A PROOF OF THE TOTAL COLORING CONJECTURE

T SRINIVASA MURTHY

ABSTRACT. Total Coloring of a graph is a major coloring problem in combinatorial mathematics, introduced in the early 1960s. A total coloring of a graph G is a map $f:V(G)\cup E(G)\to \mathcal{K}$, where \mathcal{K} is a set of colors, satisfying the following three conditions: 1. $f(u)\neq f(v)$ for any two adjacent vertices $u,v\in V(G)$; 2. $f(e)\neq f(e')$ for any two adjacent edges $e,e'\in E(G)$; and 3. $f(v)\neq f(e)$ for any vertex $v\in V(G)$ and any edge $e\in E(G)$ that is incident to the same vertex v. The total chromatic number, $\chi''(G)$, is the minimum number of colors required for a total coloring of G. Behzad (1965), and Vizing (1968), conjectured that for any graph G $\chi''(G) \leq \Delta + 2$. This conjecture is one of the classic unsolved mathematical problems. In this paper, we settle this classical conjecture by proving that the total chromatic number $\chi''(G)$ of a graph is indeed bounded above by $\Delta + 2$. Our novel approach involves algebraic settings over a finite field \mathbb{Z}_p and Vizing's theorem is an essential part of the algebraic settings.

1. Introduction

All graphs considered in this paper are finite and simple. For a graph G, we denote its vertex set, edge set, and maximum degree by V(G), E(G), and Δ respectively.

A vertex coloring of a graph G, is a map $f:V(G)\to\mathcal{K}$, where \mathcal{K} is a set of colors, such that no adjacent vertices are assigned the same color. The vertex chromatic number, $\chi(G)$, is the minimum number of colors needed for a vertex coloring of G.

The vertex chromatic number $\chi(G)$ of any graph is bounded by $\Delta + 1$. Further, Brooks [3] proved the following result,

Theorem 1.1. Let G be a connected graph. Then $\chi(G) \leq \Delta$ unless G is either a complete graph or an odd cycle.

An edge coloring of a graph G, is a map $f: E(G) \to \mathcal{K}$, where \mathcal{K} is a set of colors, such that no adjacent edges are assigned the same color. The edge chromatic number, $\chi'(G)$, is the minimum number of colors needed for an edge coloring of G.

Research was supported by the National Board for Higher Mathematics (NBHM) Post-doctoral Fellowship (2/40(9)/2016/R&D-II/5758) India, and also was supported, in part, by a research associate fellowship from the Department of Computer Science and Automation, Indian Institute of Science, Bengaluru, India.

Vizing's [12] theorem stated below provides an upper and lower bound for the edge chromatic number $\chi'(G)$ of any graph.

Theorem 1.2. For any finite, simple graph G, $\Delta \leq \chi'(G) \leq \Delta + 1$.

A total coloring of a graph G, is a map $f:V(G)\cup E(G)\to \mathcal{K}$, where \mathcal{K} is a set of colors, such that no adjacent vertices, no adjacent edges, and no edge and its end-vertices are assigned the same color.

The total chromatic number, $\chi''(G)$, is the minimum number of colors that are needed for a total coloring of G.

Behzad in 1965 [1], and Vizing in 1968 [11], posed the following famous total coloring conjecture,

Conjecture 1.1. For any graph G, $\chi''(G) \leq \Delta + 2$.

The total coloring conjecture remains an open problem despite the efforts of many in the last six decades. So far, the best upper bound is given by Molly and Reed [8]. Here, we briefly recall that Hind [6] has shown, $\chi''(G) = \Delta + o(\Delta)$. Häggkvist and Chetwynd [5] have improved this bound to $\Delta + 18\Delta^{\frac{1}{3}}log(3\Delta)$. Hind, Molloy, and Reed [7] further improved the bound to $\Delta + 8\log^8\Delta$. For sufficiently large Δ , using probabilistic approach Molly and Reed [8] obtained an upper estimate of $\Delta + O(1)$ for the total chromatic number. This conjecture has also been proved to be true for many classes of graph. One can refer to the three survey papers [2] [13] [4] for comprehensive reviews on total coloring and see [9][10] for the history of total coloring conjecture.

In this paper, we prove the long-standing conjecture by establishing that *total* chromatic number $\chi''(G)$ of a graph is bounded above by $\Delta + 2$. Our novel approach involves the algebraic settings over a finite field \mathbb{Z}_p and Vizing's theorem is an essential part of the algebraic settings.

The outline of this paper is as follows, in Section 2 we define all the necessary notations and definitions, Section 3 contains the polynomials settings, an algorithm and statements of all claims and results, and proofs of all claims and results are given in Section 4. In Section 5, for the sake of clarity, we define the schematic-diagram/flowchart which gives the reader a bird 's-eye view of the presentation of the paper.

2. Preliminaries

For a graph $G=(V,E),\ V(G)=\{v_1,v_2,\ldots,v_n\}$ is the vertex set of n verticies and $E(G)=\{e_1,e_2,\ldots,e_m\}$ is the edge set of m edges. $N(v_i)=\{v_k:\{v_i,v_k\}\in E(G)\}$, is the set of all neighbors of the vertex v_i . And $N_e(v_i)=\{e_k:v_i\in e_k=\{v_i,v_j\}\in E(G)\}$, is the set of all edges incident to the vertex v_i . $N(e_i)=\{e_j:e_i\cap e_j\neq\emptyset \text{ if } i\neq j\}$, is the set of all edges adjacent to the edge e_i . Let $N_1(v_1)=N(v_1)$, and for $2\leq i\leq n\ N_i(v_i)=N(v_i)\setminus\bigcup_{j=1}^{i-1}\{v_j\}$, is the set of neighbors of vertex v_i excluding the vertices $\{v_1,v_2,\ldots,v_{i-1}\}$. Let $N_1(e_1)=N(e_1)$, and for $2\leq i\leq m\ N_i(e_i)=N(e_i)\setminus\bigcup_{j=1}^{i-1}\{e_j\}$, is the set of adjacent edges of e_i excluding the edges $\{e_1,e_2,\ldots,e_{i-1}\}$. We can see that $N_i(v_i)$ and $N_j(e_j)$ can be a

empty set \emptyset as well.

Let $p (\geq m^2(2\Delta+2))$ be a prime number and \mathbb{Z}_p is a finite field. Let $\mathbf{F}(v_1, v_2, \ldots, v_n, e_1, e_2, \ldots, e_m) \in \mathbb{Z}_p[v_1, v_2, \ldots, v_n, e_1, e_2, \ldots, e_m]$ denote a polynomial of $v_1, v_2, \ldots, v_n, e_1, e_2, \ldots, e_m$ over \mathbb{Z}_p and $\mathbf{F}(e_i, e_{i+1}, \ldots, e_m) \in \mathbb{Z}_p[e_1, e_2, \ldots, e_m]$ denote a polynomial of $e_i, e_{i+1}, \ldots, e_m$ over \mathbb{Z}_p . Further, by Fermat's theorem, we know that $x^p \equiv x \mod p$. We denote the set of $\Delta + 2$ colors by $\mathcal{K} = \{1, 2, \ldots, \Delta, \Delta + 1\} \cup \{\alpha\}$, where $\alpha \in \mathbb{Z}_p \setminus \{0, 1, 2, \ldots, \Delta + 1\}$.

