

# SYMBOLIC POWERS OF CERTAIN COVER IDEALS OF GRAPHS

ARVIND KUMAR, RAJIV KUMAR, RAJIB SARKAR, AND S SELVARAJA

**ABSTRACT.** In this paper, we compute the regularity and Hilbert series of symbolic powers of cover ideal of a graph  $G$  when  $G$  is either a crown graph or a complete multipartite graph. We also compute the multiplicity of symbolic powers of cover ideals in terms of the number of edges.

## 1. INTRODUCTION

Symbolic powers of ideals have been studied intensely over the last two decades. We refer the reader to [4] for a review in this direction. There are many ideals associated to graphs, for example edge ideals and cover ideals. Let  $G$  denote a finite simple (no loops, no multiple edges) undirected graph with the vertex set  $V(G) = \{x_1, \dots, x_n\}$  and edge set  $E(G)$ . For a graph  $G$ , by identifying the vertices with variables in  $S = \mathbb{K}[x_1, \dots, x_n]$ , where  $\mathbb{K}$  is a field, we associate squarefree monomial ideals, *edge ideal*  $I(G) = (x_i x_j \mid \{x_i, x_j\} \in E(G))$  and *cover ideal*  $J(G) = (\prod_{x \in w} x \mid w \text{ is a minimal vertex cover of } G)$ . By [6, Proposition 2.7],  $I(G)$  and  $J(G)$  are dual to each other. Recently, building a dictionary between combinatorial data of graphs and the algebraic properties of corresponding ideals has been done by various authors (cf. [6], [12], [14], [19], [25], [29], [30], [31], [33]). In particular, establishing a relationship between Castelnuovo-Mumford regularity (or simply, regularity) of powers of ideals, Hilbert series of ideals and combinatorial invariants associated with graphs is an active area of research (cf. [1], [9], [21]).

It was proved by Cutkosky, Herzog and Trung [3], and independently Kodiyalam [22], that if  $I$  is a homogeneous ideal in  $\mathbb{K}[x_1, \dots, x_n]$ , then there exist non-negative integers  $a, b$  and  $s_0$  such that  $\text{reg}(I^s) = as + b$  for all  $s \geq s_0$ . While the coefficient  $a$  is well-understood (cf. [3], [11], [22], [32]), the free constant  $b$  and stabilization index  $s_0 = \min\{s \mid \text{reg}(I^t) = at + b \text{ for } t \geq s\}$  are quite mysterious. In the case of symbolic powers, Minh and Trung [26], ask the following question.

**Question 1.1.** *Let  $I$  be a squarefree monomial ideal. Is  $\text{reg}(I^{(s)})$  a linear function for  $s \gg 0$ ?*

In [16], Herzog, Hibi and Trung proved that, if  $I$  is a monomial ideal, then  $\text{reg}(I^{(s)})$  is a quasi-linear function for  $s \gg 0$ . For small dimension, more general results are known in [17] and [18]. It is not known whether the regularity of symbolic powers of squarefree monomial

AMS Classification 2010: 13D02, 13F20.

ideals is a linear function or not. In this article, we determine the linear polynomial for the regularity of symbolic powers of certain cover ideals of graphs.

A crown graph  $C_{n,n}$  is a graph obtained from  $K_{n,n}$  by removing a perfect matching (see definition in Section 2). The Betti numbers of edge ideal and representation number of crown graphs have been looked by several authors [8], [28]. Since crown graph is a bipartite graph, by [7, Corollary 2.6],  $J(G)^s = J(G)^{(s)}$  for all  $s \geq 1$ . In [14], Hang and Trung proved that if  $G$  is bipartite, then  $b \leq |V(G)| - \deg(J(G)) - 1$  and  $s_0 \leq |V(G)| + 2$ , where  $\deg(J(G)) = \max\{|C| : C \text{ is a minimal vertex cover of } G\}$ . In the case of crown graph we obtain that  $b = 0$  and  $s_0 = 1$  (Theorem 3.4).

We then consider complete multipartite graphs. The resolution of powers of cover ideals of complete multipartite graphs and vanishing ideal of the parametrized algebraic toric set associated to complete multipartite graphs have already been studied by several authors [20], [23], [24], [27]. We prove that, if  $G$  is complete multipartite with partition  $V(G) = V_1 \cup \dots \cup V_k$ , then  $\text{reg}(J(G)^{(s)}) = s \deg(J(G)) + p - 1$  for all  $s \geq 1$ , where  $p = \min\{p_i : p_i = |V_i|\}$  (Theorem 4.6).

The Hilbert function, Hilbert series and Hilbert polynomial are important invariants in commutative algebra and algebraic geometry that measure the growth of the dimension of its homogeneous components. In general, computing the Hilbert series of  $S/I$  is a difficult task when  $I$  is a monomial ideal [2]. In [9], Goodarzi computed the Hilbert series of squarefree monomial ideals. We compute the Hilbert series of symbolic powers of cover ideals of crown and complete multipartite graphs (Theorem 3.6, Theorem 4.10).

Computing and finding bounds for the multiplicity of homogeneous ideals have been studied by a number of researchers (see [2], [15], [33]). We compute the multiplicity of symbolic powers of cover ideals and edge ideals in terms of combinatorial invariants (Corollary 5.3).

In order to prove our main results, we first show that the minimal monomial generators of symbolic powers of cover ideals have specific order that satisfies some nice properties (Lemma 3.3, Lemma 4.4). Using this ordering and certain exact sequences, we obtain main results.

