Abstract This paper describes the derivation of the level 5 versions of Ramanujan's system of ordinary differential equations satisfied by the Eisenstein series, $E_2(q)$, $E_4(q)$, and $E_6(q)$.

Key Words: theta function; theta derivatives; rational characteristics.

MSC(2010) 14K25; 11E25

1 Introduction

Let \mathbb{N}_0 and \mathbb{N} , denote sets of nonnegative and positive integers, respectively. For k and $n \in \mathbb{N}$, $\sigma_k(n)$ is the sum of the k -th power of the positive divisors of n , and $\sigma_k(n) = 0$ for $n \in \mathbb{Q} \setminus \mathbb{N}_0$.

The *upper half plane* \mathbb{H}^2 is defined by $\mathbb{H}^2 = \{\tau \in \mathbb{C} \mid \Im\tau > 0\}$. Throughout this paper, we set $q = \exp(2\pi i\tau)$ and define the *Dedekind eta function* as $\eta(\tau) = q^{\frac{1}{24}} \prod_{n=1}^{\infty} (1 - q^n)$.

In [4], Darboux studied a problem in mechanics and differential geometry, and encountered the system of ordinary differential equations (ODEs),

$$x \frac{d}{dx}(u_1 + u_2) = u_1 u_2, \quad x \frac{d}{dx}(u_1 + u_3) = u_1 u_3, \quad x \frac{d}{dx}(u_2 + u_3) = u_2 u_3, \quad x = \exp(\pi i\tau). \quad (1.1)$$

In [6, pp. 330], Halphen provided the following solution to the problem studied by Darboux,

$$u_1 = 1 + 8 \sum_{n=1}^{\infty} \frac{x^{2n}}{(1 + x^{2n})^2}, \quad u_2 = -8 \sum_{n=1}^{\infty} \frac{x^{2n-1}}{(1 - x^{2n-1})^2}, \quad u_3 = 8 \sum_{n=1}^{\infty} \frac{x^{2n-1}}{(1 + x^{2n-1})^2}.$$

Equation (1.1) is called Halphen's system.

For studying Painlevé type equations of the third order, Chazy [2] considered the nonlinear differential equation for the complex function

$$y''' = 2yy'' - 3(y')^2. \quad (1.2)$$

Note that $y = u_1 + u_2 + u_3 = \pi i E_2(\tau)$ is a solution of Chazy's equation (1.2), where the Eisenstein series E_2, E_4 , and E_6 are respectively defined by

$$E_2(q) = E_2(\tau) := 1 - 24 \sum_{n=1}^{\infty} \sigma_1(n) q^n, \quad E_4(q) = E_4(\tau) := 1 + 240 \sum_{n=1}^{\infty} \sigma_3(n) q^n,$$

$$E_6(q) = E_6(\tau) := 1 - 504 \sum_{n=1}^{\infty} \sigma_5(n) q^n.$$

In [11], Ramanujan derived the following system of ODEs,

$$q \frac{dE_2}{dq} = \frac{(E_2)^2 - E_4}{12}, \quad q \frac{dE_4}{dq} = \frac{E_2 E_4 - E_6}{3}, \quad q \frac{dE_6}{dq} = \frac{E_2 E_6 - (E_4)^2}{2}. \quad (1.3)$$

In particular, by eliminating E_4 and E_6 , $y(\tau) = \pi i E_2(\tau)$ is observed to be a solution to Chazy's equation (1.2). Further, Ohyaama [10] showed that Halphen's differential field is an extension of Ramanujan's differential field, whose Galois group is the symmetric group S_3 .

In [8] and [9], ODEs satisfied by the cubic theta functions were derived as

$$a(q) = \sum_{m,n \in \mathbb{Z}} q^{m^2 + mn + n^2}, \quad b(q) = \sum_{m,n \in \mathbb{Z}} \omega^{n-m} q^{m^2 + mn + n^2},$$

$$c(q) = \sum_{m,n \in \mathbb{Z}} q^{(n+\frac{1}{3})^2 + (n+\frac{1}{3})(m+\frac{1}{3}) + (m+\frac{1}{3})^2}, \quad \omega = e^{\frac{2\pi i}{3}}, \quad |q| < 1.$$

Therefore, Huber used Ramanujan's theory of theta functions. In addition, Cooper [3] also treated ODEs satisfied by modular forms by using Ramanujan's theory. In the present study, the theory of theta functions with rational characteristics has been adopted. Noted is that Hermite [7] introduced theta functions with characteristics, and Farkas and Kra [5] developed the theory of theta functions with rational characteristics.

The aim of the current research was to derive the ODEs satisfied by the modular forms of level 5, and to obtain an extension of Ramanujan's differential field by using the modular forms of level 5.

The main theorems of this study are as follows.

Theorem 1.1. For $q \in \mathbb{C}$ with $|q| < 1$, set

$$P(q) = \cot \frac{2\pi}{5} + 4 \sin \frac{4\pi}{5} \sum_{n=1}^{\infty} (d_{1,5}(n) - d_{4,5}(n))q^n - 4 \sin \frac{2\pi}{5} \sum_{n=1}^{\infty} (d_{2,5}(n) - d_{3,5}(n))q^n,$$

$$Q(q) = \cot \frac{\pi}{5} + 4 \sin \frac{2\pi}{5} \sum_{n=1}^{\infty} (d_{1,5}(n) - d_{4,5}(n))q^n + 4 \sin \frac{4\pi}{5} \sum_{n=1}^{\infty} (d_{2,5}(n) - d_{3,5}(n))q^n,$$

$$R(q) = E_2(q) = 1 - 24 \sum_{n=1}^{\infty} \sigma_1(n)q^n.$$

Then, we have

$$q \frac{d}{dq} P = \frac{-13P^3 - 39P^2Q + 47PQ^2 - 9Q^3 + 2PR}{24}, \quad q \frac{d}{dq} Q = \frac{9P^3 + 47P^2Q + 39PQ^2 - 13Q^3 + 2QR}{24},$$

$$q \frac{d}{dq} R = \frac{5P^4 - 15P^3Q - 155P^2Q^2 + 15PQ^3 + 5Q^4 + R^2}{12}.$$

Theorem 1.2. Further, for $q \in \mathbb{C}$ with $|q| < 1$, set

$$P(q) = 1 + 10 \sum_{n=1}^{\infty} (d_{2,5}(n) - d_{3,5}(n))q^n, \quad Q(q) = 3 + 10 \sum_{n=1}^{\infty} (d_{1,5}(n) - d_{4,5}(n))q^n,$$

$$R(q) = E_2(q^5) = 1 - 24 \sum_{n=1}^{\infty} \sigma_1(n)q^{5n}.$$

Then, we have

$$q \frac{d}{dq} P = \frac{13P^3 + 39P^2Q - 47PQ^2 + 9Q^3 + 50PR}{120}, \quad q \frac{d}{dq} Q = \frac{-9P^3 - 47P^2Q - 39PQ^2 + 13Q^3 + 50QR}{120},$$

$$q \frac{d}{dq} R = \frac{P^4 - 3P^3Q - 31P^2Q^2 + 3PQ^3 + Q^4 + 125R^2}{300}.$$

The remainder of this paper is organized as follows. Section 2 provides an overview of Farkas' and Kra's theory of theta functions with rational characteristics. Next, Section 3 discusses Weierstrass elliptic function theory, and Section 4 describes the preliminary results obtained for P, Q , and R . Further, Section 5 derives the identities of the theta derivatives. Sections 6 and 7 provide the proofs for Theorems 1.1 and 1.2, respectively. Section 8 presents the eta products, $\eta^5(\tau)/\eta(5\tau)$ and $\eta^5(5\tau)/\eta(\tau)$. Section 9 discusses the theorem of Farkas and Kra stating the theta derivatives. Finally, Section 10 derives the Riccati equations satisfied by the modular forms of level 5.

2 Properties of the theta functions

2.1 Definitions

Following the work of Farkas and Kra [5], we introduce the *theta function with characteristics*, which is defined by

$$\theta \begin{bmatrix} \epsilon \\ \epsilon' \end{bmatrix} (\zeta, \tau) = \theta \begin{bmatrix} \epsilon \\ \epsilon' \end{bmatrix} (\zeta) := \sum_{n \in \mathbb{Z}} \exp \left(2\pi i \left[\frac{1}{2} \left(n + \frac{\epsilon}{2} \right)^2 \tau + \left(n + \frac{\epsilon}{2} \right) \left(\zeta + \frac{\epsilon'}{2} \right) \right] \right),$$

where $\epsilon, \epsilon' \in \mathbb{R}$, $\zeta \in \mathbb{C}$, and $\tau \in \mathbb{H}^2$.

The relation between theta functions with rational characteristics and Jacobi theta functions is given by

$$\vartheta_1(\pi\zeta) = -\theta \begin{bmatrix} 1 \\ 1 \end{bmatrix} (\zeta), \quad \vartheta_2(\pi\zeta) = \theta \begin{bmatrix} 1 \\ 0 \end{bmatrix} (\zeta), \quad \vartheta_3(\pi\zeta) = \theta \begin{bmatrix} 0 \\ 0 \end{bmatrix} (\zeta), \quad \vartheta_4(\pi\zeta) = \theta \begin{bmatrix} 0 \\ 1 \end{bmatrix} (\zeta).$$

The *theta constants* are given by

$$\theta \begin{bmatrix} \epsilon \\ \epsilon' \end{bmatrix} := \theta \begin{bmatrix} \epsilon \\ \epsilon' \end{bmatrix} (0, \tau).$$

Furthermore, we denote the *theta derivatives* by

$$\theta' \begin{bmatrix} \epsilon \\ \epsilon' \end{bmatrix} := \frac{\partial}{\partial \zeta} \theta \begin{bmatrix} \epsilon \\ \epsilon' \end{bmatrix} (\zeta, \tau) \Big|_{\zeta=0}, \quad \theta'' \begin{bmatrix} \epsilon \\ \epsilon' \end{bmatrix} := \frac{\partial^2}{\partial \zeta^2} \theta \begin{bmatrix} \epsilon \\ \epsilon' \end{bmatrix} (\zeta, \tau) \Big|_{\zeta=0},$$

and

$$\theta''' \begin{bmatrix} \epsilon \\ \epsilon' \end{bmatrix} := \frac{\partial^3}{\partial \zeta^3} \theta \begin{bmatrix} \epsilon \\ \epsilon' \end{bmatrix} (\zeta, \tau) \Big|_{\zeta=0}, \quad \theta^{(n)} \begin{bmatrix} \epsilon \\ \epsilon' \end{bmatrix} := \frac{\partial^n}{\partial \zeta^n} \theta \begin{bmatrix} \epsilon \\ \epsilon' \end{bmatrix} (\zeta, \tau) \Big|_{\zeta=0}, \quad (n = 1, 2, 3, 4, \dots).$$

In particular, Jacobi's derivative formula is given by

$$\theta' \begin{bmatrix} 1 \\ 1 \end{bmatrix} = -\pi \theta \begin{bmatrix} 0 \\ 0 \end{bmatrix} \theta \begin{bmatrix} 1 \\ 0 \end{bmatrix} \theta \begin{bmatrix} 0 \\ 1 \end{bmatrix}. \quad (2.1)$$

2.2 Basic properties

First, we note that for $m, n \in \mathbb{Z}$,

$$\theta \begin{bmatrix} \epsilon \\ \epsilon' \end{bmatrix} (\zeta + n + m\tau, \tau) = \exp(2\pi i) \left[\frac{n\epsilon - m\epsilon'}{2} - m\zeta - \frac{m^2\tau}{2} \right] \theta \begin{bmatrix} \epsilon \\ \epsilon' \end{bmatrix} (\zeta, \tau), \quad (2.2)$$

and

$$\theta \begin{bmatrix} \epsilon + 2m \\ \epsilon' + 2n \end{bmatrix} (\zeta, \tau) = \exp(\pi i \epsilon n) \theta \begin{bmatrix} \epsilon \\ \epsilon' \end{bmatrix} (\zeta, \tau). \quad (2.3)$$

Furthermore, it is easy to see that

$$\theta \begin{bmatrix} -\epsilon \\ -\epsilon' \end{bmatrix} (\zeta, \tau) = \theta \begin{bmatrix} \epsilon \\ \epsilon' \end{bmatrix} (-\zeta, \tau) \text{ and } \theta' \begin{bmatrix} -\epsilon \\ -\epsilon' \end{bmatrix} (\zeta, \tau) = -\theta' \begin{bmatrix} \epsilon \\ \epsilon' \end{bmatrix} (-\zeta, \tau).$$

For $m, n \in \mathbb{R}$, we get

$$\begin{aligned} & \theta \begin{bmatrix} \epsilon \\ \epsilon' \end{bmatrix} \left(\zeta + \frac{n + m\tau}{2}, \tau \right) \\ &= \exp(2\pi i) \left[-\frac{m\zeta}{2} - \frac{m^2\tau}{8} - \frac{m(\epsilon' + n)}{4} \right] \theta \begin{bmatrix} \epsilon + m \\ \epsilon' + n \end{bmatrix} (\zeta, \tau). \end{aligned} \quad (2.4)$$

Note that $\theta \begin{bmatrix} \epsilon \\ \epsilon' \end{bmatrix} (\zeta, \tau)$ has only one zero in the fundamental parallelogram, and is given by

$$\zeta = \frac{1 - \epsilon}{2}\tau + \frac{1 - \epsilon'}{2}.$$

2.3 Jacobi's triple product identity

All the theta functions have infinite product expansions given by

$$\begin{aligned} \theta \begin{bmatrix} \epsilon \\ \epsilon' \end{bmatrix} (\zeta, \tau) &= \exp\left(\frac{\pi i \epsilon \epsilon'}{2}\right) x^{\frac{\epsilon^2}{4}} z^{\frac{\epsilon}{2}} \\ &\times \prod_{n=1}^{\infty} (1 - x^{2n})(1 + e^{\pi i \epsilon'} x^{2n-1+\epsilon} z)(1 + e^{-\pi i \epsilon'} x^{2n-1-\epsilon}/z), \end{aligned} \quad (2.5)$$

where $x = \exp(\pi i \tau)$ and $z = \exp(2\pi i \zeta)$. Therefore, according to Jacobi's derivative formula (2.1), it follows that

$$\theta' \begin{bmatrix} 1 \\ 1 \end{bmatrix} (0, \tau) = -2\pi q^{\frac{1}{8}} \prod_{n=1}^{\infty} (1 - q^n)^3, \quad q = \exp(2\pi i \tau).$$

2.4 Spaces of N -th order θ -functions

Following the theory by Farkas and Kra [5], we define $\mathcal{F}_N \left[\begin{smallmatrix} \epsilon \\ \epsilon' \end{smallmatrix} \right]$ as the set of all functions f satisfying the two functional equations,

$$f(\zeta + 1) = \exp(\pi i \epsilon) f(\zeta),$$

and

$$f(\zeta + \tau) = \exp(-\pi i)[\epsilon' + 2N\zeta + N\tau] f(\zeta), \quad \zeta \in \mathbb{C}, \tau \in \mathbb{H}^2,$$

where N is a positive integer and $\left[\begin{smallmatrix} \epsilon \\ \epsilon' \end{smallmatrix} \right] \in \mathbb{R}^2$. This set of functions is called the space of N -th order θ -functions with characteristics $\left[\begin{smallmatrix} \epsilon \\ \epsilon' \end{smallmatrix} \right]$. Note that

$$\dim \mathcal{F}_N \left[\begin{smallmatrix} \epsilon \\ \epsilon' \end{smallmatrix} \right] = N.$$

For the proof, please refer to [5, pp.133].