Let $\mathbf{F}'(v_1, v_2, \dots, v_n, e_1, e_2, \dots, e_m)$ and $\mathbf{F}'(e_i, e_{i+1}, \dots, e_m)$ denote the polynomials obtained after applying the Fermat's theorem if exponent of variables is $\geq p$, that is, either $v_j^p \equiv v_j \mod p$ $(1 \leq j \leq n)$ or $e_j^p \equiv e_j \mod p$ $(1 \leq j \leq m)$, in $\mathbf{F}(v_1, v_2, \ldots, v_n, e_1, e_2, \ldots, e_m)$ and $\mathbf{F}(e_i, e_{i+1}, \ldots, e_m)$ respectively. And, we can observe that the exponent of each e_j $(1 \leq j \leq m)$ or each v_j $(1 \le j \le n)$ in $\mathbf{F}'(v_1, v_2, \dots, v_n, e_1, e_2, \dots, e_m)$ or $\mathbf{F}'(e_i, e_{i+1}, \dots, e_m)$ is less than or equal to p-1. $\mathbf{F}(v_1, v_2, \dots, v_n, e_1, e_2, \dots, e_m) \ (\equiv 0 \mod p)$ or $\mathbf{F}(e_i, e_{i+1}, \dots, e_m)$ $(\equiv 0 \mod p)$ is a zero polynomial if $\mathbf{F}(\gamma_{v_1}, \gamma_{v_2}, \ldots, \gamma_{v_n}, \gamma_{e_1}, \gamma_{e_2}, \ldots, \gamma_{e_m}) \equiv 0$ $\operatorname{mod} p \text{ or } \mathbf{F}(\gamma_{e_i}, \gamma_{e_{i+1}}, \dots, \gamma_{e_m}) \equiv 0 \operatorname{mod} p \text{ for all } \gamma_{v_1} \in \mathbb{Z}_p, \gamma_{v_2} \in \mathbb{Z}_p, \dots, \gamma_{v_n} \in$ $\mathbb{Z}_p, \gamma_{e_1} \in \mathbb{Z}_p, \gamma_{e_2} \in \mathbb{Z}_p, \dots, \gamma_{e_m} \in \mathbb{Z}_p.$ And, $\mathbf{F}'(v_1, v_2, \dots, v_n, e_1, e_2, \dots, e_m)$ (or $\mathbf{F}'(e_i,e_{i+1},\ldots,e_m)$ is a zero polynomial (is $\equiv 0 \mod p$) if there is no non-zero coefficient monomial available after applying the Fermat's theorem if exponent of variables is $\geq p$, that is, either $v_i^p \equiv v_j \mod p$ $(1 \leq j \leq n)$ or $e_i^p \equiv e_j \mod p$ $p \ (1 \le j \le m) \text{ in } \mathbf{F}(v_1, v_2, \dots, v_n, e_1, e_2, \dots, e_m) \ (\text{or } \mathbf{F}(e_i, e_{i+1}, \dots, e_m)), \text{ in other}$ words $\mathbf{F}'(v_1, v_2, \dots, v_n, e_1, e_2, \dots, e_m)$ (or $\mathbf{F}'(e_i, e_{i+1}, \dots, e_m)$) is $\not\equiv 0 \mod p$ if there is a monomial whose coefficient is $\not\equiv 0 \mod p$. For the sake of notational simplicity, let $e = (e_1, e_2, \dots, e_m)$.

3. Algebraic settings and main results

Given a graph G with a vertex set $V(G) = \{v_1, v_2, \ldots, v_n\}$ and an edge set $E(G) = \{e_1, e_2, \ldots, e_m\}$, we define the polynomial $\mathbf{T}(v_1, v_2, \ldots, v_n, e_1, e_2, \ldots, e_m)$ over the finite field \mathbb{Z}_p to find the *total coloring* of the given graph.

$$\mathbf{T}(v_1, v_2, \dots, v_n, e_1, e_2, \dots, e_m) = \prod_{i=1}^n \left(\prod_{\substack{\text{if } N_i(v_i) \neq \emptyset \\ v_j \in N_i(v_i)}} (v_i - v_j) \prod_{\substack{e_j \in N_e(v_i) \\ v_j \in N_i(v_i)}} (v_i - e_j) \prod_{\substack{l = \Delta + 2}} (v_i - l) \right)$$

$$\prod_{i=1}^m \left(\prod_{\substack{\text{if } N_i(e_i) \neq \emptyset \\ e_j \in N_i(e_i)}} (e_i - e_j) \prod_{\substack{l \in \mathbb{Z}_p \setminus \mathcal{K}}} (e_i - l) \right).$$

Here finding a tuple $(\alpha_{v_1}, \alpha_{v_2}, \dots, \alpha_{v_n}, \alpha_{e_1}, \alpha_{e_2}, \dots, \alpha_{e_m})$, where α_{e_i} or $\alpha_{v_i} \in \mathcal{K}$ such that $\mathbf{T}'(\alpha_{v_1}, \alpha_{v_2}, \dots, \alpha_{v_n}, \alpha_{e_1}, \alpha_{e_2}, \dots, \alpha_{e_m}) \not\equiv 0 \bmod p$, gives us the *total coloring* of the given graph as $\mathbf{T}'(\alpha_{v_1}, \alpha_{v_2}, \dots, \alpha_{v_n}, \alpha_{e_1}, \alpha_{e_2}, \dots, \alpha_{e_m}) \equiv \mathbf{T}(\alpha_{v_1}, \alpha_{v_2}, \dots, \alpha_{v_n}, \alpha_{e_1}, \alpha_{e_2}, \dots, \alpha_{e_m}) \not\equiv 0 \bmod p$. Thus far we have developed the algebraic setting $\mathbf{T}(v_1, v_2, \dots, v_n, e_1, e_2, \dots, e_m)$ and have no other clue on how to prove that $\mathbf{T}'(v_1, v_2, \dots, v_n, e_1, e_2, \dots, e_m) \not\equiv 0 \bmod p$. So we define the polynomials $\mathbf{P}(v_1, v_2, \dots, v_n, e_1, e_2, \dots, e_m)$ and $\mathbf{E}_m(e_1, e_2, \dots, e_m)$ over the finite field \mathbb{Z}_p . These polynomials are the respective algebraic settings to

find the *vertex coloring* and the *edge coloring* of the given graph which together define the *total coloring*. Also these settings throw light on the motivation to construct the polynomials and how colors are restricted to the set \mathcal{K} .

Remark 3.1. The most important fact that we have to note of it while proving $\mathbf{T}'(\alpha_{v_1}, \alpha_{v_2}, \dots, \alpha_{v_n}, \alpha_{e_1}, \alpha_{e_2}, \dots, \alpha_{e_m}) \equiv \mathbf{T}(\alpha_{v_1}, \alpha_{v_2}, \dots, \alpha_{v_n}, \alpha_{e_1}, \alpha_{e_2}, \dots, \alpha_{e_m}) \not\equiv 0$ mod p is that not to assume that several multivariable polynomials are not identically zero means they all do not vanish at the same point.

We define $\mathbf{P}(v_1, v_2, \dots, v_n, e_1, e_2, \dots, e_m)$ as follows,

$$\mathbf{P}(v_1, v_2, \dots, v_n, e_1, e_2, \dots, e_m) = \prod_{i=1}^n \left(\prod_{\substack{\text{if } N_i(v_i) \neq \emptyset \\ v_i \in N_i(v_i)}} (v_i - v_j) \prod_{e_j \in N_e(v_i)} (v_i - e_j) \prod_{l = \Delta + 2}^p (v_i - l) \right).$$

If we say, $C^{\mathbf{P}'}(\mathbf{e})$ is the coefficient of $\prod_{i=1}^n v_i^{l_i}$ (for some $l_i \geq 0, 1 \leq i \leq n$) in $\mathbf{P}'(v_1, v_2, \ldots, v_n, e_1, e_2, \ldots, e_m)$ then $C^{\mathbf{P}'}(\mathbf{e})$ is a polynomial of e_1, e_2, \ldots, e_m , not containing v_i 's $(1 \leq i \leq n)$.

Now, we make sure that $\mathbf{P}'(v_1, v_2, \dots, v_n, e_1, e_2, \dots, e_m) \not\equiv 0 \mod p$, by proving the following theorem. Furthermore, proving the below stated Lemma 3.1 will guarantee that the exponent of each e_i $(1 \leq i \leq m)$ in $\mathcal{C}^{\mathbf{P}'}(e)$ is always less than or equal to 2.

Theorem 3.1. There exists a coefficient $C^{\mathbf{P}'}(\mathbf{e}) \ (\not\equiv 0 \bmod p)$ of $\prod_{j=1}^n v_j^{l_j}$ (for some $l_1 \ge 0, l_2 \ge 0, \ldots, l_n \ge 0$) in $\mathbf{P}'(v_1, v_2, \ldots, v_n, e_1, e_2, \ldots, e_m)$.

Lemma 3.1. The exponent of e_k 's $(1 \le k \le m)$ in $C^{\mathbf{P}'}(\mathbf{e})$ is always less than or equal to 2.

Now, to define $\mathbf{E}_m(e)$, we first define $\mathbf{E}^i(e_i, e_{i+1}, \dots, e_m)$ such that

$$\mathbf{E}^{i}(e_{i}, e_{i+1}, \dots, e_{m}) = \prod_{\substack{\text{if } N_{i}(e_{i}) \neq \emptyset \\ e_{j} \in N_{i}(e_{i})}} (e_{i} - e_{j}) \prod_{\substack{l \in \mathbb{Z}_{p} \setminus \mathcal{K}}} (e_{i} - l)$$

which leads to the polynomial

$$\mathbf{E}_m(\boldsymbol{e}) = \prod_{i=1}^m \mathbf{E}^i(e_i, e_{i+1}, \dots, e_m).$$

Here, we can observe that finding a m-tuple $(\alpha_{e_1}, \alpha_{e_2}, \dots, \alpha_{e_m})$, $\alpha_{e_i} \in \mathcal{K}$ $(1 \leq i \leq m)$, such that $\mathbf{E}_m(\alpha_{e_1}, \alpha_{e_2}, \dots, \alpha_{e_m}) \not\equiv 0 \mod p$, is nothing but obtaining an edge coloring of the given graph. Further, Vizing's theorem guarantee the existence of m-tuple $(\alpha_{e_1}, \alpha_{e_2}, \dots, \alpha_{e_m})$, $\alpha_{e_i} \in \mathcal{K}$ $(1 \leq i \leq m)$, such that $\mathbf{E}_m(\alpha_{e_1}, \alpha_{e_2}, \dots, \alpha_{e_m}) \not\equiv 0 \mod p$, which is very essential.