Our paper is organized as follows. In Section 2, we collect the necessary notion, terminology and some results that are used in rest of the article. The regularity and Hilbert series of symbolic powers of cover ideals of crown and multipartite graphs are discussed in Sections 3 and 4, respectively. The multiplicity of symbolic powers of edge ideals and cover ideals is studied in Section 5.

## 2. PRELIMINARIES

In this section, we set up basic definitions, notation and some important results which are needed for rest of the paper.

**2.1. Notion from commutative algebra.** Let  $M = \bigoplus_{k \in \mathbb{N}} M_k$  be a finite graded  $S$ -module.

The *Hilbert series* of  $M$ , denoted by  $H(M, t)$ , is defined as  $H(M, t) := \sum_{k \in \mathbb{N}} \dim_{\mathbb{K}}(M_k)t^k$ . By

[2, Proposition 4.4.1], there exists a polynomial  $h_M(t) \in \mathbb{Z}[t]$  such that  $H(M, t) = \frac{h_M(t)}{(1-t)^d}$ ,

where  $d$  is the dimension of  $M$ . The *multiplicity* of  $M$ , denoted by  $e(M)$ , is defined as  $e(M) = h_M(1)$ . The *Castelnuovo-Mumford regularity* of  $M$ , denoted by  $\text{reg}(M)$ , is defined as  $\text{reg}(M) = \max\{j - i \mid \text{Tor}_i^S(M, \mathbb{K})_j \neq 0\}$ .

Let  $I$  be an ideal in a Noetherian domain  $R$ . The  $s$ -th *symbolic power* of  $I$  is defined by  $I^{(s)} := \bigcap_{\mathfrak{p} \in \text{Ass}(R/I)} (I^s R_{\mathfrak{p}} \cap R)$ . It follows from [15, Proposition 1.4.4] that if  $I$  is a squarefree monomial ideal in  $S$ , then  $s$ -th symbolic power of  $I$  is  $I^{(s)} = \bigcap_{\mathfrak{p} \in \text{Ass}(S/I)} \mathfrak{p}^s$ .

*Remark 2.1.* Let  $\mathfrak{p} = (x_{i_1}, \dots, x_{i_r})$ . For a monomial  $u$  in  $S$ , set  $m_i(u) = \max\{j : x_i^j \mid u\}$  and  $\deg_{\mathfrak{p}}(u) = \sum_{k=1}^r m_{i_k}(u)$ . Let  $I$  be a squarefree monomial ideal with  $I = \bigcap_{\mathfrak{p} \in \text{Ass}(S/I)} \mathfrak{p}$ . Then  $u \in I^{(s)}$  if and only if  $\deg_{\mathfrak{p}}(u) \geq s$  for all  $\mathfrak{p} \in \text{Ass}(S/I)$ .

**2.2. Notion from combinatorics.** Let  $G$  be a finite simple graph with the vertex set  $V(G)$  and edge set  $E(G)$ . A subset  $X$  of  $V(G)$  is called *independent* if for all  $x, y \in X$ ,  $\{x, y\} \notin E(G)$ . A graph  $G$  is said to be *bipartite* if there exist two disjoint independent sets  $X$  and  $Y$  such that  $V(G) = X \cup Y$ . A graph  $G$  is said to be *complete multipartite* if  $V(G)$  can be partitioned into sets  $V_1, \dots, V_k$  for some  $k \geq 2$  such that  $E(G) = \bigcup_{i \neq j} \{\{x, y\} \mid x \in V_i, y \in V_j\}$  and it is denoted by  $K_{p_1, \dots, p_k}$ , where  $p_i = |V_i|$ . An  $n$ -*crown graph* (or simply a *crown graph*), denoted by  $C_{n,n}$ , is a bipartite graph on the vertex set  $V(G) = \{x_1, \dots, x_n, y_1, \dots, y_n\}$  with edge set  $E(G) = \{\{x_i, y_j\} \mid 1 \leq i, j \leq n, i \neq j\}$ . A subset  $C \subset V(G)$  is a *vertex cover* of  $G$  if for each  $e \in E(G)$ ,  $e \cap C \neq \emptyset$ . If  $C$  is minimal with respect to inclusion, then  $C$  is called a *minimal vertex cover* of  $G$ .

**Example 2.2.** Let  $G = K_{2,2,1,1}$  and  $H = C_{4,4}$  be complete multipartite graph and crown graph on  $\{x_{1,1}, x_{1,2}, x_{2,1}, x_{2,2}, x_{3,1}, x_{4,1}\}$  and  $\{x_1, \dots, x_4, y_1, \dots, y_4\}$  as given in the figure below.

It can be noted that  $\{x_{1,1}, x_{1,2}, x_{2,1}, x_{2,2}, x_{3,1}\}$  and  $\{x_2, x_3, x_4, y_2, y_3, y_4\}$  are minimal vertex covers of  $K_{2,2,1,1}$  and  $C_{4,4}$ , respectively.

For any undefined terminology and further basic definitions, we refer the reader to [2], [15].

### 3. CROWN GRAPH

In this section, we study the regularity and Hilbert series of symbolic powers of cover ideals of crown graphs. Throughout this section,  $G$  denotes a crown graph.

**3.1. Regularity.** In this subsection, we obtain the linear function for the regularity of  $J(G)^{(s)}$  for all  $s \geq 1$ . Our result Theorem 3.4 shows that  $\text{reg}(J(G)^{(s)})$  is a linear function with the stabilization index  $s_0 = 1$  and free constant  $b = 0$ . In order to prove this, we first fix certain notation.

