

**JACOB'S LADDERS, CONJUGATE INTEGRALS, EXTERNAL
MEAN-VALUES AND OTHER PROPERTIES OF A MULTIPLY
 $\pi(T)$ -AUTOCORRELATION OF THE FUNCTION $|\zeta(\frac{1}{2} + it)|^2$**

JAN MOSER

ABSTRACT. In this paper we obtain a new class of transformation formulae (without an explicit presence of a derivative) for the integrals containing products of factors $|\zeta(\frac{1}{2} + it)|^2$ with respect to two components of a disconnected set on the critical line.

1. INTRODUCTION

1.1. In the work of reference [3] (comp. also [1] and [2]) we have introduced the following disconnected set

$$(1.1) \quad \Delta(n+1) = \Delta(n+1; T, U) = \bigcup_{k=0}^{n+1} [\varphi_1^k(T), \varphi_1^k(T+U)]$$

where

$$(1.2) \quad y = \frac{1}{2}\varphi(t) = \varphi_1(t); \quad \varphi_1^0(t) = t, \quad \varphi_1^1(t) = \varphi_1(t), \\ \varphi_1^2(t) = \varphi_1[\varphi_1(t)], \dots, \varphi_1^k(t) = \varphi_1[\varphi_1^{k-1}(t)], \dots, \quad t \in [T, T+U],$$

and $\varphi_1^k(t)$ stands for the k -th iteration of the Jacob's ladder

$$\varphi_1(t), \quad t \geq T_0[\varphi_1].$$

The set (1.1) has the following properties

$$(1.3) \quad t \sim \varphi_1^k(t), \quad \varphi_1^k(T) \geq (1-\epsilon)T, \quad k = 0, 1, \dots, n+1, \\ \varphi_1^k(T+U) - \varphi_1^k(T) < \frac{1}{2n+5} \frac{T}{\ln T}, \quad k = 1, \dots, n+1, \\ \varphi_1^k(T) - \varphi_1^{k+1}(T+U) > 0.18 \times \frac{T}{\ln T}, \quad k = 0, 1, \dots, n, \\ U \in \left(0, \frac{T}{\ln^2 T}\right],$$

and, in the macroscopic domain, i. e. for

$$(1.4) \quad U \in \left[T^{1/3+\epsilon}, \frac{T}{\ln^2 T}\right],$$

we have a more detailed information about the set (1.1), namely

$$(1.5) \quad |[\varphi_1^k(T), \varphi_1^k(T+U)]| = \varphi_1^k(T+U) - \varphi_1^k(T) \sim U, \quad k = 1, \dots, n+1, \\ \varphi_1^k(T) - \varphi_1^{k+1}(T+U) \sim (1-c) \frac{T}{\ln T}, \quad k = 0, 1, \dots, n,$$

Key words and phrases. Riemann zeta-function.

where c is the Euler constant. We have that (see (1.3))

$$[\varphi_1^{n+1}(T), \varphi_1^{n+1}(T+U)] \prec \dots \prec [\varphi_1^1(T), \varphi_1^1(T+U)] \prec [T, T+U],$$

i. e. the segments are ordered from $[T, T+U]$ to the left.

Remark 1. The asymptotic behavior of the disconnected set (1.1) is as follows: if $T \rightarrow \infty$ then the components of this set recedes unboundedly each from other (see (1.3), (1.5)) and all together are receding to infinity. Hence, if $T \rightarrow \infty$ then the set (1.1) behaves as an one-dimensional Friedman-Hubble expanding universe.

1.2. Next, we have shown (see [3]) that for the weighted mean-value of the integral

$$(1.6) \quad \int_T^{T+U} \prod_{k=0}^n \left| \zeta \left(\frac{1}{2} + i\varphi_1^k(t) \right) \right|^2 dt, \quad U \in \left(0, \frac{T}{\ln^2 T} \right]$$

the following factorization formula

$$(1.7) \quad \begin{aligned} & g_{n+1} \frac{1}{U} \int_T^{T+U} \prod_{k=0}^n \left| \zeta \left(\frac{1}{2} + i\varphi_1^k(t) \right) \right|^2 dt \sim \\ & \sim \prod_{l=1}^s g_l \frac{1}{U} \int_T^{T+U} \prod_{k=0}^{a_{j_l}-1} \left| \zeta \left(\frac{1}{2} + i\varphi_1^k(t) \right) \right|^2 dt, \quad T \rightarrow \infty \end{aligned}$$