Remark 3.2. We remark that its because of the Vizing's theorem, we can say there exists m-tuple $(\alpha_{e_1}, \alpha_{e_2}, \dots, \alpha_{e_m})$, $\alpha_{e_i} \in \mathcal{K}$ $(1 \leq i \leq m)$, such that $\mathbf{E}_m(\alpha_{e_1}, \alpha_{e_2}, \dots, \alpha_{e_m}) \not\equiv 0 \mod p$. In other words we can say that, polynomials $\mathbf{Q}_i(e)$ $(1 \leq i \leq m)$ or Claim 3.1 (both defined/stated later) may face a serious question of existential crisis without Vizing's theorem guaranteeing the existence of m-tuple $(\alpha_{e_1}, \alpha_{e_2}, \dots, \alpha_{e_m})$, $\alpha_{e_i} \in \mathcal{K}$ $(1 \leq i \leq m)$, such that $\mathbf{E}_m(\alpha_{e_1}, \alpha_{e_2}, \dots, \alpha_{e_m}) \not\equiv 0 \mod p$.

Now, to prove the conjecture from the above algebraic settings of $\mathbf{P}(v_1, v_2, \dots, v_n, e_1, e_2, \dots, e_m)$ and $\mathbf{E}_m(e)$, our goal is to find a m-tuple $(\beta_{e_1}, \beta_{e_2}, \dots, \beta_{e_m}), \beta_{e_i} \in \mathcal{K}$ $(1 \leq i \leq m)$, such that $\mathbf{E}_m(\beta_{e_1}, \beta_{e_2}, \dots, \beta_{e_m}) \not\equiv 0 \mod p$ and $\mathcal{C}^{\mathbf{P}'}(\beta_{e_1}, \beta_{e_2}, \dots, \beta_{e_m}) \not\equiv 0 \mod p$ as well. The mapping $f(e_i) = \beta_{e_i}$ $(1 \leq i \leq m)$ defines the edge coloring of G using $\Delta + 2$ colors. Since $\mathcal{C}^{\mathbf{P}'}(\beta_{e_1}, \beta_{e_2}, \dots, \beta_{e_m})$ $(\not\equiv 0 \mod p)$ is the coefficient of $\prod_{i=1}^n v_i^{l_i}$ (for some $l_i \geq 0, 1 \leq i \leq n$) in $\mathbf{P}'(v_1, v_2, \dots, v_n, e_1, e_2, \dots, e_m)$, $\mathbf{P}'(v_1, v_2, \dots, v_n, \beta_{e_1}, \beta_{e_2}, \dots, \beta_{e_m}) \not\equiv 0 \mod p$. Then we find a n-tuple $(\beta_{v_1}, \beta_{v_2}, \dots, \beta_{v_n})$, $\beta_{v_i} \in \{1, 2, \dots, \Delta + 1\}$ $(1 \leq i \leq n)$, such that $\mathbf{P}'(\beta_{v_1}, \beta_{v_2}, \dots, \beta_{e_n}, \beta_{e_1}, \beta_{e_2}, \dots, \beta_{e_m}) \not\equiv 0 \mod p$. Thus we get the desired $total\ coloring\$ of the given graph.

Remark 3.3. Before going further we remark that the polynomial $\mathbf{Z}_i(\mathbf{e})$ defined below, will help us to realise why the total chromatic number $\chi''(G)$ of the given graph $is \geq \Delta + 2$.

To define $\mathbf{Z}_i(\mathbf{e})$, for $1 \leq i \leq m$, given an edge $e_i = \{v_s, v_t\}$ (without loss of generality we assume $|N(v_s)| \geq |N(v_t)|$), let $\mathbf{S}_i = \{e_{l_1}, e_{l_2}, \dots, e_{l_r} : e_{l_j} \in N_e(v_s), 1 \leq l_1, l_2, \dots, l_r \leq m\}$ and we have $|\mathbf{S}_i| \leq \Delta$. And $\mathbf{Z}_i(\mathbf{e})$ is defined as follows

$$\mathbf{Z}_{i}(e) = \mathcal{C}^{\mathbf{P}'}(e) \prod_{1 \leq j < k \leq r} (e_{l_{j}} - e_{l_{k}}) \prod_{e_{l_{j}} \in \mathbf{S}_{i}} (\prod_{l = \Delta + 3}^{p} (e_{l_{j}} - l)).$$

Now, proving the following statement will assert our remark:

For $1 \le i \le m$, the polynomial $\mathbf{Z}_i(\mathbf{e}) \not\equiv 0 \mod p$.

Further to find a m-tuple $(\beta_{e_1}, \beta_{e_2}, \dots, \beta_{e_m})$ $(\beta_{e_i} \in \mathcal{K})$ such that $\mathbf{E}_m(\beta_{e_1}, \beta_{e_2}, \dots, \beta_{e_m}) \not\equiv 0 \mod p$ and $\mathcal{C}^{\mathbf{P}'}(\beta_{e_1}, \beta_{e_2}, \dots, \beta_{e_m}) \not\equiv 0 \mod p$ as well, we define the polynomial $\mathbf{Q}_i(\mathbf{e})$ as follows.

Let
$$\mathbf{Q}_1(\mathbf{e}) = \mathcal{C}^{\mathbf{P}'}(\mathbf{e})\mathbf{E}^1(e_1, e_2, \dots, e_m).$$

And, for $2 \le i \le m$, let

$$\mathbf{Q}_i(\mathbf{e}) = \mathbf{Q}_{i-1}(\mathbf{e})\mathbf{E}^i(e_i, e_{i+1}, \dots, e_m).$$

From the above definition of $\mathbf{Q}_i(e)$, it can be observed that finding a m-tuple $(\beta_{e_1}, \beta_{e_2}, \dots, \beta_{e_m})$ $(\beta_{e_i} \in \mathcal{K})$ such that $\mathbf{Q}_m(\beta_{e_1}, \beta_{e_2}, \dots, \beta_{e_m}) \not\equiv 0 \mod p$, that is, $\mathcal{C}^{\mathbf{P}'}(\beta_{e_1}, \beta_{e_2}, \dots, \beta_{e_m}) \mathbf{E}_m(\beta_{e_1}, \beta_{e_2}, \dots, \beta_{e_m}) \not\equiv 0 \mod p$, is nothing but obtaining an edge coloring of the given graph using $\Delta + 2$ colors, while also establishing that $\mathcal{C}^{\mathbf{P}'}(\beta_{e_1}, \beta_{e_2}, \dots, \beta_{e_m}) \not\equiv 0 \mod p$. Further, to prove $\mathbf{Q}_m(\beta_{e_1}, \beta_{e_2}, \dots, \beta_{e_m}) \not\equiv 0 \mod p$, we have to prove the following claims,

Hypothesis 3.1. Suppose there exists $(\beta_{e_1}, \beta_{e_2}, \dots, \beta_{e_{i-1}}, e_i, \dots, e_m), \ \beta_{e_j} \in \mathcal{K} = \{1, 2, \dots, \Delta + 1, \alpha = \alpha_{i-1}\} (1 \leq j \leq i-1), \ where \ \alpha_{i-1} \in \mathbb{Z}_p \setminus \{0, 1, 2, \dots, \Delta + 1\},$ such that $\mathbf{Q}_{i-1}(\beta_{e_1}, \beta_{e_2}, \dots, \beta_{e_{i-1}}, e_i, \dots, e_m) \not\equiv 0 \ mod \ p$, that is, $\mathbf{Q'}_{i-1}(e) \not\equiv 0 \ mod \ p$

p, is nothing but,

$$C^{\mathbf{P}'}(e) \prod_{j=1}^{i-1} \left(\prod_{\substack{\text{if } N_j(e_j) \neq \emptyset \\ e_l \in N_j(e_j)}} (e_j - e_l) \prod_{\substack{k \in \mathbb{Z}_p \setminus \{1, 2, \dots, \Delta + 1, \alpha = \alpha_{i-1}\}}} (e_j - k) \right) \not\equiv 0 \mod p,$$

but there does not exists $(\beta'_{e_1}, \beta'_{e_2}, \dots, \beta'_{e_{i-1}}, \beta'_{e_i}, e_{i+1}, \dots, e_m), \beta'_{e_j} \in \mathcal{K} = \{1, 2, \dots, \Delta + 1, \alpha = \alpha_{i-1}\} (1 \leq j \leq i), \text{ where } \alpha_{i-1} \in \mathbb{Z}_p \setminus \{0, 1, 2, \dots, \Delta + 1\}, \text{ such that } \mathbf{Q}_i(\beta'_{e_1}, \beta'_{e_2}, \dots, \beta'_{e_{i-1}}, \beta'_{e_i}, e_{i+1}, \dots, e_m) \not\equiv 0 \mod p. \text{ In other words, } \mathbf{Q}'_i(e) \equiv 0 \mod p, \text{ is nothing but}$

$$C^{\mathbf{P}'}(e) \prod_{j=1}^{i} \left(\prod_{\substack{\text{if } N_j(e_j) \neq \emptyset \\ e_j \in N_j(e_i)}} (e_j - e_l) \prod_{\substack{k \in \mathbb{Z}_p \setminus \{1, 2, \dots, \Delta + 1, \alpha = \alpha_{i-1}\}}} (e_j - k) \right) \equiv 0 \mod p.$$

