

Non-linear functionals, deficient topological measures, and representation theorems on locally compact spaces

Svetlana V. Butler*

February 18, 2019

Abstract

We study non-linear functionals, including quasi-linear functionals, p -conic quasi-linear functionals, d -functionals, r -functionals, and their relationships to deficient topological measures and topological measures on locally compact spaces. We prove representation theorems and show, in particular, that there is an order-preserving, conic-linear bijection between the class of finite deficient topological measures and the class of bounded p -conic quasi-linear functionals. Our results imply known representation theorems for finite topological measures and deficient topological measures. When the space is compact we obtain four equivalent definitions of a quasi-linear functional and four equivalent definitions of functionals corresponding to deficient topological measures.

Keywords: quasi-linear functional, p -conic quasi-linear functional, r -functional, s -functional, deficient topological measure, topological measure, right and left measure, representation theorem, locally compact space

1 Introduction

This paper is devoted to the study of various non-linear functionals and their relationships to deficient topological measures and topological measures on locally compact spaces. J. F. Aarnes first discovered quasi-linear functionals and the corresponding set functions, topological measures, (initially called quasi-measures) in [1]. Since then many works devoted to these objects have appeared. For their use in symplectic topology one may consult numerous papers beginning with [11] and a monograph ([12]).

We prove representation theorems for deficient topological measures on locally compact spaces. Our results imply known results, including the representation theorem for quasi-linear functionals on compact spaces ([1]), the representation theorem for deficient topological measures on compact spaces ([15]), and the representation theorems for quasi-linear functionals on locally compact spaces ([13],[5]). We also obtain new consequences where X is compact, including four equivalent definitions of a quasi-linear functional and four equivalent definitions of functionals corresponding to deficient topological measures.

Deficient topological measures were first defined and used by A. Rustad and Ø. Johansen in [10]. They were later independently rediscovered by M. Svistula ([14], [15]). In these works, deficient topological measures were defined as real-valued functions on a compact space. In this paper we use deficient topological measures on locally compact spaces as functions into extended real numbers. Quasi-linear functionals have been generalized to other non-linear functionals in order to represent deficient topological measures on compact spaces. See [10, section 6]; see also [15], where such functionals are called r- and l-functionals. To represent deficient topological measures on locally compact spaces we will need the above mentioned non-linear functionals and some others. This paper is influenced by many works, including [1], [10], [15], [13], [8], and [5].

The paper is organized as follows. Section 2 contains necessary definitions and background facts. In Section 3 we consider cones generated by a function, as well as p-conic and n-conic quasi-linear functionals. In Section 4 we consider various related non-linear functionals, including d-, r-, l-, and s-functionals. In Section 5 we show how to obtain deficient topological measures from d-functionals. In Section 6, given a finite deficient topological measure and a bounded continuous function, we define left and right measures. We give a criterion for left and right measures to coincide. Left and right measures coincide if one starts from a finite topological measure; we also give examples which show that left and right measures may or may not coincide even for $\{0, 1\}$ -valued deficient topological measures. In section 7 using right and left measures we obtain by integration p-conic and l-conic quasi-linear functionals, which are also r- and l-functionals. Section 8 is devoted to representation theorems for finite deficient topological measures in terms of bounded p-conic and l-conic quasi-linear functionals, and also r- and l-functionals. In particular, we show that there is an order-preserving, conic-linear bijection between the class of finite deficient topological measures and the class of bounded p-conic quasi-linear functionals. When X is compact, we obtain four equivalent definitions of quasi-linear functionals and four equivalent definitions of functionals corresponding to deficient topological measures.

2 Preliminaries

In this paper X is a locally compact, connected space.

By $C(X)$ we denote the set of all real-valued continuous functions on X with the uniform norm, by $C_b(X)$ the set of bounded continuous functions on X , by $C_0(X)$ the set of continuous functions on X vanishing at infinity, and by $C_c(X)$ the set of continuous functions with compact support. By $C_0^+(X)$ we denote the collection of all nonnegative functions vanishing at infinity; similarly, $C_0^-(X)$ is the collection of all nonpositive functions from $C_0(X)$.

When we consider maps into $[-\infty, \infty]$ we assume that any such map attains at most one of $\infty, -\infty$, and is not identically ∞ or $-\infty$. By $D(\rho)$ we denote the domain of a functional ρ . For example, we may take $D(\rho) = C_0^+(X)$ or $C_c(X)$. If $D(\rho) = C(X)$, where X is compact, then $D(\rho)$ contains constants.

We denote by \overline{E} the closure of a set E , and by \bigsqcup a union of disjoint sets. We denote by 1 the constant function $1(x) = 1$, by id the identity function $id(x) = x$, and by 1_K the characteristic function of a set K . By $supp f$ we mean $\{x : f(x) \neq 0\}$.

Several collections of sets are used often. They include: $\mathcal{O}(X)$, the collection of open subsets of X ; $\mathcal{C}(X)$ the collection of closed subsets of X ; $\mathcal{K}(X)$ the collection of compact subsets of X .

Definition 2.1. Let X be a topological space and μ be a nonnegative set function on \mathcal{E} , a family of subsets of X that contains $\mathcal{O}(X) \cup \mathcal{C}(X)$. We say that

- μ is inner regular (or inner compact regular) if $\mu(U) = \sup\{\mu(C) : C \subseteq U, C \in \mathcal{K}(X)\}$ for each open set U .
- μ is outer regular if $\mu(F) = \inf\{\mu(U) : F \subseteq U, U \in \mathcal{O}(X)\}$ for each closed set F .
- $\|\mu\| = \mu(X)$ and μ is finite if $\mu(X) < \infty$.
- μ is compact-finite if $\mu(K) < \infty$ for any $K \in \mathcal{K}(X)$.
- μ is monotone if $A \subseteq B$ implies $\mu(A) \leq \mu(B)$.
- μ is τ -smooth on compact sets if for every decreasing net $K_\alpha \searrow K, K_\alpha, K \in \mathcal{K}(X)$ we have $\mu(K_\alpha) \rightarrow \mu(K)$.
- μ is τ -smooth on open sets if for every increasing net $U_\alpha \nearrow U, U_\alpha, U \in \mathcal{O}(X)$ we have $\mu(U_\alpha) \rightarrow \mu(U)$.
- μ is simple if it only assumes values 0 and 1.

Definition 2.2. A deficient topological measure on a locally compact space X is a set function $\nu : \mathcal{C}(X) \cup \mathcal{O}(X) \rightarrow [0, \infty]$ which is finitely additive on compact sets, inner compact regular, and outer regular, i.e. :

(DTM1) if $C \cap K = \emptyset, C, K \in \mathcal{K}(X)$ then $\nu(C \sqcup K) = \nu(C) + \nu(K)$;

(DTM2) $\nu(U) = \sup\{\nu(C) : C \subseteq U, C \in \mathcal{K}(X)\}$ for $U \in \mathcal{O}(X)$;

(DTM3) $\nu(F) = \inf\{\nu(U) : F \subseteq U, U \in \mathcal{O}(X)\}$ for $F \in \mathcal{C}(X)$.

For a closed set $F, \nu(F) = \infty$ iff $\nu(U) = \infty$ for every open set U containing F .

Remark 2.3. Note that a deficient topological measure ν is monotone on $\mathcal{O}(X) \cup \mathcal{C}(X)$ and $\nu(\emptyset) = 0$. If ν and μ are deficient topological measures that agree on $\mathcal{K}(X)$ then $\nu = \mu$, and if $\nu \leq \mu$ on $\mathcal{K}(X)$ (or on $\mathcal{O}(X)$) then $\nu \leq \mu$.

Definition 2.4. A topological measure on X is a set function $\mu : \mathcal{C}(X) \cup \mathcal{O}(X) \rightarrow [0, \infty]$ satisfying the following conditions:

(TM1) if $A, B, A \sqcup B \in \mathcal{K}(X) \cup \mathcal{O}(X)$ then $\mu(A \sqcup B) = \mu(A) + \mu(B)$;

(TM2) $\mu(U) = \sup\{\mu(K) : K \in \mathcal{K}(X), K \subseteq U\}$ for $U \in \mathcal{O}(X)$;

(TM3) $\mu(F) = \inf\{\mu(U) : U \in \mathcal{O}(X), F \subseteq U\}$ for $F \in \mathcal{C}(X)$.

We denote by $TM(X)$ the collection of all topological measures on X , by $DTM(X)$ the collection of all deficient topological measures on X , and by $M(X)$ the collection of all Borel measures on X that are inner regular on open sets and outer regular (restricted to $\mathcal{O}(X) \cup \mathcal{C}(X)$).

Remark 2.5. Let X be locally compact. In general,

$$M(X) \subsetneq TM(X) \subsetneq DTM(X).$$

When X is compact, there are examples of topological measures that are not measures and of deficient topological measures that are not topological measures in numerous papers, beginning with [1], [10], and [14]. When X is locally compact, see [2], [4, Sections 5 and 6], and [3, Section 9] for more information on proper inclusion, criteria for a deficient topological measure to belong to $M(X)$ or $TM(X)$ (in particular, to be a Radon measure or a regular Borel measure), as well as various examples.

The proof of the next result is in [4, Section 4].

Theorem 2.6. (I) *Let X be compact, and ν a deficient topological measure. The following are equivalent:*

- (a) ν is a topological measure.
- (b) $\nu(X) = \nu(C) + \nu(X \setminus C)$, $C \in \mathcal{C}(X)$.
- (c) $\nu(X) \leq \nu(C) + \nu(X \setminus C)$, $C \in \mathcal{C}(X)$.

(II) *Let X be locally compact, and ν a deficient topological measure. The following are equivalent:*

- (a) ν is a topological measure.
- (b) $\nu(U) = \nu(C) + \nu(U \setminus C)$, $C \in \mathcal{H}(X)$, $U \in \mathcal{O}(X)$.
- (c) $\nu(U) \leq \nu(C) + \nu(U \setminus C)$, $C \in \mathcal{H}(X)$, $U \in \mathcal{O}(X)$.

Recall the following fact (see, for example, [6, Chapter XI, 6.2]):

Lemma 2.7. *Let $K \subseteq U$, $K \in \mathcal{H}(X)$, $U \in \mathcal{O}(X)$ in a locally compact space X . Then there exists a set $V \in \mathcal{O}(X)$ with compact closure such that*

$$K \subseteq V \subseteq \overline{V} \subseteq U.$$

The following is proved in [4, Section 3].

Lemma 2.8. *Let X be a locally compact space.*

- (a) *A deficient topological measure is τ -smooth on compact sets and τ -smooth on open sets. In particular, a topological measure is additive on open sets.*
- (b) *A deficient topological measure μ is superadditive, i.e. if $\bigsqcup_{t \in T} A_t \subseteq A$, where $A_t, A \in \mathcal{O}(X) \cup \mathcal{C}(X)$, and at most one of the closed sets (if there are any) is not compact, then $\mu(A) \geq \sum_{t \in T} \mu(A_t)$.*

We recall the following theorem:

Theorem 2.9 (Integration by parts for Lebesgue-Stieltjes integrals). *Let F and G be real-valued nondecreasing functions on \mathbb{R} with corresponding Lebesgue-Stieltjes measures m_F , m_G . Then for $a < b$ we have:*

$$\int_a^b G(x^+) dm_F(x) + \int_a^b F(x^-) dm_G(x) = F(b^+)G(b^+) - F(a^-)G(a^-).$$

Definition 2.10. Let ρ be a functional on $C(X)$. We say

- ρ is homogeneous if $\rho(af) = a\rho(f)$ for any $a \in \mathbb{R}$.
- ρ is positive-homogeneous if $\rho(af) = a\rho(f)$ for any $a \geq 0$.
- ρ is conic-linear on a cone S if it is linear on conic combinations of elements of S , i.e. $\rho(af + bg) = a\rho(f) + b\rho(g)$ for any $a, b \geq 0$ and any $f, g \in S$.
- ρ is positive if $f \geq 0 \implies \rho(f) \geq 0$.
- ρ is monotone if $g \leq f \implies \rho(g) \leq \rho(f)$.
- ρ is orthogonally additive if $f \cdot g = 0 \implies \rho(f + g) = \rho(f) + \rho(g)$.
- ρ is real-valued if $\rho(f) \in \mathbb{R}$ for any f .
- $\|\rho\| = \sup\{|\rho(f)| : \|f\| \leq 1\}$ and ρ is bounded if $\|\rho\| < \infty$.

The remaining definitions and facts related to quasi-linear functionals can be found in [5, Section 2]:

Definition 2.11. Let X be locally compact.

- (a) Let $f \in C_b(X)$. Define $A(f)$ to be the smallest closed subalgebra of $C_b(X)$ containing f and 1. Hence, when X is compact, we take $f \in C(X)$ and define $A(f)$ to be the smallest closed subalgebra of $C(X)$ containing f and 1. We call $A(f)$ the singly generated subalgebra of $C(X)$ generated by f .
- (b) Let \mathcal{B} be a subalgebra of $C_b(X)$. Define $B(f)$ to be the smallest closed subalgebra of \mathcal{B} containing f . We call $B(f)$ the singly generated subalgebra of \mathcal{B} generated by f .

We may take, for example, $C_c(X)$, $C_0(X)$ as \mathcal{B} .

Remark 2.12. When X is compact, $A(f)$ for $f \in C(X)$ contains all polynomials of f . It is not hard to show that $A(f)$ has the form:

$$A(f) = \{\phi \circ f : \phi \in C(f(X))\}.$$

When X is locally compact, $\mathcal{B} = C_0(X)$ and $f \in C_0(X)$ (or $\mathcal{B} = C_c(X)$ and $f \in C_c(X)$) the singly generated subalgebra has the form:

$$B(f) = \{\phi \circ f : \phi(0) = 0, \phi \in C(\overline{f(X)})\}.$$

Definition 2.13. Let X be locally compact, and let \mathcal{B} be a subalgebra of $C(X)$ containing $C_c(X)$. A real-valued map ρ on \mathcal{B} is a signed quasi-linear functional on \mathcal{B} if

- (QI1) $\rho(af) = a\rho(f)$ for $a \in \mathbb{R}$;
- (QI2) for each $h \in \mathcal{B}$ we have: $\rho(f + g) = \rho(f) + \rho(g)$ for f, g in the singly generated subalgebra $B(h)$ generated by h .