holds true for every fixed natural number n and for every proper partition (the partition $n+1 = n+1$ is excluded)

$$n+1 = a_{j_1} + a_{j_2} + \dots + a_{j_s}, \quad a_{j_l} \in [1, n], \quad l = 1, \dots, s,$$

and

$$\begin{aligned} g_l &= \frac{U}{\varphi_1^{a_{j_l}}(T+U) - \varphi_1^{a_{j_l}}(T)}, \quad l = 1, \dots, s, \\ g_{n+1} &= \frac{U}{\varphi_1^{n+1}(T+U) - \varphi_1^{n+1}(T)}. \end{aligned}$$

1.3. Next, by [3], (6.5), $n+1 \rightarrow k$, we have

$$t - \varphi_1^k \sim k(1-c)\pi(t), \quad k = 0, 1, \dots, n$$

where $\pi(t)$ is the prime-counting function. Hence

$$(1.8) \quad \begin{aligned} \frac{1}{2} + i\varphi_1^k(t) &= \frac{1}{2} + it - i[t - \varphi_1^k(t)] \sim \\ &\sim \frac{1}{2} + it - ik(1-c)\pi(t), \quad k = 0, 1, \dots, n. \end{aligned}$$

Remark 2. By (1.8) the arguments in the product (1.6) performs some complicated oscillations around the sequence

$$\frac{1}{2} + it - ik(1-c)\pi(t), \quad k = 0, 1, \dots, n$$

of the lattice points. Based on this, the integral (1.6) represents the multiple (for $k \geq 2$) $\pi(t)$ -autocorrelation of the function $|\zeta(\frac{1}{2} + it)|^2$, i. e. we have certain type of the complicated nonlinear and nonlocal interaction of the function $|\zeta(\frac{1}{2} + it)|^2$ with itself.

1.4. After this we turn back to the formula (1.7). This formula binds the corresponding set of integrals over the same segment $[T, T + U]$. However, the segment $[T, T + U]$ is only one component of the disconnected set $\Delta(n + 1)$ (see (1.1)). This is the reason for the following.

Question. Is there some formula that binds the integral (1.6) with the integral of the type

$$\int_{\varphi_1^{p(n)}(T)}^{\varphi_1^{p(n)}(T+U)} \prod_{k=0}^n \left| \zeta \left(\frac{1}{2} + i\varphi_1^k(u) \right) \right|^2 du, \quad 1 \leq p(n) \leq n,$$

i. e. with the integral over the component

$$[\varphi_1^{p(n)}(T), \varphi_1^{p(n)}(T + U)] \neq [T, T + U].$$

2. THE MAIN FORMULA AND ITS STRUCTURE

2.1. We obtain the following theorem in the direction of our Question

Theorem. For every disconnected set

$$\Delta(2l) = \Delta(2l; T, U) = \bigcup_{k=0}^{2l} [\varphi_1^k(T), \varphi_1^k(T + U)], \quad l = 1, \dots, L_0$$

where $L_0 \in \mathbb{N}$ is an arbitrary fixed number, and for every

$$U \in \left(0, \frac{T}{\ln^2 T} \right]$$

the following asymptotic transformation formula

$$(2.1) \quad \int_{\varphi_1^l(T)}^{\varphi_1^l(T+U)} \prod_{k=0}^{l-1} \left| \zeta \left(\frac{1}{2} + i\varphi_1^k(u) \right) \right|^2 du \sim \frac{\varphi_1^{2l}(T + U) - \varphi_1^{2l}(T)}{\varphi_1^l(T + U) - \varphi_1^l(T)} \int_T^{T+U} \prod_{k=0}^{l-1} \left| \zeta \left(\frac{1}{2} + i\varphi_1^k(t) \right) \right|^2 dt, \quad T \rightarrow \infty$$

holds true.

Remark 3. We call the integrals that are bind by the formula (2.1) *the conjugate integrals*.