Then we are finding a new value to α , say $\alpha = \beta_i$, such that the following claim is true and cardinality of \mathcal{K} remains same as well,

Claim 3.1. There exists $(\beta'_{e_1}, \beta'_{e_2}, \dots, \beta'_{e_{i-1}}, \beta'_{e_i}, e_{i+1}, \dots, e_m), \beta'_{e_j} \in \mathcal{K} = \{1, 2, \dots, \Delta + 1, \alpha = \beta_i\})(1 \leq j \leq i), \text{ where } \beta_i \in \mathbb{Z}_p \setminus \{0, 1, 2, \dots, \Delta + 1, \alpha_{i-1}\}, \text{ such that } \mathbf{Q}_i(\beta'_{e_1}, \beta'_{e_2}, \dots, \beta'_{e_{i-1}}, \beta'_{e_i}, e_{i+1}, \dots, e_m) \not\equiv 0 \mod p. \text{ In other words, } \mathbf{Q'}_i(e) \not\equiv 0 \mod p, \text{ is nothing but}$

$$C^{\mathbf{P}'}(e) \prod_{j=1}^{i} \left(\prod_{\substack{\text{if } N_{j}(e_{j}) \neq \emptyset \\ e_{l} \in N_{j}(e_{j})}} (e_{j} - e_{l}) \prod_{\substack{k \in \mathbb{Z}_{p} \setminus \{1, 2, \dots, \Delta + 1, \alpha = \beta_{i}\}}} (e_{j} - k) \right) \not\equiv 0 \mod p.$$

Remark 3.4.

Let
$$F(x) = x \prod_{\gamma \in \mathbb{Z}_p \setminus \{0\}} (x - \gamma) \equiv x(x^{p-1} - 1) \equiv x^p - x$$
. Then $F'(x) \equiv x - x \equiv 0$.

Remark 3.5. In this remark we will give a brief view and explaination of the strategy adopted to prove Claim 3.1. Now we will focus in understanding the scenario when Hyphothesis 3.1 is true. From the Hypothesis 3.1 we have that $\mathbf{Q'}_{i-1}(\mathbf{e}) \not\equiv 0$ mod p, is nothing but,

$$C^{\mathbf{P}'}(\boldsymbol{e}) \prod_{j=1}^{i-1} \Big(\prod_{\substack{\text{if } N_j(e_j) \neq \emptyset \\ e_l \in N_j(e_i)}} (e_j - e_l) \prod_{\substack{k \in \mathbb{Z}_p \setminus \{1, 2, \dots, \Delta + 1, \alpha = \alpha_{i-1}\}}} (e_j - k) \Big) \not\equiv 0 \mod p.$$

And $\mathbf{Q}'_{i-1}(\mathbf{e})$ can be written as follows (after applying Feramt's theorem),

(3.1)
$$\mathbf{Q'}_{i-1}(e) \equiv \sum_{\substack{\prod_{r=1}^{m} l_r \\ r \neq i}} \mathcal{C}_{\prod_{r=1}^{m} l_r} (e_i) \prod_{\substack{r=1 \\ r \neq i}}^{m} e_r^{l_r},$$

where $C_{\prod_{\substack{r=1\\r\neq i}}^m l_r}(e_i)$ (it is either an univariate polynomial in e_i or constant) is the coefficient of $\prod_{\substack{r=1\\r\neq i}}^m l_r^{-l_r}$, exponent of each e_r $\binom{1\leq r\leq m}{r\neq i}$ and e_i is $\leq p-1$. By the definition of $\mathbf{Q}_i(\mathbf{e})$, we have,

$$\mathbf{Q}_i(\mathbf{e}) = \mathbf{Q}_{i-1}(\mathbf{e})\mathbf{E}^i(e_i, e_{i+1}, \dots, e_m)$$

 $\mathbf{Q}'_{i}(\mathbf{e})$ can also be written as follows using relation (3.1),

$$\mathbf{Q}'_i(e) \equiv \Big(\sum_{\substack{\prod_{r=1}^m l_r \\ r \neq i}} \mathcal{C}_{\prod_{r=1}^m l_r}(e_i) \prod_{\substack{r=1 \\ r \neq i}}^m e_r^{l_r} \Big) \prod_{\substack{\text{if } N_i(e_i) \neq \emptyset \\ e_j \in N_i(e_i)}} (e_i - e_j) \prod_{\substack{l \in \mathbb{Z}_p \backslash \mathcal{K} = \{1, 2, \dots, \Delta + 1, \alpha = \alpha_{i-1}\}}} (e_i - l),$$

$$\mathbf{Q'}_{i}(\boldsymbol{e}) \equiv \left(\sum_{\substack{\prod_{r=1}^{m} l_r \\ r \neq i}} \left(\mathcal{C}_{\prod_{r=1}^{m} l_r}(e_i) \prod_{l \in \mathbb{Z}_p \setminus \mathcal{K} = \{1, 2, \dots, \Delta + 1, \alpha = \alpha_{i-1}\}} (e_i - l)\right) \prod_{\substack{r=1 \\ r \neq i}}^{m} e_r^{l_r}\right) \prod_{\substack{\text{if } N_i(e_i) \neq \emptyset \\ e_i \in N_i(e_i)}} (e_i - e_j),$$

where $C_{\prod_{r=1}^{m} l_r}(e_i)$ is the coefficient of $\prod_{\substack{r=1\\r\neq i}}^{m} e_r^{l_r}$, exponent of each e_r $\binom{1\leq r\leq m}{r\neq i}$ is $\leq p-1$, and as Fermat's theorem has not been applied to e_i yet, exponent of e_i is $\leq p+\Delta-2$.

Further, $\mathbf{Q'}_i(\mathbf{e})$ can also be written as follows,

$$\mathbf{Q}'_{i}(e) \equiv \left(\sum_{\substack{\prod_{r=1}^{m} l_{r} \\ r \neq i}} \mathcal{C}_{\prod_{r=1}^{m} l_{r}}^{1}(e_{i}) \prod_{\substack{r=1 \\ r \neq i}}^{m} e_{r}^{l_{r}}\right) \prod_{\substack{\text{if } N_{i}(e_{i}) \neq \emptyset \\ e_{i} \in N_{i}(e_{i})}} (e_{i} - e_{j}),$$

where $C_{\prod_{\substack{r=1\\r\neq i}}^m l_r}^1(e_i) = C_{\prod_{\substack{r=1\\r\neq i}}^m l_r}(e_i) \prod_{l\in\mathbb{Z}_p\setminus\mathcal{K}=\{1,2,\ldots,\Delta+1,\alpha=\alpha_{i-1}\}} (e_i-l)$ (it is an univariate polynomial in e_i).

We know that $C'\prod_{\substack{r=1\\r\neq i}}^{n} l_r(e_i)$ is a polynomial obtained after applying Fermat's theorem to the univariate polynomial $C\prod_{\substack{r=1\\r\neq i}}^{n} l_r(e_i)$, using this fact, $\mathbf{Q'}_i(\mathbf{e})$ can also be written as follows,

(3.2)
$$\mathbf{Q}'_{i}(e) \equiv \left(\sum_{\substack{\prod_{r=1}^{m} l_{r} \\ r \neq i}} \mathcal{C}'^{1}_{\prod_{r=1}^{m} l_{r}}(e_{i}) \prod_{\substack{r=1 \\ r \neq i}}^{m} e_{r}^{l_{r}}\right) \prod_{\substack{\text{if } N_{i}(e_{i}) \neq \emptyset \\ e_{i} \in N_{i}(e_{i})}} (e_{i} - e_{j}).$$

Here, we must note that the only possible reason for $\mathbf{Q'}_i(e) \equiv 0 \mod p$ (that is Hypothesis 3.1 is true) from the relation (3.2) is that each $\mathcal{C}'^1_{\substack{\Gamma_{r=1}^m l_r \\ r \neq i}} l_r(e_i) \equiv 0 \mod p$, that is,

$$\mathbf{Q'}_{i}(\boldsymbol{e}) \equiv \left(\sum_{\substack{\prod_{r=1}^{m} l_r \\ r \neq i}} \mathcal{C'}_{\prod_{r=1}^{m} l_r}^{1}(e_i) \prod_{\substack{r=1 \\ r \neq i}}^{m} e_r^{l_r}\right) \prod_{\substack{\text{if } N_i(e_i) \neq \emptyset \\ e_j \in N_i(e_i)}} (e_i - e_j) \equiv 0 \mod p.$$