2.5 The heat equation

The theta function satisfies the following heat equation:

$$\frac{\partial^2}{\partial \zeta^2} \theta \left[\begin{smallmatrix} \epsilon \\ \epsilon' \end{smallmatrix} \right] (\zeta, \tau) = 4\pi i \frac{\partial}{\partial \tau} \theta \left[\begin{smallmatrix} \epsilon \\ \epsilon' \end{smallmatrix} \right] (\zeta, \tau). \quad (2.6)$$

3 Weierstrass elliptic function theory

In this paper, we introduce Weierstrass \wp -function and σ -function as follows:

$$\wp(z; \omega_1, \omega_2) = \wp(z) = \frac{1}{z^2} + \sum_{\substack{(m,n) \in \mathbb{Z}^2 \\ (m,n) \neq (0,0)}} \left(\frac{1}{(z - m\omega_1 - n\omega_2)^2} - \frac{1}{(m\omega_1 + n\omega_2)^2} \right),$$

$$\sigma(z; \omega_1, \omega_2) = \sigma(z) = z \prod_{\substack{(m,n) \in \mathbb{Z}^2 \\ (m,n) \neq (0,0)}} \left(1 - \frac{z}{m\omega_1 + n\omega_2} \right) \exp \left(\frac{z}{m\omega_1 + n\omega_2} + \frac{z^2}{2(m\omega_1 + n\omega_2)^2} \right),$$

where z, ω_1, ω_2 are complex numbers with $\omega_2/\omega_1 \notin \mathbb{R}$.

The following formula is recalled from the study by Whittaker and Watson [12, pp. 437, 459]:

$$\begin{aligned}\wp'(z)^2 &= 4\wp(z)^3 - g_2\wp(z) - g_3, \\ g_2(\omega_1, \omega_2) &= 60G_4(\omega_1, \omega_2) = 60 \sum_{\substack{(m, n) \in \mathbb{Z}^2 \\ (m, n) \neq (0, 0)}} \frac{1}{(m\omega_1 + n\omega_2)^4}, \\ g_3(\omega_1, \omega_2) &= 140G_6(\omega_1, \omega_2) = 140 \sum_{\substack{(m, n) \in \mathbb{Z}^2 \\ (m, n) \neq (0, 0)}} \frac{1}{(m\omega_1 + n\omega_2)^6},\end{aligned}$$

which implies

$$\wp''(z) = 6\wp^2(z) - \frac{1}{2}g_2. \quad (3.1)$$

For $k \in \mathbb{N}$, the Eisenstein series is defined by

$$G_{2k}(\tau) = G_{2k}(1, \tau) = \sum_{\substack{(m, n) \in \mathbb{Z}^2 \\ (m, n) \neq (0, 0)}} \frac{1}{(m + n\tau)^{2k}}, \quad \tau \in \mathbb{H}^2.$$

Moreover, from [5, pp. 124], we recall

$$\begin{aligned}\wp(z; 1, \tau) &= \frac{1}{3} \frac{\theta'' \begin{bmatrix} 1 \\ 1 \end{bmatrix}}{\theta' \begin{bmatrix} 1 \\ 1 \end{bmatrix}} - \frac{d^2}{dz^2} \log \theta \begin{bmatrix} 1 \\ 1 \end{bmatrix} (z, \tau), \\ \sigma(z; \omega_1, \omega_2) &= \exp\left(\frac{\eta_1 z^2}{2\omega_1}\right) \frac{\omega_1}{\theta' \begin{bmatrix} 1 \\ 1 \end{bmatrix}} \theta \begin{bmatrix} 1 \\ 1 \end{bmatrix} \left(\frac{z}{\omega_1}, \tau\right),\end{aligned}$$

where $\omega_2/\omega_1 = \tau \in \mathbb{H}^2$.

4 Preliminary results

Proposition 4.1. *For every $\tau \in \mathbb{H}^2$, we have*

$$\frac{\theta' \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}} = -\pi \left\{ \cot \frac{2\pi}{5} + 4 \sin \frac{4\pi}{5} \sum_{n=1}^{\infty} (d_{1,5}(n) - d_{4,5}(n))q^n - 4 \sin \frac{2\pi}{5} \sum_{n=1}^{\infty} (d_{2,5}(n) - d_{3,5}(n))q^n \right\},$$

$$\frac{\theta' \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}} = -\pi \left\{ \cot \frac{\pi}{5} + 4 \sin \frac{2\pi}{5} \sum_{n=1}^{\infty} (d_{1,5}(n) - d_{4,5}(n))q^n + 4 \sin \frac{4\pi}{5} \sum_{n=1}^{\infty} (d_{2,5}(n) - d_{3,5}(n))q^n \right\},$$

where $q = \exp(2\pi i\tau)$.

Proof. The proposition follows from Jacobi's triple product identity (2.5). \square

Proposition 4.2. *For every $\tau \in \mathbb{H}^2$, we have*

$$\frac{\theta' \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}} = \frac{\pi i}{5} \left\{ 1 + 10 \sum_{n=1}^{\infty} (d_{2,5}(n) - d_{3,5}(n))y^n \right\}, \quad \frac{\theta' \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}} = \frac{\pi i}{5} \left\{ 3 + 10 \sum_{n=1}^{\infty} (d_{1,5}(n) - d_{4,5}(n))y^n \right\},$$

where $y = \exp(2\pi i\tau/5)$.

Proof. The proposition follows from Jacobi's triple product identity (2.5). \square

Proposition 4.3. *For every $\tau \in \mathbb{H}^2$, we have*

$$\frac{\theta''' \begin{bmatrix} 1 \\ 1 \end{bmatrix}}{\theta' \begin{bmatrix} 1 \\ 1 \end{bmatrix}} = 4\pi i \frac{d}{d\tau} \log \theta' \begin{bmatrix} 1 \\ 1 \end{bmatrix} = -\pi^2 E_2(q), \quad q = \exp(2\pi i\tau).$$

Proof. The proposition follows from Jacobi's triple product identity (2.5). \square

5 Applications of the residue theorem

Theorem 5.1. *The sum of all the residues of an elliptic function in the fundamental parallelogram is zero.*

5.1 Derivative formulas of level five

Theorem 5.2. *For every $\tau \in \mathbb{H}^2$, we have*

$$\frac{\theta' \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}} = \theta' \begin{bmatrix} 1 \\ 1 \end{bmatrix} \frac{\left(\theta^5 \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} - 3\theta^5 \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix} \right)}{10\theta^3 \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} \theta^3 \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}}, \quad (5.1)$$

$$\frac{\theta' \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}} = \theta' \begin{bmatrix} 1 \\ 1 \end{bmatrix} \frac{\left(3\theta^5 \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} + \theta^5 \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix} \right)}{10\theta^3 \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} \theta^3 \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}}. \quad (5.2)$$

Proof. Consider the following elliptic functions:

$$\varphi(z) = \frac{\theta^3 \begin{bmatrix} 1 \\ 1 \end{bmatrix} (z, \tau)}{\theta^2 \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} (z, \tau) \theta \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix} (z, \tau)} \quad \text{and} \quad \psi(z) = \frac{\theta^3 \begin{bmatrix} 1 \\ 1 \end{bmatrix} (z, \tau)}{\theta^2 \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix} (z, \tau) \theta \begin{bmatrix} 1 \\ -\frac{1}{5} \end{bmatrix} (z, \tau)}.$$

Note that, in the fundamental parallelogram, the poles of $\varphi(z)$ are $z = 2/5$ and $z = 1/5$. Thus, the direct calculation yields

$$\text{Res} \left(\varphi(z), \frac{2}{5} \right) = \frac{\theta^3 \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}}{\theta' \begin{bmatrix} 1 \\ 1 \end{bmatrix}^2 \theta \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}} \left\{ -3 \frac{\theta' \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}} + \frac{\theta' \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}} \right\}$$

and

$$\text{Res} \left(\varphi(z), \frac{1}{5} \right) = -\frac{\theta \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}}{\theta' \begin{bmatrix} 1 \\ 1 \end{bmatrix}}.$$

Because $\text{Res}(\varphi(z), 2/5) + \text{Res}(\varphi(z), 1/5) = 0$, it is understood that

$$3 \frac{\theta' \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}} - \frac{\theta' \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}} = -\frac{\theta' \begin{bmatrix} 1 \\ 1 \end{bmatrix} \theta^2 \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}}{\theta^3 \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}}.$$

From $\psi(z)$, we have

$$\frac{\theta' \begin{bmatrix} 1 \\ \frac{1}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{1}{5} \\ 1 \end{bmatrix}} + 3 \frac{\theta' \begin{bmatrix} 1 \\ \frac{3}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{3}{5} \\ 1 \end{bmatrix}} = \frac{\theta' \begin{bmatrix} 1 \\ 1 \end{bmatrix} \theta^2 \begin{bmatrix} 1 \\ \frac{1}{5} \\ 1 \end{bmatrix}}{\theta^3 \begin{bmatrix} 1 \\ \frac{3}{5} \\ 1 \end{bmatrix}},$$

which proves the theorem. \square

Theorem 5.3. *For every $\tau \in \mathbb{H}^2$, we have*

$$\frac{\theta' \begin{bmatrix} \frac{1}{5} \\ 1 \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{1}{5} \\ 1 \\ 1 \end{bmatrix}} = -\zeta_5^3 \theta' \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix} \frac{\left(\theta^5 \begin{bmatrix} \frac{1}{5} \\ 1 \\ 1 \end{bmatrix} + 3\theta^5 \begin{bmatrix} \frac{3}{5} \\ 1 \\ 1 \end{bmatrix} \right)}{10\theta^3 \begin{bmatrix} \frac{1}{5} \\ 1 \\ 1 \end{bmatrix} \theta^3 \begin{bmatrix} \frac{3}{5} \\ 1 \\ 1 \end{bmatrix}}, \quad (5.3)$$

$$\frac{\theta' \begin{bmatrix} \frac{3}{5} \\ 1 \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{3}{5} \\ 1 \\ 1 \end{bmatrix}} = -\zeta_5^3 \theta' \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix} \frac{\left(3\theta^5 \begin{bmatrix} \frac{1}{5} \\ 1 \\ 1 \end{bmatrix} - \theta^5 \begin{bmatrix} \frac{3}{5} \\ 1 \\ 1 \end{bmatrix} \right)}{10\theta^3 \begin{bmatrix} \frac{1}{5} \\ 1 \\ 1 \end{bmatrix} \theta^3 \begin{bmatrix} \frac{3}{5} \\ 1 \\ 1 \end{bmatrix}}. \quad (5.4)$$

Proof. Consider the following elliptic functions:

$$\varphi(z) = \frac{\theta^3 \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}(z, \tau)}{\theta^2 \begin{bmatrix} \frac{1}{5} \\ 1 \\ 1 \end{bmatrix}(z, \tau) \theta \begin{bmatrix} \frac{3}{5} \\ 1 \\ 1 \end{bmatrix}(z, \tau)} \quad \text{and} \quad \psi(z) = \frac{\theta^3 \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}(z, \tau)}{\theta^2 \begin{bmatrix} \frac{3}{5} \\ 1 \\ 1 \end{bmatrix}(z, \tau) \theta \begin{bmatrix} -\frac{1}{5} \\ 1 \\ 1 \end{bmatrix}(z, \tau)}.$$

Then, from $\varphi(z)$ and $\psi(z)$, we have

$$3 \frac{\theta' \begin{bmatrix} \frac{1}{5} \\ 1 \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{1}{5} \\ 1 \\ 1 \end{bmatrix}} - \frac{\theta' \begin{bmatrix} \frac{3}{5} \\ 1 \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{3}{5} \\ 1 \\ 1 \end{bmatrix}} = -\zeta_5^3 \frac{\theta' \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix} \theta^2 \begin{bmatrix} \frac{3}{5} \\ 1 \\ 1 \end{bmatrix}}{\theta^3 \begin{bmatrix} \frac{1}{5} \\ 1 \\ 1 \end{bmatrix}} \quad (5.5)$$

and

$$\frac{\theta' \begin{bmatrix} \frac{1}{5} \\ 1 \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{1}{5} \\ 1 \\ 1 \end{bmatrix}} + 3 \frac{\theta' \begin{bmatrix} \frac{3}{5} \\ 1 \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{3}{5} \\ 1 \\ 1 \end{bmatrix}} = -\zeta_5^3 \frac{\theta' \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix} \theta^2 \begin{bmatrix} \frac{1}{5} \\ 1 \\ 1 \end{bmatrix}}{\theta^3 \begin{bmatrix} \frac{3}{5} \\ 1 \\ 1 \end{bmatrix}}. \quad (5.6)$$

