1}{r}} \mathbf{1}_i \right\|_{p(\cdot)} 2^{\frac{dq(1+\epsilon)(k-i)}{2}} \right\}^{\frac{1}{q(1+\epsilon)}} \\ &\quad + \sup_{\epsilon > 0} \sup_{L \leq 0, L \in \mathbb{Z}} 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=-\infty}^L \sum_{i=L+3}^{\infty} 2^{\eta(0)i} q(1+\epsilon) \left\| \left(\sum_{j=1}^{\infty} |g_j|^r \right)^{\frac{1}{r}} \mathbf{1}_i \right\|_{p(\cdot)} 2^{\frac{dq(1+\epsilon)(k-i)}{2}} \right\}^{\frac{1}{q(1+\epsilon)}} \\ &=: I_3 + I_4. \end{aligned}$$

Now we consider I_3 and I_4 respectively. For $d > 0$, we get

$$\begin{aligned} I_3 &= \sup_{\epsilon > 0} \sup_{L \leq 0, L \in \mathbb{Z}} 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{i=-\infty}^{L+2} 2^{\eta(0)i} q(1+\epsilon) \left\| \left(\sum_{j=1}^{\infty} |g_j|^r \right)^{\frac{1}{r}} \mathbf{1}_i \right\|_{p(\cdot)}^q \sum_{k=-\infty}^{i-2} 2^{\frac{dq(1+\epsilon)(k-i)}{2}} \right\}^{\frac{1}{q(1+\epsilon)}} \\ &\lesssim \sup_{\epsilon > 0} \sup_{L \leq 0, L \in \mathbb{Z}} 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{i=-\infty}^{L+2} 2^{\eta(0)i} q(1+\epsilon) \left\| \left(\sum_{j=1}^{\infty} |g_j|^r \right)^{\frac{1}{r}} \mathbf{1}_i \right\|_{p(\cdot)}^q \right\}^{\frac{1}{q(1+\epsilon)}} \\ &\lesssim E_f. \end{aligned}$$

If $d > 0$ and $\lambda - d/2 < 0$, then we get

$$\begin{aligned} I_4 &\lesssim \sup_{\epsilon > 0} \sup_{L \leq 0, L \in \mathbb{Z}} 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=-\infty}^L \sum_{i=L+3}^{\infty} 2^{\frac{dq(1+\epsilon)(k-i)}{2}} \left[\sum_{m=-\infty}^i 2^{\eta(0)m} q(1+\epsilon) \left\| \left(\sum_{j=1}^{\infty} |g_j|^r \right)^{\frac{1}{r}} \mathbf{1}_m \right\|_{p(\cdot)}^q \right] \right\}^{\frac{1}{q(1+\epsilon)}} \\ &\lesssim \sup_{\epsilon > 0} \sup_{L \leq 0, L \in \mathbb{Z}} 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=-\infty}^L \sum_{i=L+3}^{\infty} 2^{\frac{dq(1+\epsilon)(k-i)}{2}} \cdot 2^{iq(1+\epsilon)\lambda} E_f^{q(1+\epsilon)} \right\}^{\frac{1}{q(1+\epsilon)}} \\ &= \sup_{\epsilon > 0} \sup_{L \leq 0, L \in \mathbb{Z}} 2^{-L\lambda} \left\{ \epsilon^\theta \left(\sum_{k=-\infty}^L 2^{dq(1+\epsilon)k/2} \right) \left(\sum_{i=L+3}^{\infty} 2^{(\lambda-d/2)q(1+\epsilon)i} \right) E_f^{q(1+\epsilon)} \right\}^{\frac{1}{q(1+\epsilon)}} \\ &\lesssim \sup_{\epsilon > 0} \sup_{L \leq 0, L \in \mathbb{Z}} \left\{ 2^{-Lq(1+\epsilon)\lambda} 2^{dq(1+\epsilon)L/2} 2^{(\lambda-d/2)q(1+\epsilon)L} E_f^{q(1+\epsilon)} \right\}^{\frac{1}{q(1+\epsilon)}} \\ &= E_f. \end{aligned}$$

Hence we get $E_T^3 \lesssim E_f$.