Otherwise, suppose there exists a monomial $\prod_{\substack{r=1\\r\neq i}}^m e_r^{l'_r}$ such that its coefficient $\mathcal{C}'\prod_{\substack{r=1\\r\neq i}}^m l'_r(e_i) \not\equiv 0$ mod p in the relation (3.2), that is,

$$\mathbf{Q}'_{i}(e) \equiv \left(\underbrace{C'^{1}_{\prod_{r=1}^{m} l'_{r}}(e_{i})}_{r \neq i} \underbrace{\prod_{r=1}^{m} e_{r}^{l'_{r}}}_{r \neq i} + \sum_{\substack{r=1 \\ r \neq i}} C'^{1}_{\prod_{r=1}^{m} l_{r}}(e_{i}) \prod_{\substack{r=1 \\ r \neq i}}^{m} e_{r}^{l_{r}} \right) \prod_{\substack{\text{if } N_{i}(e_{i}) \neq \emptyset \\ e_{j} \in N_{i}(e_{i})}} (e_{i} - e_{j}),$$

we denote the underbrace polynomial by $\mathbf{W}_i(oldsymbol{e})$

that is,

$$\mathbf{Q'}_{i}(\mathbf{e}) \equiv \mathbf{W}_{i}(\mathbf{e}) \prod_{\substack{\text{if } N_{i}(e_{i}) \neq \emptyset \\ e_{j} \in N_{i}(e_{i})}} (e_{i} - e_{j}),$$

so we have that $\mathbf{W}_i(\mathbf{e}) \not\equiv 0 \mod p$, to each variable e_1, e_2, \ldots, e_m in $\mathbf{W}_i(\mathbf{e})$ we associate the sets $A_1 = \mathbb{Z}_p, A_2 = \mathbb{Z}_p, \ldots, A_m = \mathbb{Z}_p$ respectively. Then there exists $\gamma_{e_1} \in A_1, \gamma_{e_2} \in A_2, \ldots, \gamma_{e_m} \in A_m$ such that

$$\mathbf{W}(\gamma_{e_1}, \gamma_{e_2}, \dots, \gamma_{e_i}, \gamma_{e_{i+1}}, \dots, \gamma_{e_m}) \not\equiv 0 \mod p,$$

also following holds as well,

$$\mathbf{W}(\gamma_{e_1}, \gamma_{e_2}, \dots, \gamma_{e_i}, e_{i+1}, \dots, e_m) \not\equiv 0 \mod p.$$

So, we have

$$\mathbf{Q}'_{i}(\gamma_{e_1}, \gamma_{e_2}, \dots, \gamma_{e_i}, e_{i+1}, \dots, e_m) \equiv \mathbf{W}(\gamma_{e_1}, \gamma_{e_2}, \dots, \gamma_{e_i}, e_{i+1}, \dots, e_m) \prod_{\substack{i \text{f } N_i(e_i) \neq \emptyset \\ e_j \in N_i(e_i)}} (\gamma_{e_i} - e_j).$$

Let $\prod_{j=i+1}^m e_j^{l_j}$ ($0 \le l_j \le 2\Delta$) be a monomial of maximum degree in $\mathbf{W}(\gamma_{e_1}, \gamma_{e_2}, \dots, \gamma_{e_i}, e_{i+1}, \dots, e_m)$, and we have that $\prod_{e_j \in N_i(e_i)} e_j$ is the only monomial (unique) of maximum degree in

$$\prod_{\substack{\text{if } N_i(e_i) \neq \emptyset \\ e_i \in N_i(e_i)}} (\gamma_{e_i} - e_j).$$

The product of the above two monomials give a unique monomial of maximum degree whose coefficient is non-zero $(\not\equiv 0 \bmod p)$ in $\mathbf{Q'}_i(\gamma_{e_1}, \gamma_{e_2}, \dots, \gamma_{e_i}, e_{i+1}, \dots, e_m)$. Therefore, $\mathbf{Q'}_i(\gamma_{e_1}, \gamma_{e_2}, \dots, \gamma_{e_i}, e_{i+1}, \dots, e_m)$ is not a zero polynomial, that is,

$$\mathbf{Q}'_{i}(\gamma_{e_1}, \gamma_{e_2}, \dots, \gamma_{e_i}, e_{i+1}, \dots, e_m) \not\equiv 0 \mod p,$$

so we can say that,

$$\mathbf{Q}'_{i}(e_{1}, e_{2}, \dots, e_{i}, e_{i+1}, \dots, e_{m}) \not\equiv 0 \mod p,$$

which implies that Hypothesis 3.1 is false.

So, if the Hypothesis 3.1 is true, we find a new value to α , say $\alpha = \beta_i$. In the following paragraphs we explain the strategy adopted in detail to find β_i , especially, the paragraph after defining $\mathbf{H}_{e_j}(\mathbf{e})$ gives us brief view that how this makes sure that $\mathbf{Q}'_i(\mathbf{e}) \not\equiv 0 \mod p$.

Now, our goal is to find a new value to α , say $\alpha = \beta_i$. We will find a new value $\alpha = \beta_i$ using the polynomials $\mathbf{J}_{\prod_{r=1}^m l_r(e_j)}$ defined later. To define $\mathbf{J}_{\prod_{r=1}^m l_r(e_j)}$ we need to define the polynomials $\mathbf{G}(\boldsymbol{e})$ and $\mathbf{H}_{e_j}(\boldsymbol{e})$ as follows, we use the fact that $\mathbf{Q'}_{i-1}(\boldsymbol{e}) \not\equiv 0 \mod p$, that is,

(3.3)

$$C^{\mathbf{P}'}(e) \prod_{j=1}^{i-1} \left(\prod_{\substack{\text{if } N_j(e_j) \neq \emptyset \\ e_l \in N_j(e_j)}} (e_j - e_l) \prod_{\substack{k \in \mathbb{Z}_p \setminus \{1, 2, \dots, \Delta + 1, \alpha = \alpha_{i-1}\}}} (e_j - k) \right) \not\equiv 0 \bmod p.$$

$$G(e) = Q_{i-1}(e) \prod_{j=1}^{k} (e_{l_j} - \alpha_{i-1}),$$

where $e_{l_1}, e_{l_2}, \ldots, e_{l_k} \in \{e_1, e_2, \ldots, e_{i-1}\} \ (1 \leq l_1, l_2, \ldots, l_k \leq i-1)$ such that $\mathbf{G}'(\mathbf{e}) \not\equiv 0 \mod p$ and for every $e_j \in \{e_1, e_2, \ldots, e_{i-1}\} \setminus \{e_{l_1}, e_{l_2}, \ldots, e_{l_k}\}$ the polynomial $\mathbf{H}'_{e_j}(\mathbf{e}) \equiv 0 \mod p$, where,

$$\mathbf{H}_{e_j}(\boldsymbol{e}) = \mathbf{G}'(\boldsymbol{e})(e_j - \alpha_{i-1}).$$

Our novel approach involves finding a new value to α , say $\alpha = \beta_i$ ($\notin \{0, 1, 2, ..., \Delta + 1, \alpha_{i-1}\}$), such that for each $e_j \in \{e_1, e_2, ..., e_{i-1}\} \setminus \{e_{l_1}, e_{l_2}, ..., e_{l_k}\}$, $(e_j - \beta_i)$ is a square-free factor in $\mathbf{J}_{\prod_{\substack{r=1\\r \neq i}}^{m} l_r}(e_j)$ (defined later) and $(e_j - \beta_i)$ is a square-

free factor in $\mathbf{G}'(e)$ as well (by proving the Claim 3.2 stated later). And for each $e_j \in \{e_1, e_2, \dots, e_{i-1}\} \setminus \{e_{l_1}, e_{l_2}, \dots, e_{l_k}\}$, the square-free factor $(e_j - \beta_i)$ in $\mathbf{G}'(e)$ is replaced by $(e_j - \alpha_{i-1})$ to obtain the desired result (by proving the Claim 3.1). For the sake of notational simplicity, let $M_1 = \{e_{l_1}, e_{l_2}, \dots, e_{l_k}\}$ and $M_2 = \{e_1, e_2, \dots, e_{i-1}\} \setminus \{e_{l_1}, e_{l_2}, \dots, e_{l_k}\}$ $(1 \leq l_1, l_2, \dots, l_k \leq i-1)$. To choose a new value β_i , we are defining polynomial $\mathbf{J}_{\prod_{\substack{r=1\\r\neq i}}^m l_r}(e_j)$ as follows.