Let

$$\frac{1}{2} + i\gamma, \quad \frac{1}{2} + i\gamma', \quad \gamma < \gamma'$$

be consecutive zeros of the Riemann zeta-function lying on the critical line and $l = 7, T = \gamma, U = \gamma' - \gamma$. Thus, for example, the following formula (see (2.1))

$$(2.2) \quad \int_{\varphi_1^7(\gamma)}^{\varphi_1^7(\gamma')} \prod_{k=0}^6 \left| \zeta \left(\frac{1}{2} + i\varphi_1^k(u_7) \right) \right|^2 du_7 \sim \frac{\varphi_1^{14}(T + U) - \varphi_1^{14}(T)}{\varphi_1^7(T + U) - \varphi_1^7(T)} \int_{\gamma}^{\gamma'} \prod_{k=0}^6 \left| \zeta \left(\frac{1}{2} + i\varphi_1^k(t) \right) \right|^2 dt, \quad \gamma \rightarrow \infty$$

holds true.

Remark 4. Nor the formula (2.2) for seven factors and $U = \gamma' - \gamma$ is not accessible for the current methods in the theory of the Riemann zeta-function.

2.2. By the continuity of the function $\varphi_1^l(v)$ we have (see (2.1)) that if

$$u_l = \varphi_1^l(t), \quad t \in [T, T + U]$$

then

$$\varphi_1^k(u_l) = \varphi_1^k[\varphi_1^l(t)] = \varphi_1^{k+l}(t) \in [\varphi_1^{k+l}(T), \varphi_1^{k+l}(T + U)].$$

Consequently, the product

$$\prod_{k=0}^{l-1} \left| \zeta \left(\frac{1}{2} + i\varphi_1^k(u_l) \right) \right|^2$$

corresponds to the disconnected set

$$(2.3) \quad \bigcup_{k=l}^{2l-1} [\varphi_1^k(T), \varphi_1^k(T + U)] = \Delta(l, 2l - 1),$$

and similarly the product

$$\prod_{k=0}^{l-1} \left| \zeta \left(\frac{1}{2} + i\varphi_1^k(t) \right) \right|^2$$

corresponds to the disconnected set

$$(2.4) \quad \bigcup_{k=0}^{l-1} [\varphi_1^k(T), \varphi_1^k(T + U)] = \Delta(0, l - 1),$$

where the sets (2.3), (2.4) are subsets of the set $\Delta(2l)$.

Next (comp. (1.3)), we have

$$(2.5) \quad \rho\{[\varphi_1^k(T), \varphi_1^k(T + U)]; [\varphi_1^{k+1}(T), \varphi_1^{k+1}(T + U)]\} > 0.17 \times \pi(T)$$

where ρ represents the distance of corresponding segments.

Remark 5. The formula (2.1) controls a *quasi-chaotic* behavior of the values of the function $|\zeta(\frac{1}{2} + it)|^2$ with respect to the disconnected set $\Delta(2l)$ in spite of big distances separating the components of the set $\Delta(2l)$ (see (2.5)).

3. SOME EXTERNAL MEAN-VALUES

3.1. Using the mean-value theorem on the left-hand side of (2.1) we obtain

$$(3.1) \quad \begin{aligned} & \frac{1}{U} \int_T^{T+U} \prod_{k=0}^{l-1} \left| \zeta \left(\frac{1}{2} + i\varphi_1^k(t) \right) \right|^2 dt \sim \\ & \sim \frac{\{\varphi_1^l(T + U) - \varphi_1^l(T)\}^2}{\{\varphi_1^{2l}(T + U) - \varphi_1^{2l}(T)\}U} \prod_{k=0}^{l-1} \left| \zeta \left(\frac{1}{2} + i\varphi_1^k(\alpha_l) \right) \right|^2 \end{aligned}$$

where (see the paragraph 2.2)

$$\alpha_l \in (\varphi_1^l(T), \varphi_1^l(T + U)), \quad \alpha_l = \varphi_1^l(t_l),$$

i. e.

$$(3.2) \quad \varphi_1^k(\alpha_l) = \varphi_1^{k+l}(t_l) \in (\varphi_1^{k+l}(T), \varphi_1^{k+l}(T + U)).$$