Thus, the theorem is proved. \square

5.2 Second-order theta derivatives

Proposition 5.4. *For every $\tau \in \mathbb{H}^2$, we have*

$$2 \frac{\theta'' \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}} + \frac{\theta'' \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}} - \frac{\theta''' \begin{bmatrix} 1 \\ 1 \end{bmatrix}}{\theta' \begin{bmatrix} 1 \\ 1 \end{bmatrix}} + 2 \left\{ \frac{\theta' \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}} \right\}^2 + 4 \frac{\theta' \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}} \cdot \frac{\theta' \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}} = 0, \quad (5.7)$$

$$\frac{\theta'' \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}} + 2 \frac{\theta'' \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}} - \frac{\theta''' \begin{bmatrix} 1 \\ 1 \end{bmatrix}}{\theta' \begin{bmatrix} 1 \\ 1 \end{bmatrix}} - 4 \frac{\theta' \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}} \cdot \frac{\theta' \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}} + 2 \left\{ \frac{\theta' \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}} \right\}^2 = 0. \quad (5.8)$$

Proof. Consider the following elliptic functions:

$$\frac{\theta^2 \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} (z, \tau) \theta \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix} (z, \tau)}{\theta^3 \begin{bmatrix} 1 \\ 1 \end{bmatrix} (z, \tau)}, \quad \frac{\theta \begin{bmatrix} 1 \\ -\frac{1}{5} \end{bmatrix} (z, \tau) \theta^2 \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix} (z, \tau)}{\theta^3 \begin{bmatrix} 1 \\ 1 \end{bmatrix} (z, \tau)}.$$

The proposition can be proved using Theorem 5.1. □

Proposition 5.5. *For every $\tau \in \mathbb{H}^2$, we have*

$$2 \frac{\theta'' \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}} + \frac{\theta'' \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}} - \frac{\theta''' \begin{bmatrix} 1 \\ 1 \end{bmatrix}}{\theta' \begin{bmatrix} 1 \\ 1 \end{bmatrix}} + 2 \left\{ \frac{\theta' \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}} \right\}^2 + 4 \frac{\theta' \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}} \cdot \frac{\theta' \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}} = 0, \quad (5.9)$$

$$\frac{\theta'' \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}} + 2 \frac{\theta'' \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}} - \frac{\theta''' \begin{bmatrix} 1 \\ 1 \end{bmatrix}}{\theta' \begin{bmatrix} 1 \\ 1 \end{bmatrix}} - 4 \frac{\theta' \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}} \cdot \frac{\theta' \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}} + 2 \left\{ \frac{\theta' \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}} \right\}^2 = 0. \quad (5.10)$$

Proof. Consider the following elliptic functions:

$$\frac{\theta^2 \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix} (z, \tau) \theta \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix} (z, \tau)}{\theta^3 \begin{bmatrix} 1 \\ 1 \end{bmatrix} (z, \tau)}, \quad \frac{\theta \begin{bmatrix} -\frac{1}{5} \\ 1 \end{bmatrix} (z, \tau) \theta^2 \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix} (z, \tau)}{\theta^3 \begin{bmatrix} 1 \\ 1 \end{bmatrix} (z, \tau)}.$$

The proposition can be proved using Theorem 5.1. □

5.3 Third-order theta derivatives

Proposition 5.6. *For every $\tau \in \mathbb{H}^2$, we have*

$$\begin{aligned} & \frac{\theta^{(3)} \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}} + 3 \frac{\theta^{(3)} \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}} + 9 \frac{\theta^{(2)} \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} \theta^{(1)} \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} \theta \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}} + 18 \frac{\theta^{(1)} \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}} \left\{ \frac{\theta^{(1)} \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}} \right\}^2 + 9 \frac{\theta^{(1)} \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} \theta^{(2)} \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} \theta \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}} \\ & + 6 \left\{ \frac{\theta^{(1)} \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}} \right\}^3 + 18 \frac{\theta^{(1)} \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix} \theta^{(2)} \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix} \theta \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}} - 4 \frac{\theta^{(3)} \begin{bmatrix} 1 \\ 1 \end{bmatrix}}{\theta^{(1)} \begin{bmatrix} 1 \\ 1 \end{bmatrix}} \left(\frac{\theta^{(1)} \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}} + 3 \frac{\theta^{(1)} \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}} \right) = 0, \end{aligned}$$

and

$$\begin{aligned} & 3 \frac{\theta^{(3)} \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}} - \frac{\theta^{(3)} \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}} + 9 \frac{\theta^{(1)} \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} \theta^{(2)} \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} \theta \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}} - 18 \frac{\theta^{(1)} \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}} \left\{ \frac{\theta^{(1)} \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}} \right\}^2 - 9 \frac{\theta^{(2)} \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} \theta^{(1)} \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} \theta \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}} \\ & + 6 \left\{ \frac{\theta^{(1)} \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}} \right\}^3 + 18 \frac{\theta^{(1)} \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} \theta^{(2)} \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} \theta \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}} - 4 \frac{\theta^{(3)} \begin{bmatrix} 1 \\ 1 \end{bmatrix}}{\theta^{(1)} \begin{bmatrix} 1 \\ 1 \end{bmatrix}} \left(3 \frac{\theta^{(1)} \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}} - \frac{\theta^{(1)} \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}} \right) = 0. \end{aligned}$$

Proof. Consider the following elliptic functions:

$$\frac{\theta \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} (z) \theta^3 \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix} (z)}{\theta^4 \begin{bmatrix} 1 \\ 1 \end{bmatrix} (z)}, \quad \frac{\theta^3 \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} (z) \theta \begin{bmatrix} 1 \\ -\frac{3}{5} \end{bmatrix} (z)}{\theta^4 \begin{bmatrix} 1 \\ 1 \end{bmatrix} (z)}.$$

□

Proposition 5.7. For every $\tau \in \mathbb{H}^2$, we have

$$\begin{aligned} & \frac{\theta^{(3)} \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}} + 3 \frac{\theta^{(3)} \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}} + 9 \frac{\theta^{(2)} \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix} \theta^{(1)} \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix} \theta \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}} + 18 \frac{\theta^{(1)} \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}} \left\{ \frac{\theta^{(1)} \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}} \right\}^2 + 9 \frac{\theta^{(1)} \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix} \theta^{(2)} \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix} \theta \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}} \\ & + 6 \left\{ \frac{\theta^{(1)} \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}} \right\}^3 + 18 \frac{\theta^{(1)} \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix} \theta^{(2)} \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix} \theta \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}} - 4 \frac{\theta^{(3)} \begin{bmatrix} 1 \\ 1 \end{bmatrix}}{\theta^{(1)} \begin{bmatrix} 1 \\ 1 \end{bmatrix}} \left(\frac{\theta^{(1)} \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}} + 3 \frac{\theta^{(1)} \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}} \right) = 0, \end{aligned}$$

and

$$\begin{aligned} & 3 \frac{\theta^{(3)} \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}} - \frac{\theta^{(3)} \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}} + 9 \frac{\theta^{(1)} \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix} \theta^{(2)} \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix} \theta \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}} - 18 \frac{\theta^{(1)} \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}} \left\{ \frac{\theta^{(1)} \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}} \right\}^2 - 9 \frac{\theta^{(2)} \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix} \theta^{(1)} \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix} \theta \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}} \\ & + 6 \left\{ \frac{\theta^{(1)} \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}} \right\}^3 + 18 \frac{\theta^{(1)} \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix} \theta^{(2)} \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix} \theta \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}} - 4 \frac{\theta^{(3)} \begin{bmatrix} 1 \\ 1 \end{bmatrix}}{\theta^{(1)} \begin{bmatrix} 1 \\ 1 \end{bmatrix}} \left(3 \frac{\theta^{(1)} \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}} - \frac{\theta^{(1)} \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}} \right) = 0. \end{aligned}$$

Proof. Furthermore, consider the following elliptic functions:

$$\frac{\theta \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} (z) \theta^3 \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix} (z)}{\theta^4 \begin{bmatrix} 1 \\ 1 \end{bmatrix} (z)}, \quad \frac{\theta^3 \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} (z) \theta \begin{bmatrix} 1 \\ -\frac{3}{5} \end{bmatrix} (z)}{\theta^4 \begin{bmatrix} 1 \\ 1 \end{bmatrix} (z)}.$$

□

5.4 Fourth-order theta derivatives

Proposition 5.8. *For every $\tau \in \mathbb{H}^2$ and $j = 1, 3$, we have*

$$\begin{aligned}
& \frac{\theta^{(4)} \begin{bmatrix} 1 \\ \frac{j}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{j}{5} \end{bmatrix}} + 16 \frac{\theta^{(1)} \begin{bmatrix} 1 \\ \frac{j}{5} \end{bmatrix} \theta^{(3)} \begin{bmatrix} 1 \\ \frac{j}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{j}{5} \end{bmatrix} \theta \begin{bmatrix} 1 \\ \frac{j}{5} \end{bmatrix}} + 12 \left\{ \frac{\theta^{(2)} \begin{bmatrix} 1 \\ \frac{j}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{j}{5} \end{bmatrix}} \right\}^2 + 72 \left\{ \frac{\theta^{(1)} \begin{bmatrix} 1 \\ \frac{j}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{j}{5} \end{bmatrix}} \right\}^2 \frac{\theta^{(2)} \begin{bmatrix} 1 \\ \frac{j}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{j}{5} \end{bmatrix}} \\
& + 24 \left\{ \frac{\theta^{(1)} \begin{bmatrix} 1 \\ \frac{j}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{j}{5} \end{bmatrix}} \right\}^4 - 40 \frac{\theta^{(3)} \begin{bmatrix} 1 \\ 1 \end{bmatrix}}{\theta^{(1)} \begin{bmatrix} 1 \\ 1 \end{bmatrix}} \left\{ \frac{\theta^{(1)} \begin{bmatrix} 1 \\ \frac{j}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{j}{5} \end{bmatrix}} \right\}^2 - 10 \frac{\theta^{(3)} \begin{bmatrix} 1 \\ 1 \end{bmatrix} \theta^{(2)} \begin{bmatrix} 1 \\ \frac{j}{5} \end{bmatrix}}{\theta^{(1)} \begin{bmatrix} 1 \\ 1 \end{bmatrix} \theta \begin{bmatrix} 1 \\ \frac{j}{5} \end{bmatrix}} \\

\end{aligned}$$

Proof. Consider the following elliptic functions: $f_j(z) = \theta^5 \begin{bmatrix} \frac{j}{5} \\ 1 \end{bmatrix} (z, \tau) / \theta^5 \begin{bmatrix} 1 \\ 1 \end{bmatrix} (z, \tau)$. \square

6 Proof of Theorem 1.1

6.1 Notations

For every $\tau \in \mathbb{H}^2$, set $q = \exp(2\pi i\tau)$ and

$$X = \frac{\theta' \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}}, \quad Y = \frac{\theta' \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}}, \quad Z = \frac{\theta''' \begin{bmatrix} 1 \\ 1 \end{bmatrix}}{\theta' \begin{bmatrix} 1 \\ 1 \end{bmatrix}}.$$

6.2 ODEs for $P(q)$ and $Q(q)$

Proof. Based on Proposition 5.4, we have

$$\frac{\theta'' \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}} = \frac{1}{3}Z - 4XY - \frac{4}{3}X^2 + \frac{2}{3}Y^2, \quad \frac{\theta'' \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}} = \frac{1}{3}Z + 4XY + \frac{2}{3}X^2 - \frac{4}{3}Y^2. \quad (6.1)$$

Based on Proposition 5.6, we obtain

$$\frac{\theta''' \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}} = 3X^3 + 9X^2Y - 15XY^2 + 3Y^3 + XZ, \quad \frac{\theta''' \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}} = -3X^3 - 15X^2Y - 9XY^2 + 3Y^3 + YZ. \quad (6.2)$$

Because

$$\frac{\theta''' \begin{bmatrix} 1 \\ \frac{j}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{j}{5} \end{bmatrix}} = 4\pi i \frac{d}{d\tau} \left\{ \frac{\theta' \begin{bmatrix} 1 \\ \frac{j}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{j}{5} \end{bmatrix}} \right\} + \frac{\theta' \begin{bmatrix} 1 \\ \frac{j}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{j}{5} \end{bmatrix}} \cdot \frac{\theta'' \begin{bmatrix} 1 \\ \frac{j}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{j}{5} \end{bmatrix}}, \quad (j = 1, 3),$$

it follows that

$$\begin{aligned} 4\pi i X' &= \frac{13}{3}X^3 + 13X^2Y - \frac{47}{3}XY^2 + 3Y^3 + \frac{2}{3}XZ, \\ 4\pi i Y' &= -3X^3 - \frac{47}{3}X^2Y - 13XY^2 + \frac{13}{3}Y^3 + \frac{2}{3}YZ, \end{aligned}$$

where $' = d/d\tau$. By considering $d/d\tau = 2\pi i q d/dq$, we obtain the ODEs for $P(q)$ and $Q(q)$. \square

6.3 ODE for $R(q)$

Proof. First, note that

$$\begin{aligned} \frac{\theta^{(4)} \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}} &= 4\pi i \frac{d}{d\tau} \left\{ \frac{\theta'' \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}} \right\} + \left\{ \frac{\theta'' \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}} \right\}^2, \\ &= \frac{4\pi i}{3} \frac{dZ}{d\tau} + \frac{20}{9} X^4 + \frac{52}{3} X^3 Y + \frac{316}{9} X^2 Y^2 + \frac{44}{3} X Y^3 - \frac{52}{9} Y^4 \\ &\quad - 8 X Y Z - \frac{8}{3} X^2 Z + \frac{4}{3} Y^2 Z + \frac{1}{9} Z^2, \end{aligned}$$

and

$$\frac{\theta^{(5)} \begin{bmatrix} 1 \\ 1 \end{bmatrix}}{\theta^{(1)} \begin{bmatrix} 1 \\ 1 \end{bmatrix}} = 4\pi i \frac{d}{d\tau} \left\{ \frac{\theta^{(3)} \begin{bmatrix} 1 \\ 1 \end{bmatrix}}{\theta^{(1)} \begin{bmatrix} 1 \\ 1 \end{bmatrix}} \right\} + \left\{ \frac{\theta^{(3)} \begin{bmatrix} 1 \\ 1 \end{bmatrix}}{\theta^{(1)} \begin{bmatrix} 1 \\ 1 \end{bmatrix}} \right\}^2 = 4\pi i \frac{dZ}{d\tau} + Z^2.$$