**Notation 3.1.** For  $n \geq 3$ , let  $G = C_{n,n}$  be a graph with  $V(G) = \{x_1, \dots, x_n, y_1, \dots, y_n\}$ . Set

$$M_x = \prod_{i=1}^n x_i, \quad M_y = \prod_{i=1}^n y_i, \quad M = M_x M_y \quad \text{and} \quad M_i = \frac{M}{x_i y_i} \quad \text{for } 1 \leq i \leq n.$$

First, we find the monomial generating set of cover ideal of crown graph.

**Lemma 3.2.** *Let  $G = C_{n,n}$  with notation as in 3.1. Then  $J(G) = (M_x, M_y, M_1, \dots, M_n)$ . In particular,  $\deg(J(G)) = 2n - 2$ .*

*Proof.* Since  $J(G) = \bigcap_{i \neq j} (x_i, y_j)$ ,  $(M_x, M_y, M_1, \dots, M_n) \subset J(G)$ . Let  $u$  be a monomial in  $J(G)$ . If either  $M_x \mid u$  or  $M_y \mid u$ , then we are done. Now, we assume that  $M_x \nmid u$  and  $M_y \nmid u$ . This forces that there exist  $i$  and  $j$  such that  $x_i \nmid u$  and  $y_j \nmid u$ . For  $k \neq i$ ,  $J(G) \subset (x_i, y_k)$  which forces that  $y_k \mid u$ . This implies that  $j = i$ , and by symmetry for  $k \neq i$ ,  $x_k \mid u$ . Therefore,  $M_i \mid u$  which gives the desired result.  $\square$

For a monomial  $u$ , *support* of  $u$ , denoted by  $\text{supp}(u)$ , is defined as  $\text{supp}(u) = \{x_i : x_i \mid u\}$ . The following lemma summarizes some basic properties of  $J(G)^{(s)}$ .

**Lemma 3.3.** *Let  $G = C_{n,n}$  with notation as in 3.1. Then, for  $s \geq 2$ ,*

- i)  $(M_x) : M_y = (M_x)$ .
- ii)  $(M_x) : M_i = (x_i)$  and  $M_y : M_i = (y_i)$  for  $1 \leq i \leq n$ .
- iii)  $(M_j) : M_i = (x_i y_i)$  for  $i \neq j$ .
- iv)  $(M_x, M_y, M_1, \dots, M_{i-1}) : M_i = (x_i, y_i)$  for  $1 \leq i \leq n$ .
- v)  $J(G)^s : M_x = J(G)^{s-1}$ .
- vi)  $(J(G)^s, M_x) : M_y = (J(G)^{s-1}, M_x)$ .
- vii)  $(J(G)^s, M_x, M_y, M_1, \dots, M_{i-1}) : M_i = (x_i, y_i, M_i^{s-1})$  for  $1 \leq i \leq n$ .

*Proof.* (i)-(iv) are standard.

(v) The assertion follows from [29, Lemma 3.2].

(vi) Since  $\text{supp}(M_x) \cap \text{supp}(M_y) = \emptyset$ , by (v),  $(J(G)^s, M_x) : M_y = (J(G)^{s-1}, M_x)$ .

(vii) By (iv),  $(J(G)^s, M_x, M_y, M_1, \dots, M_{i-1}) : M_i \supset (x_i, y_i, M_i^{s-1})$ . Let  $u$  be a monomial in  $(J(G)^s, M_x, M_y, M_1, \dots, M_{i-1}) : M_i$ . If either  $x_i \mid uM_i$  or  $y_i \mid uM_i$ , then  $u \in (x_i, y_i, M_i^{s-1})$ . Suppose  $x_i \nmid uM_i$  and  $y_i \nmid uM_i$ . Note that  $(M_x, M_y, M_1, \dots, M_{i-1}) \subset (x_i, y_i)$  and  $x_i \nmid uM_i$  and  $y_i \nmid uM_i$  forces that  $uM_i \in J(G)^s$ . Since  $G$  is a bipartite graph, by [7, Corollary 2.6],  $J(G)^{(s)} = J(G)^s$ , and hence  $J(G)^s = \bigcap_{i \neq j} (x_i, y_j)^s$ . For  $k \neq i$ ,  $J(G)^s \subset (x_i, y_k)^s$ , and  $x_i \nmid uM_i$  which implies that  $y_k^s \mid uM_i$ . Note that for  $k \neq i$ ,  $y_k^2 \nmid M_i$  which forces that  $y_k^{s-1} \mid u$ . Similarly, we get that  $x_k^{s-1} \mid u$  for all  $k \neq i$ . Hence  $M_i^{s-1} \mid u$ .  $\square$

We now proceed to compute the regularity of powers of  $J(G)$ .