Hence, by (3.1) and (3.2) we have the following

Corollary 1. There are the values

$$\tau_k = \tau_k(T, U, l) \in (\varphi_1^k(T), \varphi_1^k(T + U)), \quad k = l, \dots, 2l - 1$$

such that

$$(3.3) \quad \begin{aligned} & \frac{1}{U} \int_T^{T+U} \prod_{k=0}^{l-1} \left| \zeta \left(\frac{1}{2} + i\varphi_1^k(t) \right) \right|^2 dt \sim \\ & \sim \frac{\{\varphi_1^l(T + U) - \varphi_1^l(T)\}^2}{\{\varphi_1^{2l}(T + U) - \varphi_1^{2l}(T)\}U} \prod_{k=l}^{2l-1} \left| \zeta \left(\frac{1}{2} + i\tau_k \right) \right|^2 \end{aligned}$$

where

$$U \in \left(0, \frac{T}{\ln^2 T} \right], \quad l = 1, \dots, L_0, \quad T \rightarrow \infty.$$

Remark 6. Since:

(a) the integral

$$\int_T^{T+U} \prod_{k=0}^{l-1} \left| \zeta \left(\frac{1}{2} + i\varphi_1^k(t) \right) \right|^2 dt$$

corresponds to the disconnected set $\Delta(0, l - 1)$, (see (2.4)),

(b) the product

$$\prod_{k=l}^{2l-1} \left| \zeta \left(\frac{1}{2} + i\tau_k \right) \right|^2$$

corresponds to the disconnected set $\Delta(l, 2l - 1)$, (see (2.3)),

(c) the sets $\Delta(0, l - 1)$ and $\Delta(l, 2l - 1)$ are separated by the big distance

$$\rho\{\Delta(0, l - 1); \Delta(l, 2l - 1)\} > 0.17 \times \pi(T)$$

(see (2.3), (2.4)),

it is quite natural to call the right-hand side of the equation (3.3) *the external mean-value* of the integral on the left-hand side.

3.2. Next, by the similar way, we obtain the following

Corollary 2. There are the values

$$\tau_k = \tau_k(T, U, l) \in (\varphi_1^k(T), \varphi_1^k(T + U)), \quad k = 0, 1, \dots, l - 1$$

such that

$$(3.4) \quad \begin{aligned} & \frac{1}{\varphi_1^l(T + U) - \varphi_1^l(T)} \int_{\varphi_1^l(T)}^{\varphi_1^l(T+U)} \prod_{k=0}^{l-1} \left| \zeta \left(\frac{1}{2} + i\varphi_1^k(u_l) \right) \right|^2 du_l \sim \\ & \sim \frac{\{\varphi_1^{2l}(T + U) - \varphi_1^{2l}(T)\}U}{\{\varphi_1^l(T + U) - \varphi_1^l(T)\}^2} \prod_{k=0}^{l-1} \left| \zeta \left(\frac{1}{2} + i\tau_k \right) \right|^2, \end{aligned}$$

where

$$U \in \left(0, \frac{T}{\ln^2 T} \right], \quad l = 1, \dots, L_0, \quad T \rightarrow \infty.$$

Remark 7. The formula (3.4) gives us the second variant of the external mean-value theorem.

4. OTHER PROPERTIES OF THE DISTRIBUTION OF THE VALUES OF $|\zeta(\frac{1}{2} + it)|$ WITH RESPECT TO THE DISCONNECTED SET $\Delta(2l)$

4.1. Similarly to (3.3), (3.4), we obtain the following formula

$$(4.1) \quad \prod_{k=0}^l \left| \zeta \left(\frac{1}{2} + i\tau_k \right) \right| \sim \frac{\varphi_1^l(T+U) - \varphi_1^l(T)}{\sqrt{\{\varphi_1^{2l}(T+U) - \varphi_1^{2l}(T)\}U}} \prod_{k=l}^{2l-1} \left| \zeta \left(\frac{1}{2} + i\tau_k \right) \right|,$$

where

$$\tau_k \in (\varphi_1^k(T), \varphi_1^k(T+U)), \quad k = 0, 1, \dots, 2l-1.$$

Next, we obtain from (4.1) the following

Corollary 3.

$$(4.2) \quad G_0^{l-1} \left[\left| \zeta \left(\frac{1}{2} + i\tau_k \right) \right| \right] \sim \left\{ \frac{\varphi_1^l(T+U) - \varphi_1^l(T)}{\sqrt{\{\varphi_1^{2l}(T+U) - \varphi_1^{2l}(T)\}U}} \right\}^{1/l} G_l^{2l-1} \left[\left| \zeta \left(\frac{1}{2} + i\tau_k \right) \right| \right], \quad T \rightarrow \infty$$

where the following symbols

$$(4.3) \quad G_0^{l-1} \left[\left| \zeta \left(\frac{1}{2} + i\tau_k \right) \right| \right] = \left\{ \prod_{k=0}^{l-1} \left| \zeta \left(\frac{1}{2} + i\tau_k \right) \right| \right\}^{1/l},$$

$$G_l^{2l-1} \left[\left| \zeta \left(\frac{1}{2} + i\tau_k \right) \right| \right] = \left\{ \prod_{k=l}^{2l-1} \left| \zeta \left(\frac{1}{2} + i\tau_k \right) \right| \right\}^{1/l}$$

stand for the geometric means.