We say that ρ is a quasi-linear functional (or a positive quasi-linear functional) if, in addition,

(QI3) $f \geq 0 \implies \rho(f) \geq 0$.

When X is compact, we call ρ a quasi-state if $\rho(1) = 1$.

Definition 2.14. We say that a signed quasi-linear functional ρ is compact-finite if $|\rho(f)| < \infty$ for $f \in C_c(X)$.

3 Cones generated by functions

When X is a compact or locally compact, non-compact space, there is a correspondence between topological measures and quasi-linear functionals. (See [1], [13], [5]). When X is compact, there is also a correspondence between deficient topological measures and r- or l-functionals, see [15] and [10]. When X is locally compact, we shall consider relations between deficient topological measures and various non-linear functionals. We shall start with functionals that are conic-linear on cones generated by functions.

Definition 3.1. Let X be compact, $f \in C(X)$. Define cones:

$$A^+(f) = \{\phi \circ f : \phi \text{ is non-decreasing}\},$$

$$A^-(f) = \{\phi \circ f : \phi \text{ is non-increasing}\}.$$

If X is a locally compact, non-compact space, $f \in C_0(X)$ let

$$A^+(f) = \{\phi \circ f : \phi \text{ is non-decreasing, } \phi(0) = 0\},$$

$$A^-(f) = \{\phi \circ f : \phi \text{ is non-increasing, } \phi(0) = 0\}.$$

Remark 3.2. Since $f = id \circ f$, for $f \neq 0$ ($f \neq const$ if X is compact) we have $f \in A^+(f)$, $f \notin A^-(f)$, and $-f \in A^-(f)$, $-f \notin A^+(f)$. Note that $0 \in A^+(f)$, $A^-(f)$. Also, $f^+ \in A^+(f)$, $f^- \in A^-(f)$, since $f^+ = (id \vee 0) \circ f$, $f^- = ((-id) \vee 0) \circ f$. Obviously, $A^+(f)$, $A^-(f) \subseteq B(f)$ (respectively, $A^+(f)$, $A^-(f) \subseteq A(f)$ if X is compact).

Definition 3.3. We call a functional ρ on $C_0(X)$ with values in $[-\infty, \infty]$ (assuming at most one of $\infty, -\infty$) and $|\rho(0)| < \infty$ a p -conic quasi-linear functional if it is orthogonally additive and monotone on nonnegative functions and conic-linear on $A^+(f)$ for each $f \in C_0(X)$, i.e.

(p1) If $f g = 0$, $f, g \geq 0$ then $\rho(f + g) = \rho(f) + \rho(g)$.

(p2) If $0 \leq g \leq f$ then $\rho(g) \leq \rho(f)$.

(p3) For each f , if $g, h \in A^+(f)$, $a, b \geq 0$ then $\rho(ag + bh) = a\rho(g) + b\rho(h)$.

Similarly, a functional ρ on $C_0(X)$ with values in $[-\infty, \infty]$ (assuming at most one of $\infty, -\infty$) and $|\rho(0)| < \infty$ is called an n -conic quasi-linear functional if it is orthogonally additive and monotone on non-positive functions and conic-linear on $A^-(f)$ for each $f \in C_0(X)$. In other words,

(n1) If $f g = 0$, $f, g \leq 0$ then $\rho(f + g) = \rho(f) + \rho(g)$.

(n2) If $f \leq g \leq 0$ then $\rho(f) \leq \rho(g)$.

(n3) For each f , if $g, h \in A^-(f)$, $a, b \geq 0$ then $\rho(ag + bh) = a\rho(g) + b\rho(h)$.

Remark 3.4. From [5, Lemma 20(iii), Section 3 and Lemma 44, Section 4] it follows that a positive quasi-linear functional is a p-conic quasi-linear functional and also an n-conic quasi-linear functional.

Remark 3.5. Given a functional ρ , consider also the functional π defined by $\pi(f) = -\rho(-f)$ for every $f \in D(\rho)$. Then π is an n-conic quasi-linear functional iff ρ is a p-conic quasi-linear functional. This allows us to transfer results for p-conic quasi-linear functionals to n-conic quasi-linear functionals and vice versa.

Lemma 3.6. Let ρ be a functional on a locally compact space with $|\rho(0)| < \infty$.

- (I) Suppose a functional ρ is conic-linear on $A^+(f)$ or on $A^-(f)$ for some f . Then $\rho(0) = 0$.
- (II) Suppose a functional ρ is conic-linear on $A^+(h)$ for each function $h \in C_0(X)$. Then $fg = 0, f \geq 0, g \leq 0$ implies $\rho(f + g) = \rho(f) + \rho(g)$.
- (III) Suppose $0 \leq g(x) \leq f(x) \leq c, f = c$ on $\{x : g(x) > 0\}$. Then $f, g \in A^+(f + g)$. In particular, if ρ is a p-conic quasi-linear functional then $\rho(af + bg) = a\rho(f) + b\rho(g)$ for any $a, b \geq 0$. If ρ is a quasi-linear functional, then $\rho(af + bg) = a\rho(f) + b\rho(g)$ for any $a, b \in \mathbb{R}$.
- (IV) Suppose $g \geq 0, 0 \leq h \leq 1$, and $h = 1$ on $\{x : g(x) > 0\}$. If ρ is a p-conic quasi-linear functional then $\rho(ag + bh) = a\rho(g) + b\rho(h)$ for any $a, b \geq 0$. If ρ is a quasi-linear functional, then $\rho(ag + bh) = a\rho(g) + b\rho(h)$ for any $a, b \in \mathbb{R}$.
- (V) Suppose ρ is a p-conic quasi-linear functional, $f, g \in C_c(X), f, g \geq 0$. Then $|\rho(f) - \rho(g)| \leq \|\rho\| \|f - g\|$.

If X is compact we also have:

- (i) If $f \in C(X)$, and a functional ρ is conic-linear on $A^+(f)$ (or on $A^-(f)$), then $\rho(f + c) = \rho(f) + \rho(c)$.
- (ii) If ρ is conic-linear on $A^+(h)$ for each function $h \in C(X)$ (respectively, conic-linear on $A^-(h)$ for each function $h \in C(X)$) and $\rho(1) \in \mathbb{R}$, then ρ is monotone.

Proof. (I) Since $0 \in A^+(f)$, ρ is conic-linear on $A^+(f)$, and $|\rho(0)| < \infty$ we have $\rho(0) = 0$. A similar argument works for $A^-(f)$.

- (II) Suppose $fg = 0, f \geq 0, g \leq 0$. Taking $h = f + g$, observe that $f = (id \vee 0) \circ h, g = (id \wedge 0) \circ h$, so $f, g \in A^+(h)$. Then $\rho(f + g) = \rho(f) + \rho(g)$.
- (III) Note that $c \geq 0$ and $f = (id \wedge c) \circ (f + g), g = (0 \vee (id - c)) \circ (f + g)$.
- (IV) We may assume that $g \neq 0$. Since $0 \leq g \leq \|g\| h \leq \|g\|$, by part (III)

$$\rho(ag + bh) = \rho\left(ag + \frac{b}{\|g\|} \|g\| h\right) = a\rho(g) + \frac{b}{\|g\|} \rho(\|g\| h) = a\rho(g) + b\rho(h).$$

(V) Suppose $f, g \in C_c(X)$, $f, g \geq 0$. Choose $h \in C_c(X)$ such that $h \geq 0, h = 1$ on $\text{supp } f \cup \text{supp } g$. Since $f - g \leq \|f - g\| h$, i.e. $f \leq g + \|f - g\| h$, using Definition 3.3 and part (IV) we have:

$$\rho(f) \leq \rho(g + \|f - g\| h) = \rho(g) + \|f - g\| \rho(h).$$

Similarly, $\rho(g) \leq \rho(f) + \|f - g\| \rho(h)$, so

$$|\rho(f) - \rho(g)| \leq \|f - g\| \rho(h) \leq \|f - g\| \|\rho\|. \quad (3.1)$$

(i) Since every constant $c \in A^+(f)$ (and also $c \in A^-(f)$) we immediately see that $\rho(f+c) = \rho(f) + \rho(c)$.

(ii) Note that $\rho(c) \in \mathbb{R}$ for any constant $c \geq 0$. Let $g \leq f$. Choose a constant $c > 0$ such that $0 \leq g + c \leq f + c$. We have:

$$\rho(g) + \rho(c) = \rho(g + c) \leq \rho(f + c) = \rho(f) + \rho(c),$$

so $\rho(g) \leq \rho(f)$.

□

Proposition 3.7. *Suppose X is locally compact and ρ is a functional on $C_0(X)$ that is positive-homogeneous and monotone on nonnegative functions. If ρ is real-valued, then $\|\rho\| < \infty$.*

Proof. The statement can be obtained by adapting the argument from Lemma 2.3 in [13] (see Proposition 50 in [5]). □

4 d-functionals

In this section we shall define several functionals. The domains of these functionals vary, but the most common are $C(X), C_0(X), C_c(X), C_0^+(X)$. We shall not specify the domains in the definitions and results that hold for different domains, but shall indicate them later when we use these functionals on specific collections of functions.

Definition 4.1. *A functional ρ with values in $[-\infty, \infty]$ (assuming at most one of $\infty, -\infty$) and $|\rho(0)| < \infty$ is called a d-functional if on nonnegative functions it is positive-homogeneous, monotone, and orthogonally additive, i.e. for $f, g \in D(\rho)$*

$$(d1) \quad f \geq 0, a > 0 \implies \rho(af) = a\rho(f),$$

$$(d2) \quad 0 \leq g \leq f \implies \rho(g) \leq \rho(f),$$

$$(d3) \quad f \cdot g = 0, f, g \geq 0 \implies \rho(f + g) = \rho(f) + \rho(g).$$

Remark 4.2. It is easy to see that $\rho(0) = 0$, and so ρ is positive.

Definition 4.3. *We say that a functional ρ satisfies the c-level condition if*

$$f \leq c, f = c \text{ on } \text{supp } g \implies \rho(f + g) = \rho(f) + \rho(g),$$

where c is a constant, and $f, g \in D(\rho)$.

If the domain of ρ includes constants, we say that ρ satisfies the constant condition if for any function $g \in D(\rho)$ and any constant c

$$\rho(g + c) = \rho(g) + \rho(c). \quad (4.1)$$

Lemma 4.4. *Suppose the domain of ρ includes constants.*

- (i) *The c -level condition implies the constant condition.*
- (ii) *Suppose ρ is a d -functional that satisfies the constant condition, $\rho(1) \in \mathbb{R}$, and $c \geq 0$. If $f \leq c, f = c$ on $\text{supp } g, g \geq 0$, then $\rho(g - f) = \rho(g) + \rho(-f)$.*
- (iii) *Suppose a functional ρ is conic-linear on $A^+(h)$ for each function h (for example, ρ is a p -conic quasi-linear). If ρ satisfies the constant condition then ρ satisfies the c -level condition for all $g \geq 0$.*

Proof. (i) Take $f \equiv c$.

- (ii) Since $c - f \geq 0$ and $(c - f)g = 0$, we have:

$$\rho(c) + \rho(g - f) = \rho(c + g - f) = \rho(c - f) + \rho(g) = \rho(c) + \rho(-f) + \rho(g),$$

$$\text{so } \rho(g - f) = \rho(g) + \rho(-f).$$

- (iii) Suppose ρ satisfies the constant condition (4.1). Let $f \leq c, f = c$ on $\text{supp } g, g \geq 0$. Let $h = f - c$. Then $h \leq 0$ and $gh = 0$. By part (II) of Lemma 3.6, $\rho(h + g) = \rho(h) + \rho(g)$. Then

$$\begin{aligned} \rho(f + g) &= \rho(h + c + g) = \rho(h + g) + \rho(c) \\ &= \rho(h) + \rho(g) + \rho(c) = \rho(h + c) + \rho(g) = \rho(f) + \rho(g). \end{aligned}$$

□

Remark 4.5. If ρ is a monotone, positive-homogeneous functional that satisfies the constant condition then for any functions $f, g \in D(\rho)$

$$|\rho(f) - \rho(g)| \leq \rho(\|f - g\|) = \|f - g\| \rho(1).$$

One can show this by noticing that $f \leq g + \|f - g\|$ and using an argument similar to the one for part (V) of Lemma 3.6.

We modify condition (d3) in Definition 4.1 and obtain the definition of a c -functional:

Definition 4.6. *A functional ρ with values in $[-\infty, \infty]$ (assuming at most one of $\infty, -\infty$) and $|\rho(0)| < \infty$ is called a c -functional if for $f, g \in D(\rho)$*

$$(c1) \quad f \geq 0, a > 0 \implies \rho(af) = a\rho(f);$$

$$(c2) \quad 0 \leq g \leq f \implies \rho(g) \leq \rho(f);$$

$$(c3) \quad f \cdot g = 0, f, g \geq 0 \text{ or } f \geq 0, g \leq 0 \implies \rho(f + g) = \rho(f) + \rho(g).$$

Note that for a c -functional $\rho, \rho(f) = \rho(f^+) + \rho(-f^-)$.

Definition 4.7. *A real-valued functional ρ is called an s -functional if*

$$(s1) \quad f \geq 0, a \in \mathbb{R} \implies \rho(af) = a\rho(f);$$

$$(s2) \quad 0 \leq g \leq f \implies \rho(g) \leq \rho(f);$$

(s3) $f \cdot g = 0, f, g \geq 0$ or $f \geq 0, g \leq 0 \implies \rho(f + g) = \rho(f) + \rho(g)$.

Lemma 4.8. *Suppose ρ is an s-functional. Then*

(i) $\rho(f) = \rho(f^+) - \rho(f^-)$.

