## THE RATE OF INCREASE OF MEAN VALUES OF FUNCTIONS IN WEIGHTED HARDY SPACES

CHENGJI XIONG & JUNMING LIU

ABSTRACT. Let  $0 < p < \infty$  and  $0 \le q < \infty$ . For each f in the weighted Hardy space  $H_{p,q}$ , we show that  $d||f_r||_{p,q}^p/dr$  grows at most like  $o(1/1-r)$  as  $r \to 1$ .

## 1. INTRODUCTION

Let  $\mathbb D$  be the unit disk in the complex plane and  $0 < p < \infty$ . The Hardy space  $H^p(\mathbb{D})$  is the family of all analytic functions f in  $\mathbb D$  satisfying

$$
||f||_p = \lim_{r \to 1} ||f_r||_p < \infty,
$$

where

$$
||f_r||_p = \left(\frac{1}{2\pi} \int_0^{2\pi} |f(re^{i\theta})|^p d\theta\right)^{1/p}.
$$

If  $0 \leq q < \infty$ , define

$$
||f_r||_{p,q} = \left(\frac{1}{2\pi} \int_0^{2\pi} |f(re^{i\theta})|^p (1-r^2)^q d\theta\right)^{1/p}.
$$

The weighted Hardy space  $H_{p,q}(\mathbb{D})$  is the family of all analytic functions f in  $\mathbb D$ satisfying

$$
||f||_{p,q} = \sup_{0 < r < 1} ||f_r||_{p,q} < \infty.
$$

It is trivial that  $H_{p,0}$  is just the classical Hardy space  $H^p$  and  $H_{p,q}$  is a Banach space for  $p \ge 1$ . There are many books about  $H^p$  and  $H_{p,q}$  such as Duren's book [\[3\]](#page-4-0) and Zhu's book [\[7\]](#page-4-1). It is well known that  $||f_r||_p$  is a nondecreasing function of r. Furthermore, Hardy [\[4\]](#page-4-2) showed that  $\log ||f_r||_p$  is a convex function of  $\log r$ . Other properties of mean values of analytic functions can be found in [\[1,](#page-4-3) [2,](#page-4-4) [6\]](#page-4-5).

Recently, Mashreghi [\[5\]](#page-4-6) showed that  $d||f_r||_p/dr$  grows at most like  $o(1/1 - r)$  as  $r \to 1$ . In this paper, we generalized this result to weighted Hardy spaces.

## 2. Lemmas

Suppose that  $f \neq 0$  is analytic in D. Let  $W(z) = |f(z)|^p (1-|z|^2)^q$  for  $0 < p < \infty$ ,  $0 \leq q < \infty$ , and  $\nabla$  be the gradient operator.

**Lemma 1.** Let  $0 < r \leq 1$  and  $D_r = \{z : |z| < r\}$ . For  $z_0 \in D_r$  and small  $\varepsilon > 0$ , let  $D(z_0, \varepsilon) = \{z : |z - z_0| \le \varepsilon\} \subset D_r$  and

$$
I_{\varepsilon} = \int_{\partial D(z_0,\varepsilon)} \left( \log(r/|z|) \frac{\partial W}{\partial n} - W \frac{\partial \log(r/|z|)}{\partial n} \right) d\ell.
$$

If  $z_0 \neq 0$  is a zero of f, then  $\lim_{\varepsilon \to 0} I_{\varepsilon} = 0$ . If  $z_0 = 0$  then  $\lim_{\varepsilon \to 0} I_{\varepsilon} = 2\pi |f(0)|^p$ .

<sup>2000</sup> Mathematics Subject Classification. 30H10.

Key words and phrases. Hardy space, weighted Hardy space, mean value.

*Proof.* Since  $W(z) = |f(z)|^p (1 - |z|^2)^q$ , direct computation gives

$$
\nabla W(z) = (1 - |z|^2)^q \nabla |f(z)|^p + |f(z)|^p \nabla (1 - |z|^2)^q
$$

and

$$
|\nabla |f(z)|^p| \le p|f(z)|^{p-1}|f'(z)|, \quad |\nabla (1-|z|^2)^q| = 2q|z|(1-|z|^2)^{q-1}
$$

.