4.2. Since (see (4.3))

$$(4.4) \quad \frac{G_0^{l-1}}{G_l^{2l-1}} = \bar{G}_0^{l-1} \left[\frac{|\zeta(\frac{1}{2} + i\tau_k)|}{|\zeta(\frac{1}{2} + i\tau_{k+l})|} \right],$$

and we have for arithmetic and geometric means (for example)

$$(4.5) \quad \bar{x}_A \geq \bar{x}_G; \quad \bar{x}_A = \frac{1}{n} \sum_{i=1}^n x_i, \quad \bar{x}_G = \sqrt[n]{\prod_{i=1}^n x_i}, \quad x_i > 0.$$

Then we obtain from (4.2)-(4.4) the formula

$$\bar{G}_0^{l-1} \left[\frac{|\zeta(\frac{1}{2} + i\tau_k)|}{|\zeta(\frac{1}{2} + i\tau_{k+l})|} \right] \sim \left\{ \frac{\varphi_1^l(T+U) - \varphi_1^l(T)}{\sqrt{\{\varphi_1^{2l}(T+U) - \varphi_1^{2l}(T)\}U}} \right\}^{1/l} = \Omega_l.$$

Next, from the inequality

$$\bar{G}_0^{l-1} > (1 - \epsilon)\Omega_l, \quad T \rightarrow \infty$$

we obtain that (see (4.5))

$$(4.6) \quad \frac{1}{l} \sum_{k=0}^{l-1} \frac{|\zeta(\frac{1}{2} + i\tau_k)|}{|\zeta(\frac{1}{2} + i\tau_{k+l})|} > (1 - \epsilon)\Omega_l.$$

The numbers $(\tau_0, \tau_1, \dots, \tau_{l-1})$ may be ordered by $l!$ -ways in the product

$$\prod_{k=0}^{l-1} \frac{|\zeta(\frac{1}{2} + i\tau_k)|}{|\zeta(\frac{1}{2} + i\tau_{k+l})|},$$

and the same holds for the sequence of numbers $(\tau_l, \dots, \tau_{2l-1})$. Therefore we have $(l!)^2$ inequalities of the type (4.6). In this sense we use the symbol

$$\left\{ \sum_{k=0}^{l-1} \frac{|\zeta(\frac{1}{2} + i\tau_k)|}{|\zeta(\frac{1}{2} + i\tau_{k+l})|} \right\}_m, \quad m = 1, \dots, (l!)^2.$$

Hence, we obtain from (4.6) the following

Corollary 4. We have $(l!)^2$ inequalities

$$\frac{1}{l} \left\{ \sum_{k=0}^{l-1} \frac{|\zeta(\frac{1}{2} + i\tau_k)|}{|\zeta(\frac{1}{2} + i\tau_{k+l})|} \right\}_m > (1 - \epsilon) \left\{ \frac{\varphi_1^l(T + U) - \varphi_1^l(T)}{\sqrt{\{\varphi_1^{2l}(T + U) - \varphi_1^{2l}(T)\}U}} \right\}^{1/l},$$

for $\tau_0, \tau_1, \dots, \tau_{2l-1}$, where

$$m = 1, \dots, (l!)^2, \quad l = 1, \dots, L_0, \quad U \in \left(0, \frac{T}{\ln^2 T}\right], \quad l = 1, \dots, L_0, \quad T \rightarrow \infty.$$

Remark 8. There are certain multiplicative effects also in the genetics, among the polygenic systems, and consequently the geometric means is used there, see, for example, [4], pp. 336, 337. We also note that we have used the formula for multiplication of independent variables as a motivation for our paper [3].