(ii) $\rho(af) = a\rho(f)$ for any f and any $a \in \mathbb{R}$.

(iii) If $g \leq f$ then $\rho(g) \leq \rho(f)$.

(iv) If $f \cdot g = 0$ then $\rho(f + g) = \rho(f) + \rho(g)$.

Proof. (i) $\rho(f) = \rho(f^+ - f^-) = \rho(f^+) + \rho(-f^-) = \rho(f^+) - \rho(f^-)$.

(ii) Easy to see from part (i).

(iii) If $g \leq f$ then $g^+ \leq f^+, f^- \leq g^-$ and $\rho(g) = \rho(g^+) - \rho(g^-) \leq \rho(f^+) - \rho(f^-) = \rho(f)$.

(iv) If $f \cdot g = 0$ then $(f + g)^+ = f^+ + g^+, (f + g)^- = f^- + g^-$, and $f^+ \cdot g^+ = 0, f^- \cdot g^- = 0$.
Then

$$\begin{aligned} \rho(f + g) &= \rho((f + g)^+) - \rho((f + g)^-) = \rho(f^+ + g^+) - \rho(f^- + g^-) \\ &= \rho(f^+) + \rho(g^+) - \rho(f^-) - \rho(g^-) = \rho(f) + \rho(g). \end{aligned}$$

□

Lemma 4.8 shows that Definition 4.7 is equivalent to the following:

Definition 4.9. *A functional ρ is called an s-functional if it is homogeneous, monotone, and orthogonally additive, i.e.*

(sa1) $\rho(af) = a\rho(f)$ for any $a \in \mathbb{R}$;

(sa2) $g \leq f \implies \rho(g) \leq \rho(f)$;

(sa3) $f \cdot g = 0 \implies \rho(f + g) = \rho(f) + \rho(g)$.

Remark 4.10. Let X be locally compact, and let ρ be a quasi-linear functional. By [5, Lemma 20(q2), Section 3 and Lemma 44, Section 5], ρ is an s-functional.

Definition 4.11. *Let QI and L denote, respectively, the families of all quasi-linear and linear functionals. By $\Phi^d, \Phi^c, \Phi^s, \Phi^+, \Phi^-$ we denote, respectively, the families of all d-functionals, c-functionals, s-functionals, p-conic quasi-linear functionals, and n-conic quasi-linear functionals.*

Remark 4.12. We have: $L \subseteq QI \subseteq \Phi^s \subseteq \Phi^c \subseteq \Phi^d$.

Proposition 4.13. (i) ρ is a s-functional iff it is a real-valued c-functional with a property that $\rho(-g) = -\rho(g)$ for every $g \leq 0$ in the domain of ρ .

(ii) If ρ is a d-functional, $D(\rho)$ contains constants, $\rho(1) \in \mathbb{R}$, and the constants condition (4.1) is satisfied, then ρ is monotone and positive.

Proof. (i) Suppose ρ is a c-functional with the property that $\rho(-g) = -\rho(g)$ for every $g \leq 0$ in the domain of ρ . We have: $\rho(f) = \rho(f^+) + \rho(-f^-) = \rho(f^+) - \rho(f^-)$ for any function f in the domain of ρ . Then $\rho(-f) = -\rho(f)$ for any function f in the domain of ρ , and condition (sa1) of Definition 4.7 follows. Thus, ρ is an s-functional.

(ii) Let $g \leq f$. It is enough to assume that $0 \leq g \leq f$, for choosing a positive constant k such that $g+k \geq 0$ we see that $\rho(g) \leq \rho(f)$ iff $\rho(g) + \rho(k) \leq \rho(f) + \rho(k)$ iff $\rho(g+k) \leq \rho(f+k)$. But ρ is a d-functional, so $\rho(g) \leq \rho(f)$ for $0 \leq g \leq f$. Since $\rho(0) = 0$, monotonicity of ρ implies positivity. □

Now we will introduce the closely related r- and l- functionals.

Definition 4.14. A functional ρ with values in $[-\infty, \infty]$ (assuming at most one of $\infty, -\infty$) and $|\rho(0)| < \infty$ is called an r-functional if for $f, g \in D(\rho)$

$$(r1) \quad a > 0 \implies \rho(af) = a\rho(f);$$

$$(r2) \quad 0 \leq g \leq f \implies \rho(g) \leq \rho(f);$$

$$(r3) \quad \text{If } f \cdot g = 0 \text{ where } f, g \geq 0 \text{ or } f \geq 0, g \leq 0 \text{ then } \rho(f + g) = \rho(f) + \rho(g).$$

If $D(\rho)$ contains constants then we also require for $f \in D(\rho)$ and a constant c

$$\rho(f + c) = \rho(f) + \rho(c).$$

Definition 4.15. A functional ρ with values in $[-\infty, \infty]$ (assuming at most one of $\infty, -\infty$) and $|\rho(0)| < \infty$ is called an l-functional if

$$(l1) \quad a > 0 \implies \rho(af) = a\rho(f);$$

$$(l2) \quad g \leq f \leq 0 \implies \rho(g) \leq \rho(f);$$

$$(l3) \quad \text{If } f \cdot g = 0 \text{ where } f, g \leq 0 \text{ or } f \geq 0, g \leq 0 \text{ then } \rho(f + g) = \rho(f) + \rho(g).$$

If $D(\rho)$ contains constants then we also require for $f \in D(\rho)$ and a constant c

$$\rho(f + c) = \rho(f) + \rho(c).$$

Definition 4.16. By Φ^r, Φ^l we denote, respectively, the families of all r-functionals, and l-functionals on X .

Remark 4.17. Here are a few easy observations.

(i) Suppose ρ, \mathcal{R} are r-functionals with the same domain that contain constants and $\rho(1) \in \mathbb{R}$. Then $\rho = \mathcal{R}$ iff $\rho = \mathcal{R}$ on nonnegative functions. Indeed, for an arbitrary function f choose a constant $c \geq 0$ such that $f + c \geq 0$ and see that $\rho(f) + \rho(c) = \rho(f + c) = \mathcal{R}(f + c) = \mathcal{R}(f) + \mathcal{R}(c) = \mathcal{R}(f) + \rho(c)$, i.e. $\rho(f) = \mathcal{R}(f)$.

(ii) We have: $\Phi^s \subseteq \Phi^r \subseteq \Phi^c \subseteq \Phi^d$ and from Definition 4.9 $\Phi^s \subseteq \Phi^l$.

(iii) Given a functional ρ , consider also the functional π defined by $\pi(f) = -\rho(-f)$ for every $f \in D(\rho)$. Then π is an l-functional iff ρ is an r-functional.

Lemma 4.18. *Each p-conic quasi-linear functional is an r-functional. Each n-conic quasi-linear functional is an l-functional. So $\Phi^+ \subseteq \Phi^r$ and $\Phi^- \subseteq \Phi^l$.*

Proof. Using part (II) and part (i) of Lemma 3.6 we see that a p-conic quasi-linear functional is an r-functional. The second statement follows from Remark 3.5 and part (iii) of Remark 4.17. \square

Lemma 4.19. *Let X be compact and ρ be a functional on $C(X)$.*

- (I) *If ρ is an r-functional with $\rho(1) \in \mathbb{R}$ or an l-functional with $\rho(-1) \in \mathbb{R}$ then ρ is monotone.*
- (II) *If ρ is an r-functional with $\rho(1) \in \mathbb{R}$ then $|\rho(f) - \rho(g)| \leq \|\rho\| \|f - g\| = \rho(1) \|f - g\|$.*
- (III) *If ρ is an r-functional with $\rho(-1) \in \mathbb{R}$ then ρ satisfies the c-level condition for any $g \geq 0$.*
- (IV) *If ρ is an r-functional, $f \cdot g = 0$, $f \geq 0$ then $\rho(f + g) = \rho(f) + \rho(g)$. Similarly, if ρ is an l-functional, $f \cdot g = 0$, $f \leq 0$ then $\rho(f + g) = \rho(f) + \rho(g)$.*

Proof. (I) Suppose $g \leq f$. Choose a constant $c > 0$ such that $0 \leq g + c \leq f + c$. Then $\rho(g) + \rho(c) = \rho(g + c) \leq \rho(f + c) = \rho(f) + \rho(c)$, which gives $\rho(g) \leq \rho(f)$. The monotonicity of an l-functional can be proved similarly.

(II) Use part (I) and Remark 4.5.

(III) Assume that $f \leq c$, $f = c$ on $\text{supp } g$, $g \geq 0$. Then $(f - c)g = 0$, $f - c \leq 0$, and

$$\rho(-c) + \rho(f + g) = \rho(f + g - c) = \rho(f - c) + \rho(g) = \rho(f) + \rho(-c) + \rho(g).$$

Thus, $\rho(f + g) = \rho(f) + \rho(g)$.

(IV) Let ρ be an r-functional, $f \cdot g = 0$, $f \geq 0$. Then $(f + g^+)(-g^-) = 0$, $f \cdot g^+ = 0$, and by Definition 4.14

$$\begin{aligned} \rho(f + g) &= \rho(f + g^+ - g^-) = \rho(f + g^+) + \rho(-g^-) = \\ &= \rho(f) + \rho(g^+) + \rho(-g^-) = \rho(f) + \rho(g). \end{aligned}$$

The proof for an l-functional is similar. \square

Remark 4.20. Part (IV) of Lemma 4.19 and part (iii) of Remark 4.17 were first observed for a compact space in [15, Propositions 17 and 18].

Definition 4.21. *Let ρ be a d-functional. Let $g \geq 0$. Define $\rho_g(f) = \rho(fg)$ for $f \in D(\rho)$.*

Lemma 4.22. *If ρ is a d-, c-, r-, l-, s- functional or a linear functional, then so is ρ_g .*

Proof. Easy to check. \square

5 Deficient topological measures from d-functionals

Definition 5.1. Let X be locally compact, and let ρ be a d -functional with $C_c^+(X) \subseteq D(\rho) \subseteq C_b(X)$. Define a set function $\mu_\rho : \mathcal{O}(X) \cup \mathcal{C}(X) \rightarrow [0, \infty]$ as follows: for an open set $U \subseteq X$ let

$$\mu_\rho(U) = \sup\{\rho(f) : f \in C_c(X), 0 \leq f \leq 1, \text{supp } f \subseteq U\},$$

and for a closed set $F \subseteq X$ let

$$\mu_\rho(F) = \inf\{\mu_\rho(U) : F \subseteq U, U \in \mathcal{O}(X)\}.$$

Note that Definition 5.1 is consistent for clopen sets.

Lemma 5.2. For the set function μ_ρ from Definition 5.1 the following holds:

y1. μ_ρ is nonnegative.

y2. μ_ρ is monotone.

y3. Given an open set U , for any compact $K \subseteq U$

$$\mu_\rho(U) = \sup\{\rho(g) : 1_K \leq g \leq 1, g \in C_c(X), \text{supp } g \subseteq U\}.$$

y4. For any $K \in \mathcal{K}(X)$

$$\mu_\rho(K) = \inf\{\rho(g) : g \in C_c(X), g \geq 1_K\}.$$

y5. For any $K \in \mathcal{K}(X)$

$$\mu_\rho(K) = \inf\{\rho(g) : g \in C_c(X), 1_K \leq g \leq 1\}.$$

y6. Given $K \in \mathcal{K}(X)$, for any open U such that $K \subseteq U$

$$\mu_\rho(K) = \inf\{\mu_\rho(V) : V \in \mathcal{O}(X), K \subseteq V \subseteq \bar{V} \subseteq U\}.$$

y7. For any $U \in \mathcal{O}(X)$

$$\mu_\rho(U) = \sup\{\mu_\rho(K) : K \in \mathcal{K}(X), K \subseteq U\}.$$

y8. For any disjoint compact sets K and C

$$\mu_\rho(K \sqcup C) = \mu_\rho(K) + \mu_\rho(C).$$

y9. Suppose X is compact, $\rho(1) \in \mathbb{R}$, and ρ is an s -functional satisfying the constant condition (4.1). If $K \subseteq U$, $K \in \mathcal{K}(X)$, $U \in \mathcal{O}(X)$ then

$$\mu_\rho(U) = \mu_\rho(K) + \mu_\rho(U \setminus K).$$

Proof. For part y1, μ_ρ is nonnegative since ρ is a positive functional by Remark 4.2. Part y2 is easy to see. Proofs for parts y3 - y8 follow proofs of the corresponding parts of [5, Lemma 35, Sect. 4]. We shall show part y9.

Let $K \subseteq U$, $K \in \mathcal{K}(X)$, $U \in \mathcal{O}(X)$. First we shall show that

$$\mu_\rho(U \setminus K) + \mu_\rho(K) \geq \mu_\rho(U). \quad (5.1)$$

If $\mu_\rho(K) = \infty$, the inequality (5.1) trivially holds, so we assume that $\mu_\rho(K) < \infty$. By Lemma 2.7 let $V \in \mathcal{O}(X)$ with compact closure be such that

$$K \subseteq V \subseteq \overline{V} \subseteq U.$$

For $\epsilon > 0$ choose $W_1 \in \mathcal{O}(X)$ such that $K \subseteq W_1 \subseteq V$ and $\mu_\rho(W_1) < \mu_\rho(K) + \epsilon$. Also, there exists $W \in \mathcal{O}(X)$ with compact closure such that

$$K \subseteq W \subseteq \overline{W} \subseteq W_1 \subseteq V \subseteq \overline{V} \subseteq U.$$

Choose an Urysohn function $g \in C_c(X)$ such that $1_{\overline{W}} \leq g \leq 1$, $\text{supp } g \subseteq W_1$. Then

$$\rho(g) \leq \mu_\rho(W_1) < \mu_\rho(K) + \epsilon.$$

First assume that $\mu_\rho(U) < \infty$. By part y3 choose $f \in C_c(X)$ such that $1_{\overline{V}} \leq f \leq 1$, $\text{supp } f \subseteq U$, and

$$\rho(f) > \mu_\rho(U) - \epsilon.$$

Note that $0 \leq f - g \leq 1$, and, since $f - g = 0$ on \overline{W} , we have $\text{supp } (f - g) \subseteq U \setminus K$. Since $f = 1$ on $\text{supp } g$ and ρ is an s-functional, by Remark 4.12 and part (ii) of Lemma 4.4

$$\rho(g - f) = \rho(g) + \rho(-f) = \rho(g) - \rho(f),$$

so

$$\rho(f - g) = \rho(f) - \rho(g). \quad (5.2)$$

Then we have:

$$\mu_\rho(U \setminus K) \geq \rho(f - g) = \rho(f) - \rho(g) \geq \mu_\rho(U) - \epsilon - \mu_\rho(K) - \epsilon,$$

which gives us inequality (5.1). If $\mu_\rho(U) = \infty$, use instead of f functions f_n with $1_{\overline{V}} \leq f_n \leq 1$, $\text{supp } f_n \subseteq U$, $\rho(f_n) \geq n$ in the above argument to show that $\mu_\rho(U \setminus K) = \infty$. Then inequality (5.1) holds.

