

## ON THE RESIDUAL NILPOTENCE OF PURE ARTIN GROUPS

IVAN MARIN

**Abstract.** In this very short note we show that the residual nilpotence of pure Artin groups of spherical type is easily deduced from the faithfulness of the Krammer-Digne representations.

Let  $W$  be a finite Coxeter group,  $B$  the associated (spherical) Artin group of spherical type, and  $P$  the corresponding pure group, defined as the kernel of the projection  $\pi : B \rightarrow W$ . It is conjectured that the group  $P$  is residually nilpotent, meaning that the intersection of the terms  $C^r P$  for  $r \geq 1$  of its descending central series, defined by  $C^1 P$  equals the commutator group  $(P, P)$  and  $C^{r+1} P = (P, C^r P)$ , is trivial. This fact is obvious for the dihedral types, since it reduces in this case to the study of the free groups, which is known for a long time. It was proved by Falk and Randell for types  $A_n$ ,  $B_n$  (and  $I_2(m)$ ) in [6] as an easy consequence of their previous work [5], and by Markushевич in [8, 9] for type  $D_n$ .

There is a short way to prove this for every Artin group of spherical type using the generalization of the Krammer representation by F. Digne (these representations were also obtained in type ADE by A.M. Cohen and D.B. Wales in [2]) — in the same spirit that the linearity of these groups imply their residual finiteness by Malcev theorem. It seems that this very simple application had been unnoticed yet.

**Theorem.** *The pure Artin groups of spherical type are residually nilpotent.*

*Proof.* First we may assume that  $W$  is reduced. Moreover let's assume first that  $W$  is of crystallographic type. Let  $N$  be the number of reflexions of  $W$  and  $V \simeq \mathbb{R}^N$  the  $\mathbb{R}$ -vector space formed by linear formal combination of reflexions of  $W$ . We let  $L = \mathbb{R}[q, q^{-1}, t]$ ,  $A = \mathbb{k}[[h]]$  where  $q, t, h$  are indeterminates. There are embeddings  $\iota : L \hookrightarrow A$  given, for example, by  $q \mapsto e^h$  and  $t \mapsto e^{\sqrt{2}h}$ . We let  $V_{q,t} = V \otimes_{\mathbb{R}} L$ , and  $V_h = V \otimes_{\mathbb{R}} A = V_{q,t} \otimes_{\iota} A$ . There is a reduction morphism  $\varphi : V_h \rightarrow V$ . F. Digne defined in [4] a faithful representation  $R_W : B \rightarrow GL(V_{q,t}) \subset GL(V_h)$ , and it is easily checked from his formulas that the following diagram is commutative

$$\begin{array}{ccc} B & \longrightarrow & GL(V_h) \\ \downarrow & & \downarrow \varphi \\ W & \xrightarrow{R_W^0} & GL(V) \end{array}$$

where the map  $R_W^0 : W \rightarrow GL(V)$  is given by the natural conjugation action of  $W$  on its set of reflexions. It follows, using the identifications  $V = \mathbb{R}^N$ ,  $\text{End}(V_h) = M_N(A)$ , that  $R_W(C^r P) \subset 1 + h^{r+1} M_N(A)$ . In particular, if  $x$  belongs to the intersection of the terms  $C^r P$ ,  $R_W(x)$  belongs to the intersection of the terms  $1 + h^{r+1} M_N(A)$ , which is trivial. Hence  $R_W(x) = 1$  and  $x = 1$  by faithfulness of the Krammer-Digne representation.

If  $W$  is of type  $H_3$ , we let  $W'$  be of type  $D_6$ , and denote by  $B'$ ,  $P'$  the Artin group and pure Artin group associated to it. There exists an injective morphism

---

*Date:* January 2005.

$j : B \rightarrow B'$  which sends  $P$  to  $P'$  and induces an injective morphism  $\check{j} : W \rightarrow W'$  such that the following diagram commutes

$$\begin{array}{ccc} B & \xrightarrow{j} & B' \\ \downarrow & & \downarrow \\ W & \xrightarrow{\check{j}} & W' \end{array}$$

where the vertical arrows are the natural projections. If  $\sigma_1, \sigma_2, \sigma_3$  denote the Artin generators of  $B$  such that  $\langle \sigma_1, \sigma_2 \rangle$  is of type  $I_2(5)$  and  $\langle \sigma_2, \sigma_3 \rangle$  has type  $I_2(3)$ , and the Artin generators  $\sigma'_1, \dots, \sigma'_6$  of  $B'$  are numbered according to Bourbaki (see [1]),  $j$  is defined by  $\sigma_1 \mapsto \sigma'_3 \sigma'_5$ ,  $\sigma_2 \mapsto \sigma'_2 \sigma'_4$ ,  $\sigma_3 \mapsto \sigma'_1 \sigma'_6$ . This is one of the “folding morphisms” defined by J. Crisp in [3]. If  $W$  is of type  $H_4$ , let  $W'$  be of type  $E_8$ , let  $\sigma_1, \sigma_2, \sigma_3, \sigma_4$  be the Artin generators of  $H_4$  such that  $\langle \sigma_1, \sigma_2, \sigma_3 \rangle$  is of type  $H_3$  and number the Artin generators  $\sigma'_1, \dots, \sigma'_8$  of  $B'$  according to Bourbaki. There is also a folding morphism defined by  $\sigma_1 \mapsto \sigma'_3 \sigma'_5$ ,  $\sigma_2 \mapsto \sigma'_4 \sigma'_6$ ,  $\sigma_3 \mapsto \sigma'_3 \sigma'_7$  and  $\sigma_4 \mapsto \sigma'_1 \sigma'_8$ . Then  $j$  restricts to a monomorphism  $P \rightarrow P'$ , and  $R_{W'} \circ j$  is faithful. Then  $R_{W'} \circ j(P) \subset 1 + hM_N(A)$ , where  $N$  is the number of reflexions of  $W'$ . It follows that  $P$  is residually nilpotent by the same argument. Since there are also folding morphisms from the groups of type  $I_2(m)$  to any Artin group of Coxeter number  $m$ , the conclusion also holds for type  $I_2(m)$  (alternatively one may use the faithfulness of the Iwahori-Hecke representation proved in [7]). □

Notice that we could have restricted ourselves to the representations constructed by A.M. Cohen and D.B. Wales (see [2]) in type ADE since all Artin groups of spherical type embed in one of these by a folding morphism.