5. REMARKS ABOUT ESSENTIAL INFLUENCE OF THE RIEMANN HYPOTHESIS ON THE SEQUENCE $\{\varphi_1^k(T + U) - \varphi_1^k(T)\}_{k=1}^{L_0}$

5.1. Let us remind that in the macroscopic case (1.4) we have the asymptotic formula (see (1.5))

$$(5.1) \quad \varphi_1^k(T + U) - \varphi_1^k(T) \sim U, \quad k = 1, \dots, L_0.$$

In connection with (5.1) we ask the question: what is the influence of the Riemann hypothesis on measures of the segments

$$[\varphi_1(T), \varphi_1(T + U)]$$

in the case (comp. (1.4))

$$(5.2) \quad U \in (0, T^{1/3-\epsilon_0}],$$

for example, in the case $\epsilon_0 = \frac{1}{12}$, i. e.

$$U \in (0, T^{1/4}].$$

First of all we have, on the Riemann hypothesis, that (see [5], p. 300)

$$(5.3) \quad \zeta\left(\frac{1}{2} + it\right) = \mathcal{O}\left(t^{\frac{A}{\ln \ln t}}\right), \quad t \rightarrow \infty,$$

i. e.

$$(5.4) \quad \zeta\left(\frac{1}{2} + it\right) = \mathcal{O}\left(T^{\frac{A}{m \ln T}}\right), \quad t \in [(1 - \epsilon)T, T + U]$$

(comp. (1.3) and [3], (6.17)). Next we obtain for (5.2) from our formula (see [2], (2.5))

$$\int_T^{T+V} \left| \zeta\left(\frac{1}{2} + it\right) \right|^2 dt \sim [\varphi_1(T + V) - \varphi_1(T)] \ln T,$$

$$V \in \left(0, \frac{T}{\ln T}\right],$$

by (5.4) that

$$(5.5) \quad \begin{aligned} \varphi_1^1(T + U) - \varphi_1^1(T) &= \mathcal{O}\left(\frac{U}{\ln T} T^{\frac{2A}{m \ln T}}\right), \\ \varphi_1^2(T + U) - \varphi_1^2(T) &= \mathcal{O}\left(\frac{U}{\ln^2 T} T^{2\frac{2A}{m \ln T}}\right), \\ &\vdots \\ \varphi_1^{L_0}(T + U) - \varphi_1^{L_0}(T) &= \mathcal{O}\left(\frac{U}{\ln^{L_0} T} T^{L_0 \frac{2A}{m \ln T}}\right). \end{aligned}$$

Since

$$(5.6) \quad T^{L_0 \frac{2A}{m \ln T}} = T^{\frac{2L_0 A}{\sqrt{m \ln T}} \frac{1}{\sqrt{m \ln T}}} < T^{\frac{1}{\sqrt{m \ln T}}},$$

then by (5.5), (5.6) we obtain the following

Remark 9. On the Riemann hypothesis the following estimates hold true

$$(5.7) \quad \begin{aligned} U \in (0, T^{1/3-\epsilon}] \Rightarrow \varphi_1^k(T + U) - \varphi_1^k(T) &= \mathcal{O}\left(UT^{\frac{1}{\sqrt{m \ln T}}}\right), \\ k &= 1, \dots, L_0. \end{aligned}$$

For example, if $U = 1$ then on Riemann hypothesis we have that

$$\varphi_1^k(T + 1) - \varphi_1^k(T) = \mathcal{O}\left(T^{\frac{1}{\sqrt{m \ln T}}}\right), \quad k = 1, \dots, L_0$$

either for

$$L_0 = S = 10^{10^{10^{34}}}$$

(S is the Skeewes' constant).

5.2. In the general case (with or without the Riemann hypothesis) we have (comp. (5.3), (5.4))

$$\zeta\left(\frac{1}{2} + it\right) = \mathcal{O}(t^{1/6-\epsilon}) = \mathcal{O}(T^{1/6-\epsilon}), \quad t \in [(1 - \epsilon)T, T + U], \quad T \rightarrow \infty,$$

and consequently we obtain (comp. (5.5))

$$\begin{aligned} \varphi_1^1(T + 1) - \varphi_1^1(T) &= \mathcal{O}(T^{2(1/6-\epsilon)}) = \mathcal{O}(T^{1/3-2\epsilon}), \\ \varphi_1^2(T + 1) - \varphi_1^2(T) &= \mathcal{O}(T^{4(1/6-\epsilon)}) = \mathcal{O}(T^{2/3-4\epsilon}). \end{aligned}$$

Remark 10. In the general case we are able to guarantee only that

$$(5.8) \quad \varphi_1^1(T+1) - \varphi_1^1(T) \in (0, T^{1/3-\epsilon_0}], \quad \epsilon \leq \frac{\epsilon_0}{2}.$$

Hence, the comparison of (5.7), $U = 1$, with (5.8) shows the essential influence of the Riemann hypothesis on our subject.