**Theorem 3.4.** *Let  $G = C_{n,n}$ . Then for all  $s \geq 1$ ,*

$$\text{reg}(J(G)^s) = s \cdot \text{deg}(J(G)).$$

*Proof.* It follows from [31, Lemma 3.1] that  $s \cdot \text{deg}(J(G)) \leq \text{reg}(J(G)^s)$ . We need to prove that  $\text{reg}(J(G)^s) \leq s \cdot \text{deg}(J(G))$ . By [15, Proposition 8.1.10],  $\text{reg}(J(G)) = \text{pd}(S/I(G))$ . If  $s = 1$ , then the result follows from [28, Theorem 4.3]. So, assume that  $s \geq 2$ . Consider the following short exact sequence:

$$0 \longrightarrow \frac{S}{J(G)^s : M_x}(-n) \longrightarrow \frac{S}{J(G)^s} \longrightarrow \frac{S}{(J(G)^s, M_x)} \longrightarrow 0. \quad (3.1)$$

By Lemma 3.3,  $J(G)^s : M_x = J(G)^{s-1}$ . Then, by induction,

$$\text{reg}(J(G)^{s-1}(-n)) \leq (s-1) \cdot \text{deg}(J(G)) + n \leq s \cdot \text{deg}(J(G)).$$

Now, by Equation (3.1), it is sufficient to show that  $\text{reg}(J(G)^s, M_x) \leq s \cdot \text{deg}(J(G))$ .

**Claim:**  $\text{reg}(J(G)^s, M_x) \leq s \cdot \text{deg}(J(G))$  for all  $s \geq 1$ .

*Proof of the claim:* We proceed by induction on  $s$ . If  $s = 1$ , then  $(J(G), M_x) = J(G)$  and the result follows from [28, Theorem 4.3]. Assume that  $s \geq 2$ . Set  $K = (J(G)^s, M_x)$ ,  $K_1 = (K, M_y)$  and for  $2 \leq l \leq n+1$ ,  $K_l = (K_{l-1}, M_{l-1})$ . Note that  $K_{n+1} = J(G)$ . Consider the following short exact sequences:

$$0 \longrightarrow \frac{S}{K : M_y}(-n) \longrightarrow \frac{S}{K} \longrightarrow \frac{S}{K_1} \longrightarrow 0, \quad (3.2)$$

for  $1 \leq l \leq n$ ,

$$0 \longrightarrow \frac{S}{K_l : M_l}(-(2n-2)) \longrightarrow \frac{S}{K_l} \longrightarrow \frac{S}{K_{l+1}} \longrightarrow 0. \quad (3.3)$$

Using Equations (3.2) and (3.3), we get

$$\text{reg}(K) \leq \max \{ \text{reg}(K : M_y) + n, \text{reg}(J(G)), \text{reg}(K_l : M_l) + 2n - 2 \text{ for } 1 \leq l \leq n \}.$$

We now prove that each of regularities appearing on the right hand side of the above inequality is bounded above by  $s \cdot \text{deg}(J(G))$ . By Lemma 3.3, Theorem 3.4 and [28, Theorem

4.3], we have

$$\begin{aligned} \operatorname{reg}(K : M_y) &= \operatorname{reg}(J(G)^{s-1}, M_x), \quad \operatorname{reg}(J(G)) = \operatorname{deg}(J(G)) \\ \operatorname{reg}(K_l : M_l) &= \operatorname{reg}(x_l, y_l, M_l^{s-1}), \quad \text{for all } 1 \leq l \leq n. \end{aligned}$$

By induction,  $\operatorname{reg}(K : M_y) \leq (s-1) \cdot \operatorname{deg}(J(G))$ . Since  $x_l, y_l, M_l^{s-1}$  is a regular sequence with  $\operatorname{deg}(x_l) = \operatorname{deg}(y_l) = 1$  and  $\operatorname{deg}(M_l)^{s-1} = (s-1) \cdot \operatorname{deg}(J(G))$ ,  $\operatorname{reg}(K_l : M_l) = (s-1) \cdot \operatorname{deg}(J(G))$ . Therefore,  $\operatorname{reg}(J(G)^s, M_x) \leq s \cdot \operatorname{deg}(J(G))$ .  $\square$

**3.2. Hilbert series.** We compute the Hilbert series of symbolic powers of cover ideals of crown graphs. We begin by computing the Hilbert series of cover ideal.

**Theorem 3.5.** *Let  $G = C_{n,n}$  for  $n \geq 3$  with notation as in 3.1. Then*

$$H\left(\frac{S}{J(G)}, t\right) = \frac{\sum_{i=0}^{n-1} (i+1)t^i + \sum_{i=0}^{n-3} (n-i-1)t^{n+i} - (n-1)t^{2n-2}}{(1-t)^{2n-2}}.$$

*Proof.* Set  $I_0 = (M_x, M_y)$  and  $I_i = (I_{i-1}, M_i)$  for all  $1 \leq i \leq n$ . For  $1 \leq i \leq n$ , consider the exact sequence:

$$0 \longrightarrow \frac{S}{I_{i-1} : M_i}(-2n-2) \longrightarrow \frac{S}{I_{i-1}} \longrightarrow \frac{S}{I_i} \longrightarrow 0.$$

We have  $H\left(\frac{S}{J(G)}, t\right) = H\left(\frac{S}{I_0}, t\right) - t^{2n-2} \sum_{i=1}^n H\left(\frac{S}{I_{i-1} : M_i}, t\right)$ . Since  $M_x, M_y$  is a regular sequence on  $S$  of degree  $n$ , we get  $H\left(\frac{S}{I_0}, t\right) = \frac{(1-t^n)^2}{(1-t)^{2n}}$ . By Lemma 3.3,  $I_{i-1} : M_i = (x_i, y_i)$  for any  $1 \leq i \leq n$  which implies that  $H\left(\frac{S}{I_{i-1} : M_i}, t\right) = \frac{1}{(1-t)^{2n-2}}$ . Hence

$$H\left(\frac{S}{J(G)}, t\right) = \frac{\sum_{i=0}^{n-1} (i+1)t^i + \sum_{i=0}^{n-3} (n-i-1)t^{n+i} - (n-1)t^{2n-2}}{(1-t)^{2n-2}}.$$

$\square$

We end this section by proving the following main result.