By using Proposition 5.8, we have

$$4\pi i Z' = \frac{10}{3} X^4 - 10 X^3 Y - \frac{310}{3} X^2 Y^2 + 10 X Y^3 + \frac{10}{3} Y^4 + \frac{2}{3} Z^2,$$

and

$$\frac{\theta^{(4)} \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}} = \frac{10}{3} X^4 + 14 X^3 Y + \frac{2}{3} X^2 Y^2 + 18 X Y^3 - \frac{14}{3} X Y^3 + \frac{1}{3} Z^2 - 8 X Y Z - \frac{8}{3} X^2 Z + \frac{4}{3} Y^2 Z,$$

where $' = d/d\tau$. By considering $d/d\tau = 2\pi i q d/dq$, we obtain the ODE for $R(q)$. \square

6.4 Note on E_4 and E_6

Theorem 6.1. For $q \in \mathbb{C}$ with $|q| < 1$, set

$$\begin{aligned} P(q) &= \cot \frac{2\pi}{5} + 4 \sin \frac{4\pi}{5} \sum_{n=1}^{\infty} (d_{1,5}(n) - d_{4,5}(n)) q^n - 4 \sin \frac{2\pi}{5} \sum_{n=1}^{\infty} (d_{2,5}(n) - d_{3,5}(n)) q^n, \\ Q(q) &= \cot \frac{\pi}{5} + 4 \sin \frac{2\pi}{5} \sum_{n=1}^{\infty} (d_{1,5}(n) - d_{4,5}(n)) q^n + 4 \sin \frac{4\pi}{5} \sum_{n=1}^{\infty} (d_{2,5}(n) - d_{3,5}(n)) q^n. \end{aligned}$$

Then, we have

$$E_4(q) = -5P^4 + 15P^3Q + 155P^2Q^2 - 15PQ^3 - 5Q^4,$$

$$E_6(q) = \frac{-395P^6 - 3690P^5Q - 8025P^4Q^2 - 8025P^2Q^4 + 3690PQ^5 - 395Q^6}{8}.$$

Proof. For the proof, we use

$$\wp = \wp(z; 1, \tau) = \frac{1}{3} \frac{\theta''' \begin{bmatrix} 1 \\ 1 \end{bmatrix}}{\theta' \begin{bmatrix} 1 \\ 1 \end{bmatrix}} - \frac{d^2}{dz^2} \log \theta \begin{bmatrix} 1 \\ 1 \end{bmatrix} (z).$$

Note that

$$\wp'' = 6\wp^2 - g_2, \quad g_2(1, \tau) = \frac{4\pi^4}{3} E_4(q).$$

By substituting $z = -2/5$, we have

$$g_2 = -\frac{20}{3}X^4 + 20X^3Y + \frac{620}{3}X^2Y^2 - 20XY^3 - \frac{20}{3}Y^4, \quad (6.3)$$

which implies

$$E_4(q) = -5P^4 + 15P^3Q + 155P^2Q^2 - 15PQ^3 - 5Q^4.$$

Next, note that

$$(\wp')^2 = 4\wp^3 - g_2\wp - g_3, \quad g_3(1, \tau) = \frac{8\pi^6}{27} E_6(q).$$

By substituting $z = -2/5$, we obtain

$$g_3 = -\frac{395}{27}X^6 - \frac{410}{3}X^5Y - \frac{2675}{9}X^4Y^2 - \frac{2675}{9}X^2Y^4 + \frac{410}{3}XY^5 - \frac{395}{27}Y^6, \quad (6.4)$$

which implies

$$E_6(q) = \frac{-395P^6 - 3690P^5Q - 8025P^4Q^2 - 8025P^2Q^4 + 3690PQ^5 - 395Q^6}{8}.$$

□

Corollary 6.2. For $q \in \mathbb{C}$ with $|q| < 1$, set

$$\begin{aligned}
S(q) &= \frac{\sqrt{250 - 110\sqrt{5}}}{5} \prod_{n=1}^{\infty} \frac{(1 - q^n)^5}{(1 - q^{5n})^3} \left(1 + \frac{1 - \sqrt{5}}{2} q^n + q^{2n} \right)^5 \\
&= \frac{\sqrt{250 - 110\sqrt{5}}}{5} \left\{ 1 - \frac{5}{2}(1 + \sqrt{5}) \sum_{n=1}^{\infty} (d_{1,5}(n) - d_{4,5}(n))q^n + \frac{5}{2}(7 + 3\sqrt{5}) \sum_{n=1}^{\infty} (d_{2,5}(n) - d_{3,5}(n))q^n \right\}, \\
T(q) &= \frac{\sqrt{250 + 110\sqrt{5}}}{5} \prod_{n=1}^{\infty} \frac{(1 - q^n)^5}{(1 - q^{5n})^3} \left(1 + \frac{1 + \sqrt{5}}{2} q^n + q^{2n} \right)^5 \\
&= \frac{\sqrt{250 + 110\sqrt{5}}}{5} \left\{ 1 + \frac{5}{2}(-1 + \sqrt{5}) \sum_{n=1}^{\infty} (d_{1,5}(n) - d_{4,5}(n))q^n + \frac{5}{2}(7 - 3\sqrt{5}) \sum_{n=1}^{\infty} (d_{2,5}(n) - d_{3,5}(n))q^n \right\}.
\end{aligned}$$

Then we have

$$\begin{aligned}
E_4(q) &= \frac{S^4 + 12S^3T + 14S^2T^2 - 12ST^3 + T^4}{16}, \\
E_6(q) &= -\frac{1}{64} (S^2 + T^2) (S^4 + 18S^3T + 74S^2T^2 - 18ST^3 + T^4),
\end{aligned}$$

and

$$\begin{aligned}
q(q : q)_{\infty}^{24} &= \frac{(E_4(q))^3 - (E_6(q))^2}{1728} = -\frac{S^5T^5(S^2 + 11ST - T^2)}{4096}, \\
j(q) &= -\frac{(S^4 + 12S^3T + 14S^2T^2 - 12ST^3 + T^4)^3}{S^5T^5(S^2 + 11ST - T^2)} = -\frac{(f^4 - 12f^3 + 14f^2 + 12f + 1)^3}{f^5(-f^2 + 11f + 1)}, \quad f = T/S.
\end{aligned}$$

Proof. The corollary can be obtained by considering

$$S = -3P + Q, \quad T = P + 3Q, \quad \text{and } f = T/S.$$

□

Corollary 6.3. For $q \in \mathbb{C}$ with $|q| < 1$, set

$$\begin{aligned} V(q) &= \prod_{n=1}^{\infty} \frac{(1-q^n)^5}{(1-q^{5n})^3} \left(1 + \frac{1-\sqrt{5}}{2}q^n + q^{2n} \right)^5 \\ &= 1 - \frac{5}{2}(1+\sqrt{5}) \sum_{n=1}^{\infty} (d_{1,5}(n) - d_{4,5}(n))q^n + \frac{5}{2}(7+3\sqrt{5}) \sum_{n=1}^{\infty} (d_{2,5}(n) - d_{3,5}(n))q^n, \end{aligned}$$

$$\begin{aligned} W(q) &= \prod_{n=1}^{\infty} \frac{(1-q^n)^5}{(1-q^{5n})^3} \left(1 + \frac{1+\sqrt{5}}{2}q^n + q^{2n} \right)^5 \\ &= 1 + \frac{5}{2}(-1+\sqrt{5}) \sum_{n=1}^{\infty} (d_{1,5}(n) - d_{4,5}(n))q^n + \frac{5}{2}(7-3\sqrt{5}) \sum_{n=1}^{\infty} (d_{2,5}(n) - d_{3,5}(n))q^n. \end{aligned}$$

Then we have

$$E_4(q) = \frac{(123 - 55\sqrt{5})V^4 + 12(-11 + 5\sqrt{5})V^3W + 28V^2W^2 - 12(11 + 5\sqrt{5})VW^3 + (123 + 55\sqrt{5})W^4}{10},$$

$$\begin{aligned} E_6(q) &= \frac{1}{25}(-1525 + 682\sqrt{5})V^6 - \frac{9}{25}(-275 + 123\sqrt{5})V^5W + \frac{3}{2}(-25 + 11\sqrt{5})V^4W^2 \\ &\quad - \frac{3}{2}(25 + 11\sqrt{5})V^2W^4 + \frac{9}{25}(275 + 123\sqrt{5})VW^5 - \frac{1}{25}(1525 + 682\sqrt{5})W^6, \end{aligned}$$

and

$$\begin{aligned} q(q; q)_{\infty}^{24} &= -\frac{1}{250}V^5W^5(V-W) \left((-11 + 5\sqrt{5})V + (11 + 5\sqrt{5})W \right) \\ &= \frac{1}{250}(11 - 5\sqrt{5})V^7W^5 - \frac{11}{125}V^6W^6 + \frac{1}{250}(11 + 5\sqrt{5})V^5W^7. \end{aligned}$$

Theorem 6.4. For every $\tau \in \mathbb{H}^2$, we have

$$G_4(\tau) = \frac{\theta' \begin{bmatrix} 1 \\ 1 \end{bmatrix}^4}{720 \cdot \theta^{12} \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} \theta^{12} \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}} (A^4 - 12A^3B + 14A^2B^2 + 12AB^3 + B^4),$$

and

$$G_6(\tau) = \frac{-\theta' \begin{bmatrix} 1 \\ 1 \end{bmatrix}^6}{30240 \cdot \theta^{18} \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} \theta^{18} \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}} (A^2 + B^2) (A^4 - 18A^3B + 74A^2B^2 + 18AB^3 + B^4),$$

where

$$A = \theta^5 \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}, \quad B = \theta^5 \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}.$$

Proof. The theorem is based on equations (6.3) and (6.4) and the derivative formulas of Theorem 5.2. \square

Theorem 6.5. For every $\tau \in \mathbb{H}^2$, we have

$$\Delta = g_2^3 - 27g_3^2 = \frac{\theta' \begin{bmatrix} 1 \\ 1 \end{bmatrix}^{12}}{\theta^{11} \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} \theta^{11} \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}} \left(\theta^{10} \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} - 11\theta^5 \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} \theta^5 \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix} - \theta^{10} \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix} \right),$$

and

$$j = \frac{12^3 g_2^3}{\Delta} = \frac{(f^4(\tau) - 12f^3(\tau) + 14f^2(\tau) + 12f(\tau) + 1)^3}{f^5(\tau)(f^2(\tau) - 11f(\tau) - 1)},$$

where

$$f(\tau) = \theta^5 \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} / \theta^5 \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix} = \frac{11 + 5\sqrt{5}}{2} \prod_{n=1}^{\infty} \frac{\left(1 + \frac{1+\sqrt{5}}{2}q^n + q^{2n}\right)^5}{\left(1 + \frac{1-\sqrt{5}}{2}q^n + q^{2n}\right)^5}, \quad q = \exp(2\pi i\tau).$$

Proof. By using equations (6.3) and (6.4), we have

$$\begin{aligned} \Delta &= -25(3X - Y)^5(X + 3Y)^5(X^2 + 4XY - Y^2) = \frac{\theta' \begin{bmatrix} 1 \\ 1 \end{bmatrix}^{12}}{\theta^{36} \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} \theta^{36} \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}} A^5 B^5 (A^2 - 11AB - B^2), \\ j &= \frac{320(X^4 - 3X^3Y - 31X^2Y^2 + 3XY^3 + Y^4)^3}{27(3X - Y)^5(X + 3Y)^5(X^2 + 4XY - Y^2)} = \frac{(A^4 - 12A^3B + 14A^2B^2 + 12AB^3 + B^4)^3}{A^5B^5(A^2 - 11AB - B^2)}, \end{aligned}$$

where

$$A = \theta^5 \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}, \quad B = \theta^5 \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}.$$

\square

Corollary 6.6. For $q \in \mathbb{C}$ with $|q| < 1$, set

$$\begin{aligned} P(q) &= \cot \frac{2\pi}{5} + 4 \sin \frac{4\pi}{5} \sum_{n=1}^{\infty} (d_{1,5}(n) - d_{4,5}(n))q^n - 4 \sin \frac{2\pi}{5} \sum_{n=1}^{\infty} (d_{2,5}(n) - d_{3,5}(n))q^n, \\ Q(q) &= \cot \frac{\pi}{5} + 4 \sin \frac{2\pi}{5} \sum_{n=1}^{\infty} (d_{1,5}(n) - d_{4,5}(n))q^n + 4 \sin \frac{4\pi}{5} \sum_{n=1}^{\infty} (d_{2,5}(n) - d_{3,5}(n))q^n. \end{aligned}$$

Then, we have

$$j(\tau) = j(q) = \frac{320(P^4 - 3P^3Q - 31P^2Q^2 + 3PQ^3 + Q^4)^3}{27(3P - Q)^5(P + 3Q)^5(P^2 + 4PQ - Q^2)},$$

and

$$f(\tau) = \theta^5 \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} / \theta^5 \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix} = -\frac{P + 3Q}{3P - Q}, \quad q = \exp(2\pi i\tau).$$

Proof. The expression of $f(\tau)$ follows from the derivative formulas (5.1) and (5.2), which implies that

$$f(\tau) = -\frac{X + 3Y}{3X - Y}.$$

□

Theorem 6.7. For every $\tau \in \mathbb{H}^2$, we have

$$\theta' \begin{bmatrix} 1 \\ 1 \end{bmatrix}^4 = \frac{(2\pi)^4 \theta^{11} \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} \theta^{11} \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}}{\theta^{10} \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} - 11\theta^5 \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} \theta^5 \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix} - \theta^{10} \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}}. \quad (6.5)$$

Proof. Recall the following formula from Apostol [1, pp. 51]:

$$\Delta = (2\pi)^{12} \eta^{24}(\tau) = (2\pi)^4 \theta' \begin{bmatrix} 1 \\ 1 \end{bmatrix}^8. \quad (6.6)$$

The theorem follows from Theorem 6.5. □

Theorem 6.8.