By the definition of G(e) and $Q_{i-1}(e)$, G(e) can be written as follows,

(3.4)

$$\mathbf{G}(\boldsymbol{e}) = \left(\mathcal{C}^{\mathbf{P'}}(\boldsymbol{e}) \prod_{j=1}^{i-1} \Big(\prod_{\substack{\text{if } N_j(e_j) \neq \emptyset \\ e_l \in N_j(e_j)}} (e_j - e_l) \prod_{k \in \mathbb{Z}_p \setminus \{1, 2, \dots, \Delta + 1, \alpha = \alpha_{i-1}\}} (e_j - k) \Big) \right) \left(\prod_{j=1}^k (e_{l_j} - \alpha_{i-1}) \right).$$

Given an $e_j \in M_2$, the polynomial $\mathbf{G}'(e)$ can be written as (Fermat's theorem is applied to each e_r $(1 \le r \le m)$),

(3.5)
$$\mathbf{G}'(e) \equiv \sum_{\substack{\prod_{r=1}^{m} l_r \\ r \neq j}} \mathcal{C}_{\prod_{r=1}^{m} l_r}(e_j) \prod_{\substack{r=1 \\ r \neq j}}^{m} e_r^{l_r},$$

where $C_{\prod_{r=1}^{m} l_r}(e_j)$ is the coefficient of $\prod_{\substack{r=1\\r\neq j}}^{m} e_r^{l_r}$, exponent of each e_r $\binom{1\leq r\leq m}{r\neq j}$ and e_j is $\leq p-1$.

Also we can observe that, given an $e_j \in M_2$, from the relation (3.4) $\mathbf{G}'(e)$ can also be

written as (excepting e_j , Fermat's theorem is applied to each e_r $\binom{1 \le r \le m}{r \ne j}$),

(3.6)
$$\mathbf{G}'(e) \equiv \sum_{\substack{\prod_{r=1}^{m} l_r \\ r \neq j}} \left(\mathcal{C}_{\prod_{r=1}^{m} l_r}^{j} (e_j) \prod_{l \in \mathbb{Z}_p \setminus \{1, 2, \dots, \Delta + 1, \alpha = \alpha_{i-1}\}} (e_j - l) \right) \prod_{\substack{r=1 \\ r \neq j}}^{m} e_r^{l_r},$$

where $0 \leq l_r \leq p-1$ (as Fermat's theorem is applied to each e_r $\binom{1 \leq r \leq m}{r \neq j}$, except e_j), $\mathcal{C}_{\prod_{\substack{r=1\\r \neq j}} l_r}^j(e_j)$ is a univariate polynomial of e_j and exponent of e_j in the following products,

$$\left(\mathcal{C}^{j}_{\prod_{r=1}^{m} l_{r}}(e_{j}) \prod_{\substack{l \in \mathbb{Z}_{p} \setminus \{1, 2, \dots, \Delta+1, \alpha = \alpha_{i-1}\}}} (e_{j} - l)\right) \text{ is } \leq (2\Delta + p - (\Delta + 2)) = p + \Delta - 2.$$

The most important fact we observe from relation (3.5) and relation (3.6) is that, on applying Fermat's theorem to e_j ,

(3.7)
$$C_{\prod_{\substack{r=1\\r\neq j}}^{m}l_{r}}^{j}(e_{j})\prod_{\substack{l\in\mathbb{Z}_{p}\setminus\{1,2,...,\Delta+1,\alpha=\alpha_{i-1}\}}}(e_{j}-l)\equiv C_{\prod_{\substack{r=1\\r\neq j}}^{m}l_{r}}(e_{j}),$$

as both are coefficient of $\prod_{\substack{r=1\\r\neq j}}^m e_r^{l_r}$.

Now, for each $e_j \in M_2$, we define polynomial $\mathbf{J}_{\prod_{r=1}^m l_r}(e_j)$ using a non-zero coefficient of some monomial $\prod_{\substack{r=1\\r\neq j}}^m e_r^{l_r}$ in the congruence relation (3.6) as follows,

for each $e_j \in M_2$,

(3.8)
$$\mathbf{J}_{\prod_{\substack{r=1\\r\neq j}}^{m}l_r}(e_j) = C_{\prod_{\substack{r=1\\r\neq j}}^{m}l_r}^{j}(e_j) \prod_{l\in\mathbb{Z}_p\setminus\{1,2,...,\Delta+1,\alpha=\alpha_{i-1}\}} (e_j-l),$$

where.

$$C^j_{\prod_{\substack{r=1\\r\neq j}}^m l_r}(e_j)\prod_{l\in\mathbb{Z}_p\setminus\{1,2,\ldots,\Delta+1,\alpha=\alpha_{i-1}\}}(e_j-l) \text{ is }$$

is the coefficient of some monomial $\prod_{\substack{r=1\\r\neq j}}^m e_r^{l_r}$ in the congruence relation (3.6). And $\mathbf{J}_{\prod_{\substack{r=1\\r\neq i}}^m l_r(e_i)}$ is defined below,

(3.9)
$$\mathbf{J}_{\prod_{\substack{r=1\\r\neq i}}^{m}l_r}(e_i) = \mathcal{C}_{\prod_{\substack{r=1\\r\neq i}}^{m}l_r}^{l_r}(e_i),$$

where, $C_{\prod_{r=1}^{m} l_r}^{i}(e_i)$ is the coefficient of some monomial $\prod_{\substack{r=1\\r\neq i}}^{m} e_r^{l_r}$ in the congruence relation (3.6).

Now, with the help of the polynomials $\{\mathbf{J}_{\prod_{\substack{r=1\\r\neq j}}^m l_r}(e_j): e_j \in M_2\} \cup \{\mathbf{J}_{\prod_{\substack{r=1\\r\neq i}}^m l_r}(e_i)\}$ (as defined in (3.8) and (3.9)), we will find the new value to α , that is, $\alpha = \beta_i$, in the following claim,

Claim 3.2. There exists $\beta_i \in \mathbb{Z}_p \setminus \{0, 1, 2, \dots, \Delta + 1, \alpha_{i-1}\}$ such that for each $e_j \in M_2$, $(e_j - \beta_i)$ divides $\mathbf{J}_{\prod_{r=1}^m l_r}(e_j)$ but $(e_j - \beta_i)^2$ does not divide $\mathbf{J}_{\prod_{r=1}^m l_r}(e_j)$. Moreover, for each $e_j \in M_2$, $(e_j - \beta_i)$ divides $\mathbf{G}'(\mathbf{e})$ but $(e_j - \beta_i)^2$ does not divide $\mathbf{G}'(\mathbf{e})$. And also $(e_i - \beta_i)$ does not divide $\mathbf{J}_{\prod_{r=1}^m l_r}(e_i)$ and $\mathbf{G}'(\mathbf{e})$ as well.

To prove the Claim 3.2 we have to prove the following Lemma 3.2, and to prove the Claim 3.1 we have to prove the Lemma 3.3.

Lemma 3.2. Given an $e_j \in M_2$, $\mathbf{H}_{e_j}(\mathbf{e}) = \mathbf{G}'(\mathbf{e})(e_j - \alpha_{i-1})$. For every $e_j \in M_2$, the polynomial $\mathbf{H}'_{e_j}(\mathbf{e}) \equiv 0 \mod p$. Then

$$\mathbf{G}'(\boldsymbol{e}) \equiv \prod_{e_j \in M_2} \Big(\prod_{l \in \mathbb{Z}_p \setminus \{\alpha_{i-1}\}} (e_j - l) \Big) \Big(\sum_{\substack{\prod_{r=1}^m l_r \\ r \notin K}} \mathcal{C}_{\prod_{r=1}^m l_r} l_r(e_i) \prod_{\substack{r=1 \\ r \notin K}}^m e_r^{l_r} \Big),$$

where, $K = \{s : e_s \in M_2\} \cup \{i\}$ and $C_{\prod_{\substack{r=1\\r \notin K}}^m l_r}(e_i)$ is a univariate polynomial in e_i .

