

THE RATE OF INCREASE OF MEAN VALUES OF FUNCTIONS IN WEIGHTED HARDY SPACES

CHENGJI XIONG & JUNMING LIU

ABSTRACT. Let $0 < p < \infty$ and $0 \leq q < \infty$. For each f in the weighted Hardy space $H_{p,q}$, we show that $d\|f_r\|_{p,q}^p/dr$ grows at most like $o(1/1-r)$ as $r \rightarrow 1$.

1. INTRODUCTION

Let \mathbb{D} be the unit disk in the complex plane and $0 < p < \infty$. The Hardy space $H^p(\mathbb{D})$ is the family of all analytic functions f in \mathbb{D} satisfying

$$\|f\|_p = \lim_{r \rightarrow 1} \|f_r\|_p < \infty,$$

where

$$\|f_r\|_p = \left(\frac{1}{2\pi} \int_0^{2\pi} |f(re^{i\theta})|^p d\theta \right)^{1/p}.$$

If $0 \leq q < \infty$, define

$$\|f_r\|_{p,q} = \left(\frac{1}{2\pi} \int_0^{2\pi} |f(re^{i\theta})|^p (1-r^2)^q d\theta \right)^{1/p}.$$

The weighted Hardy space $H_{p,q}(\mathbb{D})$ is the family of all analytic functions f in \mathbb{D} satisfying

$$\|f\|_{p,q} = \sup_{0 < r < 1} \|f_r\|_{p,q} < \infty.$$

It is trivial that $H_{p,0}$ is just the classical Hardy space H^p and $H_{p,q}$ is a Banach space for $p \geq 1$. There are many books about H^p and $H_{p,q}$ such as Duren's book [3] and Zhu's book [7]. It is well known that $\|f_r\|_p$ is a nondecreasing function of r . Furthermore, Hardy [4] showed that $\log \|f_r\|_p$ is a convex function of $\log r$. Other properties of mean values of analytic functions can be found in [1, 2, 6].

Recently, Mashreghi [5] showed that $d\|f_r\|_p/dr$ grows at most like $o(1/1-r)$ as $r \rightarrow 1$. In this paper, we generalized this result to weighted Hardy spaces.

2. LEMMAS

Suppose that $f \not\equiv 0$ is analytic in \mathbb{D} . Let $W(z) = |f(z)|^p(1-|z|^2)^q$ for $0 < p < \infty$, $0 \leq q < \infty$, and ∇ be the gradient operator.

Lemma 1. *Let $0 < r \leq 1$ and $D_r = \{z : |z| < r\}$. For $z_0 \in D_r$ and small $\varepsilon > 0$, let $D(z_0, \varepsilon) = \{z : |z - z_0| \leq \varepsilon\} \subset D_r$ and*

$$I_\varepsilon = \int_{\partial D(z_0, \varepsilon)} \left(\log(r/|z|) \frac{\partial W}{\partial n} - W \frac{\partial \log(r/|z|)}{\partial n} \right) dl.$$

If $z_0 \neq 0$ is a zero of f , then $\lim_{\varepsilon \rightarrow 0} I_\varepsilon = 0$. If $z_0 = 0$ then $\lim_{\varepsilon \rightarrow 0} I_\varepsilon = 2\pi |f(0)|^p$.

2000 *Mathematics Subject Classification.* 30H10.

Key words and phrases. Hardy space, weighted Hardy space, mean value.