For $0 < q(1 + \epsilon) \leq 1$, then using (3.4) in (3.7) we get

$$\begin{aligned}
E_T^3 &\lesssim \sup_{\epsilon>0} \sup_{L\leq 0, L\in \mathbb{Z}} 2^{-L\lambda} \left\{ \sum_{k=-\infty}^L \sum_{i=k+2}^{\infty} 2^{\eta(0)i q(1+\epsilon)} \left\| \left(\sum_{j=1}^{\infty} |g_j|^r \right)^{\frac{1}{r}} \mathbf{1}_i \right\|_{p(\cdot)}^{q(1+\epsilon)} 2^{dq(k-i)} \right\}^{\frac{1}{q(1+\epsilon)}} \\
&\lesssim \sup_{\epsilon>0} \sup_{L\leq 0, L\in \mathbb{Z}} 2^{-L\lambda} \left\{ \sum_{k=-\infty}^L \sum_{i=k+2}^{L+2} 2^{\eta(0)i q(1+\epsilon)} \left\| \left(\sum_{j=1}^{\infty} |g_j|^r \right)^{\frac{1}{r}} \mathbf{1}_i \right\|_{p(\cdot)}^{q(1+\epsilon)} 2^{dq(1+\epsilon)(k-i)} \right\}^{\frac{1}{q(1+\epsilon)}} \\
&+ \sup_{\epsilon>0} \sup_{L\leq 0, L\in \mathbb{Z}} 2^{-L\lambda} \left\{ \sum_{k=-\infty}^L \sum_{i=L+3}^{\infty} 2^{\eta(0)i q(1+\epsilon)} \left\| \left(\sum_{j=1}^{\infty} |g_j|^r \right)^{\frac{1}{r}} \mathbf{1}_i \right\|_{p(\cdot)}^{q(1+\epsilon)} 2^{dq(1+\epsilon)(k-i)} \right\}^{\frac{1}{q(1+\epsilon)}} \\
&=: J_3 + J_4.
\end{aligned}$$

Similarly we conclude that $E_T^3 \lesssim E_f$ holds for $0 < q(1+\epsilon) \leq 1$.

Then we consider H_T^3 . Similarly, we have

$$H_T^3 \lesssim 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=0}^L \left(\sum_{i=k+2}^{\infty} 2^{\eta_\infty i} \left\| \left(\sum_{j=1}^{\infty} |g_j|^r \right)^{\frac{1}{r}} \mathbf{1}_i \right\|_{p(\cdot)}^{q(1+\epsilon)} 2^{d_1(k-i)} \right)^{\frac{1}{q(1+\epsilon)}} \right\} \quad (3.8)$$

here $d_1 = n\omega_1 + \eta_\infty > 0$.

If $1 < q(1+\epsilon) < \infty$, then Hölder's inequality yields

$$\begin{aligned}
H_T^3 &\lesssim 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=0}^L \left(\sum_{i=k+2}^{\infty} 2^{\eta_\infty q(1+\epsilon)i} \left\| \left(\sum_{j=1}^{\infty} |g_j|^r \right)^{\frac{1}{r}} \mathbf{1}_i \right\|_{p(\cdot)}^{q(1+\epsilon)} 2^{\frac{d_1 q(1+\epsilon)(k-i)}{2}} \right) \right. \\
&\quad \times \left. \left(\sum_{i=k+2}^{\infty} 2^{\frac{d_1(q(1+\epsilon))'(k-i)}{2}} \right)^{\frac{q(1+\epsilon)}{(q(1+\epsilon))'}} \right)^{\frac{1}{q(1+\epsilon)}} \\
&\lesssim 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=0}^{\frac{1}{q}} \sum_{i=k+2}^{\infty} 2^{\eta_\infty q(1+\epsilon)i} \left\| \left(\sum_{j=1}^{\infty} |g_j|^r \right)^{\frac{1}{r}} \mathbf{1}_i \right\|_{p(\cdot)}^{q(1+\epsilon)} 2^{\frac{d_1 q(1+\epsilon)(k-i)}{2}} \right\}^{\frac{1}{q(1+\epsilon)}} \\
&\leq 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=0}^L \sum_{i=k+2}^{L+2} 2^{\eta_\infty q(1+\epsilon)i} \left\| \left(\sum_{j=1}^{\infty} |g_j|^r \right)^{\frac{1}{r}} \mathbf{1}_i \right\|_{p(\cdot)}^{q(1+\epsilon)} 2^{\frac{d_1 q(1+\epsilon)(k-i)}{2}} \right\}^{\frac{1}{q(1+\epsilon)}} \\
&\quad + 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=0}^L \sum_{i=L+3}^{\infty} 2^{\eta_\infty q(1+\epsilon)i} \left\| \left(\sum_{j=1}^{\infty} |g_j|^r \right)^{\frac{1}{r}} \mathbf{1}_i \right\|_{p(\cdot)}^{q(1+\epsilon)} 2^{\frac{d_1 q(1+\epsilon)(k-i)}{2}} \right\}^{\frac{1}{q(1+\epsilon)}} \\
&=: I_5 + I_6.
\end{aligned}$$