Lemma 3.3.

$$\frac{\mathbf{G}(\boldsymbol{e})}{\prod_{e_{i}\in M_{2}}\left(e_{j}-\beta_{i}\right)}\equiv\frac{\mathbf{G}'(\boldsymbol{e})}{\prod_{e_{i}\in M_{2}}\left(e_{j}-\beta_{i}\right)},$$

that is,

$$\mathcal{C}^{\mathbf{P}'}(e) \prod_{e_{j} \in M_{1}} \left(\prod_{\substack{\text{if } N_{j}(e_{j}) \neq \emptyset \\ e_{l} \in N_{j}(e_{j})}} (e_{j} - e_{l}) \prod_{\substack{k \in \mathbb{Z}_{p} \setminus \{1, 2, \dots, \Delta + 1\} \\ e_{l} \in N_{j}(e_{j})}} (e_{j} - k) \right) \\
\prod_{e_{j} \in M_{2}} \left(\prod_{\substack{\text{if } N_{j}(e_{j}) \neq \emptyset \\ e_{l} \in N_{j}(e_{j})}} (e_{j} - e_{l}) \prod_{\substack{k \in \mathbb{Z}_{p} \setminus \{1, 2, \dots, \Delta + 1, \alpha_{i-1}, \beta_{i}\} \\ e_{l} \in N_{j}(e_{j})}} (e_{j} - k) \right) \equiv \\
\prod_{e_{j} \in M_{2}} \left(\prod_{\substack{l \in \mathbb{Z}_{p} \setminus \{\alpha_{i-1}, \beta_{i}\} \\ l \in \mathbb{Z}_{p} \setminus \{\alpha_{i-1}, \beta_{i}\}}} (e_{j} - l) \right) \left(\prod_{\substack{l = 1 \\ r \neq k}} \prod_{\substack{l r \ r \in I \\ r \notin K}} l_{r}(e_{i}) \prod_{\substack{r = 1 \\ r \notin K}}} e_{r}^{l_{r}} \right),$$

where, $K = \{s : e_s \in M_2\} \cup \{i\}$ and $C_{\prod_{\substack{r=1\\r \notin K}}^m l_r}(e_i)$ is a univariate polynomial in e_i .

Now, we have built all the necessary theory to define a formal algorithm (see page 12, Algorithm 1) that defines the steps of finding a m-tuple $(\beta_{e_1}, \beta_{e_2}, \dots, \beta_{e_m})$, $\beta_{e_j} \in \mathcal{K} = \{1, 2, \dots, \Delta + 1, \alpha\}$, such that $\mathbf{Q}_m(\beta_{e_1}, \beta_{e_2}, \dots, \beta_{e_m}) \not\equiv 0 \mod p$. To start the flow in the algorithm, we have to prove the following Claim.

Claim 3.3. There exists $(\beta_{e_1}, \beta_{e_2}, \dots, \beta_{e_m})$, $\beta_{e_j} \in \mathcal{K} = \{1, 2, \dots, \Delta + 1, \alpha = \Delta + 2\}$, such that $\mathbf{Q}'_1(\beta_{e_1}, \beta_{e_2}, \dots, \beta_{e_m}) \not\equiv 0 \mod p$. That is, $\mathbf{Q}'_1(e) \not\equiv 0 \mod p$.

Actually, by proving the Claim 3.3, Claim 3.2 and Claim 3.1, we have established the following result.

Result 3.1. There exists $(\beta_{e_1}, \beta_{e_2}, \dots, \beta_{e_m})$, $\beta_{e_j} \in \mathcal{K} = \{1, 2, \dots, \Delta + 1, \alpha\}$ $(1 \leq j \leq m)$, such that $\mathbf{Q}_m(\beta_{e_1}, \beta_{e_2}, \dots, \beta_{e_m}) \not\equiv 0 \mod p$. That is,

$$\mathcal{C}^{\mathbf{P}'}(e) \prod_{j=1}^m \left(\prod_{\substack{\text{if } N_j(e_j) \neq \emptyset \\ e_l \in N_j(e_j)}} (e_j - e_l) \prod_{k \in \mathbb{Z}_p \setminus \{1, 2, \dots, \Delta + 1, \alpha\}} (e_j - k) \right) \not\equiv 0 \, \, \text{mod} \, \, p.$$

Finally, to establish that for a given graph, the total chromatic number $\chi''(G)$ is bounded above by $\Delta + 2$, we prove the following theorem,

Theorem 3.2. There exists $(\beta_{e_1}, \beta_{e_2}, ..., \beta_{e_m})$, $\beta_{e_i} \in \{1, 2, ..., \Delta + 1, \alpha\}$ $(1 \le i \le m)$, such that $C^{\mathbf{P}'}(\beta_{e_1}, \beta_{e_2}, ..., \beta_{e_m}) \not\equiv 0 \mod p$, and $(\beta_{v_1}, \beta_{v_2}, ..., \beta_{v_n})$, $\beta_{v_i} \in \{1, 2, ..., \Delta + 1\}$ $(1 \le i \le n)$, such that $\mathbf{P}'(\beta_{v_1}, \beta_{v_2}, ..., \beta_{v_n}, \beta_{e_1}, \beta_{e_2}, ..., \beta_{e_m}) \not\equiv 0 \mod p$.

The Theorem 3.2 will have the following corollary.

Corollary 3.1. For any graph G, $\chi''(G) \leq \Delta + 2$.

Theorem 3.1 will guarantee that $\mathbf{P}'(v_1, v_2, \dots, v_n, e_1, e_2, \dots, e_m) \not\equiv 0 \mod p$. That is, $\mathbf{P}'(v_1, v_2, \dots, v_n, e_1, e_2, \dots, e_m)$ is not a zero polynomial. Result 3.1 not only guarantee that all the edges of the given graph are properly colored using $\Delta + 2$ colors $(\beta_{e_i} \in \{1, 2, \dots, \Delta + 1, \alpha\})$, it also proves that $\mathcal{C}^{\mathbf{P}'}(\beta_{e_1}, \beta_{e_2}, \dots, \beta_{e_m}) \not\equiv 0 \mod p$. Theorem 3.2 and Corollary 3.1 will guarantee that the total chromatic number $\chi''(G)$ of the given graph is bounded above by $\Delta + 2$ colors. That is, the mapping $f(v_i) = \beta_{v_i} (1 \leq i \leq n)$ and $f(e_i) = \beta_{e_i} (1 \leq i \leq m)$ will establish the desired result of proving the total chromatic number $\chi''(G)$ of the given graph to have a upper bound of $\Delta + 2$.

4. Proofs of a remark, Lemmas, Claims, Theorems, and a corollary

Proof of Theorem 3.1. Without loss of generality, let $e_i = 0$ (for all $i, 1 \le i \le m$) in $\mathbf{P}(v_1, v_2, \dots, v_n, e_1, e_2, \dots, e_m)$. By this we get,

$$\mathbf{P}(v_1, v_2, \dots, v_n, 0, 0, \dots, 0) = \prod_{i=1}^n \Big(\prod_{\substack{\text{if } N_i(v_i) \neq \emptyset \\ v_j \in N_i(v_i)}} (v_i - v_j) \prod_{\substack{e_j \in N_e(v_i)}} v_i \prod_{\substack{l = \Delta + 2}}^p (v_i - l) \Big).$$

Here, finding $\alpha_{v_i} \in \{1, 2, ..., \Delta + 1\}$ such that $\mathbf{P}(\alpha_{v_1}, \alpha_{v_2}, ..., \alpha_{v_n}, 0, 0, ..., 0) \not\equiv 0$ mod p is nothing but obtaining the *vertex coloring* of the given graph. That is, the map $f(v_i) = \alpha_{v_i}$ $(1 \leq i \leq n)$ defines the *vertex coloring* of the given graph.

We already know from Brooks' theorem, $\chi(G) = \Delta + 1$, and this implies $\mathbf{P}'(v_1, v_2, \dots, v_n, 0, 0, \dots, 0) \not\equiv 0 \mod p$. We can also see, $\mathbf{P}'(v_1, v_2, \dots, v_n, e_1, e_2, \dots, e_m) \not\equiv 0 \mod p$. Therefore, there exists a coefficient $\mathcal{C}^{\mathbf{P}'}(e) (\not\equiv 0 \mod p)$ of $\prod_{j=1}^n v_j^{l_j}($ for some $l_1 \geq 0, l_2 \geq 0, \dots, l_n \geq 0)$ in $\mathbf{P}'(v_1, v_2, \dots, v_n, e_1, e_2, \dots, e_m)$.

Proof of Lemma 3.1. Given an edge $e_k = \{v_i, v_j\}$, e_k is incident to vertices v_i and v_j . Therefore, exponents of e_k 's $(1 \le k \le m)$ in $\mathbf{P}(v_1, v_2, \dots, v_n, e_1, e_2, \dots, e_m)$ is always less than or equal to 2. So the same holds true for the coefficient $\mathcal{C}^{\mathbf{P}'}(\mathbf{e})$.

Proof of Remark 3.3. Given an edge $e_i = \{v_s, v_t\}$, we have $\mathbf{S}_i = \{e_{l_1}, e_{l_2}, \dots, e_{l_r} : e_{l_j} \in N_e(v_s), 1 \leq l_1, l_2, \dots, l_r \leq m\}$ and $|\mathbf{S}_i| \leq r \leq \Delta$. And we have

$$\mathbf{Z}_i(\boldsymbol{e}) = \mathcal{C}^{\mathbf{P}'}(\boldsymbol{e}) \prod_{1 \leq j < k \leq r} (e_{l_j} - e_{l_k}) \prod_{e_{l_j} \in \mathbf{S}_i} (\prod_{l = \Delta + 3}^p (e_{l_j} - l)).$$

By Lemma 3.1, exponent of each variable in $\mathcal{C}^{\mathbf{P}'}(e)$ is ≤ 2 . And exponent of each variable in

$$\prod_{1 \leq j < k \leq r} (e_{l_j} - e_{l_k}) \prod_{e_{l_j} \in \mathbf{S}_i} (\prod_{l = \Delta + 3}^p (e_{l_j} - l))$$

is $\leq p-3$. Therefore, there always exists a monomial $\prod_{j=1}^r e_{l_j}^{s_j}$ (for some $s_j \geq 0$) in $\mathbf{Z}_i(e)$ whose coefficient is $\not\equiv 0 \mod p$, this implies $\mathbf{Z}_i(e) \not\equiv 0 \mod p$.