**Theorem 3.6.** *Let  $G = C_{n,n}$  for  $n \geq 3$  with notation as in 3.1. Then for all  $s \geq 1$ ,*

$$\begin{aligned} & H\left(\frac{S}{J(G)^s}, t\right) \\ &= \frac{\sum_{i=0}^{ns-1} (i+1)t^i + \sum_{i=0}^{n-3} (n-i-1)st^{ns+i} - (n-1)st^{ns+n-2} - \sum_{i=0}^{s-2} (i+1)nt^{s(2n-2)-i(n-2)}}{(1-t)^{2n-2}}. \end{aligned}$$

*Proof.* We proceed by induction on  $s$ . By Theorem 3.5, the result is true for  $s = 1$ . Assume that  $s \geq 2$ . Using Lemma 3.3 (v) and exact sequence (3.1), we get

$$H\left(\frac{S}{J(G)^s}, t\right) = t^n H\left(\frac{S}{J(G)^{s-1}}, t\right) + H\left(\frac{S}{(J(G)^s, M_x)}, t\right). \quad (3.4)$$

**Claim:** For all  $s \geq 1$ ,  $H\left(\frac{S}{(J(G)^s, M_x)}, t\right)$

$$= \frac{\sum_{i=0}^{n-1} (i+1)t^i + n \sum_{i=n}^{ns-1} t^i + \sum_{i=1}^{n-2} (n-i)t^{ns+i-1} - (n-1)t^{ns+n-2} - n \sum_{i=0}^{s-2} t^{s(2n-2)-i(n-2)}}{(1-t)^{2n-2}}.$$

Now, it is enough to prove the above claim as the desired result follows from induction argument, claim and Equation (3.4).

*Proof of the claim:* For  $s = 1$  the result follows from Theorem 3.5 and the fact that  $(J(G), M_x) = J(G)$ . Assume that  $s \geq 2$ . Using Equations (3.2) and (3.3), we get

$$H\left(\frac{S}{K}, t\right) = t^n H\left(\frac{S}{K : M_y}, t\right) + \sum_{i=1}^m t^{2n-2} H\left(\frac{S}{K_i : M_i}, t\right) + H\left(\frac{S}{J(G)}, t\right). \quad (3.5)$$

By Lemma 3.3(vi) and (vii),  $K : M_y = (J(G)^{s-1}, M_x)$  and  $K_i : M_i = (x_i, y_i, M_i^{s-1})$ . Since  $x_i, y_i, M_i^{s-1}$  is a regular sequence with  $\deg(M_i) = 2n - 2$ , we get that

$$H\left(\frac{S}{K_i : M_i}, t\right) = \frac{(1 - t^{(s-1)(2n-2)})}{(1-t)^{2n-2}}.$$

Now the claim follows from Equation (3.5), Theorem 3.5 and induction.  $\square$

#### 4. COMPLETE MULTIPARTITE GRAPH

In this section, we study the regularity and Hilbert series of symbolic powers of cover ideals of complete multipartite graphs. Throughout this section,  $G$  denotes a complete multipartite graph.

**4.1. Regularity.** We determine the regularity of symbolic powers of cover ideals of complete multipartite graphs. In order to compute the regularity of  $J(G)^{(s)}$ , we first find the generators of  $J(G)$  and its symbolic powers. We begin by fixing some notation which are used for the rest of this section.

**Notation 4.1.** Let  $G = K_{p_1, \dots, p_k}$  be a complete multipartite graph with the vertex set

$$V(G) = \bigcup_{i=1}^k \{x_{ij} : 1 \leq j \leq p_i\}, \quad p_1 \geq p_2 \geq \dots \geq p_k \geq 1 \text{ and } k \geq 2.$$

Set

$$n = p_1 + p_2 + \dots + p_k, \quad M_i = \prod_{j=1}^{p_i} x_{ij} \text{ for } 1 \leq i \leq k, \quad M = \prod_{i=1}^k M_i \text{ and } N_i = \frac{M}{M_i} \text{ for } 1 \leq i \leq k.$$

The following lemma describes the minimal monomial generating set of  $J(G)$ .

**Lemma 4.2.** *Let  $G = K_{p_1, \dots, p_k}$  with the notation as in 4.1. Then  $J(G) = (N_i \mid 1 \leq i \leq k)$ . In particular,  $\deg(J(G)) = n - p_k$ .*

*Proof.* Note that  $\text{supp}(N_i)$  is a vertex cover of  $G$  which implies that  $(N_i \mid 1 \leq i \leq k) \subset J(G)$ . Let  $u$  be a monomial in  $J(G)$ . If for all  $i, j$ ,  $x_{i,j} \mid u$ , then  $u \in (N_i \mid 1 \leq i \leq k)$ . Now, without loss of generality, assume that  $x_{1,1} \nmid u$ . Since for all  $i \neq 1$  and  $j$ ,  $J(G) \subset (x_{1,1}, x_{i,j})$ , we get  $x_{i,j} \mid u$ , which further implies that  $N_1 \mid u$ . This completes the proof.  $\square$

If  $k = 2$ , then by [7, Corollary 2.6],  $J(G)^s = J(G)^{(s)}$  for all  $s \geq 1$ . If  $k \geq 3$ , then  $G$  is non-bipartite graph and every vertex in  $G$  is adjacent to every odd cycle in  $G$ . Therefore, by [5, Theorem 4.9 and Remark 4.10],  $J(G)^{(s)} = MJ(G)^{(s-2)} + J(G)^s$ . Now, we further reduce the above expression.