So

$$
\left|\frac{\partial W(z)}{\partial n}\right| \le |\nabla W(z)| \le (1-|z|^2)^q |\nabla| f(z)|^p |+|f(z)|^p |\nabla (1-|z|^2)^q|
$$
  

$$
\le p|f(z)|^{p-1}|f'(z)|(1-|z|^2)^q+2q|z||f(z)|^p(1-|z|^2)^{q-1}
$$

and

$$
\left|\frac{\partial \log(r/|z|)}{\partial n}\right| \leq |\nabla \log(r/|z|)| = \frac{1}{|z|}.
$$

Write

$$
I_{\varepsilon} = \int_{\partial D(z_0,\varepsilon)} \left( \log(r/|z|) \frac{\partial W}{\partial n} - W \frac{\partial \log(r/|z|)}{\partial n} \right) d\ell
$$
  
= 
$$
\int_0^{2\pi} \log(r/|z_0 + \varepsilon e^{i\theta}|) \frac{\partial W(z_0 + \varepsilon e^{i\theta})}{\partial n} \varepsilon d\theta - \int_{\partial D(z_0,\varepsilon)} W(z) \frac{\partial \log(r/|z|)}{\partial n} d\ell
$$
  
=  $I_1 - I_2$ .

For convenience, let  $C > 0$  be a constant independent of  $\varepsilon$ , whose value may change from line to line.

If  $z_0 \neq 0$  is a zero of order  $k \geq 1$ , then  $|I_1| \leq C\varepsilon^{kp}$  and  $|I_2| \leq C\varepsilon^{k+1}$ . Thus  $\lim_{\varepsilon\to 0} I_{\varepsilon}(z_0) = 0.$ 

If  $z_0 = 0$  and  $f(z_0) \neq 0$ , then  $|I_1| \leq \varepsilon \log(r/\varepsilon)$  and

$$
-I_2 = \int_0^{2\pi} W(\varepsilon e^{i\theta}) d\theta = (1 - \varepsilon^2)^q \int_0^{2\pi} |f(\varepsilon e^{i\theta})|^p d\theta.
$$

Hence  $\lim_{\varepsilon \to 0} I_{\varepsilon} = 2\pi |f(0)|^p$ .

At last, if  $z_0 = 0$  is a zero of f of order  $k \ge 1$ , then  $|I_1| \le C \varepsilon^{kp} \log(r/\varepsilon)$  and  $|I_2| \leq C \varepsilon^{kp}$ . We have  $\lim_{\varepsilon \to 0} I_\varepsilon = 2\pi |f(0)|^p$  also.  $P$  also.

Lemma 2. Let  $f \in H_{p, q}(\mathbb{D})$ ,  $0 < p < \infty$ ,  $0 \le q < \infty$ , and  $f \not\equiv 0$ . Then

$$
\lim_{r \to 1} \int_0^{2\pi} |f(re^{i\theta})|^p (1 - r^2)^q d\theta - 2\pi |f(0)|^p = \int_{|z| < 1} \log(1/|z|) G(z) dx dy,
$$

where

$$
G(z) = (1 - |z|^2)^q \nabla^2 |f|^p + 2\nabla |f|^p \cdot \nabla (1 - |z|^2)^q + |f|^p \nabla^2 (1 - |z|^2)^q.
$$