Because $d_1 > 0$, we have

$$\begin{aligned}
I_5 &= 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{i=2}^{L+2} 2^{\eta_\infty q(1+\epsilon)i} \left\| \left(\sum_{j=1}^{\infty} |g_j|^r \right)^{\frac{1}{r}} \mathbf{1}_i \right\|_{p(\cdot)}^{q(1+\epsilon)} \sum_{k=0}^{i-2} 2^{\frac{d_1 q(k-i)}{2}} \right\}^{\frac{1}{q(1+\epsilon)}} \\
&\lesssim 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{i=2}^{L+2} 2^{\eta_\infty q(1+\epsilon)i} \left\| \left(\sum_{j=1}^{\infty} |g_j|^r \right)^{\frac{1}{r}} \mathbf{1}_i \right\|_{p(\cdot)}^{q(1+\epsilon)} \right\}^{\frac{1}{q(1+\epsilon)}}
\end{aligned}$$

$$\lesssim H_f.$$

Since $d_1 > 0$ and $\lambda - d_1/2 < 0$, we obtain

$$\begin{aligned} I_6 &= 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=0}^L \sum_{i=L+3}^\infty 2^{\eta_\infty q(1+\epsilon)i} \left\| \left(\sum_{j=1}^\infty |g_j|^r \right)^{\frac{1}{r}} \mathbf{1}_i \right\|_{p(\cdot)}^{q(1+\epsilon)} 2^{\frac{d_1 q(1+\epsilon)(k-i)}{2}} \right\}^{\frac{1}{q(1+\epsilon)}} \\ &\leq 2^{-L\lambda} \left\{ \epsilon^\theta \left(\sum_{k=0}^L 2^{\frac{d_1 q(1+\epsilon)k}{2}} \right) \left(\sum_{i=L+3}^\infty 2^{(\lambda-d_1/2)q(1+\epsilon)i} \right) \right. \\ &\quad \times \left. \left[\sum_{m=0}^i 2^{\eta_\infty q(1+\epsilon)m} \left\| 2^{-i\lambda} \left(\sum_{j=1}^\infty |g_j|^r \right)^{\frac{1}{r}} \mathbf{1}_m \right\|_{p(\cdot)}^{q(1+\epsilon)} \right] \right\}^{\frac{1}{q(1+\epsilon)}} \\ &\lesssim 2^{-L\lambda} 2^{d_1/2L} 2^{(\lambda-d_1/2)L} H_f \\ &= H_f. \end{aligned}$$

For $0 < q(1 + \epsilon) \leq 1$, we use (3.4) in (3.8) and have

$$\begin{aligned} H_T^3 &\lesssim 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=0}^L \sum_{i=k+2}^\infty 2^{\eta_\infty q(1+\epsilon)i} \left\| \left(\sum_{j=1}^\infty |g_j|^r \right)^{\frac{1}{r}} \mathbf{1}_i \right\|_{p(\cdot)}^{q(1+\epsilon)} 2^{d_1 q(1+\epsilon)(k-i)} \right\}^{\frac{1}{q(1+\epsilon)}} \\ &\leq 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=0}^L \sum_{i=k+2}^{L+2} 2^{\eta_\infty q(1+\epsilon)i} \left\| \left(\sum_{j=1}^\infty |g_j|^r \right)^{\frac{1}{r}} \mathbf{1}_i \right\|_{p(\cdot)}^{q(1+\epsilon)} 2^{d_1 q(1+\epsilon)(k-i)} \right\}^{\frac{1}{q(1+\epsilon)}} \\ &\quad + 2^{-L\lambda} \left\{ \epsilon^\theta \sum_{k=0}^L \sum_{i=L+3}^\infty 2^{\eta_\infty q(1+\epsilon)i} \left\| \left(\sum_{j=1}^\infty |g_j|^r \right)^{\frac{1}{r}} \mathbf{1}_i \right\|_{p(\cdot)}^{q(1+\epsilon)} 2^{d_1 q(1+\epsilon)(k-i)} \right\}^{\frac{1}{q(1+\epsilon)}} \\ &=: I_J + J_6. \end{aligned}$$

Similarly we can get $H_T^3 \lesssim H_f$ where $0 < q(1 + \epsilon) \leq 1$.