**Lemma 4.3.** *Let  $G = K_{p_1, \dots, p_k}$  with the notation as in 4.1. Then*

$$J(G)^{(s)} = MJ(G)^{(s-2)} + (N_j^s \mid j \in [k]).$$

*Proof.* For  $e \in E(G)$ ,  $\mathfrak{p}_e$  denote an ideal generated by end points of  $e$ . Let  $u$  be a monomial  $J(G)^{(s)}$ . By Remark 2.1, for every  $e \in E(G)$ , we have  $\deg_{\mathfrak{p}_e}(u) \geq s$ . Note that  $\deg_{\mathfrak{p}_e}(M) = 2$ . If  $u = Mv$ , then  $\deg_{\mathfrak{p}_e}(v) \geq s - 2$  which implies that  $v \in J(G)^{(s-2)}$ .

Suppose  $M \nmid u$ . Then there exists  $x_{i,j}$  such that  $x_{i,j}$  does not divide  $u$ . Without loss of generality, we may assume that  $x_{1,1} \nmid u$ . Since  $x_{1,1}$  is adjacent to  $x_{i,j}$  for  $i \geq 2$  and for all  $j$ , by Remark 2.1,  $N_1^s$  divides  $u$ . Thus, we have  $J(G)^{(s)} \subset MJ(G)^{(s-2)} + (N_j^s \mid j \in [k])$ . Clearly,  $(N_j^s \mid j \in [k]) \subset J(G)^{(s)}$ . It follows from Remark 2.1 that  $MJ(G)^{(s-2)} \subset J(G)^{(s)}$  which completes the proof.  $\square$

For a monomial ideal  $I = (m_1, \dots, m_r)$ , let  $I^{[s]}$  denote an ideal generated by  $m_1^s, \dots, m_r^s$ . The following lemma plays a crucial role to compute the regularity of  $J(G)^{(s)}$ .

**Lemma 4.4.** *Let  $G = K_{p_1, \dots, p_k}$  with the notation as in 4.1. Then*

- i)  $J(G)^{(s)} : M = J(G)^{(s-2)}$  for  $s \geq 2$ .
- ii)  $(J(G)^{(s)}, M) = (J(G)^{[s]}, M)$  for  $s \geq 1$ .
- iii)  $(N_1^s, \dots, N_{i-1}^s) : N_i^s = (M_i^s)$  for  $2 \leq i \leq k$ .
- iv)  $J(G)^{[s]} : M = J(G)^{[s-1]}$  for  $s \geq 2$ .

*Proof.* (i) and (ii) follow from [30, Lemma 3.4] and Lemma 4.3, respectively.

(iii) Clearly  $(M_i^s) \subset (N_1^s, \dots, N_{i-1}^s) : N_i^s$ . Let  $u$  be a monomial in  $(N_1^s, \dots, N_{i-1}^s) : N_i^s$ . This forces that for some  $1 \leq j < i$ ,  $N_j^s \mid uN_i^s$  which implies that  $M_i^s \mid u$ .

(iv) If  $u \in J(G)^{[s]} : M$ , then there exists  $i$  such that  $N_i^s \mid uM$  and so  $N_i^{s-1} \mid u$ . On the other side, since  $N_i \mid M$  for all  $i$ , we get  $N_i^s \mid MN_i^{s-1}$ .  $\square$

For fixed  $s \geq 2$  and  $j \in [k]$ , we associate an ideal  $I_{s,j} = (M, N_1^s, \dots, N_j^s)$ . Now, we compute the regularity of  $I_{s,j}$  in terms of  $s$  and  $p_j$ , which helps to compute the regularity of  $J(G)^{(s)}$ .

**Lemma 4.5.** *For fixed  $s \geq 2$  and  $j \in [k]$ ,  $\text{reg}(I_{s,j}) = s(n - p_j) + p_j - 1$ .*

*Proof.* We prove the assertion by induction on  $j$ . Suppose  $j = 1$ , consider the exact sequence

$$0 \longrightarrow \frac{S}{M : N_1^s}(-s(n - p_1)) \longrightarrow \frac{S}{M} \longrightarrow \frac{S}{(M, N_1^s)} \longrightarrow 0.$$

Note that  $\text{reg}(M) = n$  and  $(M : N_1^s) = (M_1)$ . Therefore,

$$\text{reg}((M : N_1^s)(-s(n - p_1))) = p_1 + s(n - p_1).$$

Since  $s \geq 2$ , it follows from [13, Lemma 1.2 (v)] that  $\text{reg}(M, N_1^s) = s(n - p_1) + p_1 - 1$ .