- (1) For each positive integer k , the Eisenstein series $G_{4k}(\tau)$ can be expressed using a rational expression as follows:

$$\theta \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} (0, \tau), \quad \text{and} \quad \theta \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix} (0, \tau).$$

- (2) For each positive integer k , the Eisenstein series $G_{4k+2}(\tau)$ can be expressed using a rational expression as follows:

$$\theta \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} (0, \tau), \quad \theta \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix} (0, \tau), \quad \text{and} \quad \theta' \begin{bmatrix} 1 \\ 1 \end{bmatrix} (0, \tau).$$

Proof. From the study by Apostol [1, pp. 118], we recall that for $k = 2, 3, 4, \dots$,

$$G_{2k}(\tau) = \sum_{a,b} c_{a,b} G_4^a(\tau) G_6^b(\tau),$$

where $c_{a,b}$ are complex numbers, and the sum is extended over all integers $a \geq 0, b \geq 0$ such that $4a + 6b = k$. The theorem follows from Theorems 6.4 and 6.7. \square

6.5 Proof of Ramanujan's ODEs (1.3)

Theorem 6.9. *For $q \in \mathbb{C}$ with $|q| < 1$, we have*

$$q \frac{dE_2}{dq} = \frac{(E_2)^2 - E_4}{12}, \quad q \frac{dE_4}{dq} = \frac{E_2 E_4 - E_6}{3}, \quad q \frac{dE_6}{dq} = \frac{E_2 E_6 - (E_4)^2}{2}.$$

Proof. According to Theorems 1.1 and 6.1,

$$q \frac{d}{dq} E_2 = q \frac{d}{dq} R = \frac{5P^4 - 15P^3Q - 155P^2Q^2 + 15PQ^3 + 5Q^4 + R^2}{12} = \frac{E_2^2 - E_4}{12}.$$

Next, it is observed that

$$\begin{aligned} q \frac{d}{dq} E_4 &= q \frac{d}{dq} (-5P^4 + 15P^3Q + 155P^2Q^2 - 15PQ^3 - 5Q^4) \\ &= \frac{395P^6}{24} + \frac{615P^5Q}{4} + \frac{2675P^4Q^2}{8} + \frac{2675P^2Q^4}{8} - \frac{615PQ^5}{4} + \frac{395Q^6}{24} \\ &\quad - \frac{5P^4R}{3} + 5P^3QR + \frac{155}{3}P^2Q^2R - 5PQ^3R - \frac{5Q^4R}{3} \\ &= \frac{E_2 E_4 - E_6}{3}. \end{aligned}$$

Finally, we obtain

$$\begin{aligned} q \frac{d}{dq} E_6 &= q \frac{d}{dq} \left\{ \frac{-395P^6 - 3690P^5Q - 8025P^4Q^2 - 8025P^2Q^4 + 3690PQ^5 - 395Q^6}{8} \right\} \\ &= -\frac{25P^8}{2} + 75P^7Q + \frac{1325P^6Q^2}{2} - 2400P^5Q^3 - \frac{23625P^4Q^4}{2} \\ &\quad + 2400P^3Q^5 + \frac{1325P^2Q^6}{2} - 75PQ^7 - \frac{25Q^8}{2} \\ &\quad - \frac{395P^6R}{16} - \frac{1845}{8}P^5QR - \frac{8025}{16}P^4Q^2R - \frac{8025}{16}P^2Q^4R + \frac{1845}{8}PQ^5R - \frac{395Q^6R}{16} \\ &= \frac{E_2 E_6 - (E_4)^2}{2}. \end{aligned}$$

\square

7 Proof of Theorem 1.2

7.1 Notations

For every $\tau \in \mathbb{H}^2$, set $y = \exp(2\pi i\tau/5)$ and

$$X = \frac{\theta' \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}}, \quad Y = \frac{\theta' \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}}, \quad Z = \frac{\theta''' \begin{bmatrix} 1 \\ 1 \end{bmatrix}}{\theta' \begin{bmatrix} 1 \\ 1 \end{bmatrix}}.$$

7.2 ODEs for $P(q)$ and $Q(q)$

Proof. According to Proposition 5.5, we have

$$\frac{\theta'' \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}} = \frac{1}{3}Z - 4XY - \frac{4}{3}X^2 + \frac{2}{3}Y^2, \quad \frac{\theta'' \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}} = \frac{1}{3}Z + 4XY + \frac{2}{3}X^2 - \frac{4}{3}Y^2. \quad (7.1)$$

According to Proposition 5.7, we obtain

$$\frac{\theta''' \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}} = 3X^3 + 9X^2Y - 15XY^2 + 3Y^3 + XZ, \quad \frac{\theta''' \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}} = -3X^3 - 15X^2Y - 9XY^2 + 3Y^3 + YZ. \quad (7.2)$$

Because

$$\frac{\theta''' \begin{bmatrix} \frac{j}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{j}{5} \\ 1 \end{bmatrix}} = 4\pi i \frac{d}{d\tau} \left\{ \frac{\theta' \begin{bmatrix} \frac{j}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{j}{5} \\ 1 \end{bmatrix}} \right\} + \frac{\theta' \begin{bmatrix} \frac{j}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{j}{5} \\ 1 \end{bmatrix}} \cdot \frac{\theta'' \begin{bmatrix} \frac{j}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{j}{5} \\ 1 \end{bmatrix}}, \quad (j = 1, 3),$$

we get

$$\begin{aligned} 4\pi i X' &= \frac{13}{3}X^3 + 13X^2Y - \frac{47}{3}XY^2 + 3Y^3 + \frac{2}{3}XZ, \\ 4\pi i Y' &= -3X^3 - \frac{47}{3}X^2Y - 13XY^2 + \frac{13}{3}Y^3 + \frac{2}{3}YZ, \end{aligned}$$

where $' = d/d\tau$. Thus, by changing $\tau \rightarrow 5\tau$, we obtain the ODEs for $P(q)$ and $Q(q)$. \square

7.3 ODE for $R(q)$

Proof. First, note that

$$\begin{aligned} \frac{\theta^{(4)} \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}} &= 4\pi i \frac{d}{d\tau} \left\{ \frac{\theta'' \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}} \right\} + \left\{ \frac{\theta'' \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}} \right\}^2, \\ &= \frac{4\pi i}{3} \frac{dZ}{d\tau} + \frac{20}{9} X^4 + \frac{52}{3} X^3 Y + \frac{316}{9} X^2 Y^2 + \frac{44}{3} X Y^3 - \frac{52}{9} Y^4 \\ &\quad - 8 X Y Z - \frac{8}{3} X^2 Z + \frac{4}{3} Y^2 Z + \frac{1}{9} Z^2, \end{aligned}$$

and

$$\frac{\theta^{(5)} \begin{bmatrix} 1 \\ 1 \end{bmatrix}}{\theta^{(1)} \begin{bmatrix} 1 \\ 1 \end{bmatrix}} = 4\pi i \frac{d}{d\tau} \left\{ \frac{\theta^{(3)} \begin{bmatrix} 1 \\ 1 \end{bmatrix}}{\theta^{(1)} \begin{bmatrix} 1 \\ 1 \end{bmatrix}} \right\} + \left\{ \frac{\theta^{(3)} \begin{bmatrix} 1 \\ 1 \end{bmatrix}}{\theta^{(1)} \begin{bmatrix} 1 \\ 1 \end{bmatrix}} \right\}^2 = 4\pi i \frac{dZ}{d\tau} + Z^2.$$

Thus, according to Proposition 5.9, we have

$$4\pi i Z' = \frac{10}{3} X^4 - 10 X^3 Y - \frac{310}{3} X^2 Y^2 + 10 X Y^3 + \frac{10}{3} Y^4 + \frac{2}{3} Z^2,$$

and

$$\frac{\theta^{(4)} \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}} = \frac{10}{3} X^4 + 14 X^3 Y + \frac{2}{3} X^2 Y^2 + 18 X Y^3 - \frac{14}{3} X Y^3 + \frac{1}{3} Z^2 - 8 X Y Z - \frac{8}{3} X^2 Z + \frac{4}{3} Y^2 Z,$$

where $' = d/d\tau$. Thus, by changing $\tau \rightarrow 5\tau$, we obtain the ODE for $R(q)$. \square

Theorem 7.1. For $q \in \mathbb{C}$ with $|q| < 1$, set

$$P(q) = 1 + 10 \sum_{n=1}^{\infty} (d_{2,5}(n) - d_{3,5}(n)) q^n, \quad Q(q) = 3 + 10 \sum_{n=1}^{\infty} (d_{1,5}(n) - d_{4,5}(n)) q^n.$$

Then, we have

$$\begin{aligned} E_4(q^5) &= \frac{-P^4 + 3P^3Q + 31P^2Q^2 - 3PQ^3 - Q^4}{125}, \\ E_6(q^5) &= \frac{79P^6 + 738P^5Q + 1605P^4Q^2 + 1605P^2Q^4 - 738PQ^5 + 79Q^6}{24 \cdot 25000}. \end{aligned}$$

Proof. For the proof, we use

$$\wp = \wp(z; 1, \tau) = \frac{1}{3} \frac{\theta''' \begin{bmatrix} 1 \\ 1 \end{bmatrix}}{\theta' \begin{bmatrix} 1 \\ 1 \end{bmatrix}} - \frac{d^2}{dz^2} \log \theta \begin{bmatrix} 1 \\ 1 \end{bmatrix} (z).$$

First, note that

$$\wp'' = 6\wp^2 - g_2, \quad g_2(1, \tau) = \frac{4\pi^4}{3} E_4(q).$$

Then, by substituting $z = -2\tau/5$, we have

$$g_2 = -\frac{20}{3}X^4 + 20X^3Y + \frac{620}{3}X^2Y^2 - 20XY^3 - \frac{20}{3}Y^4, \quad (7.3)$$

which implies

$$E_4(q^5) = \frac{-P^4 + 3P^3Q + 31P^2Q^2 - 3PQ^3 - Q^4}{125}.$$

Next, it is observed that

$$(\wp')^2 = 4\wp^3 - g_2\wp - g_3, \quad g_3(1, \tau) = \frac{8\pi^6}{27} E_6(q).$$

Thus, by substituting $z = -2\tau/5$, we obtain

$$g_3 = -\frac{395}{27}X^6 - \frac{410}{3}X^5Y - \frac{2675}{9}X^4Y^2 - \frac{2675}{9}X^2Y^4 + \frac{410}{3}XY^5 - \frac{395}{27}Y^6, \quad (7.4)$$

which implies

$$E_6(q^5) = \frac{79P^6 + 738P^5Q + 1605P^4Q^2 + 1605P^2Q^4 - 738PQ^5 + 79Q^6}{25000}.$$

□

Corollary 7.2. For $q \in \mathbb{C}$ with $|q| < 1$, set

$$S(q) = q \prod_{n=1}^{\infty} \frac{(1 - q^n)^2}{(1 - q^{5n-2})^5 (1 - q^{5n-3})^5} = \sum_{n=1}^{\infty} (d_{1,5}(n) - d_{4,5}(n))q^n - 3 \sum_{n=1}^{\infty} (d_{2,5}(n) - d_{3,5}(n))q^n,$$

and

$$T(q) = \prod_{n=1}^{\infty} \frac{(1 - q^n)^2}{(1 - q^{5n-1})^5 (1 - q^{5n-4})^5} = 1 + 3 \sum_{n=1}^{\infty} (d_{1,5}(n) - d_{4,5}(n))q^n + \sum_{n=1}^{\infty} (d_{2,5}(n) - d_{3,5}(n))q^n.$$

Then, we have

$$\begin{aligned} E_4(q^5) &= S^4 + 12S^3T + 14S^2T^2 - 12ST^3 + T^4, \\ E_6(q^5) &= (S^2 + T^2) (S^4 + 18S^3T + 74S^2T^2 - 18ST^3 + T^4), \end{aligned}$$

and

$$\begin{aligned} q^5(q^5; q^5)_\infty &= -S^5T^5 (S^2 + 11ST - T^2) \\ j(q^5) &= -\frac{(S^4 + 12S^3T + 14S^2T^2 - 12ST^3 + T^4)^3}{S^5T^5 (S^2 + 11ST - T^2)} = -\frac{(g^4 + 12g^3 + 14g^2 - 12g + 1)^3}{g^5 (g^2 + 11g - 1)}, \quad g = S/T. \end{aligned}$$

Proof. The corollary can be obtained by considering

$$S = -\frac{3}{10}P + \frac{1}{10}Q, \quad T = \frac{1}{10}P + \frac{3}{10}Q.$$

□

Theorem 7.3. For every $\tau \in \mathbb{H}^2$, we have

$$G_4(\tau) = \frac{\zeta_5^2 \theta' \begin{bmatrix} 1 \\ 1 \end{bmatrix}^4}{720 \cdot \theta^{12} \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix} \theta^{12} \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}} (A^4 + 12A^3B + 14A^2B^2 - 12AB^3 + B^4),$$

and

$$G_6(\tau) = \frac{-\zeta_5^3 \theta' \begin{bmatrix} 1 \\ 1 \end{bmatrix}^6}{30240 \cdot \theta^{18} \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix} \theta^{18} \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}} (A^2 + B^2) (A^4 + 18A^3B + 74A^2B^2 - 18AB^3 + B^4),$$

where $\zeta_5 = \exp(2\pi i/5)$, and

$$A = \theta^5 \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}, \quad B = \theta^5 \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}.$$

Proof. The theorem follows from equations (7.3) and (7.4) and the derivative formulas of Theorem 5.3. □