Hence we completes our proof. \square

Now we turn to prove Theorem 2.13. Because the proofs of B -parts and F -parts are similar, we only prove F -parts below. Our proof will use the idea that comes from [49]. To continue, we recall some lemmas.

Lemma 3.2. [33]

Let $\mu, \nu \in \mathcal{S}(\mathbb{R}^n)$, $-1 \leq M \in \mathbb{Z}$,

$$D^\tau \widehat{\mu}(0) = 0 \quad \text{for all } |\tau| \leq M.$$

Then for any $N > 0$ there is a constant C_N such that

$$\sup_{z \in \mathbb{R}^n} |\mu_t * \nu(z)| (1 + |z|)^N \leq C_N t^{M+1},$$

where $\mu_t(x) = t^{-n} \mu\left(\frac{x}{t}\right)$ for all $0 < t \leq 2$.

Lemma 3.3. [33] If $\omega > 0$ and $q \in (0, \infty]$. Then for a sequence $\{g_j\}_0^\infty$, we have

$$G_j = \sum_{\ell=0}^\infty 2^{-|\ell-j|\omega} g_\ell.$$

Then

$$\left\| \{G_j\}_0^\infty \right\|_{\ell_q} \leq C \left\| \{g_j\}_0^\infty \right\|_{\ell_q}. \quad (3.9)$$

Lemma 3.4. If $\kappa, q \in (0, \infty]$, $\omega > 0$, $s \in \mathbb{R}$, and η, q, p , are same as given in Theorem 2.8. For a sequence $\{g_j\}_0^\infty$, we have

$$G_j(x) = \sum_{k=0}^{\infty} 2^{-|k-j|\omega} g_k(x), \quad x \in \mathbb{R}^n.$$

Then there are some constants $C_1 = C_1(q, \omega)$ and $C_2 = C_2(p(\cdot), q, \omega)$ such that

$$\left\| \{G_j\}_{j=0}^\infty \right\|_{M\dot{K}_{\lambda, p(\cdot)}^{\eta(\cdot), q, \theta}(\ell_\kappa)} \leq C_1 \left\| \{g_j\}_{j=0}^\infty \right\|_{M\dot{K}_{\lambda, p(\cdot)}^{\eta(\cdot), q, \theta}(\ell_\kappa)} \quad (3.10)$$

and

$$\left\| \{G_j\}_{j=0}^\infty \right\|_{\ell_\kappa(M\dot{K}_{\lambda, p(\cdot)}^{\eta(\cdot), q, \theta})} \leq C_2 \left\| \{g_j\}_{j=0}^\infty \right\|_{\ell_\kappa(M\dot{K}_{\lambda, p(\cdot)}^{\eta(\cdot), q, \theta})}. \quad (3.11)$$

Proof. Firstly, (3.10) follows immediately from Lemma 3.3. Next we prove (3.11) for $p(\cdot) \in \mathcal{P}^0(\mathbb{R}^n)$ and we separate it into two cases.

Case 1. $p_- \geq 1, q \geq 1$. Because $\|\cdot\|_{M\dot{K}_{\lambda, p(\cdot)}^{\eta(\cdot), q, \theta}}$ is a norm, we have

$$\|G_j\|_{M\dot{K}_{\lambda, p(\cdot)}^{\eta(\cdot), q, \theta}} \leq \sum_{k=0}^{\infty} 2^{-|k-j|\omega} \|g_k\|_{M\dot{K}_{\lambda, p(\cdot)}^{\eta(\cdot), q, \theta}}.$$

Using Lemma 3.4, we get (3.11).