Proof. Since $W(z) = |f(z)|^p(1 - |z|^2)^q$, direct computation gives

$$\nabla W(z) = (1 - |z|^2)^q \nabla |f(z)|^p + |f(z)|^p \nabla (1 - |z|^2)^q$$

and

$$|\nabla |f(z)|^p| \leq p|f(z)|^{p-1}|f'(z)|, \quad |\nabla (1 - |z|^2)^q| = 2q|z|(1 - |z|^2)^{q-1}.$$

So

$$\begin{aligned} \left| \frac{\partial W(z)}{\partial n} \right| &\leq |\nabla W(z)| \leq (1 - |z|^2)^q |\nabla |f(z)|^p| + |f(z)|^p |\nabla (1 - |z|^2)^q| \\ &\leq p|f(z)|^{p-1}|f'(z)|(1 - |z|^2)^q + 2q|z||f(z)|^p(1 - |z|^2)^{q-1} \end{aligned}$$

and

$$\left| \frac{\partial \log(r/|z|)}{\partial n} \right| \leq |\nabla \log(r/|z|)| = \frac{1}{|z|}.$$

Write

$$\begin{aligned} I_\varepsilon &= \int_{\partial D(z_0, \varepsilon)} \left(\log(r/|z|) \frac{\partial W}{\partial n} - W \frac{\partial \log(r/|z|)}{\partial n} \right) d\ell \\ &= \int_0^{2\pi} \log(r/|z_0 + \varepsilon e^{i\theta}|) \frac{\partial W(z_0 + \varepsilon e^{i\theta})}{\partial n} \varepsilon d\theta - \int_{\partial D(z_0, \varepsilon)} W(z) \frac{\partial \log(r/|z|)}{\partial n} d\ell \\ &= I_1 - I_2. \end{aligned}$$

For convenience, let $C > 0$ be a constant independent of ε , whose value may change from line to line.

If $z_0 \neq 0$ is a zero of order $k \geq 1$, then $|I_1| \leq C\varepsilon^{kp}$ and $|I_2| \leq C\varepsilon^{k+1}$. Thus $\lim_{\varepsilon \rightarrow 0} I_\varepsilon(z_0) = 0$.

If $z_0 = 0$ and $f(z_0) \neq 0$, then $|I_1| \leq \varepsilon \log(r/\varepsilon)$ and

$$-I_2 = \int_0^{2\pi} W(\varepsilon e^{i\theta}) d\theta = (1 - \varepsilon^2)^q \int_0^{2\pi} |f(\varepsilon e^{i\theta})|^p d\theta.$$

Hence $\lim_{\varepsilon \rightarrow 0} I_\varepsilon = 2\pi|f(0)|^p$.

At last, if $z_0 = 0$ is a zero of f of order $k \geq 1$, then $|I_1| \leq C\varepsilon^{kp} \log(r/\varepsilon)$ and $|I_2| \leq C\varepsilon^{kp}$. We have $\lim_{\varepsilon \rightarrow 0} I_\varepsilon = 2\pi|f(0)|^p$ also. \square

Lemma 2. *Let $f \in H_{p, q}(\mathbb{D})$, $0 < p < \infty$, $0 \leq q < \infty$, and $f \neq 0$. Then*

$$\lim_{r \rightarrow 1} \int_0^{2\pi} |f(re^{i\theta})|^p (1 - r^2)^q d\theta - 2\pi|f(0)|^p = \int_{|z| < 1} \log(1/|z|) G(z) dx dy,$$

where

$$G(z) = (1 - |z|^2)^q \nabla^2 |f|^p + 2\nabla |f|^p \cdot \nabla (1 - |z|^2)^q + |f|^p \nabla^2 (1 - |z|^2)^q.$$

Proof. Since $f \neq 0$ is analytic in \mathbb{D} , for any $0 < R < 1$, we can choose r , $R < r < 1$ such that f has finite many zeros in $D_r = \{|z| < r\}$ and no zeros on the circle ∂D_r . Let $\{z_1, z_2, \dots, z_n\}$ be the set consisting of 0 and all zeros of f in D_r . Take $\varepsilon > 0$ so small that $\{z : |z - z_k| \leq \varepsilon\} \subset D_r$ for $1 \leq k \leq n$, and all these disks are disjoint. Denote

$$\Omega = D_r \setminus \bigcup_{k=1}^n \{z : |z - z_k| \leq \varepsilon\}.$$

The function $W(z) = |f(z)|^p(1 - |z|^2)^q$ is infinitely differentiable in a neighborhood of $\bar{\Omega}$. Then by Green's theorem, we have

$$\int_{\Omega} \log(r/|z|) \nabla^2 W(z) dx dy = \int_{\partial\Omega} \left(\log(r/|z|) \frac{\partial W}{\partial n} - W \frac{\partial \log(r/|z|)}{\partial n} \right) d\ell. \quad (2.1)$$