Now we would like to show that

$$\mu_\rho(U) \geq \mu_\rho(U \setminus K) + \mu_\rho(K). \quad (5.3)$$

By monotonicity of μ_ρ it is enough assume that $\mu_\rho(U \setminus K), \mu_\rho(K) < \infty$. Given $\epsilon > 0$, choose $g \in C_c(X)$, $0 \leq g \leq 1$ such that $C = \text{supp } g \subseteq U \setminus K$ and

$$\rho(g) > \mu_\rho(U \setminus K) - \epsilon.$$

Note that $K \subseteq U \setminus C$. If $\mu_\rho(U \setminus C) = \infty$, then $\mu_\rho(U) = \infty$, so (5.3) holds. So assume that $\mu_\rho(U \setminus C) < \infty$. By part y3 choose $f \in C_c(X)$ such that $1_K \leq f \leq 1$, $\text{supp } f \subseteq U \setminus C$, and $\rho(f) > \mu_\rho(U \setminus C) - \epsilon$. Then

$$\rho(f) > \mu_\rho(U \setminus C) - \epsilon \geq \mu_\rho(K) - \epsilon.$$

Since $fg = 0$, $f, g \geq 0$, we have $\rho(f+g) = \rho(f) + \rho(g)$. Since $f+g \in C_c(X)$ with $\text{supp } (f+g) \subseteq U$, we obtain:

$$\mu_\rho(U) \geq \rho(f+g) = \rho(f) + \rho(g) \geq \mu_\rho(K) + \mu_\rho(U \setminus K) - 2\epsilon.$$

Therefore, $\mu_\rho(U) \geq \mu_\rho(U \setminus K) + \mu_\rho(K)$. □

Remark 5.3. In the proof of part y9 the only place where we need the fact that X is compact and $D(\rho)$ contains constants is when we use part (ii) of Lemma 4.4 to obtain formula (5.2) in order to get inequality (5.1). If ρ is a quasi-linear functional on a locally compact space then formula (5.2) holds by part (III) of Lemma 3.6, and we again obtain inequality (5.1). Our means of obtaining inequality (5.1) resembles one from [13, Theorem 3.9].

Theorem 5.4. *Suppose X is locally compact, ρ is a d -functional with $C_c(X) \subseteq D(\rho) \subseteq C_b(X)$, and μ_ρ defined in Definition 5.1. Then*

- (i) μ_ρ is a deficient topological measure.
- (ii) If ρ is real-valued on $C_c(X)$, then μ_ρ is compact-finite.
- (iii) If ρ is bounded, then μ_ρ is finite.
- (iv) If X is compact and $D(\rho) = C(X)$ then $\mu_\rho(X) = \rho(1)$.
- (v) If the domain of ρ includes constants, $\rho(1) \in \mathbb{R}$, and ρ is an s -functional satisfying constant condition (4.1) then μ_ρ is a topological measure.
- (vi) If ρ is a quasi-linear functional then μ_ρ is a topological measure.

Proof. (i) Note that since ρ is not identically ∞ , then neither is μ_ρ . By part y1 of Lemma 5.2 μ_ρ is nonnegative. Part y8 of Lemma 5.2 gives (DTM1) of Definition 2.2. Definition 5.1 and part y7 of Lemma 5.2 give regularity conditions (DTM2) and (DTM3) of Definition 2.2. Thus, μ_ρ is a deficient topological measure.

(ii) Follows from part y4 of Lemma 5.2.

(iii) Evident from Definition 5.1.

(iv) See Definition 5.1.

(v) Follows from part y9 (or just inequality (5.1)) of Lemma 5.2 and Theorem 2.6.

(vi) Follows from Remark 5.3 and Theorem 2.6. □

6 Left and right measures

Given a deficient topological measure and a bounded continuous function we may consider four distribution functions.

Definition 6.1. Let μ be a finite deficient topological measure on a locally compact space X . Let $f \in C_b(X)$. Define the following nonnegative functions on \mathbb{R} :

$$\begin{aligned} L_1(t) &= L_{1,\mu,f}(t) = \mu(f^{-1}((-\infty, t))), \\ L_2(t) &= L_{2,\mu,f}(t) = \mu(f^{-1}((-\infty, t])), \\ R_1(t) &= R_{1,\mu,f}(t) = \mu(f^{-1}((t, \infty))), \\ R_2(t) &= R_{2,\mu,f}(t) = \mu(f^{-1}([t, \infty))). \end{aligned}$$

Remark 6.2. For particular μ and f to simplify notations we use L_1, L_2, R_1, R_2 . When we need to emphasize the dependence on μ and f , we use notations $L_{1,\mu,f}, R_{1,\mu,f}$ and so on. When we need to use, say, L_1 as a function of f we denote it by $L_{1,f}$.

Lemma 6.3. Let μ be a finite deficient topological measure on a locally compact space X , $f \in C_b(X)$. Let nonnegative real-valued functions L_1, L_2, R_1, R_2 be as in Definition 6.1. Then

I. Functions L_1, L_2 are non-decreasing; R_1, R_2 are non-increasing. If $f(X) \subseteq [a, b]$ then

$$\begin{aligned} L_1(a) = L_2(a^-) = 0; \quad L_1(b^+) = L_2(b^+) = L_2(b) = \mu(X), \\ R_1(a^-) = R_2(a^-) = R_2(a) = \mu(X); \quad R_1(b) = R_2(b^+) = 0. \end{aligned}$$

II. L_1 is left-continuous, R_1 is right-continuous.

III. $L_1(t^-) = L_2(t^-) = L_1(t)$ for any t . If L_2 is left-continuous at t (in particular, continuous at t) then $L_1(t) = L_2(t)$. Similarly, $R_2(t^+) = R_1(t^+) = R_1(t)$ for any t , and if R_2 is right-continuous at t then $R_1(t) = R_2(t)$. In particular, the set of t where $L_1(t) \neq L_2(t)$ and the set of t where $R_1(t) \neq R_2(t)$ are, at most, countable sets.

IV. $L_1(t) + R_1(t) \leq \mu(X)$ for every t .

V. If X is compact, the function L_2 is right-continuous, and R_2 is left-continuous. If X is locally compact, $f \in C_0(X)$, then $R_2(t)$ is left-continuous at a and any $t > 0$, and $L_2(t)$ is right-continuous at b and any $t < 0$. In particular, R_2 is left-continuous at all t except, possibly, $t \in E$ for some countable set $E \subseteq (-\infty, 0] \setminus \{a\}$ and $L_2(t)$ is right-continuous at all t except, possibly, $t \in E_1$ for some countable set $E_1 \subseteq [0, \infty) \setminus \{b\}$.

Proof. I. Easy to see.

II. The sets $U_s = f^{-1}((-\infty, s))$ are open, $U_s \nearrow U_t$ as $s \rightarrow t^-$, so by Lemma 2.8 L_1 is left-continuous. The argument for R_1 is similar.

III. Let $s < t$. Then $f^{-1}((-\infty, s)) \subseteq f^{-1}((-\infty, s]) \subseteq f^{-1}((-\infty, t))$, and so $L_1(t^-) \leq L_2(t^-) \leq L_1(t) \leq L_2(t)$. By left-continuity of L_1 we have $L_1(t^-) = L_2(t^-) = L_1(t)$; if L_2 is left-continuous at t then $L_1(t) = L_2(t)$. Similarly for R_1 and R_2 .

IV. The sets $f^{-1}((-\infty, t))$ and $f^{-1}((t, \infty))$ are disjoint open sets, so from superadditivity of μ we see that $L_1(t) + R_1(t) \leq \mu(X)$ for every t .

V. If X is compact, the sets $C_a = f^{-1}([a, \infty))$ are compact. From Lemma 2.8 it follows that R_2 is left-continuous. If X is locally compact and $f \in C_0(X)$ then the sets $K_a = f^{-1}([a, \infty))$, $a > 0$ are compact. From Lemma 2.8 it follows that R_2 is left-continuous at any $t > 0$. The assertions about L_2 are proved similarly. \square

Remark 6.4. Let μ be a finite deficient topological measure on a locally compact space X . Let $f \in C_b(X)$ with $f(X) \subseteq [a, b]$. By Theorem 2.9 and part I of Lemma 6.3 the Riemann-Stieltjes integral

$$\int_a^b id dL_1 = - \int_a^b L_1(t)dt + L_1(b^+)b = - \int_a^b L_1(t)dt + b\mu(X).$$

Let l be the Lebesgue-Stieltjes measure associated with L_1 , so l is a regular Borel measure on \mathbb{R} . By part III of Lemma 6.3 we see that

$$\int_a^b id dl = \int_a^b id dL_1 = - \int_a^b L_1(t)dt + b\mu(X) = - \int_a^b L_2(t)dt + b\mu(X).$$

Let r be the Lebesgue-Stieltjes measure associated with $-R_1$, a regular Borel measure on \mathbb{R} . We have:

$$\int_a^b id dr = \int_a^b id d(-R_1) = \int_a^b R_1(t)dt + a\mu(X) = \int_a^b R_2(t)dt + a\mu(X).$$

Definition 6.5. We call l the left measure and r the right measure. When the right and left measures are equal, we set $m = r = l$.

Remark 6.6. The measures r and l arise from functions $R_1 = R_{1,\mu,f}$ and $L_1 = L_{1,\mu,f}$. We use notations $R_{1,f}, r_f, l_f$ when we need to emphasize the dependence of R_1 and measures r, l on the function f . If we want to use measures r and l as functions of f and μ , we write $r_{f,\mu}, l_{f,\mu}$.

When μ is a topological measure, measure m is equal to μ_f in [13] and m_f in [5]. See [5, Remark 28, Sect. 3].

Theorem 6.7. Let μ be a finite deficient topological measure on a locally compact space X , and let $f \in C_0(X)$.

(I) There are regular Borel measures r and l on \mathbb{R} such that $\text{supp } r \subseteq \overline{f(X)}$, $\text{supp } l \subseteq \overline{f(X)}$, $l(\mathbb{R}) = \mu(X)$, $r(\mathbb{R}) = \mu(X)$,

$$r((t, \infty)) = \mu(f^{-1}((t, \infty))) \text{ for all } t,$$

$$r([t, \infty)) = \mu(f^{-1}([t, \infty))) \text{ for all } t \notin E,$$

where $E \subseteq (-\infty, 0]$ is a countable set from part V of Lemma 6.3

$$l((-\infty, t)) = \mu(f^{-1}((-\infty, t))) \text{ for all } t,$$

$$l((-\infty, t]) = \mu(f^{-1}((-\infty, t])) \text{ for all } t \notin E_1,$$

where $E_1 \subseteq [0, \infty)$ is a countable set from part V of Lemma 6.3.

(II) For any open or closed set $A \subseteq \mathbb{R}$

$$\mu(f^{-1}(A)) \leq l(A), \quad \mu(f^{-1}(A)) \leq r(A).$$

Proof. Let $\overline{f(X)} = [a, b]$.

(I) By Lemma 6.3 L_1 is left-continuous, so for every t

$$l((-\infty, t)) = L_1(t) = \mu(f^{-1}((-\infty, t))).$$

Next, using Lemma 2.8

$$l(\mathbb{R}) = \lim_{n \rightarrow \infty} r((-\infty, n)) = \lim_{n \rightarrow \infty} \mu(f^{-1}((-\infty, n))) = \mu(f^{-1}(\mathbb{R})) = \mu(X).$$

If $t \notin E_1$, then L_2 is right-continuous at t . Since $L_2 = L_1$ outside of a countable set, $l((-\infty, t]) = \lim_{s \rightarrow t^+} l((-\infty, s)) = \lim_{s \rightarrow t^+} L_1(s) = \lim_{s \rightarrow t^+} L_2(s) = L_2(t) = \mu(f^{-1}((-\infty, t]))$.

Since L_1 is constant on $(-\infty, a)$ and on (b, ∞) , we see that $l((-\infty, a)) = l((b, \infty)) = 0$. It follows that $\text{suppl} \subseteq [a, b] = f(X)$.

The statements for r can be proved similarly.

(II) Let $(a, b) \subseteq \mathbb{R}, b \notin E$. By the superadditivity of μ and part (I)

$$\begin{aligned} \mu(f^{-1}((a, b))) &\leq \mu(f^{-1}((a, \infty))) - \mu(f^{-1}([b, \infty))) \\ &= r((a, \infty)) - r([b, \infty)) = r((a, b)). \end{aligned}$$

For (a, b) with $b \in E$, choose $b_n \notin E$ such that $(a, b_n) \nearrow (a, b)$. Since by Lemma 2.8 $\mu \circ f^{-1}$ and r are both τ -smooth on open sets, we have $\mu(f^{-1}((a, b))) \leq r((a, b))$ for any (a, b) . We see that $\mu(f^{-1}(J)) \leq r(J)$ for any finite or infinite open interval J . Then the same inequality holds for any open set $W \subseteq \mathbb{R}$.