Case 2. If $q < 1$, let $p_0 < \min(p_-, q)$ then we get

$$\begin{aligned} \|G_j\|_{M\dot{K}_{\lambda, p(\cdot)}^{\eta(\cdot), q, \theta}}^{p_0} &= \left\| |G_j|^{p_0} \right\|_{M\dot{K}_{p_0, \lambda, p(\cdot)/p_0}^{p_0 \eta(\cdot), q/p_0, p_0 \theta}} \\ &\leq \left\| \sum_{k=0}^{\infty} 2^{-|k-j|p_0 \omega} |g_k|^{p_0} \right\|_{M\dot{K}_{p_0, \lambda, p(\cdot)/p_0}^{p_0 \eta(\cdot), q/p_0, p_0 \theta}} \\ &\leq \sum_{k=0}^{\infty} 2^{-|k-j|p_0 \omega} \|g_k\|_{M\dot{K}_{p_0, \lambda, p(\cdot)/p_0}^{p_0 \eta(\cdot), q/p_0, p_0 \theta}}^{p_0}. \end{aligned}$$

Consequently we get

$$\begin{aligned} \left\| \{G_j\}_{j=0}^\infty \right\|_{\ell_\kappa(M\dot{K}_{\lambda, p(\cdot)}^{\eta(\cdot), q, \theta})}^{p_0} &= \left\| \{|G_j|^{p_0}\}_{j=0}^\infty \right\|_{\ell_{\kappa/p_0}(M\dot{K}_{p_0, \lambda, p(\cdot)/p_0}^{p_0 \eta(\cdot), q/p_0, p_0 \theta})} \\ &\lesssim \left\| \{g_k\}_{j=0}^\infty \right\|_{\ell_{\kappa/p_0}(M\dot{K}_{p_0, \lambda, p(\cdot)/p_0}^{p_0 \eta(\cdot), q/p_0, p_0 \theta})} \\ &= \left\| \{g_k\}_{j=0}^\infty \right\|_{\ell_\kappa(M\dot{K}_{\lambda, p(\cdot)}^{\eta(\cdot), q, \theta})}^{p_0}. \end{aligned}$$

By using the power $1/p_0$, we get (3.11). \square

Lemma 3.5 ([11], Theorem 6). Let $\{\varphi_j\}_{j \in \mathbb{N}_0}$ is the resolution of unity, $R \in \mathbb{N}$. Then there exists functions $\theta_0, \theta \in \mathcal{S}(\mathbb{R}^n)$ which satisfy

$$\text{supp } \theta, \text{supp } \theta_0 \subseteq \{y \in \mathbb{R}^n : |y| \leq 1\},$$

$$|\widehat{\theta}_0(\varrho)| > 0 \quad \text{on } \{|\varrho| < 2\varepsilon\},$$

$$|\widehat{\theta}(\varrho)| > 0 \quad \text{on } \left\{ \frac{\varepsilon}{2} < |\varrho| < 2\varepsilon \right\},$$

$$\int_{\mathbb{R}^n} y^\gamma \theta(x) dy = 0, \quad \forall \gamma, 0 < |\gamma| \leq R,$$

such that

$$\widehat{\theta}_0(\varrho) \widehat{\Psi}_0(\varrho) + \sum_{j=1}^{\infty} \widehat{\theta}(p^{-j} \varrho) \widehat{\Psi}(p^{-j} \varrho) = 1, \quad \forall \varrho \in \mathbb{R}^n,$$

and $\Psi_0, \Psi \in \mathcal{S}(\mathbb{R}^n)$ are given as

$$\widehat{\Psi}_0(\varrho) = \frac{\varphi_0(\varrho)}{\theta_0(\varrho)}, \quad \widehat{\Psi}(\varrho) = \frac{\varphi_1(2\varrho)}{\theta(\varrho)}.$$

Proof. Now we will give the proof of Theorem 2.13.

Step 1. Let $g \in \mathcal{S}'(\mathbb{R}^n)$, then

$$\|g\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta} F_\kappa^s}^{(2)} \lesssim \|g\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta} F_\kappa^s}^{(1)} \lesssim \|g\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta} F_\kappa^s}^{(2)}.$$

Using Lemmas 3.2 and 3.5, and the fact $r < \min\{p_-, \kappa\}$ for $N \in \mathbb{N}$. Then for $g \in \mathcal{S}(\mathbb{R}^n)$, then

$$\begin{aligned} \left(\int_1^2 \left| 2^{ls} (\Phi_{2^{-l}}^* g)_a(x) \right|^{\kappa} \frac{dt}{t} \right)^{r/\kappa} &\lesssim \sum_{k \in l + \mathbb{N}_0} 2^{(l-k)(Nr-n+rs)} 2^{krs} \\ &\times \mathcal{M} \left[\left(\int_1^2 |((\Phi_k)_t * g)(\cdot)|^{\kappa} \frac{dt}{t} \right)^{r/\kappa} \right] (x). \end{aligned}$$