6. THE PROOF OF THEOREM

6.1. By using our formula (see [2], (9.1))

$$\tilde{Z}^2(t) = \frac{d\varphi_1(t)}{dt}$$

we obtain (see (1.2))

$$\begin{aligned} & \int_T^{T+U} \prod_{k=0}^n \tilde{Z}^2[\varphi_1^k(t)] dt = \\ &= \int_T^{T+U} \tilde{Z}^2[\varphi_1^n(t)] \tilde{Z}^2[\varphi_1^{n-1}(t)] \cdots \tilde{Z}^2[\varphi_1^1(t)] \tilde{Z}^2[t] dt = \\ &= \int_T^{T+U} \tilde{Z}^2[\varphi_1^{n-1}(\varphi_1^1(t))] \tilde{Z}^2[\varphi_1^{n-2}(\varphi_1^1(t))] \cdots \tilde{Z}^2[\varphi_1^1(t)] \frac{d\varphi_1^1(t)}{dt} dt = \\ &= \int_{\varphi_1^1(T)}^{\varphi_1^1(T+U)} \tilde{Z}^2[\varphi_1^{n-1}(u_1)] \tilde{Z}^2[\varphi_1^{n-2}(u_1)] \cdots \tilde{Z}^2[\varphi_1^1(u_1)] \tilde{Z}^2[u_1] du_1 = \\ &= \int_{\varphi_1^1(T)}^{\varphi_1^1(T+U)} \tilde{Z}^2[\varphi_1^{n-2}(\varphi_1^1(u_1))] \cdots \tilde{Z}^2[\varphi_1^1(u_1)] \frac{d\varphi_1^1(u_1)}{du_1} du_1 = \\ &= \int_{\varphi_1^2(T)}^{\varphi_1^2(T+U)} \tilde{Z}^2[\varphi_1^{n-2}(u_2)] \cdots \tilde{Z}^2[u_2] du_2 = \cdots = \\ &= \int_{\varphi_1^l(T)}^{\varphi_1^l(T+U)} \tilde{Z}^2[\varphi_1^{n-l}(u_l)] \cdots \tilde{Z}^2[\varphi_1^0(u_l)] du_l, \quad l = 1, \dots, n, \end{aligned}$$

i. e. the following formula

$$(6.1) \quad \int_T^{T+U} \prod_{k=0}^n \tilde{Z}^2[\varphi_1^k(t)] dt = \int_{\varphi_1^l(T)}^{\varphi_1^l(T+U)} \prod_{k=0}^{n-l} \tilde{Z}^2[\varphi_1^k(u_l)] du_l, \\ l = 1, \dots, n$$

holds true.

6.2. Let us remind that (see [3], (6.14))

$$(6.2) \quad \tilde{Z}^2(t) = \frac{Z^2(t)}{2\Phi'_\varphi[\varphi(t)]} = \frac{|\zeta(\frac{1}{2} + it)|^2}{\{1 + \mathcal{O}(\frac{\ln \ln T}{\ln T})\} \ln t}, \\ t \in [T, T+U], \quad U \in \left(0, \frac{T}{\ln T}\right], \\ (\varphi_1^l(T), \varphi_1^l(T+U)) \subset (\varphi_1^{n+1}(T), T+U).$$

Putting (6.2) into (6.1) and using the mean-value theorem on both integrals in (6.1) we obtain the following formula (comp. [3], (6.17))

$$(6.3) \quad \begin{aligned} & \int_T^{T+U} \prod_{k=0}^n \left| \zeta \left(\frac{1}{2} + i\varphi_1^k(t) \right) \right|^2 dt \sim \\ & \sim \ln^l T \int_{\varphi_1^l(T)}^{\varphi_1^l(T+U)} \prod_{k=0}^{n-l} \left| \zeta \left(\frac{1}{2} + i\varphi_1^k(u) \right) \right|^2 du, \quad l = 1, \dots, n, \quad T \rightarrow \infty. \end{aligned}$$