Now let $C \subseteq \mathbb{R}$ be closed. Then

$$\begin{aligned} \mu(f^{-1}(C)) &\leq \inf\{\mu(f^{-1}(W)) : C \subseteq W, W \in \mathcal{O}(X)\} \\ &\leq \inf\{r(W) : C \subseteq W, W \in \mathcal{O}(X)\} = r(C). \end{aligned}$$

The statements for the left measure l can be proved in a similar way. □

Theorem 6.8. *Let μ be a finite deficient topological measure on a locally compact space. Then $r = l$ iff $L_1(t) + R_1(t) = \mu(X)$ for a.e. t with respect to the Lebesgue measure.*

Proof. Using Remark 6.4 and part IV of Lemma 6.3 we may note that

$$\begin{aligned} r = l &\implies \int_a^b id dL_1 = \int_a^b id d(-R_1) \\ &\iff \int_a^b R_1 dx + a\mu(X) = - \int_a^b L_1 dx + b\mu(X) \end{aligned}$$

$$\begin{aligned} &\iff \int_a^b (L_1 + R_1)dx = (b - a)\mu(X) \\ &\iff L_1 + R_1 = \mu(X) \text{ a.e.,} \end{aligned}$$

where a.e. is with respect to the Lebesgue measure λ .

Conversely, let $L_1(t) + R_1(t) = \mu(X)$ for $t \notin D$, where $\lambda(D) = 0$. We may assume that D contains sets E, E_1 from part V of Lemma 6.3 and all points where $L_1 \neq L_2, R_1 \neq R_2$. If $[a, b] \subseteq \mathbb{R}$ and $a, b \notin E$ then by part (I) of Theorem 6.7 we have:

$$\begin{aligned} l([a, b]) &= l((-\infty, b]) - l((-\infty, a)) = L_2(b) - L_1(a) \\ &= \mu(X) - R_1(b) - \mu(X) + R_2(a) = r([a, \infty)) - r((b, \infty)) = r([a, b]). \end{aligned}$$

An arbitrary interval (a, b) can be written as $\bigcup_{n=1}^{\infty} [a_n, b_n]$, where intervals $[a_n, b_n]$ are ordered by inclusion, and $a_n, b_n \notin E$. It follows that measures $l = r$ on \mathbb{R} . \square

Theorem 6.9. *Let μ be a finite topological measure on a locally compact space X . Let $f \in C_0(X)$. Then for the right and left measures r, l we have $r = l$.*

Proof. Let $f(X) \subseteq [a, b]$. By Theorem 6.8 it is enough to show that there is a countable set D such that $L_1(t) + R_1(t) = \mu(X)$ for all $t \in \mathbb{R} \setminus D$. Let D be the countable (by part III of Lemma 6.3) set consisting of 0 and all points where $L_1 \neq L_2, R_1 \neq R_2$. If $t > 0$ then $f^{-1}([t, \infty))$ is compact, and it follows from (TM1) of Definition 2.4 that $L_1(t) + R_2(t) = \mu(X)$. $R_1(t) = R_2(t)$ for $t \in (0, \infty) \setminus D$, so $L_1(t) + R_1(t) = L_1(t) + R_2(t) = \mu(X)$. Similarly, for all $t \in (-\infty, 0) \setminus D$ we have $L_1(t) + R_1(t) = L_2(t) + R_1(t) = \mu(X)$. \square

Theorem 6.10. *Let μ be a finite topological measure on a locally compact space X , and let regular Borel measure $m = r = l$.*

(I) *If $f \in C_0(X)$, then $m(A) = \mu(f^{-1}(A))$ for any open set $A \subseteq \mathbb{R}$ and any closed set $A \subseteq \mathbb{R} \setminus \{0\}$.*

(II) *If X is compact, $f \in C(X)$ then $m(A) = \mu(f^{-1}(A))$ for any open or closed set $A \subseteq \mathbb{R}$.*

Proof. (I) First let $(a, b) \in \mathbb{R}, b \neq 0$. Note that in

$$f^{-1}((a, \infty)) = f^{-1}((a, b)) \sqcup f^{-1}(\{b\}) \sqcup f^{-1}((b, \infty)),$$

all the sets are open except for the middle set on the right hand side, which is compact since $f \in C_0(X)$. Applying μ we obtain

$$R_1(a) = \mu(f^{-1}((a, b))) + \mu(f^{-1}(\{b\})) + \mu(f^{-1}((b, \infty))) \quad (6.1)$$

Since $f^{-1}((b, \infty)) \sqcup f^{-1}(\{b\}) \subseteq f^{-1}((t, \infty))$ for any $t < b$, by superadditivity (see Lemma 2.8) we have:

$$\mu(f^{-1}(\{b\})) + \mu(f^{-1}((b, \infty))) \leq \mu(f^{-1}((t, \infty))) = R_1(t).$$

Thus, from (6.1) we see that $R_1(a) \leq \mu(f^{-1}((a, b))) + R_1(t)$. As $t \rightarrow b^-$ we have:

$$m((a, b)) = R_1(a) - R_1(b^-) \leq \mu(f^{-1}((a, b))).$$

Together with part (II) of Theorem 6.7 we obtain $m((a, b)) = \mu(f^{-1}((a, b)))$ for any interval (a, b) , $b \neq 0$. An interval $(a, 0) = \cup_{n=1}^{\infty} (a, -\frac{1}{n})$. Since both μ and m are τ -smooth and additive on open sets (see Lemma 2.8), the result holds for any finite open interval in \mathbb{R} , and then for any open set in \mathbb{R} . Below in (III) we shall prove that $\mu(f^{-1}(C)) = m(C)$ for closed sets in $\mathbb{R} \setminus \{0\}$.

(II) The set $f^{-1}([d, \infty))$ is compact for every d , and the argument as in part (I) shows that $m(W) = \mu(f^{-1}(W))$ for every open set $W \subseteq \mathbb{R}$.

Now let $C \subseteq \mathbb{R}$ be closed. Choose $W \in \mathcal{O}(X)$ such that $C \subseteq W$. Since $f^{-1}(C)$ is compact and μ is a topological measure,

$$\begin{aligned} m(W) - \mu(f^{-1}(C)) &= \mu(f^{-1}(W)) - \mu(f^{-1}(C)) \\ &= \mu(f^{-1}(W \setminus C)) = m(W \setminus C). \end{aligned}$$

Thus $\mu(f^{-1}(C)) = m(C)$.

(III) Now we shall finish the proof of part (I). Let $C \in \mathbb{R} \setminus \{0\}$. Set $C_1 = C \cap (0, \infty)$ and $C_2 = C \cap (-\infty, 0)$. We have $C = C_1 \sqcup C_2$, and $b = \inf C_1 > 0$. Since $f^{-1}(C_1) \subseteq f^{-1}([b, \infty))$, the set $f^{-1}(C_1)$ is compact. An argument similar to the one in part (II) shows that $\mu(f^{-1}(C_1)) = m(C_1)$. Similarly, $\mu(f^{-1}(C_2)) = m(C_2)$, and so by finite additivity of μ and m on compact sets $\mu(f^{-1}(C)) = m(C)$. □

Lemma 6.11. *Let μ be a finite deficient topological measure on a locally compact space X .*

I. *If μ is a simple deficient topological measure, then measures r and l are point masses, $l = \delta_a$, $r = \delta_b$, $b \leq a$, where*

$$a = \inf\{t : L_1(t) = 1\} = \sup\{s : L_1(s) = 0\},$$

$$b = \inf\{t : R_1(t) = 0\} = \sup\{s : R_1(s) = 1\}.$$

II. *If X is compact and $f = c$ is a constant function, then the measure $m = \mu(X)\delta_c$, where δ_c is a point mass at c .*

Proof. I. Since μ is simple, the non-decreasing function L_1 assumes only two values, and has single discontinuity at $a = \inf\{t : L_1(t) = 1\} = \sup\{s : L_1(s) = 0\}$. Since $l(\{a\}) = L_1(a^+) - L_1(a^-) = 1$, we see that $l = \delta_a$. Similarly, $r = \delta_b$, where $b = \inf\{t : R_1(t) = 0\} = \sup\{s : R_1(s) = 1\}$.

If $a < b$ then $L_1(t) + R_1(t) = 2$ on interval (a, b) , which contradicts part IV of Lemma 6.3. Thus, $b \leq a$.

II. We have $R_1(t) = \mu(X)$ for every $t < c$, and $R_1(t) = 0$ for every $t \geq c$. Then $m(\{c\}) = r(\{c\}) = R_1(c^-) - R_1(c^+) = \mu(X)$. □

Example 1. Let $X = \mathbb{R}$, $D = [0, 1]$ and μ be a simple deficient topological measure as in [4, Example 48, Sect. 6], i.e. $\mu(A) = 1$ if $D \subseteq A$ and $\mu(A) = 0$ otherwise, where $A \in \mathcal{O}(X) \cup \mathcal{K}(X)$. Consider the following $f \in C_0(X) : f(0) = 1, f(t) = 0$ for $t \in (-\infty, -1] \cup [1, \infty)$, and

f is linear on $[-1, 0]$ and $[0, 1]$. Note that $D \subseteq f^{-1}((-\infty, t))$ iff $t > 1$, and $D \subseteq f^{-1}((t, \infty))$ iff $t < 0$. Thus,

$$L_1(t) = \begin{cases} 1 & \text{if } t > 1 \\ 0 & \text{if } t \leq 1 \end{cases}$$

and

$$R_1(t) = \begin{cases} 1 & \text{if } t < 0 \\ 0 & \text{if } t \geq 0 \end{cases}$$

So $l = \delta_1$ and $r = \delta_0$.

Example 2. Let $X = \mathbb{R}$, the family $\mathcal{E} = \{D = [1, 2]\}$, $\lambda_0 = \delta_{3/2}$. Let $\mu = \lambda^+$ as in [4, Example 49, Sect. 6]. Consider the following $f \in C_0(X) : f(0) = 2, f(t) = 1$ for $t \in [1, 2], f(t) = 0$ for $t \in (-\infty, -1] \cup [3, \infty)$, and f is linear on $[-1, 0], [0, 1]$, and $[2, 3]$. Note that $D \subseteq f^{-1}((-\infty, t))$ iff $t > 1$, and $D \subseteq f^{-1}((t, \infty))$ iff $t < 1$. It follows that

$$L_1(t) = \lambda^+(f^{-1}((-\infty, t))) = \begin{cases} 1 & \text{if } t > 1 \\ 0 & \text{if } t \leq 1 \end{cases}$$

and

$$R_1(t) = \lambda^+(f^{-1}((t, \infty))) = \begin{cases} 1 & \text{if } t < 1 \\ 0 & \text{if } t \geq 1 \end{cases}$$

Thus, for measures l, r we have $l = r = \delta_1$.

Remark 6.12. In Theorem 6.7 it is stated that $\text{suppl}, \text{suppr} \subseteq f(X)$. In Example 1 and Example 2 suppl and suppr are properly contained in $f(X)$. On the other hand, from part II of Lemma 6.11 we see that it is also possible to have $\text{suppl} = \text{suppr} = f(X)$.

Remark 6.13. From part IV of Lemma 6.3 we know that $L_1(t) + R_1(t) \leq \mu(X)$. Although $L_1(t) + R_1(t) = \mu(X)$ a.e. when μ is a finite topological measure (see Theorems 6.8 and 6.9), for deficient topological measures we may have both situations: in Example 2 $L_1(t) + R_1(t) = \mu(X)$ a.e., but in Example 1 we have $L_1(t) + R_1(t) = 0 < \mu(X)$ for $t \in (0, 1)$.

In Lemma 6.11 we have $b \leq a$. Example 1 and Example 2 show that both situations when $b < a$ and $b = a$ are possible. These examples also show that when μ is a deficient topological measure, we can have both situations for measures l and r induced by μ and a given function f : when $l = r$ and when $l \neq r$.

7 Functionals from deficient topological measures

When μ is a finite deficient topological measure (not a topological measure) the measures r, l are not equal in general, and we consider two different integrals:

$$\int_a^b id \, dl$$

and

$$\int_a^b id \, dr.$$

Definition 7.1. Let μ be a finite deficient topological measure on a locally compact space X , and let measures $r = r_{f,\mu}, l = l_{f,\mu}, m = m_{f,\mu}$ be as in Definition 6.5, Remark 6.4, and Remark 6.6. Define the following functionals on $C_b(X)$:

$$\mathcal{R}(f) = \mathcal{R}_\mu(f) = \int_{\mathbb{R}} id \, dr,$$

$$\mathcal{L}(f) = \mathcal{L}_\mu(f) = \int_{\mathbb{R}} id \, dl,$$

and

$$\rho(f) = \rho_\mu(f) = \int_{\mathbb{R}} id \, dm.$$

Remark 7.2. By Theorem 6.7 $\text{supp } r, \text{supp } l \subseteq \overline{f(X)}$, so for any $[a, b]$ containing $f(X)$

$$\mathcal{R}(f) = \int_{\mathbb{R}} id \, dr = \int_{[a,b]} id \, dr, \quad \mathcal{L}(f) = \int_{[a,b]} id \, dl, \quad \rho(f) = \int_{[a,b]} id \, dm.$$

With functions L_1, L_2, R_1, R_2 as in Definition 6.1 by Remark 6.4 we have:

$$\mathcal{L}(f) = \int_{\mathbb{R}} id \, dl = \int_a^b id \, dl = - \int_a^b L_1(t) dt + b\mu(X) = - \int_a^b L_2(t) dt + b\mu(X). \quad (7.1)$$

$$\mathcal{R}(f) = \int_{\mathbb{R}} id \, dr = \int_a^b id \, dr = \int_a^b R_1(t) dt + a\mu(X) = \int_a^b R_2(t) dt + a\mu(X). \quad (7.2)$$

If $f = c$ is a constant function then

$$\mathcal{R}(f) = \mathcal{L}(f) = c\mu(X). \quad (7.3)$$

If f is nonnegative with $f(X) \subseteq [0, b]$ we have:

$$\mathcal{R}(f) = \int_0^b id \, dr = \int_0^b R_1(t) dt = \int_0^b R_2(t) dt. \quad (7.4)$$

When $r = l$ (in particular, when μ is a topological measure) and $f(X) \subseteq [0, b]$ we have

$$\rho(f) = \int_0^b id \, dm = \int_0^b R_1(t) dt = \int_0^b R_2(t) dt.$$

Similarly, if f is nonpositive with $f(X) \subseteq [a, 0]$ we have:

$$\mathcal{L}(f) = \int_a^0 id \, dl = - \int_a^0 L_1(t) dt = - \int_a^0 L_2(t) dt. \quad (7.5)$$

When $r = l$ (in particular, when μ is a topological measure) and $f(X) \subseteq [a, 0]$ we have

$$\rho(f) = \int_a^0 id \, dm = - \int_a^0 L_1(t) dt = - \int_a^0 L_2(t) dt.$$

Remark 7.3. Note that when μ is a topological measure, we obtain familiar formulas. See, for example, [13, Proposition 3.7] and [5, Remark 43, Section 5]. These results were, in turn, generalizations of results first obtained by J. F. Aarnes for compact spaces in [1]. For example, when X is compact and $\mu(X) = 1$, formula (7.2) gives [1, formula (3.3)].