Direct computation gives

$$\nabla^2 W(z) = (1 - |z|^2)^q \nabla^2 |f|^p + 2 \nabla |f|^p \cdot \nabla (1 - |z|^2)^q + |f|^p \nabla^2 (1 - |z|^2)^q = G(z).$$

The direction of every small circle in $\partial\Omega$ is clockwise. For $\varepsilon \rightarrow 0$, by Lemma 1, formula (2.1) becomes

$$\int_{\partial D_r} \left(\log(r/|z|) \frac{\partial W}{\partial n} - W \frac{\partial \log(r/|z|)}{\partial n} \right) d\ell - 2\pi |f(0)|^p = \int_{D_r} \log(r/|z|) G(z) dx dy.$$

The left-side of above formula is equal to

$$\int_0^{2\pi} W(re^{i\theta}) d\theta - 2\pi |f(0)|^p.$$

Now we obtain the lemma as $r \rightarrow 1$. \square

3. THE RATE OF INCREASE OF $\|f_r\|_{p,q}^p$

Theorem 1. *Let $f \in H_{p,q}(\mathbb{D})$ and $f \not\equiv 0$, then*

$$\frac{d\|f_r\|_{p,q}^p}{dr} = o(1/1-r) \text{ as } r \rightarrow 1.$$

Proof. As in the proof of Lemma 2, we choose suitable r and ε . Replacing $\log r/|z|$ by $\log 1/|z|$, by Green's theorem, we have,

$$\int_{\Omega} \log(1/|z|) \nabla^2 W(z) dx dy = \int_{\partial\Omega} \left(\log(1/|z|) \frac{\partial W}{\partial n} - W \frac{\partial \log(1/|z|)}{\partial n} \right) d\ell. \quad (3.1)$$

For $\varepsilon \rightarrow 0$, using Lemma 1 for $r = 1$, formula (3.1) turns into

$$\begin{aligned} \int_{D_r} \log(1/|z|) G(z) dx dy &= \int_{\partial D_r} \left(\log(1/|z|) \frac{\partial W}{\partial n} - W \frac{\partial \log(1/|z|)}{\partial n} \right) d\ell - 2\pi |f(0)|^p \\ &= \int_0^{2\pi} \left(\log \frac{1}{r} \frac{\partial W}{\partial r}(re^{i\theta}) + \frac{W(re^{i\theta})}{r} \right) r d\theta - 2\pi |f(0)|^p \\ &= \int_0^{2\pi} W(re^{i\theta}) d\theta - r \log r \int_0^{2\pi} \frac{\partial W}{\partial r}(re^{i\theta}) d\theta - 2\pi |f(0)|^p \\ &= \int_0^{2\pi} |f(re^{i\theta})|^p (1 - r^2)^q d\theta - 2\pi r \log r \frac{d\|f_r\|_{p,q}^p}{dr} - 2\pi |f(0)|^p. \end{aligned}$$

Now let $r \rightarrow 1$. By Lemma 2, we have

$$\lim_{r \rightarrow 1} \log r \frac{d\|f_r\|_{p,q}^p}{dr} = 0.$$

Hence,

$$\lim_{r \rightarrow 1} \frac{d\|f_r\|_{p,q}^p}{dr} = o(1/\log r) = o(1/1-r). \quad \square$$

By Theorem 1, if $\lim_{r \rightarrow 1} \|f_r\|_{p,q} \neq 0$, or for $q = 0$, $\|f_r\|_{p,q}$ is increasing with r , then we can get $\lim_{r \rightarrow 1} d\|f_r\|_{p,q}/dr = o(1/1-r)$.