Consider the exact sequence

$$0 \longrightarrow \frac{S}{I_{s,j-1} : N_j^s}(-s(n - p_j)) \longrightarrow \frac{S}{I_{s,j-1}} \longrightarrow \frac{S}{I_{s,j}} \longrightarrow 0.$$

Note that  $(I_{s,j-1} : N_j^s) = (M_j)$ , and hence  $\text{reg}((I_{s,j-1} : N_j^s)(-s(n - p_j))) = s(n - p_j) + p_j$ . By induction,  $\text{reg}(I_{s,j-1}) = s(n - p_{j-1}) + p_{j-1} - 1$ . Hence by [13, Lemma 1.2 (v)], we get  $\text{reg}(I_{s,j}) = s(n - p_j) + p_j - 1$ .  $\square$

We now compute the regularity of  $J(G)^{(s)}$ . Since complete multipartite graph is a matroid, there is another way to compute the regularity of  $J(G)^{(s)}$ , see [26, Theorem 4.5]. We have provided here an elementary proof so that the result is accessible to readers who are not familiar with matroid.

**Theorem 4.6.** *Let  $G = K_{p_1, \dots, p_k}$  with the notation as in 4.1. Then for all  $s \geq 1$ ,*

$$\text{reg}(J(G)^{(s)}) = s \cdot \text{deg}(J(G)) + p_k - 1.$$

*Proof.* We prove the result by induction on  $s$ . If  $s = 1$ , then the result follows from [19, Theorem 5.3.8]. Assume that  $s > 1$ . Consider the following exact sequence:

$$0 \longrightarrow \frac{S}{J(G)^{(s)} : M}(-n) \longrightarrow \frac{S}{J(G)^{(s)}} \longrightarrow \frac{S}{(J(G)^{(s)}, M)} \longrightarrow 0. \quad (4.1)$$

By Lemma 4.4(i),  $J(G)^{(s)} : M = J(G)^{(s-2)}$  and by induction

$$\text{reg}((J(G)^{(s)} : M)(-n)) = (s - 2) \cdot \text{deg}(J(G)) + n + p_k - 1.$$

It follows from Lemma 4.3 that  $(J(G)^{(s)}, M) = I_{s,k}$ . Now, by Lemma 4.5, we get

$$\text{reg}(J(G)^{(s)}, M) = s \cdot \text{deg}(J(G)) + p_k - 1.$$

Hence the assertion follows [13, Lemma 1.2].  $\square$

It follow from Theorem 4.6 that if  $p_k = 1$ , then the free constant  $b = 0$ .

**Corollary 4.7.** *Let  $G$  be a complete graph on  $n$  vertices. Then, for all  $s \geq 1$ ,*

$$\text{reg} \left( J(G)^{(s)} \right) = s \cdot \text{deg}(J(G)) = s(n-1).$$

**4.2. Hilbert series.** In this subsection, we compute the Hilbert series of symbolic powers of  $J(G)$  in terms of number of vertices and cardinality of partition. To accomplish this, we first study the Hilbert series of  $\frac{S}{J(G)^{[s]}}$  for all  $s \geq 1$ .

**Proposition 4.8.** *Let  $G = K_{p_1, \dots, p_k}$  with the notation as in 4.1. Then, for all  $s \geq 1$ ,*

$$H \left( \frac{S}{J(G)^{[s]}}, t \right) = \frac{1 - \sum_{i=1}^k t^{s(n-p_i)} + (k-1)t^{sn}}{(1-t)^n}.$$

*Proof.* By Lemma 4.4(iii),  $(N_1^s, \dots, N_{i-1}^s) : N_i^s = (M_i^s)$  for all  $2 \leq i \leq k$ . Now, for  $2 \leq i \leq k$  consider the exact sequences:

$$0 \longrightarrow \frac{S}{(M_i^s)}(-s(n-p_i)) \longrightarrow \frac{S}{(N_1^s, \dots, N_{i-1}^s)} \longrightarrow \frac{S}{(N_1^s, \dots, N_i^s)} \longrightarrow 0.$$

We know that  $H \left( \frac{S}{(M_i^s)}, t \right) = \frac{1-t^{sp_i}}{(1-t)^n}$  for all  $2 \leq i \leq k$ . Therefore, by applying successively the above short exact sequences, we get

$$\begin{aligned} H \left( \frac{S}{J(G)^{[s]}}, t \right) &= H \left( \frac{S}{(N_1^s)}, t \right) - \sum_{i=2}^k t^{s(n-p_i)} H \left( \frac{S}{(M_i^s)}, t \right) \\ &= \frac{1-t^{s(n-p_1)}}{(1-t)^n} - \sum_{i=2}^k \left( \frac{t^{s(n-p_i)} - t^{sn}}{(1-t)^n} \right) \\ &= \frac{1 - \sum_{i=1}^k t^{s(n-p_i)} + (k-1)t^{sn}}{(1-t)^n}. \end{aligned}$$

□

To obtain the Hilbert series of  $\frac{S}{J(G)^{(s)}}$ , we need the following lemma:

**Lemma 4.9.** *Let  $G = K_{p_1, \dots, p_k}$  with the notation as in 4.1. Then for all  $s \geq 1$ ,*

$$H \left( \frac{S}{(J(G)^{[s]}, M)}, t \right) = \frac{1 - t^n - \sum_{i=1}^k t^{s(n-p_i)} + \sum_{i=1}^k t^{s(n-p_i)+p_i}}{(1-t)^n}.$$

*Proof.* Consider the short exact sequence:

$$0 \longrightarrow \frac{S}{J(G)^{[s]} : M}(-n) \longrightarrow \frac{S}{J(G)^{[s]}} \longrightarrow \frac{S}{(J(G)^{[s]}, M)} \longrightarrow 0. \quad (4.2)$$

By Lemma 4.4(iv),  $J(G)^{[s]} : M = J(G)^{[s-1]}$ . Therefore

$$H\left(\frac{S}{(J(G)^{[s]}, M)}, t\right) = H\left(\frac{S}{J(G)^{[s]}, t}\right) - t^n H\left(\frac{S}{J(G)^{[s-1]}, t}\right).$$

Using Proposition 4.8, we get the result.  $\square$

We are now ready to establish the Hilbert series of  $\frac{S}{J(G)^{(s)}}$  for all  $s \geq 1$ .