Theorem 7.4. For every $\tau \in \mathbb{H}^2$, we have

$$\Delta(\tau) = g_2^3 - 27g_3^2 = \frac{\zeta_5 \theta' \begin{bmatrix} 1 \\ 1 \end{bmatrix}^{12}}{\theta^{11} \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix} \theta^{11} \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}} \left(\theta^{10} \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix} - 11\theta^5 \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix} \theta^5 \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix} - \theta^{10} \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix} \right),$$

and

$$j(5\tau) = \frac{12^3 g_2(5\tau)^3}{\Delta(5\tau)} = \frac{(g^4(\tau) - 12g^3(\tau) + 14g^2(\tau) + 12g(\tau) + 1)^3}{g^5(\tau)(g^2(\tau) - 11g(\tau) - 1)},$$

where $\zeta_5 = \exp(2\pi i/5)$,

$$g(\tau) = \theta^5 \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix} (0, 5\tau) / \theta^5 \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix} (0, 5\tau) = -q \prod_{n=1}^{\infty} \frac{(1 - q^{5n-1})^5 (1 - q^{5n-4})^5}{(1 - q^{5n-2})^5 (1 - q^{5n-3})^5}, \quad q = \exp(2\pi i\tau).$$

Proof. Based on equations (7.3) and (7.4), we have

$$\begin{aligned} \Delta &= -25(3X - Y)^5 (X + 3Y)^5 (X^2 + 4XY - Y^2) = \frac{-\zeta_5 \theta' \begin{bmatrix} 1 \\ 1 \end{bmatrix}^{12}}{\theta^{36} \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix} \theta^{36} \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}} A^5 B^5 (A^2 + 11AB - B^2), \\ j &= \frac{320(X^4 - 3X^3Y - 31X^2Y^2 + 3XY^3 + Y^4)^3}{27(3X - Y)^5 (X + 3Y)^5 (X^2 + 4XY - Y^2)} = -\frac{(A^4 + 12A^3B + 14A^2B^2 - 12AB^3 + B^4)^3}{A^5 B^5 (A^2 + 11AB - B^2)}, \end{aligned}$$

where

$$A = \theta^5 \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}, \quad B = \theta^5 \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}.$$

□

Corollary 7.5. For $q \in \mathbb{C}$ with $|q| < 1$, set

$$P(q) = 1 + 10 \sum_{n=1}^{\infty} (d_{2,5}(n) - d_{3,5}(n))q^n, \quad Q(q) = 3 + 10 \sum_{n=1}^{\infty} (d_{1,5}(n) - d_{4,5}(n))q^n.$$

Then, we have

$$j(5\tau) = j(q^5) = \frac{320(P^4 - 3P^3Q - 31P^2Q^2 + 3PQ^3 + Q^4)^3}{27(3P - Q)^5 (P + 3Q)^5 (P^2 + 4PQ - Q^2)^3},$$

and

$$g(\tau) = \theta^5 \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix} (0, 5\tau) / \theta^5 \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix} (0, 5\tau) = \frac{3P - Q}{P + 3Q}, \quad q = \exp(2\pi i\tau).$$

Proof. The expression of $g(\tau)$ follows from the derivative formulas (5.3) and (5.4), which imply that

$$g(\tau/5) = \frac{3X - Y}{X + 3Y}.$$

□

Theorem 7.6. *For every $\tau \in \mathbb{H}^2$, set*

$$f(\tau) = \frac{\theta^5 \left[\begin{matrix} 1 \\ \frac{1}{5} \end{matrix} \right] (0, \tau)}{\theta^5 \left[\begin{matrix} 1 \\ \frac{3}{5} \end{matrix} \right] (0, \tau)} = \frac{11 + 5\sqrt{5}}{2} \prod_{n=1}^{\infty} \frac{\left(1 + \frac{1+\sqrt{5}}{2}q^n + q^{2n}\right)^5}{\left(1 + \frac{1-\sqrt{5}}{2}q^n + q^{2n}\right)^5},$$

and

$$g(\tau) = \frac{\theta^5 \left[\begin{matrix} \frac{3}{5} \\ 1 \end{matrix} \right] (0, 5\tau)}{\theta^5 \left[\begin{matrix} \frac{1}{5} \\ 1 \end{matrix} \right] (0, 5\tau)} = -q \prod_{n=1}^{\infty} \frac{(1 - q^{5n-1})^5 (1 - q^{5n-4})^5}{(1 - q^{5n-2})^5 (1 - q^{5n-3})^5}, \quad q = \exp(2\pi i\tau).$$

Then, we have

$$g(\tau) = \frac{\frac{1}{2}(-11 + 5\sqrt{5})f(\tau) - 1}{-f(\tau) - \frac{1}{2}(-11 + 5\sqrt{5})}. \quad (7.5)$$

Proof. We first set

$$P_2(q) := 1 + 10 \sum_{n=1}^{\infty} (d_{2,5}(n) - d_{3,5}(n))q^n, \quad Q_2(q) := 3 + 10 \sum_{n=1}^{\infty} (d_{1,5}(n) - d_{4,5}(n))q^n,$$

which implies that

$$\begin{aligned} P_1(q) &:= \cot \frac{2\pi}{5} + 4 \sin \frac{4\pi}{5} \sum_{n=1}^{\infty} (d_{1,5}(n) - d_{4,5}(n))q^n - 4 \sin \frac{2\pi}{5} \sum_{n=1}^{\infty} (d_{2,5}(n) - d_{3,5}(n))q^n, \\ &= -\frac{2}{5} \sin \frac{2\pi}{5} P_2(q) + \frac{2}{5} \sin \frac{4\pi}{5} Q_2(q), \\ Q_1(q) &:= \cot \frac{\pi}{5} + 4 \sin \frac{2\pi}{5} \sum_{n=1}^{\infty} (d_{1,5}(n) - d_{4,5}(n))q^n + 4 \sin \frac{4\pi}{5} \sum_{n=1}^{\infty} (d_{2,5}(n) - d_{3,5}(n))q^n, \\ &= \frac{2}{5} \sin \frac{4\pi}{5} P_2(q) + \frac{2}{5} \sin \frac{2\pi}{5} Q_2(q). \end{aligned}$$

The theorem is derived from Corollaries 6.6 and 7.5. □

Theorem 7.7. For every $\tau \in \mathbb{H}^2$, we have

$$\theta' \begin{bmatrix} 1 \\ 1 \end{bmatrix}^4 = \frac{-(2\pi)^4 \zeta_5^4 \theta^{11} \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix} \theta^{11} \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}}{\theta^{10} \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix} + 11\theta^5 \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix} \theta^5 \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix} - \theta^{10} \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}}, \quad (7.6)$$

where $\zeta_5 = \exp(2\pi i/5)$.

Proof. The theorem is derived from formula (6.6) and Theorem 7.4. \square

Theorem 7.8.

- (1) For each positive integer k , the Eisenstein series $G_{4k}(\tau)$ can be expressed using a rational expression

$$\theta \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix} (0, \tau), \text{ and } \theta \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix} (0, \tau).$$

- (2) For each positive integer k , the Eisenstein series $G_{4k+2}(\tau)$ can be expressed using a rational expression

$$\theta \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix} (0, \tau), \theta \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix} (0, \tau), \text{ and } \theta' \begin{bmatrix} 1 \\ 1 \end{bmatrix} (0, \tau).$$

Proof. The theorem can be proved in the same way as Theorem 6.8 \square

8 Some product-series identities

8.1 Some theta functional formulas

Proposition 8.1. For every $(z, \tau) \in \mathbb{C} \times \mathbb{H}^2$, we have

$$\begin{aligned} & \theta^2 \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix} \theta \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} (z) \theta \begin{bmatrix} 1 \\ \frac{9}{5} \end{bmatrix} (z) - \theta^2 \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} \theta \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix} (z) \theta \begin{bmatrix} 1 \\ \frac{7}{5} \end{bmatrix} (z) \\ & + \theta \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} \theta \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix} \theta^2 \begin{bmatrix} 1 \\ 1 \end{bmatrix} (z) = 0, \end{aligned} \quad (8.1)$$

$$\begin{aligned} & -\zeta_5^2 \theta^2 \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix} \theta \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix} (z) \theta \begin{bmatrix} \frac{9}{5} \\ 1 \end{bmatrix} (z) + \zeta_5^3 \theta^2 \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix} \theta \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix} (z) \theta \begin{bmatrix} \frac{7}{5} \\ 1 \end{bmatrix} (z) \\ & + \theta \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix} \theta \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix} \theta^2 \begin{bmatrix} 1 \\ 1 \end{bmatrix} (z) = 0, \end{aligned} \quad (8.2)$$

where $\zeta_5 = \exp(2\pi i/5)$.

Proof. Here, we provide the proof of equation (8.1). Equation (8.2) can be proved in the same manner. First, note that $\dim \mathcal{F}_2 \begin{bmatrix} 0 \\ 0 \end{bmatrix} = 2$, and

$$\theta \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} (z, \tau) \theta \begin{bmatrix} 1 \\ \frac{9}{5} \end{bmatrix} (z, \tau), \theta \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix} (z, \tau) \theta \begin{bmatrix} 1 \\ \frac{7}{5} \end{bmatrix} (z, \tau), \theta^2 \begin{bmatrix} 1 \\ 1 \end{bmatrix} (z, \tau) \in \mathcal{F}_2 \begin{bmatrix} 0 \\ 0 \end{bmatrix}.$$

Therefore, there exist some complex numbers, x_1, x_2 , and x_3 , which are not all zeros, such that

$$x_1 \theta \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} (z, \tau) \theta \begin{bmatrix} 1 \\ \frac{9}{5} \end{bmatrix} (z, \tau) + x_2 \theta \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix} (z, \tau) \theta \begin{bmatrix} 1 \\ \frac{7}{5} \end{bmatrix} (z, \tau) + x_3 \theta^2 \begin{bmatrix} 1 \\ 1 \end{bmatrix} (z, \tau) = 0.$$

Note that in the fundamental parallelogram, the zero of $\theta \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} (z)$, $\theta \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix} (z)$, or $\theta \begin{bmatrix} 1 \\ 1 \end{bmatrix} (z)$ is $z = 2/5, 1/5$ or 0 . By substituting $z = 2/5, 1/5$, and 0 , we have

$$\begin{aligned} x_2 \theta \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix} + x_3 \theta \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} &= 0, \\ -x_1 \theta \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} + x_3 \theta \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix} &= 0, \\ -x_1 \theta^2 \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} - x_2 \theta^2 \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix} &= 0. \end{aligned}$$

By solving this system of equations, we get

$$(x_1, x_2, x_3) = \alpha \left(\theta^2 \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}, -\theta^2 \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}, \theta \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} \theta \begin{bmatrix} 1 \\ \frac{5}{3} \end{bmatrix} \right) \text{ for some } \alpha \in \mathbb{C} \setminus \{0\},$$

which proves the proposition. \square

Lemma 8.2. *For every $(z, \tau) \in \mathbb{C} \times \mathbb{H}^2$, we have*

$$\left\{ \frac{\theta' \begin{bmatrix} \epsilon \\ \epsilon' \end{bmatrix} (z)}{\theta \begin{bmatrix} \epsilon \\ \epsilon' \end{bmatrix} (z)} \right\}^2 = \frac{\theta'' \begin{bmatrix} \epsilon \\ \epsilon' \end{bmatrix} (z)}{\theta \begin{bmatrix} \epsilon \\ \epsilon' \end{bmatrix} (z)} - \frac{d^2}{dz^2} \log \theta \begin{bmatrix} \epsilon \\ \epsilon' \end{bmatrix} (z).$$

Proof. The lemma can be proved by direct calculation. \square

Theorem 8.3. For every $\tau \in \mathbb{H}^2$, we have

$$\frac{\eta^5(\tau)}{\eta(5\tau)} = \frac{(q; q)_\infty^5}{(q^5; q^5)_\infty} = 1 - 5 \sum_{n=1}^{\infty} \left(\sum_{d|n} d \left(\frac{d}{5} \right) \right) q^n, \quad (8.3)$$

$$\frac{\eta^5(5\tau)}{\eta(\tau)} = q \frac{(q^5; q^5)_\infty^5}{(q; q)_\infty} = \sum_{n=1}^{\infty} \left(\sum_{d|n} \frac{n}{d} \left(\frac{d}{5} \right) \right) q^n, \quad q = \exp(2\pi i\tau), \quad (8.4)$$

where for each $m \in \mathbb{N}$,

$$\left(\frac{m}{5} \right) = \begin{cases} 1 & \text{if } m \equiv \pm 1 \pmod{5}, \\ -1 & \text{if } m \equiv \pm 2 \pmod{5}, \\ 0 & \text{if } m \equiv 0 \pmod{5}. \end{cases}$$

Proof. By comparing the coefficients of term z^2 in equations (8.1) and (8.2), we have

$$\frac{\left\{ \theta' \begin{bmatrix} 1 \\ 1 \end{bmatrix} \right\}^2}{\theta \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} \theta \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}} = \frac{d^2}{dz^2} \log \theta \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} (z) \Big|_{z=0} - \frac{d^2}{dz^2} \log \theta \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix} (z) \Big|_{z=0}, \quad (8.5)$$

and

$$\zeta_5 \frac{\left\{ \theta' \begin{bmatrix} 1 \\ 1 \end{bmatrix} \right\}^2}{\theta \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix} \theta \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}} = \frac{d^2}{dz^2} \log \theta \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix} (z) \Big|_{z=0} - \frac{d^2}{dz^2} \log \theta \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix} (z) \Big|_{z=0}. \quad (8.6)$$

Therefore, the theorem can be obtained using Jacobi's triple product identity (2.5). \square

Theorem 8.4. For $q \in \mathbb{C}$ with $|q| < 1$, set

$$P(q) = \cot \frac{2\pi}{5} + 4 \sin \frac{4\pi}{5} \sum_{n=1}^{\infty} (d_{1,5}(n) - d_{4,5}(n)) q^n - 4 \sin \frac{2\pi}{5} \sum_{n=1}^{\infty} (d_{2,5}(n) - d_{3,5}(n)) q^n,$$

$$Q(q) = \cot \frac{\pi}{5} + 4 \sin \frac{2\pi}{5} \sum_{n=1}^{\infty} (d_{1,5}(n) - d_{4,5}(n)) q^n + 4 \sin \frac{4\pi}{5} \sum_{n=1}^{\infty} (d_{2,5}(n) - d_{3,5}(n)) q^n.$$

Then, we have

$$\frac{(q; q)_\infty^5}{(q^5; q^5)_\infty} = -\frac{\sqrt{5}}{4} (3P - Q)(P + 3Q). \quad (8.7)$$