*Proof.* Since  $f \not\equiv 0$  is analytic in D, for any  $0 < R < 1$ , we can choose r,  $R < r < 1$ such that f has finite many zeros in  $D_r = \{ |z| < r \}$  and no zeros on the circle  $\partial D_r$ . Let  $\{z_1, z_2, \dots, z_n\}$  be the set consisting of 0 and all zeros of f in  $D_r$ . Take  $\varepsilon > 0$ so small that  $\{z : |z - z_k| \le \varepsilon\} \subset D_r$  for  $1 \le k \le n$ , and all these disks are disjoint. Denote

$$
\Omega = D_r \setminus \bigcup_{k=1}^n \{z : |z - z_k| \le \varepsilon\}.
$$

The function  $W(z) = |f(z)|^p (1 - |z|^2)^q$  is infinitely differentiable in a neighborhood of  $\overline{\Omega}$ . Then by Green's theorem, we have

$$
\int_{\Omega} \log(r/|z|) \nabla^2 W(z) dx dy = \int_{\partial \Omega} \left( \log(r/|z|) \frac{\partial W}{\partial n} - W \frac{\partial \log(r/|z|)}{\partial n} \right) d\ell. \tag{2.1}
$$

Direct computation gives

$$
\nabla^2 W(z) = (1 - |z|^2)^q \nabla^2 |f|^p + 2\nabla |f|^p \cdot \nabla (1 - |z|^2)^q + |f|^p \nabla^2 (1 - |z|^2)^q = G(z).
$$

The direction of every small circle in  $\partial\Omega$  is clockwise. For  $\varepsilon \to 0$ , by Lemma 1, formula (2.1) becomes

$$
\int_{\partial D_r} \Big( \log(r/|z|) \frac{\partial W}{\partial n} - W \frac{\partial \log(r/|z|)}{\partial n} \Big) d\ell - 2\pi |f(0)|^p = \int_{D_r} \log(r/|z|) G(z) dxdy.
$$

The left-side of above formula is equal to

$$
\int_0^{2\pi} W(re^{i\theta})d\theta - 2\pi |f(0)|^p.
$$

Now we obtain the lemma as  $r \to 1$ .

3. The rate of increase of  $||f_r||_{p,q}^p$ 

**Theorem 1.** Let  $f \in H_{p, q}(\mathbb{D})$  and  $f \not\equiv 0$ , then

$$
\frac{d||f_r||_{p,q}^p}{dr} = o(1/1 - r) \text{ as } r \to 1.
$$

*Proof.* As in the proof of Lemma 2, we choose suitable r and  $\varepsilon$ . Replacing  $\log r/|z|$ by  $\log 1/|z|$ , by Green's theorem, we have,

$$
\int_{\Omega} \log(1/|z|) \nabla^2 W(z) dx dy = \int_{\partial \Omega} \left( \log(1/|z|) \frac{\partial W}{\partial n} - W \frac{\partial \log(1/|z|)}{\partial n} \right) d\ell. \tag{3.1}
$$

For  $\varepsilon \to 0$ , using Lemma 1 for  $r = 1$ , formula (3.1) turns into

$$
\int_{D_r} \log(1/|z|)G(z)dxdy = \int_{\partial D_r} \left( \log(1/|z|) \frac{\partial W}{\partial n} - W \frac{\partial \log(1/|z|)}{\partial n} \right) d\ell - 2\pi |f(0)|^p
$$

$$
= \int_0^{2\pi} \left( \log \frac{1}{r} \frac{\partial W}{\partial r} (re^{i\theta}) + \frac{W(re^{i\theta})}{r} \right) r d\theta - 2\pi |f(0)|^p
$$

$$
= \int_0^{2\pi} W(re^{i\theta}) d\theta - r \log r \int_0^{2\pi} \frac{\partial W}{\partial r} (re^{i\theta}) d\theta - 2\pi |f(0)|^p
$$

$$
= \int_0^{2\pi} |f(re^{i\theta})|^p (1-r^2)^q d\theta - 2\pi r \log r \frac{d||f_r||_{p,q}^p}{dr} - 2\pi |f(0)|^p.
$$

Now let  $r \to 1$ . By Lemma 2, we have

$$
\lim_{r\to 1}\log r\frac{d\|f_r\|_{p,q}^p}{dr}=0.
$$

Hence,

$$
\lim_{r \to 1} \frac{d||f_r||_{p,q}^p}{dr} = o(1/\log r) = o(1/1 - r).
$$

 $\Box$ 

By Theorem 1, if  $\lim_{r\to 1} ||f_r||_{p,q} \neq 0$ , or for  $q = 0$ ,  $||f_r||_{p,q}$  is increasing with r, then we can get  $\lim_{r \to 1} d||f_r||_{p,q}/dr = o(1/1 - r)$ .