If $l \in \mathbb{N}$, $p_0 = r \in (n/a, \min\{p_-, \kappa\})$, $N > \max\{0, -s\} + a$ and $\omega := N + s - d/r > 0$, then we get

$$\begin{aligned} &\left(\int_1^2 \left| 2^{ls} (\Phi_{2^{-l}}^* g)_a(x) \right|^{\kappa} \frac{dt}{t} \right)^{r/\kappa} \\ &\lesssim \sum_{k \in l + \mathbb{N}_0} 2^{-\omega r|l-k|} 2^{krs} \mathcal{M} \left[\left(\int_1^2 |((\Phi_k)_t * g)(\cdot)|^{\kappa} \frac{dt}{t} \right)^{r/\kappa} \right] (x). \end{aligned}$$

Using Lemma 3.5 in $M\dot{K}_{r\lambda,p(\cdot)/r}^{r\eta(\cdot), q/r, r\theta}(\ell_{\kappa/r})$, we obtain

$$\begin{aligned} &\left\| \left\{ \left(\int_1^2 \left| 2^{ls} (\Phi_{2^{-l}}^* g)_a(x) \right|^{\kappa} \frac{dt}{t} \right)^{r/\kappa} \right\}_{l \in \mathbb{N}} \right\|_{M\dot{K}_{r\lambda,p(\cdot)/r}^{r\eta(\cdot), q/r, r\theta}(\ell_{\kappa/r})} \\ &\lesssim \left\| \left\{ \mathcal{M} \left[\left(\int_1^2 \left| 2^{ks} ((\Phi_l)_t * g)(\cdot) \right|^{\kappa} \frac{dt}{t} \right)^{r/\kappa} \right] \right\}_{l \in \mathbb{N}} \right\|_{M\dot{K}_{r\lambda,p(\cdot)/r}^{r\eta(\cdot), q/r, r\theta}(\ell_{\kappa/r})} \end{aligned}$$

Theorem 2.8 yields

$$\begin{aligned} &\left\| \left\{ \left(\int_1^2 \left| 2^{ls} (\Phi_{2^{-l}}^* g)_a(x) \right|^{\kappa} \frac{dt}{t} \right)^{r/\kappa} \right\}_{l \in \mathbb{N}} \right\|_{M\dot{K}_{r\lambda,p(\cdot)/r}^{r\eta(\cdot), q/r, r\theta}(\ell_{\kappa/r})} \\ &\lesssim \left\| \left\{ \left(\int_1^2 \left| 2^{ks} ((\Phi_l)_t * g)(\cdot) \right|^{\kappa} \frac{dt}{t} \right)^{r/\kappa} \right\}_{l \in \mathbb{N}} \right\|_{M\dot{K}_{r\lambda,p(\cdot)/r}^{r\eta(\cdot), q/r, r\theta}(\ell_{\kappa/r})} \\ &= \left\| \left\{ \left(\int_1^2 \left| 2^{ks} ((\Phi_l)_t * g)(\cdot) \right|^{\kappa} \frac{dt}{t} \right)^{1/\kappa} \right\}_{l \in \mathbb{N}} \right\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta}(\ell_\kappa)}^r. \end{aligned}$$

Hence, we have

$$\begin{aligned} &\left\| \left(\int_0^1 \left| \lambda^{-s} (\Phi_\lambda^* g)_a(\cdot) \right|^{\kappa} \frac{d\lambda}{\lambda} \right)^{1/\kappa} \right\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta}} \\ &\approx \left\| \left(\sum_{l=1}^{\infty} \int_1^2 \left| 2^{ls} (\Phi_{2^{-l}}^* g)_a(\cdot) \right|^{\kappa} \frac{dt}{t} \right)^{1/\kappa} \right\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta}} \end{aligned}$$

$$\begin{aligned} &\lesssim \left\| \left\{ \left(\int_1^2 \left| 2^{ls} \Phi_{2^{-l}t} * g(\cdot) \right|^{\kappa} \frac{dt}{t} \right)^{1/\kappa} \right\}_{l \in \mathbb{N}} \right\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta}(\ell_k)} \\ &\approx \left\| \left(\int_0^1 \left| \lambda^{-s} \Phi_{\lambda} * g(\cdot) \right|^{\kappa} \frac{d\lambda}{\lambda} \right)^{1/\kappa} \right\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta}}. \end{aligned}$$

This proves $\|g\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta} F_k^s}^{(2)} \lesssim \|g\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta} F_k^s}^{(1)}$.