Proof. The theorem follows from equations (6.1) and (8.5). \square

Theorem 8.5. For $q \in \mathbb{C}$ with $|q| < 1$, set

$$P(q) = 1 + 10 \sum_{n=1}^{\infty} (d_{2,5}(n) - d_{3,5}(n))q^n, \quad Q(q) = 3 + 10 \sum_{n=1}^{\infty} (d_{1,5}(n) - d_{4,5}(n))q^n.$$

Then, we have

$$q \frac{(q^5; q^5)_{\infty}^5}{(q; q)_{\infty}} = -\frac{1}{100} (3P - Q)(P + 3Q), \quad (8.8)$$

and

$$\frac{(q; q)_{\infty}^5}{(q^5; q^5)_{\infty}} = \frac{1}{4} (P^2 + 4PQ - Q^2). \quad (8.9)$$

Proof. The theorem can be proved in the same way as Theorem 8.4. \square

9 Some theorem of Farkas and Kra

Theorem 9.1. (Farkas and Kra [5, pp. 318]) For every $\tau \in \mathbb{H}^2$, we have

$$\frac{d}{d\tau} \log \left(\frac{\eta(5\tau)}{\eta(\tau)} \right) + \frac{1}{2\pi i \cdot 3} \left[\left\{ \frac{\theta' \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} (0, \tau)}{\theta \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} (0, \tau)} \right\}^2 + \left\{ \frac{\theta' \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix} (0, \tau)}{\theta \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix} (0, \tau)} \right\}^2 \right] = 0.$$

Proof. Summing both sides of equations (5.7) and (5.8) yields

$$3 \frac{\theta'' \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}} + 3 \frac{\theta'' \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}} - 2 \frac{\theta''' \begin{bmatrix} 1 \\ 1 \end{bmatrix}}{\theta' \begin{bmatrix} 1 \\ 1 \end{bmatrix}} + 2 \left\{ \frac{\theta' \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}} \right\}^2 + 2 \left\{ \frac{\theta' \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}} \right\}^2 = 0.$$

The heat equation, Eq. (2.6), implies that

$$4\pi i \frac{d}{d\tau} \log \frac{\theta^3 \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} \theta^3 \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}}{\left\{ \theta' \begin{bmatrix} 1 \\ 1 \end{bmatrix} \right\}^2} + 2 \left\{ \frac{\theta' \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}} \right\}^2 + 2 \left\{ \frac{\theta' \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}} \right\}^2 = 0.$$

Jacobi's triple product identity (2.5) yields

$$\frac{\theta^3 \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} \theta^3 \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}}{\left\{ \theta' \begin{bmatrix} 1 \\ 1 \end{bmatrix} \right\}^2} = \frac{(\sqrt{5})^3 \eta^3(5\tau)}{4\pi^2 \eta^3(\tau)},$$

which proves the theorem. \square

Corollary 9.2. For $q \in \mathbb{C}$ with $|q| < 1$, set

$$P(q) = \cot \frac{2\pi}{5} + 4 \sin \frac{4\pi}{5} \sum_{n=1}^{\infty} (d_{1,5}(n) - d_{4,5}(n))q^n - 4 \sin \frac{2\pi}{5} \sum_{n=1}^{\infty} (d_{2,5}(n) - d_{3,5}(n))q^n,$$

$$Q(q) = \cot \frac{\pi}{5} + 4 \sin \frac{2\pi}{5} \sum_{n=1}^{\infty} (d_{1,5}(n) - d_{4,5}(n))q^n + 4 \sin \frac{4\pi}{5} \sum_{n=1}^{\infty} (d_{2,5}(n) - d_{3,5}(n))q^n.$$

Then, we have

$$P^2 + Q^2 = \frac{1}{2} \{-E_2(q) + 5E_2(q^5)\}. \quad (9.1)$$

Theorem 9.3. For $q \in \mathbb{C}$ with $|q| < 1$, set

$$P(q) = \cot \frac{2\pi}{5} + 4 \sin \frac{4\pi}{5} \sum_{n=1}^{\infty} (d_{1,5}(n) - d_{4,5}(n))q^n - 4 \sin \frac{2\pi}{5} \sum_{n=1}^{\infty} (d_{2,5}(n) - d_{3,5}(n))q^n,$$

$$Q(q) = \cot \frac{\pi}{5} + 4 \sin \frac{2\pi}{5} \sum_{n=1}^{\infty} (d_{1,5}(n) - d_{4,5}(n))q^n + 4 \sin \frac{4\pi}{5} \sum_{n=1}^{\infty} (d_{2,5}(n) - d_{3,5}(n))q^n.$$

Then, we have

$$E_4(q^5) = P^4 + 3P^3Q - P^2Q^2 - 3PQ^3 + Q^4,$$

$$E_6(q^5) = \frac{1}{40} (P^2 + Q^2) (41P^4 + 198P^3Q + 154P^2Q^2 - 198PQ^3 + 41Q^4).$$

Proof. Changing $q \rightarrow q^5$ in Ramanujan's system (1.3), we have

$$q \frac{d}{dq} E_2(q^5) = \frac{5}{12} \left\{ (E_2(q^5))^2 - E_4(q^5) \right\}, \quad q \frac{d}{dq} E_4(q^5) = \frac{5}{3} \left\{ E_2(q^5)E_4(q^5) - E_6(q^5) \right\}.$$

From Corollary 9.2, we have

$$E_2(q^5) = \frac{1}{5} (2P^2 + 2Q^2 + R), \quad R = E_2(q),$$

which implies that

$$q \frac{d}{dq} E_2(q^5) = -\frac{7P^4}{20} - \frac{5P^3Q}{4} + \frac{11P^2Q^2}{20} + \frac{5PQ^3}{4} - \frac{7Q^4}{20} + \frac{P^2R}{15} + \frac{Q^2R}{15} + \frac{R^2}{60}.$$

Therefore, it follows that

$$E_4(q^5) = (E_2(q^5))^2 - \frac{12}{5} q \frac{d}{dq} E_2(q^5) = P^4 + 3P^3Q - P^2Q^2 - 3PQ^3 + Q^4.$$

In the same way, we note that

$$\begin{aligned} q \frac{d}{dq} E_4(q^5) &= -\frac{25P^6}{24} - \frac{25P^5Q}{4} - \frac{65P^4Q^2}{8} - \frac{65P^2Q^4}{8} + \frac{25PQ^5}{4} - \frac{25Q^6}{24} \\ &\quad + P^3QR - \frac{1}{3}P^2Q^2R - PQ^3R + \frac{P^4R}{3} + \frac{Q^4R}{3}, \end{aligned}$$

which implies that

$$\begin{aligned} E_6(q^5) &= E_2(q^5)E_4(q^5) - \frac{3}{5} q \frac{d}{dq} E_4(q^5) \\ &= \frac{1}{40} (P^2 + Q^2) (41P^4 + 198P^3Q + 154P^2Q^2 - 198PQ^3 + 41Q^4). \end{aligned}$$

□

Corollary 9.4. For $q \in \mathbb{C}$ with $|q| < 1$, set

$$\begin{aligned} S(q) &= \frac{\sqrt{250 - 110\sqrt{5}}}{5} \prod_{n=1}^{\infty} \frac{(1 - q^n)^5}{(1 - q^{5n})^3} \left(1 + \frac{1 - \sqrt{5}}{2} q^n + q^{2n} \right)^5 \\ &= \frac{\sqrt{250 - 110\sqrt{5}}}{5} \left\{ 1 - \frac{5}{2}(1 + \sqrt{5}) \sum_{n=1}^{\infty} (d_{1,5}(n) - d_{4,5}(n))q^n + \frac{5}{2}(7 + 3\sqrt{5}) \sum_{n=1}^{\infty} (d_{2,5}(n) - d_{3,5}(n))q^n \right\}, \\ T(q) &= \frac{\sqrt{250 + 110\sqrt{5}}}{5} \prod_{n=1}^{\infty} \frac{(1 - q^n)^5}{(1 - q^{5n})^3} \left(1 + \frac{1 + \sqrt{5}}{2} q^n + q^{2n} \right)^5 \\ &= \frac{\sqrt{250 + 110\sqrt{5}}}{5} \left\{ 1 + \frac{5}{2}(-1 + \sqrt{5}) \sum_{n=1}^{\infty} (d_{1,5}(n) - d_{4,5}(n))q^n + \frac{5}{2}(7 - 3\sqrt{5}) \sum_{n=1}^{\infty} (d_{2,5}(n) - d_{3,5}(n))q^n \right\}. \end{aligned}$$

Then we have

$$\begin{aligned} E_4(q^5) &= \frac{S^4 - 228S^3T + 494S^2T^2 + 228ST^3 + T^4}{10000} \\ E_6(q^5) &= -\frac{(S^2 + T^2)(S^4 + 522S^3T - 10006S^2T^2 - 522ST^3 + T^4)}{1000000}, \end{aligned}$$

and

$$\begin{aligned}
q^5(q^5 : q^5)_\infty^{24} &= \frac{(E_4(q^5))^3 - (E_6(q^5))^2}{1728} = -\frac{ST(S^2 + 11ST - T^2)^5}{1000000000000} \\
j(q^5) &= -\frac{(S^4 - 228S^3T + 494S^2T^2 + 228ST^3 + T^4)^3}{ST(S^2 + 11ST - T^2)^5} \\
&= -\frac{(f^4 + 228f^3 + 494f^2 - 228f + 1)^3}{f(-f^2 + 11f + 1)^5}, \quad f = T/S.
\end{aligned}$$

Proof. The corollary can be obtained by considering

$$S = -3P + Q, \quad T = P + 3Q, \quad \text{and } f = T/S.$$

□

Corollary 9.5. For $q \in \mathbb{C}$ with $|q| < 1$, set

$$\begin{aligned}
V(q) &= \prod_{n=1}^{\infty} \frac{(1 - q^n)^5}{(1 - q^{5n})^3} \left(1 + \frac{1 - \sqrt{5}}{2} q^n + q^{2n} \right)^5 \\
&= 1 - \frac{5}{2}(1 + \sqrt{5}) \sum_{n=1}^{\infty} (d_{1,5}(n) - d_{4,5}(n)) q^n + \frac{5}{2}(7 + 3\sqrt{5}) \sum_{n=1}^{\infty} (d_{2,5}(n) - d_{3,5}(n)) q^n, \\
W(q) &= \prod_{n=1}^{\infty} \frac{(1 - q^n)^5}{(1 - q^{5n})^3} \left(1 + \frac{1 + \sqrt{5}}{2} q^n + q^{2n} \right)^5 \\
&= 1 + \frac{5}{2}(-1 + \sqrt{5}) \sum_{n=1}^{\infty} (d_{1,5}(n) - d_{4,5}(n)) q^n + \frac{5}{2}(7 - 3\sqrt{5}) \sum_{n=1}^{\infty} (d_{2,5}(n) - d_{3,5}(n)) q^n.
\end{aligned}$$

Then we have

$$\begin{aligned}
E_4(q^5) &= \frac{1}{6250} \times \\
&\times \left\{ (123 - 55\sqrt{5}) V^4 + 228 (11 - 5\sqrt{5}) V^3 W + 988 V^2 W^2 + 228 (11 + 5\sqrt{5}) V W^3 + (123 + 55\sqrt{5}) W^4 \right\}, \\
E_6(q^5) &= -\frac{((11\sqrt{5} - 25) V^2 - (25 + 11\sqrt{5}) W^2)}{1562500} \times \\
&\times \left\{ (55\sqrt{5} - 123) V^4 - 522 (5\sqrt{5} - 11) V^3 W + 20012 V^2 W^2 \right. \\
&\quad \left. + 522 (11 + 5\sqrt{5}) V W^3 - (123 + 55\sqrt{5}) W^4 \right\}
\end{aligned}$$

and

$$q^5(q^5; q^5)_\infty^{24} = -\frac{VW(V-W)^5}{61035156250} \times \\ \times \left\{ (75025\sqrt{5} - 167761) V^5 + 10(305\sqrt{5} - 682) V^4W + 10(5\sqrt{5} - 11) V^3W^2 \right. \\ \left. + 10(11 + 5\sqrt{5}) V^2W^3 + 10(682 + 305\sqrt{5}) VW^4 + (167761 + 75025\sqrt{5}) W^5 \right\}.$$

Theorem 9.6. *For every $\tau \in \mathbb{H}^2$, we have*

$$\frac{d}{d\tau} \log \left(\frac{\eta(\tau/5)}{\eta(\tau)} \right) + \frac{1}{2\pi i \cdot 3} \left[\left\{ \frac{\theta' \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix} (0, \tau)}{\theta \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix} (0, \tau)} \right\}^2 + \left\{ \frac{\theta' \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix} (0, \tau)}{\theta \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix} (0, \tau)} \right\}^2 \right] = 0.$$

Proof. Summing both sides of equations (5.9) and (5.10) yields

$$3 \frac{\theta'' \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}} + 3 \frac{\theta'' \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}} - 2 \frac{\theta''' \begin{bmatrix} 1 \\ 1 \end{bmatrix}}{\theta' \begin{bmatrix} 1 \\ 1 \end{bmatrix}} + 2 \left\{ \frac{\theta' \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}} \right\}^2 + 2 \left\{ \frac{\theta' \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}} \right\}^2 = 0.$$

The heat equation (2.6) implies that

$$4\pi i \frac{d}{d\tau} \log \frac{\theta^3 \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix} \theta^3 \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}}{\left\{ \theta' \begin{bmatrix} 1 \\ 1 \end{bmatrix} \right\}^2} + 2 \left\{ \frac{\theta' \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}} \right\}^2 + 2 \left\{ \frac{\theta' \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}} \right\}^2 = 0.$$

Jacobi's triple product identity (2.5) yields

$$\frac{\theta^3 \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix} \theta^3 \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}}{\left\{ \theta' \begin{bmatrix} 1 \\ 1 \end{bmatrix} \right\}^2} = \frac{\zeta_5^3 \eta^3(\tau/5)}{4\pi^2 \eta^3(\tau)},$$

which proves the theorem. □

Corollary 9.7. *For $q \in \mathbb{C}$ with $|q| < 1$, set*

$$P(q) = 1 + 10 \sum_{n=1}^{\infty} (d_{2,5}(n) - d_{3,5}(n)) q^n, \quad Q(q) = 3 + 10 \sum_{n=1}^{\infty} (d_{1,5}(n) - d_{4,5}(n)) q^n.$$