**Theorem 4.10.** *Let  $G = K_{p_1, \dots, p_k}$  with the notation as in 4.1. Then  $H\left(\frac{S}{J(G)^{(s)}, t}\right)$  is*

$$\left\{ \begin{array}{ll} \frac{1 - t^{rn} + \sum_{j=0}^{r-1} \sum_{i=1}^k (t^{p_i} - 1) t^{(s-j)(n-p_i)+jp_i}}{(1-t)^n}, & \text{if } s = 2r, r \geq 1 \\ \frac{1 + (k-1)t^{(r+1)n} - \sum_{i=1}^k t^{(n-p_i)+rn} + \sum_{j=0}^{r-1} \sum_{i=1}^k (t^{p_i} - 1) t^{(s-j)(n-p_i)+jp_i}}{(1-t)^n} & \text{if } s = 2r + 1, r \geq 0. \end{array} \right.$$

*Proof.* It follows from Lemma 4.4(i) and (ii) that for  $s \geq 2$ ,  $J(G)^{(s)} : M = J(G)^{(s-2)}$  and  $(J(G)^{(s)}, M) = (J(G)^{[s]}, M)$ . Using Equation (4.1), we get

$$H\left(\frac{S}{J(G)^{(s)}, t}\right) = t^n H\left(\frac{S}{J(G)^{(s-2)}, t}\right) + H\left(\frac{S}{(J(G)^{[s]}, M)}, t\right). \quad (4.3)$$

Suppose  $s = 2r$ . We prove this by induction on  $r$ . If  $r = 1$ , then, by Lemma 4.3,  $J(G)^{(2)} = (J(G)^{[2]}, M)$ . Now the result follows from Lemma 4.9. Assume that  $r \geq 2$ . Now by induction and Lemma 4.9, we get the assertion.

Suppose  $s = 2r + 1$ . By Lemma 4.8, the result holds for  $r = 0$ . Now assume that  $r \geq 1$ . The assertion follows from induction, Lemma 4.9 and Equation (4.3).  $\square$

## 5. MULTIPLICITY

In this section, we study the multiplicity of symbolic powers of cover ideals and edge ideals. The following lemma is probably well-known. We include it for the sake of completeness.

**Lemma 5.1.** *Let  $I$  be minimally generated by  $h$  linear forms. Then  $e\left(\frac{S}{I^s}\right) = \binom{s+h-1}{h}$ .*

*Proof.* Let  $x \in \mathfrak{m} \setminus I$  be a generator of  $\mathfrak{m}$ , where  $\mathfrak{m} = (x_1, \dots, x_n)$  is the unique homogeneous maximal ideal in  $S$ . Then  $x$  is a regular element on  $I$ , and so on  $I^s$ . This gives  $H\left(\frac{S}{(I^s, x)}, t\right) = (1-t)H\left(\frac{S}{I^s}, t\right)$ , and hence  $e\left(\frac{S}{(I^s, x)}\right) = e\left(\frac{S}{I^s}\right)$ . Therefore, without loss of generality, we may assume that  $I = \mathfrak{m}$ . Thus, we get  $e\left(\frac{S}{I^s}\right) = \dim_{\mathbb{K}}\left(\frac{S}{I^s}\right)$ .  $\square$

**Observation 5.2.** Let  $I$  be a squarefree monomial ideal in  $S$ . Since the minimal associated primes of squarefree monomial ideals are generated by subsets of variables, by [2, Corollary 4.7.8] and Lemma 5.1, we have

$$e\left(\frac{S}{I^{(s)}}\right) = \binom{h+s-1}{h} |\text{Minh}(I)|,$$

where  $\text{Minh}(I) = \{\mathfrak{p} \in \text{Ass}(S/I) : \text{ht}(\mathfrak{p}) = \text{ht}(I)\}$  and  $h = \text{ht}(I)$

As a consequence of Observation 5.2, we obtain the multiplicity of symbolic powers of edge ideals and cover ideals in terms of combinatorial invariants.

**Corollary 5.3.** *Let  $G$  be a graph and  $h$  be the size of the smallest vertex cover of  $G$ . Then for all  $s \geq 1$ ,*

- i)  $e\left(\frac{S}{I(G)^{(s)}}\right) = \binom{h+s-1}{h} \mathcal{V}(G)$ , where  $\mathcal{V}(G)$  is the number of minimal vertex covers of  $G$  of minimal size.
- ii)  $e\left(\frac{S}{J(G)^{(s)}}\right) = \binom{s+1}{2} |E(G)|$ .

**Acknowledgement:** We would like to thank A. V. Jayanthan and J. K. Verma for clarifications on several doubts. The computational commutative algebra package Macaulay 2 [10] was heavily used to compute several examples. The first named author is partially supported by NBHM, India. The third named author is partially supported by UGC, India. The last named author is partially supported by the Institute of Mathematical Sciences, Chennai and National Postdoctoral Fellowship (PDF/2019/002800) by Sciences and Engineering Research Board, India. We also thank the referee for carefully reading the manuscript and making several suggestions that improved the exposition.