Remark 7.4. We have the connection between \mathcal{R} and \mathcal{L} (which is the same as noted in [15, p. 739]). We use notations as in Remark 6.6. Observe that $R_{1,f}(-t) = L_{1,-f}(t)$. Thus, $l_{-f} = r_f \circ T^{-1}$, where $T(t) = -t$ for $t \in \mathbb{R}$. Then $\int_{\mathbb{R}} id dl_{-f} = - \int_{\mathbb{R}} id dr_f$, i.e.

$$\mathcal{L}(-f) = -\mathcal{R}(f). \quad (7.6)$$

We may prove results for \mathcal{R} and obtain similar results for \mathcal{L} by analogy (as we did, for example, in Theorem 6.7) or using relation (7.6).

Definition 7.5. Let \mathcal{R} be the functional as in Definition 7.1. We call the functional \mathcal{R} a quasi-integral (with respect to a deficient topological measure μ) and write:

$$\int_X f d\mu = \mathcal{R}(f) = \mathcal{R}_\mu(f) = \int_{\mathbb{R}} id dr.$$

Remark 7.6. If μ is a topological measure on X , by Definitions 7.1 and 6.5 we obtain exactly the quasi-integral in [5, Definition 27, Section 3].

Lemma 7.7. Let \mathcal{L}, \mathcal{R} be functionals as in Definition 7.1.

- (i) \mathcal{R} is orthogonally additive on nonnegative functions, and \mathcal{L} is orthogonally additive on nonpositive functions.
- (ii) $\mathcal{R}(0) = 0$ and $\mathcal{L}(0) = 0$.
- (iii) \mathcal{L}, \mathcal{R} are positive-homogeneous functionals.
- (iv) \mathcal{L}, \mathcal{R} are monotone. In particular, \mathcal{L}, \mathcal{R} are positive.

Proof. We use notations as indicated in Remark 6.6.

- (i) Let $f, g \geq 0$ and $fg = 0$. Say, $f(X), g(X) \subseteq [0, b]$. For any $t > 0$ observe that $(f + g)^{-1}((t, \infty)) = f^{-1}((t, \infty)) \sqcup g^{-1}((t, \infty))$, so by additivity of a deficient topological measure on disjoint open sets we immediately obtain $R_{1,f+g}(t) = R_{1,f}(t) + R_{1,g}(t)$. Since $(f + g)(X) \subseteq [0, b]$, from (7.4) we have $\mathcal{R}(f + g) = \mathcal{R}(f) + \mathcal{R}(g)$. Thus, \mathcal{R} is orthogonally additive on nonnegative functions. Then orthogonal additivity of \mathcal{L} on nonpositive functions follows from (7.6).
- (ii) Follows from part (i) or from (7.4) and (7.5).
- (iii) If $c = 0$ then from (ii) we see that $\mathcal{R}(cf) = \mathcal{L}(cf) = 0$. Let $c > 0$. Since $L_{1,cf}(t) = L_{1,f}(t/c)$, from (7.1) we see that $\mathcal{L}(cf) = c\mathcal{L}(f)$. One can show that \mathcal{R} is also positive-homogeneous in a similar way using (7.2) or using positive-homogeneity of \mathcal{L} together with formula (7.6).
- (iv) Suppose that $f \leq g$. Choose an interval $[a, b]$ which contains both $f(X)$ and $g(X)$. Since $L_{1,f} \geq L_{1,g}$ and $R_{1,f} \leq R_{1,g}$, from (7.1) and (7.2) we see that $\mathcal{L}(f) \leq \mathcal{L}(g)$ and $\mathcal{R}(f) \leq \mathcal{R}(g)$.

□

Lemma 7.8. *If $h = \phi \circ f \in A^+(f)$ and $[a, b]$ is any interval containing $f(X)$ then*

$$\mathcal{R}(h) = \int_{[a,b]} \phi dr_f.$$

Similarly, if $h = \phi \circ f \in A^-(f)$ then

$$\mathcal{L}(h) = \int_{[a,b]} \phi dl_f.$$

Proof. Let r_f, r_h be the right measures for functions f and h as in Theorem 6.7, r_f is supported on $\overline{f(X)} \subseteq [a, b]$. Since ϕ is nondecreasing, for any interval (t, ∞) we have $\phi^{-1}((t, \infty)) = (s, \infty)$, where $s = \min\{y \in [a, b] : \phi(y) = t\}$. (This is similar to [15, Proposition 13(1)].) Then

$$\begin{aligned} r_h((t, \infty)) &= \mu(h^{-1}((t, \infty))) = \mu(f^{-1}(\phi^{-1}((t, \infty)))) \\ &= \mu(f^{-1}((s, \infty))) = r_f((s, \infty)) = (r_f \circ \phi^{-1})((t, \infty)). \end{aligned}$$

Thus, $r_h = r_f \circ \phi^{-1}$ are equal as measures. Using formula (7.2) we have:

$$\mathcal{R}(h) = \int_{\mathbb{R}} id dr_h = \int_{[a,b]} \phi dr_f.$$

The formula $\mathcal{L}(h) = \int_{[a,b]} \phi dl_f$ can be proved in a similar way. □

Lemma 7.9. *The functional \mathcal{R} is conic-linear on each cone $A^+(f)$, and the functional \mathcal{L} is conic-linear on each cone $A^-(f)$.*

Proof. Suppose $h, g \in A^+(f)$, $h = \phi \circ f, g = \psi \circ f, \overline{f(X)} \subseteq [a, b]$. Applying Lemma 7.8 we have:

$$\begin{aligned} \mathcal{R}(h + g) &= \mathcal{R}(\phi \circ f + \psi \circ f) = \mathcal{R}((\phi + \psi) \circ f) = \int_{[a,b]} (\phi + \psi) dr_f \\ &= \int_{[a,b]} \phi dr_f + \int_{[a,b]} \psi dr_f = \mathcal{R}(h) + \mathcal{R}(g). \end{aligned}$$

Since by Lemma 7.7 \mathcal{R} is also positive-homogeneous, we see that \mathcal{R} is conic-linear on $A^+(f)$ for each f . The statements for \mathcal{L} can be proved similarly. □

Theorem 7.10. (i) *The functional \mathcal{R} is a p -conic quasi-linear functional, and the functional \mathcal{L} is an n -conic quasi-linear functional.*

(ii) *The functional \mathcal{R} is an r -functional, and \mathcal{L} is an l -functional.*

Proof. (i) Follows from Lemma 7.7 and Lemma 7.9.

(ii) Apply Lemma 4.18. □

Remark 7.11. When μ is a topological measure, the functional $\rho = \rho_\mu$ is a quasi-linear functional (see [5, Theorem 30, Section 3]), so ρ is linear on each singly generated subalgebra. Theorem 7.10 gives an analog of this for the case when μ is a deficient topological measure: if μ is a deficient topological measure, then the functional \mathcal{R} obtained from μ is p-conic linear, so, in particular, it is conic-linear on the cone $A^+(f)$ for each f .

The next lemma shows properties that relate \mathcal{R} and μ .

Lemma 7.12. *Let μ be a finite deficient topological measure, and \mathcal{R}, \mathcal{L} be functionals on $C_0(X)$ obtained from μ as in Definition 7.1.*

z1. *If $U \in \mathcal{O}(X)$ and $f \in C(X)$ is such that $\text{supp } f \subseteq U$, $0 \leq f \leq 1$ then $\mathcal{R}(f) \leq \mu(U)$.*

z2. *If $C \in \mathcal{C}(X)$ and f is such that $0 \leq f \leq 1$, $f = 1$ on C , then $\mathcal{R}(f) \geq \mu(C)$.*

z3. *For any $f \in C_0(X)$*

$$\mu(X) \cdot \inf_{x \in X} f(x) \leq \mathcal{R}(f) \leq \mu(X) \cdot \sup_{x \in X} f(x).$$

Similarly,

$$\mu(X) \cdot \inf_{x \in X} f(x) \leq \mathcal{L}(f) \leq \mu(X) \cdot \sup_{x \in X} f(x).$$

Hence, $\|\mathcal{R}\|, \|\mathcal{L}\| \leq \mu(X)$.

z4. *If $U \in \mathcal{O}(X)$ then $\mu(U) = \sup\{\mathcal{R}(f) : f \in C_c(X), 0 \leq f \leq 1, \text{supp } f \subseteq U\}$.*

z5. *If $K \in \mathcal{K}(X)$ then $\mu(K) = \inf\{\mathcal{R}(g) : g \in C_c(X), g \geq 1_K\}$.*

z6. *If $K \in \mathcal{K}(X)$ then*

$$\begin{aligned} \mu(K) &= \inf\{\mathcal{R}(g) : g \in C_c(X), g \geq 1_K, 0 \leq g \leq 1\} \\ &= \inf\{\mathcal{R}(g) : g \in C_0(X), g \geq 1_K\} \\ &= \inf\{\mathcal{R}(g) : g \in C_0(X), g \geq 1_K, 0 \leq g \leq 1\}. \end{aligned}$$

z7. *$\|\mathcal{R}\| = \mu(X) = \|\mathcal{L}\|$, so $|\mathcal{R}(f)| \leq \|\mathcal{R}\| \|f\|$ and $|\mathcal{L}(f)| \leq \|\mathcal{L}\| \|f\|$.*

z8. *If $f, g \in C_c(X)$, $f, g \geq 0$, $\text{supp } f, \text{supp } g \subseteq K$ where K is compact, then*

$$|\mathcal{R}(f) - \mathcal{R}(g)| \leq \|f - g\| \mu(K).$$

If X is compact we also have:

(i) *If c is a constant then $\mathcal{R}(c) = c\mu(X)$ and, hence, $\mathcal{R}(f + c) = \mathcal{R}(f) + c\mu(X)$.*

(ii) *For any functions $f, g \in D(\rho)$*

$$|\mathcal{R}(f) - \mathcal{R}(g)| \leq \mathcal{R}(1) \|f - g\| = \mu(X) \|f - g\|.$$

Proof. By Theorem 6.7, if $0 \leq f \leq 1$ then $\text{supp } f \subseteq [0, 1]$.

z1. Using formula (7.2) and part (I) of Theorem 6.7, we have: $\mathcal{R}(f) = \int_{\mathbb{R}} id \, dr \leq 1 \cdot r(\{t : t > 0\}) = \mu(f^{-1}(0, \infty)) \leq \mu(U)$.

z2. Using part (I) of Theorem 6.7 we have:

$$\mathcal{R}(f) = \int_{\mathbb{R}} id \, dr \geq 1 \cdot r(\{t : t = 1\}) = \mu(f^{-1}([1, \infty))) \geq \mu(C).$$

z3. Let $a = \inf_{x \in X} f(x)$, $b = \sup_{x \in X} f(x)$. It is enough to assume $a \notin E$ (see part (I) of Theorem 6.7), for otherwise we may take $a_n \nearrow a, a_n \notin E$. Then

$$\begin{aligned} a\mu(X) &= a\mu(f^{-1}([a, \infty))) = ar([a, \infty)) = ar([a, b]) \\ &\leq \int_a^b id \, dr = \mathcal{R}(f) \leq br([a, \infty)) = b\mu(X). \end{aligned}$$

Because of formula (7.6), the statement for $\mathcal{L}(f)$ also holds.

z4. By part z1, $\sup\{\mathcal{R}(f) : f \in C_c(X), 0 \leq f \leq 1, \text{supp } f \subseteq U\} \leq \mu(U)$. For $\epsilon > 0$ choose $K \in \mathcal{K}(X)$ such that $\mu(U) - \mu(K) < \epsilon$. Pick $f \in C_c(X)$ such that $0 \leq f \leq 1$, $\text{supp } f \subseteq U$, $f = 1$ on K . Then by part z2 $\mathcal{R}(f) \geq \mu(K) \geq \mu(U) - \epsilon$. It follows that $\sup\{\mathcal{R}(f) : f \in C_c(X), 0 \leq f \leq 1, \text{supp } f \subseteq U\} = \mu(U)$.

