## Aharonov-Bohm effect and classical Hamiltonian mechanics

Alexander Ershkovich and Peter Israelevich Department of Geophysics and Planetary Sciences Tel Aviv University, Ramat Aviv, Israel

Aharonov-Bohm effect (1959) was always considered to be a quantum mechanics one. For instance, Feynman et al. [1] mentioned that it was implicit from the beginning of quantum mechanics in 1926. One of us, A.E. [2] drew attention to the fact that Hamilton-Jacobi equation which governs the classical mechanics explicitly depends on the potential **A** of the magnetic field, like Schroedinger equation, and hence **A** should be a physical reality (rather than a mathematical artifice) in classical physics as well. This is quite natural as the classical mechanics follows from Hamilton principle of least action, and the action *S* contains the term

$$S_{in} = q \int \mathbf{A} d\mathbf{r} \tag{1}$$

which is indicative of the electric charge *q* interaction with the magnetic field  $\mathbf{B} = \nabla \times \mathbf{A}$  (or more correctly, with the field  $\mathbf{A}$ ).

Let us show that Aharonov-Bohm effect may be derived from the Hamilton-Jacobi equation using de Broglie idea (1924) on wave-particle duality.

Hamilton-Jacobi equation for the action S is

$$\frac{\partial S}{\partial t} + H = 0 \tag{2}$$

where  $H = \frac{1}{2m} \left( \frac{\partial S}{\partial \mathbf{r}} - q \mathbf{A} \right)^2$  is the Hamiltonian. The phase  $\Psi$  of the de Broglie wave obeys the eikonal equation in geometrical optics

obeys the eikonal equation in geometrical optics

$$\frac{\partial \Psi}{\partial t} + \omega = 0 \tag{3}$$

With the energy  $H = \hbar \omega$ , and the generalized momentum  $\mathbf{P} = \hbar \mathbf{k}$ , equation (3) differs from (2) only by the factor  $\hbar = H/\omega = S/\Psi$ . Thus the phase shift  $\Psi_s$ 

accumulated due to particle field-interaction is  $\Psi_s = S_{in}/\hbar$ . Using equation (1) we arrived at the Aharonov-Bohm effect:

$$\Psi_{s} = \frac{q}{\hbar} \int \mathbf{A} d\mathbf{r}$$
(4)

Schroedinger equation was not required. It means that Aharonov-Bohm effect, strictly speaking, is not a quantum mechanics effect. It might have been predicted well before the quantum mechanics creation by Heisenberg and Schroedinger.