Step 2. Suppose that $\Psi_0, \Psi \in \mathcal{S}'(\mathbb{R}^n)$ and $g \in \mathcal{S}'(\mathbb{R}^n)$.

$$\|g\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta} F_k^s(\mathbb{R}^n, \Psi)}^{(4)} \lesssim \|g\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta} F_k^s(\mathbb{R}^n, \Phi)}^{(2)}. \quad (3.11)$$

By applying Lemmas 3.5 and 3.2, and the fact $\omega = \min\{1, S + 1 - s\}$, then for $g \in \mathcal{S}$, we get

$$2^{ls} (\Psi_l^* g)_a(x) \leq C \sum_{k \in \mathbb{N}_0} 2^{-|k-l|\omega} 2^{ks} (\Phi_{2^{-k}t}^* g)_a(x), \quad x \in \mathbb{R}^n \text{ and } t \in [1, 2]. \quad (3.12)$$

If $\kappa \geq 1$. By using the $\left(\int_1^2 |\cdot|^{\kappa} dt/t \right)^{1/\kappa}$, we get

$$2^{ls} (\Psi_l^* g)_a(x) \lesssim \sum_{k \in \mathbb{N}_0} 2^{-|k-l|\omega} 2^{ks} \left(\int_1^2 \left| (\Phi_{2^{-k}t}^* g)_a(x) \right|^{\kappa} \frac{dt}{t} \right)^{1/\kappa}.$$

Applying Lemma 3.5, we obtain

$$\left\| \left\{ 2^{ls} (\Psi_l^* g)_a \right\}_{l \in \mathbb{N}} \right\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta}(\ell_k)} \lesssim \left\| \left(\sum_{k=1}^{\infty} 2^{ks\kappa} \int_1^2 \left| (\Phi_{2^{-k}t}^* g)_a(x) \right|^{\kappa} \frac{dt}{t} \right)^{1/\kappa} \right\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta}}.$$

Hence we obtain the required result.

If $\kappa < 1$, then $\left(\int_1^2 |\cdot|^{\kappa} dt/t \right)^{1/\kappa}$ is not the norm. Thus we get

$$(2^{ls} (\Psi_l^* g)_a(x))^{\kappa} \lesssim \sum_{k \in \mathbb{N}_0} 2^{-\kappa|k-l|\omega} 2^{ks\kappa} \int_1^2 \left| (\Phi_{2^{-k}t}^* g)_a(x) \right|^{\kappa} \frac{dt}{t}.$$

Convolution $(\gamma * \eta)_\ell$ of the sequences yields

$$\gamma_k = 2^{-|k|\omega\kappa} \quad \text{and} \quad \tau_k = 2^{ks\kappa} \int_1^2 \left| (\Phi_{2^{-k}t}^* g)_a(x) \right|^{\kappa} \frac{dt}{t}$$

For $x \in \mathbb{R}^n$, using ℓ_1 -norm gives as

$$\begin{aligned} \left\| 2^{ls} (\Psi_l^* g)_a(x) \right\|_{\ell_k}^{\kappa} &\leq \|\gamma\|_{\ell_1} \cdot \|\tau\|_{\ell_1} \\ &\lesssim \sum_{k=1}^{\infty} 2^{ks\kappa} \int_1^2 \left| (\Phi_{2^{-k}t}^* g)_a(x) \right|^{\kappa} \frac{dt}{t}. \end{aligned}$$

By taking $(\dots)^{1/\kappa}$ and using $\dot{K}_{p(\cdot)}^{\eta(\cdot),q,\theta}$ -norm. We obtain desired result (3.11).

Similarly, for any $g \in \mathcal{S}'(\mathbb{R}^n)$, we obtain

$$\|g\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta} F_k^s(\mathbb{R}^n, \Phi)}^{(2)} \lesssim \|g\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta} F_k^s(\mathbb{R}^n, \Psi)}^{(4)}.$$

Step 3. Using $t = 1$ in **Step 1**, we get

$$\|g\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta} F_k^s}^{(5)} \lesssim \|g\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta} F_k^s}^{(4)} \lesssim \|g\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta} F_k^s}^{(5)}.$$

Step 4. We show (2.15) is equivalent to the rest.