In the proof of Theorem 1, using 1 instead of $\log 1/|z|$, similar arguments can deduce

$$2\pi r \frac{d\|f_r\|_{p,q}^p}{dr} = \int_{|z|<r} G(z) dx dy.$$

Corollary 1. *If $f \in H_{p,q}$ with $0 < p < \infty$, $0 \leq q < \infty$, then we have*

$$\begin{aligned} 2 \lim_{r \rightarrow 1} \int_0^{2\pi} |f(re^{i\theta})|^p (1-r^2)^q d\theta &= \int_{\mathbb{D}} (1-|z|^2) \nabla^2 \left(|f(z)|^p (1-|z|^2)^q \right) dx dy \\ &+ 4 \int_{\mathbb{D}} |f(z)|^p (1-|z|^2)^q dx dy. \end{aligned} \quad (3.2)$$

Proof. Denote

$$J_\varepsilon = \int_{\partial D(z_0, \varepsilon)} \left((1-|z|^2) \frac{\partial W}{\partial n} - W \frac{\partial(1-|z|^2)}{\partial n} \right) d\ell,$$

where z_0 is a zero of f . Similar arguments as in the proof of Lemma 1, we have $\lim_{\varepsilon \rightarrow 0} J_\varepsilon = 0$. Choosing suitable r and ε as in the proof of Theorem 1, by Green's theorem, we have

$$\int_{\Omega} (1-|z|^2) \nabla^2 W(z) - \nabla^2(1-|z|^2) \cdot W(z) dx dy = \int_{\partial \Omega} \left((1-|z|^2) \frac{\partial W}{\partial n} - W \frac{\partial(1-|z|^2)}{\partial n} \right) d\ell$$

As $\varepsilon \rightarrow 0$, the above formula turns into

$$\begin{aligned} \int_{D_r} (1-|z|^2) \nabla^2 W(z) + 4W(z) dx dy &= \int_{\partial D_r} \left((1-|z|^2) \frac{\partial W}{\partial n} - W \frac{\partial(1-|z|^2)}{\partial n} \right) d\ell \\ &= \int_0^{2\pi} \left((1-r^2) \frac{\partial W}{\partial r}(re^{i\theta}) + 2rW(re^{i\theta}) \right) r d\theta. \end{aligned} \quad (3.3)$$

By Theorem 1, we have

$$\lim_{r \rightarrow 1} \int_0^{2\pi} r(1-r^2) \frac{\partial W}{\partial r}(re^{i\theta}) d\theta = 2 \lim_{r \rightarrow 1} \left[(1-r) \frac{\partial}{\partial r} \int_0^{2\pi} W(re^{i\theta}) d\theta \right] = 0.$$

The proof is completed by letting $r \rightarrow 1$ in formula (3.3). \square

Note that $\nabla^2 |f|^p = p^2 |f|^{p-2} |f'|^2$. Taking $q = 0$ in formula (3.2), we obtain

$$\int_0^{2\pi} |f(e^{i\theta})|^p d\theta = \frac{p^2}{2} \int_{\mathbb{D}} (1-|z|^2) |f(z)|^{p-2} |f'(z)|^2 dx dy + 2 \int_{\mathbb{D}} |f(z)|^p dx dy,$$

which is reminiscent of Hardy-Stein identity

$$\frac{1}{2\pi} \int_0^{2\pi} |f(e^{i\theta})|^p d\theta = |f(0)|^p + \frac{p^2}{2\pi} \int_{\mathbb{D}} \log \frac{1}{|z|} |f(z)|^{p-2} |f'(z)|^2 dx dy.$$