In the proof of Theorem 1, using 1 instead of  $log 1/|z|$ , similar arguments can deduce

$$
2\pi r\frac{d\|f_r\|_{p,q}^p}{dr}=\int_{|z|
$$

Corollary 1. If  $f \in H_{p,q}$  with  $0 < p < \infty$ ,  $0 \le q < \infty$ , then we have

$$
2\lim_{r \to 1} \int_0^{2\pi} |f(re^{i\theta})|^p (1 - r^2)^q d\theta = \int_{\mathbb{D}} (1 - |z|^2) \nabla^2 \left( |f(z)|^p (1 - |z|^2)^q \right) dx dy
$$

$$
+ 4 \int_{\mathbb{D}} |f(z)|^p (1 - |z|^2)^q dx dy. \tag{3.2}
$$

Proof. Denote

$$
J_{\varepsilon} = \int_{\partial D(z_0,\varepsilon)} \left( (1-|z|^2) \frac{\partial W}{\partial n} - W \frac{\partial (1-|z|^2)}{\partial n} \right) d\ell,
$$

where  $z_0$  is a zero of f. Similar arguments as in the proof of Lemma 1, we have  $\lim_{\varepsilon\to 0} J_{\varepsilon} = 0$ . Choosing suitable r and  $\varepsilon$  as in the proof of Theorem 1, by Green's theorem, we have

$$
\int_{\Omega} (1-|z|^2) \nabla^2 W(z) - \nabla^2 (1-|z|^2) \cdot W(z) dx dy = \int_{\partial \Omega} \left( (1-|z|^2) \frac{\partial W}{\partial n} - W \frac{\partial (1-|z|^2)}{\partial n} \right) d\ell
$$

As  $\varepsilon \to 0$ , the above formula turns into

$$
\int_{D_r} (1 - |z|^2) \nabla^2 W(z) + 4W(z) dx dy = \int_{\partial D_r} \left( (1 - |z|^2) \frac{\partial W}{\partial n} - W \frac{\partial (1 - |z|^2)}{\partial n} \right) d\ell
$$

$$
= \int_0^{2\pi} \left( (1 - r^2) \frac{\partial W}{\partial r} (re^{i\theta}) + 2rW(re^{i\theta}) \right) r d\theta. \tag{3.3}
$$

By Theorem 1, we have

$$
\lim_{r \to 1} \int_0^{2\pi} r(1 - r^2) \frac{\partial W}{\partial r} (re^{i\theta}) d\theta = 2 \lim_{r \to 1} \left[ (1 - r) \frac{\partial}{\partial r} \int_0^{2\pi} W (re^{i\theta}) d\theta \right] = 0.
$$

The proof is completed by letting  $r \to 1$  in formula (3.3).

Note that  $\nabla^2 |f|^p = p^2 |f|^{p-2} |f'|^2$ . Taking  $q = 0$  in formula (3.2), we obtain

$$
\int_0^{2\pi} |f(e^{i\theta})|^p d\theta = \frac{p^2}{2} \int_{\mathbb{D}} (1 - |z|^2) |f(z)|^{p-2} |f'(z)|^2 dx dy + 2 \int_{\mathbb{D}} |f(z)|^p dx dy,
$$

which is reminiscent of Hardy-Stein identity

$$
\frac{1}{2\pi} \int_0^{2\pi} |f(e^{i\theta})|^p d\theta = |f(0)|^p + \frac{p^2}{2\pi} \int_{\mathbb{D}} \log \frac{1}{|z|} |f(z)|^{p-2} |f'(z)|^2 dxdy.
$$