First, we will show that for any $g \in \mathcal{S}'(\mathbb{R}^n)$

$$\|g\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta} F_k^s(\mathbb{R}^n)}^{(2)} \lesssim \|g\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta} F_k^s}^{(3)}. \quad (3.13)$$

For $0 < r < \min\{p_-, \kappa\}$, see [49], there exists a positive constant C such that for any $g \in \mathcal{S}'(\mathbb{R}^n)$,

$$\begin{aligned} & \left(\int_1^2 \left| (\Psi_{2^{-l}}^* g)_a(x) \right|^\kappa \frac{dt}{t} \right)^{r/\kappa} \\ & \leq C \sum_{k \in \mathbb{N}_0} 2^{-kNs} 2^{(k+l)n} \int_{\mathbb{R}^n} \frac{\left(\int_1^2 \int_{|z| < 2^{-(k+l)t}} |((\Phi_{k+l})_t * g)(z+y)|^\kappa dz \frac{dt}{t^{n+1}} \right)^{r/\kappa}}{(1 + 2^l|x-y|)^{ar}} dy. \end{aligned}$$

Let $ar > n$, we get

$$g_l(y) := \frac{2^{nl}}{(1 + 2^l|y|)^{ar}}, \quad \forall y \in \mathbb{R}^n.$$

Hence we get

$$\begin{aligned} & \left(\int_1^2 \left| 2^{ls} (\Phi_{2^{-l}t}^* g)_a(x) \right|^\kappa \frac{dt}{t} \right)^{r/\kappa} \\ & \lesssim \sum_{k \in \mathbb{N}_0} 2^{-kNr} 2^{kn} 2^{lsr} \left[g_l * \left(\int_1^2 \int_{|z| < 2^{-(k+l)t}} |((\Phi_{k+l})_t * g)(z+\cdot)|^\kappa dz \frac{dt}{t^{n+1}} \right)^{r/\kappa} \right] (x). \end{aligned}$$

By applying the majorant property see [36] to obtain

$$\begin{aligned} & \left(\int_1^2 \left| 2^{ls} (\Phi_{2^{-l}t}^* g)_a(x) \right|^\kappa \frac{dt}{t} \right)^{r/\kappa} \\ & \lesssim \sum_{k \in \mathbb{N}_0} 2^{lsr} 2^{k(-Nr+n)} \mathcal{M} \left[\left(\int_1^2 \int_{|z| < 2^{-(k+l)t}} |((\Phi_{k+l})_t * g)(z+\cdot)|^\kappa dz \frac{dt}{t^{n+1}} \right)^{r/\kappa} \right] (x). \end{aligned}$$

An index shift on the right-hand side gives

$$\begin{aligned} & \left(\int_1^2 \left| 2^{ls} (\Phi_{2^{-l}t}^* g)_a(x) \right|^\kappa \frac{dt}{t} \right)^{r/\kappa} \\ & \lesssim \sum_{k \in l+\mathbb{N}_0} 2^{lsr} 2^{(k-l)(-Nr+n)} \mathcal{M} \left[\left(\int_1^2 \int_{|z| < 2^{-k}t} |((\Phi_k)_t * g)(z+\cdot)|^\kappa dz \frac{dt}{t^{n+1}} \right)^{r/\kappa} \right] (x) \\ & = \sum_{k \in l+\mathbb{N}_0} 2^{(l-k)(Nr-n+rs)} 2^{krs} \mathcal{M} \left[\left(\int_1^2 \int_{|z| < 2^{-k}t} |((\Phi_k)_t * g)(z+\cdot)|^\kappa dz \frac{dt}{t^{n+1}} \right)^{r/\kappa} \right] (x). \end{aligned}$$

It is simple to note that $\|g\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta} F_\kappa^s}^{(3)} \lesssim \|g\|_{M\dot{K}_{\lambda,p(\cdot)}^{\eta(\cdot),q,\theta} F_\kappa^s}^{(2)}$, since for any $t > 0$

$$\frac{1}{t^n} \int_{|z| < t} |(\Phi_t * g)(x+z)| dz \lesssim \sup_{|z| < t} \frac{|(\Phi_t * g)(x+z)|}{(1 + 1/t|z|)^a} \lesssim (\Phi_t^* g)_a(x).$$

Hence we completes the proof. \square