Next, the formula (see [3], (3.1))

$$(6.4) \quad \begin{aligned} & \int_T^{T+U} \prod_{k=0}^n \left| \zeta \left(\frac{1}{2} + i\varphi_1^k(t) \right) \right|^2 dt \sim \{ \varphi_1^{n+1}(T+U) - \varphi_1^{n+1}(T) \} \ln^{n+1} T; \\ & \ln^{n+1} T = \ln^{(l-1)+1} T \ln^{(n-l)+1} T \end{aligned}$$

together with the formula (6.3) gives the following asymptotic equality

$$\frac{\int_T^{T+U}}{\varphi_1^{n+1}(T+U) - \varphi_1^{n+1}(T)} \sim \frac{\int_T^{T+U}}{\int_{\varphi_1^l(T)}^{\varphi_1^l(T+U)}} \frac{\int_T^{T+U}}{\int_{\varphi_1^{n+1-l}(T)}^{\varphi_1^{n+1-l}(T+U)}},$$

i. e.

$$(6.5) \quad \begin{aligned} & \{ \varphi_1^{n+1}(T+U) - \varphi_1^{n+1}(T) \} \int_T^{T+U} \prod_{k=0}^n \left| \zeta \left(\frac{1}{2} + i\varphi_1^k(t) \right) \right|^2 dt \sim \\ & \sim \int_{\varphi_1^l(T)}^{\varphi_1^l(T+U)} \prod_{k=0}^{n-l} \left| \zeta \left(\frac{1}{2} + i\varphi_1^k(u) \right) \right|^2 du \times \\ & \times \int_{\varphi_1^{n+1-l}(T)}^{\varphi_1^{n+1-l}(T+U)} \prod_{k=0}^{l-1} \left| \zeta \left(\frac{1}{2} + i\varphi_1^k(v) \right) \right|^2 dv, \quad l = 1, \dots, n, \quad T \rightarrow \infty. \end{aligned}$$

6.3. Next, in the case

$$n - l = l - 1 \Rightarrow n = 2l - 1,$$

we obtain that (see (6.4), (6.5))

$$\begin{aligned} & \left\{ \int_{\varphi_1^l(T)}^{\varphi_1^l(T+U)} \prod_{k=0}^{l-1} \left| \zeta \left(\frac{1}{2} + i\varphi_1^k(u_l) \right) \right|^2 du_l \right\}^2 \sim \\ & \sim \{ \varphi_1^{2l}(T+U) - \varphi_1^{2l}(T) \} \int_T^{T+U} \prod_{k=0}^{2l-1} \left| \zeta \left(\frac{1}{2} + i\varphi_1^k(t) \right) \right|^2 dt \sim \\ & \sim \{ \varphi_1^{2l}(T+U) - \varphi_1^{2l}(T) \}^2 \ln^{2l} T, \end{aligned}$$

i. e. the following formula holds true

$$(6.6) \quad \begin{aligned} & \int_{\varphi_1^l(T)}^{\varphi_1^l(T+U)} \prod_{k=0}^{l-1} \left| \zeta \left(\frac{1}{2} + i\varphi_1^k(u_l) \right) \right|^2 du_l \sim \\ & \sim \{ \varphi_1^{2l}(T+U) - \varphi_1^{2l}(T) \} \ln^l T. \end{aligned}$$

Consequently, we obtain from (6.6) by (6.4), in the case $n = l - 1$, the formula

$$\begin{aligned} & \int_{\varphi_1^l(T)}^{\varphi_1^l(T+U)} \prod_{k=0}^{l-1} \left| \zeta \left(\frac{1}{2} + i\varphi_1^k(u_l) \right) \right|^2 du_l \sim \\ & \sim \frac{\varphi_1^{2l}(T+U) - \varphi_1^{2l}(T)}{\varphi_1^l(T+U) - \varphi_1^l(T)} \int_T^{T+U} \prod_{k=0}^{l-1} \left| \zeta \left(\frac{1}{2} + i\varphi_1^k(t) \right) \right|^2 dt \end{aligned}$$

that verifies (2.1).

I would like to thank Michal Demetrian for his help with electronic version of this paper.