z5. Take any $U \in \mathcal{O}(X)$ containing K . Taking an Urysohn function f such that $f = 1$ on K , $\text{supp } f \subseteq U$ and using part z1 we see that $\inf\{\mathcal{R}(g) : g \in C_c(X), g \geq 1_K\} \leq \mathcal{R}(f) \leq \mu_\rho(U)$. Taking the infimum over all open sets containing K we have:

$$\inf\{\mathcal{R}(g) : g \in C_c(X), g \geq 1_K\} \leq \mu_\rho(K).$$

To prove the opposite inequality, take any $g \in C_c(X)$ such that $g \geq 1_K$. Let $0 < \delta < 1$. Let

$$U = \{x : g(x) > 1 - \delta\}.$$

Then U is open and $K \subseteq U$. Consider function $h = \inf\{g, 1 - \delta\}$, so $h \in C_c(X)$. Since $0 \leq h \leq g$ we have $\mathcal{R}(h) \leq \mathcal{R}(g)$. Because $\frac{h}{1 - \delta} = 1$ on U , for any function $f \in C_c(X)$, $0 \leq f \leq 1, \text{supp } f \subseteq U$ we have $f \leq \frac{h}{1 - \delta}$ and so by parts (iii) and (iv) of Lemma 7.7

$$\mathcal{R}(f) \leq \mathcal{R}\left(\frac{h}{1 - \delta}\right) = \frac{\mathcal{R}(h)}{1 - \delta} \leq \frac{\mathcal{R}(g)}{1 - \delta}.$$

Then

$$\begin{aligned} \mu(K) &\leq \mu(U) = \sup\{\mathcal{R}(f) : f \in C_c(X), 0 \leq f \leq 1_U, \text{supp } f \subseteq U\} \\ &\leq \frac{\mathcal{R}(g)}{1 - \delta}. \end{aligned}$$

Thus, for any $g \in C_c(X)$ such that $g \geq 1_K$ and any $0 < \delta < 1$

$$(1 - \delta)\mu(K) \leq \mathcal{R}(g).$$

Therefore, $\mu(K) \leq \inf\{\mathcal{R}(g) : g \in C_b(X), g \geq 1_K\}$.

z6. In the argument for part z5 we may use, respectively, $g \in C_c(X), g \geq 1_K, 0 \leq g \leq 1$ or $g \in C_0(X), g \geq 1_K$ or $g \in C_0(X), g \geq 1_K, 0 \leq g \leq 1$.

z7. By part z4 we see that $\mu(X) \leq \| \mathcal{R} \|$. Using also part z3 we have $\| \mathcal{R} \| = \mu(X)$, and by formula (7.6) also $\| \mathcal{L} \| = \mu(X)$.

z8. It is enough to consider $K = \text{supp } f \cup \text{supp } g$. For any function $h \in C_c(X)$ such that $h \geq 0, h = 1$ on K as in formula (3.1) in the proof of part (V) of Lemma 3.6 we have:

$$|\mathcal{R}(f) - \mathcal{R}(g)| \leq \| f - g \| \mathcal{R}(h).$$

Taking the infimum over functions h , by part z5 we obtain the assertion.

(i) By formula (7.3), $\mathcal{R}(c) = c\mu(X)$, and the rest of the statement follows from Theorem 7.10.

(ii) Since \mathcal{R} is monotone, an r-functional, and $\mu(X) = \| \mathcal{R} \| = \mathcal{R}(1)$ the statement follows from Remark 4.5.

□

Remark 7.13. The proof of part z5 is similar to the one for [5, Lemma 35(p4), Sect. 4], which, in turn, follows a proof from [9].

Remark 7.14. Part z8 of Lemma 7.12 means that on $C_0^+(X)$ the functional \mathcal{R} is continuous with respect to topology of uniform convergence on compacta.

Definition 7.15. Let f be a continuous function on X on a locally compact space X . Consider the σ -algebra of subsets of X

$$\Sigma_f = f^{-1}(\mathcal{B}(\mathbb{R})),$$

where $\mathcal{B}(\mathbb{R})$ are the Borel subsets of \mathbb{R} . Let r, l, m be measures on \mathbb{R} as in Theorem 6.7. On Σ_f define measure n_r, n_l, n by setting for each $E \in \Sigma_f$

$$n_r(E) = r(f(E)), \quad n_l(E) = l(f(E)), \quad n(E) = m(f(E))$$

Remark 7.16. Definition 7.15 leads to another way to represent functionals \mathcal{R} and \mathcal{L} . Let Σ_f and measures n_r, n_l be as in Definition 7.15. Then for any set $D \in \mathcal{B}(\mathbb{R})$ we have:

$$n_r \circ f^{-1}(D) = r(f(f^{-1}(D))) = r(D), \quad n_l \circ f^{-1}(D) = l(D),$$

i.e.

$$n_r \circ f^{-1} = r, \quad n_l \circ f^{-1} = l \text{ and } n \circ f^{-1} = m \text{ on } \mathcal{B}(\mathbb{R}). \quad (7.7)$$

By formula (7.2)

$$\mathcal{R}(f) = \int_{\mathbb{R}} id \, dr = \int_{\mathbb{R}} id \, d(n_r \circ f^{-1}) = \int_X f \, dn_r,$$

i.e.

$$\mathcal{R}(f) = \int_X f \, dn_r.$$

Similarly,

$$\mathcal{L}(f) = \int_X f \, dn_l.$$

Lemma 7.17. *Let μ be a finite deficient topological measure on a locally compact space X , $f \in C_0(X)$, and n_r, n_l be measures defined in Definition 7.15.*

(i) $n_r(f^{-1}((t, \infty))) = \mu(f^{-1}((t, \infty)))$ for all t ,

$$n_r(f^{-1}([t, \infty))) = \mu(f^{-1}([t, \infty))) \text{ for all } t \notin E,$$

where $E \subseteq (-\infty, 0]$ is a countable set from part V of Lemma 6.3;

$$n_l(f^{-1}((-\infty, t))) = \mu(f^{-1}((-\infty, t))) \text{ for all } t,$$

$$n_l(f^{-1}((-\infty, t])) = \mu(f^{-1}((-\infty, t])) \text{ for all } t \notin E_1,$$

where $E_1 \subseteq [0, \infty)$ is a countable set from part V of Lemma 6.3.

(ii) For any open or closed set $A \subseteq \mathbb{R}$

$$\mu(f^{-1}(A)) \leq n_r(f^{-1}(A)), \quad \mu(f^{-1}(A)) \leq n_l(f^{-1}(A)).$$

(iii) If μ is a finite topological measure and $f \in C_0(X)$, then also $n(f^{-1}(A)) = \mu(f^{-1}(A))$ for any open or closed set $A \subseteq \mathbb{R} \setminus \{0\}$.

(iv) If μ is a finite topological measure and X is compact, then $n(f^{-1}(A)) = \mu(f^{-1}(A))$ for any open or closed set $A \subseteq \mathbb{R}$.

Proof. Follows from (7.7), Theorem 6.7, and Theorem 6.10. □

Remark 7.18. Definition 7.15 and Remark 7.16 were first observed for the case of the compact space X by M. Svistula, see [15, (3.4)].

8 Representation Theorems for deficient topological measures

Theorem 8.1 (Representation theorem). *Let μ be a finite deficient topological measure on a locally compact space X .*

(i) *Then there exists a unique p -conic quasi-linear functional \mathcal{R} on $C_0^+(X)$ of finite norm such that $\mu = \mu_{\mathcal{R}}$ and $\|\mathcal{R}\| = \mu(X)$. In fact, $\mathcal{R} = \mathcal{R}_{\mu}$.*

(ii) *If X is compact, the unique functional \mathcal{R} can be taken to be a real-valued r -functional on $C(X)$.*

Here \mathcal{R}_{μ} and $\mu_{\mathcal{R}}$ are as in Definition 7.1 and Definition 5.1.

Proof. (i) Let μ be a finite deficient topological measure on a locally compact space X , and let $\mathcal{R} = \mathcal{R}_{\mu}$ be a functional on $C_0^+(X)$ obtained from μ as in Definition 7.1. Note that \mathcal{R} is a d -functional by Theorem 7.10 and Remark 4.17. Then $\mu_{\mathcal{R}}$ defined as in Definition 5.1 from \mathcal{R} is a deficient topological measure by Theorem 5.4. From part y4 of Lemma 5.2 and part z5 of Lemma 7.12 we see that $\mu(K) = \mu_{\mathcal{R}}(K)$ for every compact K . Thus, $\mu = \mu_{\mathcal{R}}$. By part z7 of Lemma 7.12 $\mu(X) = \|\mathcal{R}\|$.

Now we shall show the uniqueness. Let η be another p -conic quasi-linear functional on $C_0^+(X)$ of finite norm such that $\mu_{\eta} = \mu_{\mathcal{R}}$. Then for some $a \geq 1$

$$\|\eta\| \leq a\mu(X).$$

Let $f \in C_0^+(X)$. Both ρ and η are positive-homogeneous, so we may assume that $\overline{f(X)} = [0, 1]$. For $n \in \mathbb{N}$ let $t_i = i/n$, $i = 0, \dots, n$. For $i = 1, \dots, n$ consider functions ϕ_i defined as follows:

$$\phi_i(t) = \begin{cases} 0 & \text{if } t \leq t_{i-1} \\ t - t_{i-1} & \text{if } t_{i-1} < t < t_i \\ \frac{1}{n} & \text{if } t \geq t_i. \end{cases}$$

With functions $f_i = \phi_i \circ f$ we have $f = \sum_{i=1}^n f_i$. Since each ϕ_i is non-decreasing, and $\phi_i(0) = 0$, each $f_i \in A^+(f)$. Since \mathcal{R} and η are both p-conic quasi-linear functionals, we have

$$\mathcal{R}(f) = \mathcal{R}\left(\sum_{i=1}^n f_i\right) = \sum_{i=1}^n \mathcal{R}(f_i), \quad \eta(f) = \sum_{i=1}^n \eta(f_i). \quad (8.1)$$

By part z1 of Lemma 7.12 $\mathcal{R}(nf_1) \leq \mu(X)$, so $0 \leq \mathcal{R}(f_1) \leq \frac{1}{n}\mu(X) \leq \frac{a}{n}\mu(X)$. We have $0 \leq \eta(nf_1) \leq \|\eta\| \leq a\mu(X)$, i.e. $0 \leq \eta(f_1) \leq \frac{a}{n}\mu(X)$. Thus,

$$|\mathcal{R}(f_1) - \eta(f_1)| \leq \frac{a\mu(X)}{n}. \quad (8.2)$$

For each $i = 2, \dots, n$ let $K_i = f^{-1}([t_i, \infty))$, $V_i = f^{-1}((t_{i-1}, \infty))$. Choose an open set $U_i \subseteq V_i$ such that $\mu(U_i) - \mu(K_i) < \frac{1}{n}$ and then pick an Urysohn function $g_i \in C_c(X)$ such that $0 \leq g_i \leq \frac{1}{n}$, $g_i = \frac{1}{n}$ on K_i and $\text{supp } g_i \subseteq U_i \subseteq V_i$. Since $ng_i = 1$ on K and $\mu = \mu_{\mathcal{R}} = \mu_{\eta}$, by part y4 of Lemma 5.2 and Definition 5.1 $\mu(K_i) \leq \mathcal{R}(ng_i)$, $\eta(ng_i) \leq \mu(U_i)$, and so $|\mathcal{R}(ng_i) - \eta(ng_i)| \leq \mu(U_i) - \mu(K_i) \leq \frac{1}{n}$. Then

$$|\mathcal{R}(g_i) - \eta(g_i)| \leq \frac{1}{n^2}. \quad (8.3)$$

Let $g = \sum_{i=2}^n g_i$, $h = \sum_{i=2}^n f_i$. Since $\text{supp } (g_3 + \dots + g_n) \subseteq K_2$ and $g_2 = 1$ on K_2 , by part (III) of Lemma 3.6 $\rho(g_2 + g_3 + \dots + g_n) = \rho(g_2) + \rho(g_3 + \dots + g_n)$. Similarly for η . By induction

$$\mathcal{R}(g) = \sum_{i=2}^n \mathcal{R}(g_i), \quad \eta(g) = \sum_{i=2}^n \eta(g_i). \quad (8.4)$$

Then

$$|\mathcal{R}(g) - \eta(g)| \leq \sum_{i=2}^n |\mathcal{R}(g_i) - \eta(g_i)| \leq \frac{n-1}{n^2} < \frac{1}{n}. \quad (8.5)$$

Note that $\|g - h\| \leq \frac{1}{n}$, so by part (V) of Lemma 3.6

$$|\mathcal{R}(g) - \mathcal{R}(h)| \leq \frac{\mu(X)}{n}, \quad |\eta(g) - \eta(h)| \leq \frac{a\mu(X)}{n}. \quad (8.6)$$

Using (8.2), (8.6), and (8.5) we obtain:

$$|\mathcal{R}(f) - \eta(f)| \leq |\mathcal{R}(f_1) - \eta(f_1)| + |\mathcal{R}(h) - \eta(h)|$$

$$\begin{aligned}
&\leq |\mathcal{R}(f_1) - \eta(f_1)| + |\mathcal{R}(h) - \mathcal{R}(g)| \\
&+ |\mathcal{R}(g) - \eta(g)| + |\eta(g) - \eta(h)| \\
&\leq \frac{a\mu(X)}{n} + \frac{\mu(X)}{n} + \frac{1}{n} + \frac{a\mu(X)}{n} \leq \frac{1}{n}(3a\mu(X) + 1).
\end{aligned}$$

Thus, $\mathcal{R} = \eta$.

- (ii) Now let X be compact. We shall show that the proof for part (i) still applies, although the reasoning for some estimates is different. We define the functional $\mathcal{R} = \mathcal{R}_\mu$ on $C(X)$. It is an r -functional by Theorem 7.10. Then $|\mathcal{R}(1)| = \|\mathcal{R}\| = \mu(X) < \infty$, and $|\mathcal{R}(-1)| \leq \|\mathcal{R}\| < \infty$. By monotonicity, \mathcal{R} is real-valued. Let η be another real-valued (hence, bounded by Proposition 3.7) r -functional on $C(X)$ such that $\mu = \mu_{\mathcal{R}} = \mu_\eta$. To show the uniqueness, by Remark 4.17 it is enough to show that $\rho(f) = \eta(f)$ for $f \geq 0$. For the functions f_i from the proof for part (i) note the following: $\text{supp}(f_2 + \dots + f_n) \subseteq f^{-1}([t_1, \infty))$, $f_1 = \frac{1}{n}$ on $f^{-1}([t_1, \infty))$, thus by part (III) of Lemma 4.19 we may apply the c -level condition to obtain

$$\mathcal{R}(f_1 + f_2 + \dots + f_n) = \mathcal{R}(f_1) + \mathcal{R}(f_2 + \dots + f_n).$$

Then by induction we may show that formula (8.1) holds for \mathcal{R} and, similarly, for η . In the same manner, by part (III) of Lemma 4.19 and induction we show that formula (8.4) holds. Note that (8.2), (8.3), and (8.5) hold as in the proof of part (i). Estimations (8.6) are valid by part (II) of Lemma 4.19. Now as in the end of the proof for part (i), we show that $\mathcal{R} = \eta$.