Then, we have

$$P^2 + Q^2 = \frac{5}{2} \{-E_2(q) + 5E_2(q^5)\}. \quad (9.2)$$

Theorem 9.8. For $q \in \mathbb{C}$ with $|q| < 1$, set

$$P(q) = 1 + 10 \sum_{n=1}^{\infty} (d_{2,5}(n) - d_{3,5}(n))q^n, \quad Q(q) = 3 + 10 \sum_{n=1}^{\infty} (d_{1,5}(n) - d_{4,5}(n))q^n.$$

Then, we have

$$\begin{aligned} E_4(q) &= P^4 + 3P^3Q - P^2Q^2 - 3PQ^3 + Q^4, \\ E_6(q) &= -\frac{1}{40} (P^2 + Q^2) (41P^4 + 198P^3Q + 154P^2Q^2 - 198PQ^3 + 41Q^4), \end{aligned}$$

and

$$\begin{aligned} 1728q(q; q)_{\infty}^{24} &= (E_4(q))^3 - (E_6(q))^2 = -\frac{27(3P - Q)(P + 3Q)(P^2 + 4PQ - Q^2)^5}{1600}, \\ j(q) &= \frac{1728(E_4(q))^3}{(E_4(q))^3 - (E_6(q))^2} = -\frac{102400(P^4 + 3P^3Q - P^2Q^2 - 3PQ^3 + Q^4)^3}{(3P - Q)(P + 3Q)(P^2 + 4PQ - Q^2)^5} \\ &= \frac{(g^4 + 228g^3 + 494g^2 - 228g + 1)^3}{g(g^2 - 11g - 1)^5}, \end{aligned}$$

where

$$g(q) = \frac{3P - Q}{P + 3Q} = -q \prod_{n=1}^{\infty} \frac{(1 - q^{5n-1})^5(1 - q^{5n-4})^5}{(1 - q^{5n-2})^5(1 - q^{5n-3})^5}.$$

Proof. From Corollary 9.7, we have

$$E_2(q) = \frac{-2P^2 - 2Q^2 + 25R}{5}, \quad R = E_2(q^5),$$

which implies that

$$q \frac{d}{dq} E_2(q) = -\frac{7P^4}{100} - \frac{P^3Q}{4} + \frac{11P^2Q^2}{100} + \frac{PQ^3}{4} - \frac{7Q^4}{100} - \frac{P^2R}{3} - \frac{Q^2R}{3} + \frac{25R^2}{12}.$$

By Ramanujan's system (1.3), we obtain

$$E_4(q) = \{E_2(q)\}^2 - 12q \frac{d}{dq} E_2(q) = P^4 + 3P^3Q - P^2Q^2 - 3PQ^3 + Q^4.$$

In the same way, we note that

$$q \frac{d}{dq} E_4(q) = \frac{5P^6}{24} + \frac{5P^5Q}{4} + \frac{13P^4Q^2}{8} + \frac{13P^2Q^4}{8} - \frac{5PQ^5}{4} + \frac{5Q^6}{24} \\ - \frac{5}{3}P^2Q^2R + 5P^3QR - 5PQ^3R + \frac{5P^4R}{3} + \frac{5Q^4R}{3},$$

which implies that

$$E_6(q) = E_2(q)E_4(q) - 3q \frac{d}{dq} E_4(q) \\ = -\frac{1}{40} (P^2 + Q^2) (41P^4 + 198P^3Q + 154P^2Q^2 - 198PQ^3 + 41Q^4).$$

□

Corollary 9.9. For $q \in \mathbb{C}$ with $|q| < 1$, set

$$S(q) = q \prod_{n=1}^{\infty} \frac{(1 - q^n)^2}{(1 - q^{5n-2})^5 (1 - q^{5n-3})^5} = \sum_{n=1}^{\infty} (d_{1,5}(n) - d_{4,5}(n)) q^n - 3 \sum_{n=1}^{\infty} (d_{2,5}(n) - d_{3,5}(n)) q^n,$$

and

$$T(q) = \prod_{n=1}^{\infty} \frac{(1 - q^n)^2}{(1 - q^{5n-1})^5 (1 - q^{5n-4})^5} = 1 + 3 \sum_{n=1}^{\infty} (d_{1,5}(n) - d_{4,5}(n)) q^n + \sum_{n=1}^{\infty} (d_{2,5}(n) - d_{3,5}(n)) q^n.$$

Then, we have

$$E_4(q) = S^4 - 228S^3T + 494S^2T^2 + 228ST^3 + T^4, \\ E_6(q) = (S^2 + T^2) (S^4 + 522S^3T - 10006S^2T^2 - 522ST^3 + T^4),$$

and

$$q(q; q)_{\infty} = -ST (S^2 + 11ST - T^2)^5 \\ j(q) = -\frac{(S^4 - 228S^3T + 494S^2T^2 + 228ST^3 + T^4)^3}{ST (S^2 + 11ST - T^2)^5} = -\frac{(g^4 - 228g^3 + 494g^2 + 228g + 1)^3}{g (g^2 + 11g - 1)^5},$$

where

$$g = S/T = q \prod_{n=1}^{\infty} \frac{(1 - q^{5n-1})^5 (1 - q^{5n-4})^5}{(1 - q^{5n-2})^5 (1 - q^{5n-3})^5}.$$

Remark

Corollary 9.7 and Theorem 9.8 enable us to consider the extension of the differential fields,

$$\mathbb{Q}(E_2(q), E_4(q), E_6(q)) \subset \mathbb{Q}(P(q), Q(q), E_2(q)),$$

where

$$P(q) = 1 + 10 \sum_{n=1}^{\infty} (d_{2,5}(n) - d_{3,5}(n))q^n, \quad Q(q) = 3 + 10 \sum_{n=1}^{\infty} (d_{1,5}(n) - d_{4,5}(n))q^n.$$

10 Riccati equations satisfied by level 5 modular forms

10.1 Derivation of Riccati equation (1)

Proposition 10.1. *For every $\tau \in \mathbb{H}^2$, we have*

$$\frac{\theta'' \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}} - \frac{\theta'' \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}}{\theta \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}} = \frac{\left\{ \theta' \begin{bmatrix} 1 \\ 1 \end{bmatrix} \right\}^2}{100\theta^6 \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} \theta^6 \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}} \left\{ -8\theta^{10} \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} + 88\theta^5 \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} \theta^5 \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix} + 8\theta^{10} \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix} \right\}.$$

Proof. The proposition can be obtained by considering the derivative formulas (5.1) and (5.2) and by comparing the coefficients of term z^2 in the equation (8.1). \square

Theorem 10.2. *For every $\tau \in \mathbb{H}^2$, set*

$$W = \frac{\theta^5 \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} (0, \tau)}{\theta^5 \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix} (0, \tau)} = \frac{11 + 5\sqrt{5}}{2} \prod_{n=1}^{\infty} \frac{\left(1 + \frac{1+\sqrt{5}}{2}q^n + q^{2n}\right)^5}{\left(1 + \frac{1-\sqrt{5}}{2}q^n + q^{2n}\right)^5}, \quad q = \exp(2\pi i\tau).$$

W then satisfies the following Riccati equation:

$$q \frac{d}{dq} W = \frac{1}{(\sqrt{5})^3} \frac{(q; q)_{\infty}^5}{(q^5; q^5)_{\infty}} (W^2 - 11W - 1). \quad (10.1)$$

Proof. The heat equation (2.6) and Proposition 10.1 imply that

$$\begin{aligned} & 4\pi i \frac{d}{d\tau} \log \theta \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} - 4\pi i \frac{d}{d\tau} \log \theta \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix} \\ &= \frac{\left\{ \theta' \begin{bmatrix} 1 \\ 1 \end{bmatrix} \right\}^2 \left\{ -8\theta^{10} \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} + 88\theta^5 \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} \theta^5 \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix} + 8\theta^{10} \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix} \right\}}{100\theta \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} \theta \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix} \theta^5 \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} \theta^5 \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}}, \end{aligned}$$

which shows that

$$\begin{aligned} & 4\pi i \frac{d}{d\tau} \log \theta^5 \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} - 4\pi i \frac{d}{d\tau} \log \theta^5 \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix} \\ &= \frac{\left\{ \theta' \begin{bmatrix} 1 \\ 1 \end{bmatrix} \right\}^2 \left\{ -8\theta^{10} \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} + 88\theta^5 \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} \theta^5 \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix} + 8\theta^{10} \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix} \right\}}{20\theta \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} \theta \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix} \theta^5 \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} \theta^5 \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}}. \end{aligned}$$

Jacobi's triple product identity (2.5) yields

$$\frac{\left\{ \theta' \begin{bmatrix} 1 \\ 1 \end{bmatrix} \right\}^2}{\theta \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix} \theta \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix}} = \frac{4\pi^2}{\sqrt{5}} \prod_{n=1}^{\infty} \frac{(1-q^n)^5}{(1-q^{5n})} = \frac{4\pi^2}{\sqrt{5}} \frac{\eta(\tau)^5}{\eta(5\tau)}.$$

By setting

$$(X, Y) = \left(\theta^5 \begin{bmatrix} 1 \\ \frac{1}{5} \end{bmatrix}, \theta^5 \begin{bmatrix} 1 \\ \frac{3}{5} \end{bmatrix} \right),$$

we obtain

$$\frac{dX}{d\tau} Y - X \frac{dY}{d\tau} = \frac{2\pi i}{(\sqrt{5})^3} \frac{\eta^5(\tau)}{\eta(5\tau)} (X^2 - 11XY - Y^2),$$

which implies that

$$\frac{d}{d\tau} W = \frac{d}{d\tau} \left(\frac{X}{Y} \right) = \frac{\frac{dX}{d\tau} Y - X \frac{dY}{d\tau}}{Y^2} = \frac{2\pi i}{(\sqrt{5})^3} \frac{\eta^5(\tau)}{\eta(5\tau)} (W^2 - 11W - 1).$$

The theorem can be obtained by considering that $\frac{d}{d\tau} = \frac{dq}{d\tau} \frac{d}{dq} = 2\pi i q \frac{d}{dq}$. □

10.2 Derivation of a Riccati equation (2)

Proposition 10.3. *For every $\tau \in \mathbb{H}^2$, we have*

$$\frac{\theta'' \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}} - \frac{\theta'' \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}}{\theta \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}} = \frac{2\zeta_5}{25} \frac{\left\{ \theta' \begin{bmatrix} 1 \\ 1 \end{bmatrix} \right\}^2}{\theta^6 \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix} \theta^6 \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix}} \left\{ \theta^{10} \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix} + 11\theta^5 \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix} \theta^5 \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix} - \theta^{10} \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix} \right\}.$$

Proof. The proposition can be obtained by considering the derivative formulas (5.3) and (5.4) and by comparing the coefficients of the term z^2 in equation (8.2). \square

Theorem 10.4. *For every $\tau \in \mathbb{H}^2$, set*

$$W = \frac{\theta^5 \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix} (0, 5\tau)}{\theta^5 \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix} (0, 5\tau)} = -q \prod_{n=1}^{\infty} \frac{(1 - q^{5n-1})^5 (1 - q^{5n-4})^5}{(1 - q^{5n-2})^5 (1 - q^{5n-3})^5}, \quad q = \exp(2\pi i\tau).$$

W then satisfies the following Riccati equation:

$$q \frac{d}{dq} W = q \frac{(q^5; q^5)_{\infty}^5}{(q; q)_{\infty}} (W^2 - 11W - 1). \quad (10.2)$$

Proof. The heat equation (2.6) and Proposition 10.3 imply that

$$\begin{aligned} & 4\pi i \frac{d}{d\tau} \log \theta \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix} - 4\pi i \frac{d}{d\tau} \log \theta \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix} \\ &= -\frac{2\zeta_5}{25} \frac{\left\{ \theta' \begin{bmatrix} 1 \\ 1 \end{bmatrix} \right\}^2}{\theta \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix} \theta \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}} \frac{\left\{ \theta^{10} \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix} - 11\theta^5 \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix} \theta^5 \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix} - \theta^{10} \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix} \right\}}{\theta^5 \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix} \theta^5 \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}}, \end{aligned}$$

which shows that

$$\begin{aligned} & 4\pi i \frac{d}{d\tau} \log \theta^5 \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix} - 4\pi i \frac{d}{d\tau} \log \theta^5 \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix} \\ &= -\frac{2\zeta_5}{5} \frac{\left\{ \theta' \begin{bmatrix} 1 \\ 1 \end{bmatrix} \right\}^2}{\theta \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix} \theta \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}} \frac{\left\{ \theta^{10} \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix} - 11\theta^5 \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix} \theta^5 \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix} - \theta^{10} \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix} \right\}}{\theta^5 \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix} \theta^5 \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}}. \end{aligned}$$

Jacobi's triple product identity (2.5) yields

$$\frac{\left\{ \theta' \begin{bmatrix} 1 \\ 1 \end{bmatrix} \right\}^2}{\theta \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix} \theta \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix}} = \frac{4\pi^2}{\zeta_5} y \prod_{n=1}^{\infty} \frac{(1 - y^{5n})^5}{(1 - y^n)} = \frac{4\pi^2}{\zeta_5} \frac{\eta^5(\tau)}{\eta(\tau/5)}, \quad y = \exp(2\pi i\tau/5).$$

By setting

$$(X, Y) = \left(\theta^5 \begin{bmatrix} \frac{1}{5} \\ 1 \end{bmatrix} (0, \tau), \theta^5 \begin{bmatrix} \frac{3}{5} \\ 1 \end{bmatrix} (0, \tau) \right),$$

we obtain

$$y \frac{d}{dy} W = y \frac{d}{dy} \left(\frac{Y}{X} \right) = y \frac{(y^5; y^5)_{\infty}^5}{(y; y)_{\infty}} (W^2 - 11W - 1).$$

The theorem can be obtained by changing $\tau \rightarrow 5\tau$. □