The proof is complete now. \square

Remark 8.2. Our inequality (8.3) is inspired by a similar estimate in the proof of [15, Theorem 9].

Definition 8.3. Let $\mathbf{L}, \mathbf{QI}, \Phi^s, \Phi^+, \Phi^-, \Phi^r, \Phi^l$ represent subfamilies of bounded functionals from $L, QI, \Phi^s, \Phi^+, \Phi^-, \Phi^r, \Phi^l$ respectively. We may indicate in parenthesis the domain of functionals. For example, $\Phi^+ = \Phi^+(C(X))$ is the collection of all bounded p -conic quasi-linear functionals on $C(X)$.

Definition 8.4. Let $\mathbf{DTM}(X), \mathbf{TM}(X), \mathbf{M}(X)$ represent, respectively, subfamilies of finite set functions from $DTM(X), TM(X), M(X)$.

Corollary 8.5. Let X be locally compact.

- (i) There is a bijection $\Gamma : \Phi^+(C_0^+(X)) \longrightarrow \mathbf{DTM}(X)$ given by $\Gamma(\mathcal{R}) = \mu_{\mathcal{R}}$. The inverse bijection $\Pi = \Gamma^{-1}$ is given by $\Pi : \mathbf{DTM}(X) \longrightarrow \Phi^+(C_0^+(X))$ where $\Pi(\mu) = \mathcal{R}_\mu$. Here $\mu_{\mathcal{R}}$ and \mathcal{R}_μ are according to Definition 5.1 and Definition 7.1.
- (ii) There is a bijection $\Delta : \mathbf{DTM}(X) \longrightarrow \Phi^-(C_0^-(X))$ given by $\Delta(\mu) = \mathcal{L}_\mu$, where \mathcal{L}_μ is according to Definition 7.1.
- (iii) If X is compact, there is a bijection between $\mathbf{DTM}(X)$ and $\Phi^r(C(X))$ given by $\mu \mapsto \mathcal{R}_\mu$, and a bijection between $\mathbf{DTM}(X)$ and $\Phi^l(C(X))$.

Proof. (i) Follows from Theorem 8.1.

- (ii) By Remark 3.5 there is a bijection between $\Phi^+(C_0^+(X))$ and $\Phi^-(C_0^-(X))$, so we obtain bijection Δ . By formula (7.6) $-\mathcal{R}_\mu(-f) = \mathcal{L}_\mu(f)$.
- (iii) By Theorem 8.1 there is a bijection between $\mathbf{DTM}(X)$ and $\Phi^r(C(X))$ given by $\mu \mapsto \mathcal{R}_\mu$. By Remark 4.17 there is a bijection between $\Phi^r(C(X))$ and $\Phi^1(C(X))$. \square

Corollary 8.6. *Suppose ρ is a finite c -functional on $C_0(X)$, and $\rho = \mathcal{R}_\mu$ on $C_0^+(X)$, where \mathcal{R}_μ is a functional on $C_0(X)$ for some finite deficient topological measure μ as in Definition 7.1. Then ρ is an s -functional iff $\mathcal{L}_\mu(g) = \rho(g)$ for all $g \in C_0^-(X)$, where \mathcal{L}_μ is a functional on $C_0(X)$ as in Definition 7.1.*

Proof. If $\rho(g) = \mathcal{L}_\mu(g)$ for all $g \in C_0^-(X)$ then $\rho(g) = \mathcal{L}_\mu(g) = -\mathcal{R}_\mu(-g) = -\rho(-g)$, i.e. $-\rho(g) = \rho(-g)$. Since μ is finite, ρ is real-valued on $C_0^+(X)$, so ρ is real-valued. Then ρ is an s -functional by part (i) of Proposition 4.13. The other direction can be proved similarly. \square

Theorem 8.7. *Let X be locally compact. Let $\Phi^+ = \Phi^+(C_0^+(X))$. Consider the map $\Pi : \mathbf{DTM}(X) \rightarrow \Phi^+$ where $\Pi(\mu) = \mathcal{R}_\mu$ and \mathcal{R}_μ is the functional according to Definition 7.1. Then the map Π has the following properties:*

- (I) Π is conic-linear, i.e. $\Pi(c\mu + d\nu) = c\Pi(\mu) + d\Pi(\nu)$, $c, d \geq 0$.
- (II) $\mu \leq \nu$ if and only if $\Pi(\mu) \leq \Pi(\nu)$ (i.e., $\mathcal{R}_\mu(f) \leq \mathcal{R}_\nu(f)$ for all $f \in C_0^+(X)$).
- (III) $\mu \in \mathbf{TM}(X)$ iff ρ is a quasi-linear functional on $C_0(X)$, and $\mu \in \mathbf{M}(X)$ iff ρ is a linear functional on $C_0(X)$, where $\rho(f) = \Pi(\mu)(f^+) - \Pi(\mu)(f^-)$.
- (IV) $\|\mathcal{R}_\mu\| = \mu(X)$.
- (V) The map $\Pi : \mathbf{DTM}(X) \rightarrow \Phi^+$ is a conic-linear order-preserving bijection such that $\|\mathcal{R}_\mu\| = \mu(X)$.

Proof. (I) Let $\lambda = c\mu + d\nu$, $c, d \geq 0$. Take any $f \in C_0^+(X)$. For function $R_{1,\lambda,f}$ in Definition 6.1 we see that $R_{1,\lambda,f} = cR_{1,\mu,f} + dR_{1,\nu,f}$. From formula (7.4) $\mathcal{R}_\lambda(f) = c\mathcal{R}_\mu(f) + d\mathcal{R}_\nu(f)$, and the statement follows.

(II) Let $\mu \leq \nu$. Take any $f \in C_0^+(X)$. Using Definition 6.1 we see that $R_{1,\mu,f} \leq R_{1,\nu,f}$. Then by formula (7.4) we have $\mathcal{R}_\mu(f) \leq \mathcal{R}_\nu(f)$. Thus, $\mathcal{R}_\mu \leq \mathcal{R}_\nu$.

Now assume that $\mathcal{R}_\mu \leq \mathcal{R}_\nu$. From part z5 of Lemma 7.12 we see that $\mu(K) \leq \nu(K)$ for any compact K . By Remark 2.3 $\mu \leq \nu$.

(III) Suppose $\rho(f) = \mathcal{R}_\mu(f^+) - \mathcal{R}_\mu(f^-)$ is a quasi-linear functional on $C_0(X)$. By part (i) of Corollary 8.5 and part (vi) of Theorem 5.4 μ is a finite topological measure.

Now suppose that μ is a finite topological measure. Let m_f be the measure from Theorem 6.10 for f , where $f \in C_0(X)$. Consider functional $\rho(f) = \int_{\mathbb{R}} id \, dm_f$ on $C_0(X)$. For $\phi \in C(\overline{f(X)})$ and any open set $W \subseteq \mathbb{R}$ we have

$$m_{\phi \circ f}(W) = \mu((\phi \circ f)^{-1}(W)) = \mu(f^{-1}(\phi^{-1}(W))) = m_f(\phi^{-1}(W)) = (m_f \circ \phi^{-1})(W),$$

thus, $m_{\phi \circ f}$ and $m_f \circ \phi^{-1}$ are equal as measures on \mathbb{R} , and for $\phi \circ f \in A(f)$ we obtain

$$\rho(\phi \circ f) = \int_{\mathbb{R}} id \, dm_{\phi \circ f} = \int_{\mathbb{R}} id \, d(m_f \circ \phi^{-1}) = \int_{\mathbb{R}} \phi \, dm_f.$$

For $\phi \circ f, \psi \circ f \in A(f)$ we have:

$$\rho(\phi \circ f + \psi \circ f) = \int_{\mathbb{R}} (\phi + \psi) dm_f = \int_{\mathbb{R}} \phi dm_f + \int_{\mathbb{R}} \psi dm_f = \rho(\phi \circ f) + \rho(\psi \circ f).$$

For any const c we see that $\rho(cf) = \rho((cid) \circ f) = \int_{\mathbb{R}} cid dm_f = c\rho(f)$. Thus, ρ is a quasi-linear functional on $C_0(X)$. Since $f^+ = (0 \vee id) \circ f \in A(f)$, and $f^- \in A(f)$, we know that $\rho(f) = \rho(f^+) - \rho(f^-)$. It is clear that $\rho(g) = \mathcal{R}_\mu(g)$ for any $g \in C_0^+$, so $\rho(f) = \rho(f^+) - \rho(f^-) = \mathcal{R}_\mu(f^+) - \mathcal{R}_\mu(f^-) = \Pi(\mu)(f^+) - \Pi(\mu)(f^-)$.

If $\mu \in \mathbf{M}(X)$ then $\rho(f) = \int id dm_f = \int f d\mu$ is the usual integral, and the last assertion is a well known fact.

(IV) This is part z7 of Lemma 7.12.

(V) Clear from part (i) of Corollary 8.5 and parts (I), (II), and (IV). □

Theorem 8.8. *Let X be compact.*

(i) $\mathbf{QI} = \Phi^s$.

(ii) $\Phi^+ = \Phi^r$ and $\Phi^- = \Phi^l$.

Here all functionals are on $C(X)$.

Proof. (i) By Remark 4.12 we need to show that $\Phi^s \subseteq \mathbf{QI}$, so let $\rho \in \Phi^s$. Then $\rho \in \Phi^r$ by Remark 4.17. By Corollary 8.5 there is a unique deficient topological measure μ such that $\rho(f) = \rho_\mu(f)$ for all $f \in C(X)$. By part (v) of Theorem 5.4, μ is a topological measure. Then ρ is a quasi-linear functional (see [1, Theorem 4.1] or [5, Theorem 42, Sect. 4]).

(ii) If ρ is an r-functional, by Corollary 8.5 $\rho = \mathcal{R}_\mu$ for a unique deficient topological measure μ . By Theorem 7.10 \mathcal{R}_μ is a p-conic quasi-linear functional. Thus, $\Phi^r \subseteq \Phi^+$. The other inclusion is given by Lemma 4.18. We can prove that $\Phi^- = \Phi^l$ in a similar way, using Corollary 8.5 and Lemma 4.18. □

Remark 8.9. From Theorem 8.1, part (iii) of Corollary 8.5, and Theorem 8.8, it follows that when X is compact, in Theorem 8.7 we may take Φ^+ to be $\Phi^+(C(X) = \Phi^r(C(X))$.

Theorem 8.10. (I) *Let X be locally compact. For functionals on $C_0(X)$ we have:*

$$\begin{aligned} L &\subseteq \mathbf{QI} \subseteq \Phi^+ \cap \Phi^- \subseteq \Phi^r \cap \Phi^l, \\ \mathbf{L} &\subseteq \mathbf{QI} \subseteq \Phi^+ \cap \Phi^- \subseteq \Phi^r \cap \Phi^l = \Phi^s. \end{aligned}$$

In general,

$$L \not\subseteq \mathbf{QI} \not\subseteq \Phi^+.$$

(II) *Let X be compact. Then for functionals on $C(X)$ we have:*

$$\mathbf{L} \subseteq \mathbf{QI} = \Phi^+ \cap \Phi^- = \Phi^r \cap \Phi^l = \Phi^s.$$

In general,

$$\mathbf{L} \not\subseteq \mathbf{QI}.$$

Proof. (I) The inclusion $QI \subseteq \Phi^+ \cap \Phi^-$ is given by Remark 3.4. The inclusion $\Phi^+ \cap \Phi^- \subseteq \Phi^r \cap \Phi^l$ follows from Lemma 4.18. By Remark 4.17 $\Phi^r \subseteq \Phi^c$, so from Corollary 8.6 we see that $\Phi^r \cap \Phi^l \subseteq \Phi^s$. By part (ii) of Remark 4.17 we have: $\Phi^s \subseteq \Phi^r \cap \Phi^l$.

The proper inclusion $L \subsetneq QI$ follows from the existence of quasi-linear functionals that are not linear, or existence of topological measures that are not measures. The proper inclusion $QI \subsetneq \Phi^+$ follows from part (III) of Theorem 8.7 and the existence of deficient topological measures that are not topological measures. See Remark 2.5. For an example of a quasi-linear but not linear functional on a locally compact space see [5, Example 55, Sect. 5].

(II) Use the previous part and Theorem 8.8. □

Remark 8.11. Let X be compact. From Corollary 8.5 and Theorem 8.8 we see that the functionals corresponding to finite deficient topological measures can be described in four ways: as p-conic quasi-linear functionals, as r-functionals, as n-conic quasi-linear functionals, and as l-functionals.

From Theorem 8.10 we see that the functionals corresponding to finite topological measures can be described in four ways: as quasi-linear functionals; as s-functionals; as functionals that are both p-conic quasi-linear and n-conic quasi-linear; and as functionals that are both r- and l-functionals.

Remark 8.12. Theorem 8.10 answers positively the question posed in [15, Remark 7], of whether for a compact space $\Phi^s = \Phi^r \cap \Phi^l$. Note that by part (I) of Lemma 4.19 our definition of r- and l-functionals in the compact case coincide with those in [15, Definition 6]. By Definition 4.9 and Theorem 8.10 our definition of an s-functional coincides with the one in [15, Definition 6], where it was first introduced.

Acknowledgments. This work was conducted at the Department of Mathematics at the University of California Santa Barbara. The author would like to thank the department for its hospitality and supportive environment.