Proof of Claim 3.3. Without loss of generality, we assume $\alpha_1 = \Delta + 2$. By Lemma 3.1, exponent of each variable e_i in $\mathcal{C}^{\mathbf{P}'}(\mathbf{e})$ is ≤ 2 . $\mathcal{C}^{\mathbf{P}'}(\mathbf{e})$ can be rewritten as,

$$C^{\mathbf{P}'}(\mathbf{e}) = \sum_{j=0}^{2} a_{j}(e_{2}, \dots, e_{m})e_{1}^{j},$$

where $a_i(e_2, e_3, \dots, e_m)$ is either a polynomial in e_2, e_3, \dots, e_m or constant. To the variable e_1 , we associate the set $A_1 = \mathcal{K} = \{1, 2, \dots, \Delta + 1, \alpha = \Delta + 2\}$. Then there exists $\beta_{e_1} \in \mathcal{A}_1$ such that $\mathcal{C}^{\mathbf{P}'}(\beta_{e_1}, e_2, \dots, e_m) \not\equiv 0 \mod p$.

$$\mathbf{Q}_{1}(\beta_{e_{1}}, e_{2}, \dots, e_{m}) = \mathcal{C}^{\mathbf{P}'}(\beta_{e_{1}}, e_{2}, \dots, e_{m}) \prod_{\substack{\text{if } N_{1}(e_{1}) \neq \emptyset \\ e_{j} \in N_{1}(e_{1})}} (\beta_{e_{1}} - e_{j}) \prod_{\substack{l \in \mathbb{Z}_{p} \setminus \{1, 2, \dots, \Delta + 1, \Delta + 2\}}} (\beta_{e_{1}} - l).$$

Let $\prod_{j=2}^m e_j^{l_j}$ $(0 \le l_j \le 2)$ be a monomial of maximum degree in $\mathcal{C}^{\mathbf{P}'}(\beta_{e_1}, e_2, \dots, e_m)$, and we have that $\prod_{e_j \in N_1(e_1)} e_j$ is the only monomial (unique) of maximum degree in

$$\prod_{\substack{\text{if } N_1(e_1)\neq\emptyset\\e_j\in N_1(e_1)}} (\beta_{e_1}-e_j).$$

The product of the above two monomials give a unique monomial of maximum degree in $\mathbf{Q}_1(\beta_{e_1},e_2,\ldots,e_m).$

So,
$$\mathbf{Q}_1(\beta_{e_1}, e_2, \dots, e_m) \not\equiv 0 \mod p$$
. This implies, $\mathbf{Q'}_1(e_1, e_2, \dots, e_m) \not\equiv 0 \mod p$.

Proof of Lemma 3.2. Given an $e_j \in M_2$, from the relation (3.5) we have,

$$\mathbf{G}'(\boldsymbol{e}) \equiv \sum_{\substack{\prod_{r=1}^{m} l_r \\ r \neq j}} \mathcal{C}_{\prod_{r=1}^{m} l_r}(e_j) \prod_{\substack{r=1 \\ r \neq j}}^{m} e_r^{l_r},$$

where $C_{\prod_{r=1}^m l_r}(e_j)$ is the coefficient of $\prod_{\substack{r=1\\r\neq j}}^m e_r^{l_r}$, and is a univariate polynomial in e_j , and exponent of e_j and each $e_r \binom{1 \le r \le m}{r \ne j}$ is $\le p - 1$.

So, given an $e_j \in M_2$, using the relation (3.5), $\mathbf{H}_{e_j}(\mathbf{e}) = \mathbf{G}'(\mathbf{e})(e_j - \alpha_{i-1})$ can be rewritten as,

(4.1)
$$\mathbf{H}_{e_j}(\mathbf{e}) \equiv \left(\sum_{\substack{\prod_{r=1}^m l_r \\ r \neq j}} \mathcal{C}_{\prod_{r=1}^m l_r}(e_j) \prod_{\substack{r=1 \\ r \neq j}}^m e_r^{l_r}\right) \left(e_j - \alpha_{i-1}\right).$$

Let
$$\mathbf{L}_{\prod_{\substack{r=1\\r\neq j}}^{m}l_r}(e_j) = \mathcal{C}_{\prod_{\substack{r=1\\r\neq j}}^{m}l_r}(e_j)(e_j - \alpha_{i-1}).$$

Let $\mathbf{L}_{\prod_{\substack{r=1\\r\neq j}}^m l_r}(e_j) = \mathcal{C}_{\prod_{\substack{r=1\\r\neq j}}^m l_r}(e_j)(e_j - \alpha_{i-1}),$ where $\mathcal{C}_{\prod_{\substack{r=1\\r\neq j}}^m l_r}(e_j)$ is the coefficient of $\prod_{\substack{r=1\\r\neq j}}^m e_r^{l_r}$ in $\mathbf{G}'(\boldsymbol{e})$.

Given an $e_j \in M_2$, we have, $\mathbf{H}'_{e_j}(e_1, e_2, \dots, e_m) \equiv 0$. In other words, we can say that, for every coefficient $\mathcal{C}_{\prod_{\substack{r=1\\r\neq j}}^m l_r}(e_j)$ in $\mathbf{G}'(e)$ (congruence relation (3.5)),

(4.2)
$$\mathbf{L}'_{\prod_{\substack{r=1\\r\neq j}}^{m}l_r}(e_j) \equiv 0 \bmod p.$$

Since, $\mathbf{L}'_{\prod_{\substack{r=1\\r\neq j}}^m l_r}(e_j) \equiv 0 \mod p$, $\mathcal{C}_{\prod_{\substack{r=1\\r\neq j}}^m l_r}(e_j)$ is the coefficient of $\prod_{\substack{r=1\\r\neq j}}^m l_r \stackrel{l_r}{=} e_r \stackrel{l_r}{=}$ and exponent of e_j is $\leq p-1$, we can conclude that,

(4.3)
$$\mathcal{C}_{\prod_{\substack{r=1\\r\neq j}}^{m}l_r}(e_j) \equiv b_{\prod_{\substack{r=1\\r\neq j}}^{m}l_r} \prod_{l\in\mathbb{Z}_p\setminus\{\alpha_{i-1}\}} (e_j-l),$$

where $b_{\prod_{\substack{r=1\\r\neq j}}^{m}l_r}^{l_r} \in \mathbb{Z}_p \setminus \{0\}.$

From the above congruence relations (4.2) and (4.3), we can rewrite the polynomial $\mathbf{G}'(e)$ as follows,

$$\mathbf{G}'(e) \equiv \sum_{\substack{\prod_{r=1 \ r \neq j}^{m} l_r \\ r \neq j}} \left(b_{\prod_{r=1 \ r \neq j}^{m} l_r}^{j} \prod_{l \in \mathbb{Z}_p \setminus \{\alpha_{i-1}\}} (e_j - l) \right) \prod_{\substack{r=1 \ r \neq j}}^{m} e_r^{l_r},$$

where $b_{\prod_{\substack{r=1\\r\neq j}}^{m}l_r}^{j} \in \mathbb{Z}_p \setminus \{0\}.$

So.

(4.4)
$$\mathbf{G}'(\boldsymbol{e}) \equiv \prod_{\substack{l \in \mathbb{Z}_p \setminus \{\alpha_{i-1}\}\\r \neq j}} (e_j - l) \left(\sum_{\substack{\prod_{\substack{r=1\\r \neq j}} l_r\\r \neq j}} b_{\prod_{\substack{r=1\\r \neq j}}}^m l_r \prod_{\substack{r=1\\r \neq j}}^m e_r^{l_r} \right),$$

where $b_{\prod_{\substack{r=1\\r\neq j}}^m l_r}^j \in \mathbb{Z}_p \setminus \{0\}.$

Since, for every $e_j \in M_2$, the polynomial $\mathbf{H}'_{e_j}(e) \equiv 0 \mod p$, we can rewrite the polynomial $\mathbf{G}'(e)$ as follows,

(4.5)
$$\mathbf{G}'(\mathbf{e}) \equiv \prod_{\substack{e_j \in M_2}} \Big(\prod_{\substack{l \in \mathbb{Z}_p \setminus \{\alpha_{i-1}\}\\r \notin K}} (e_j - l) \Big) \Big(\sum_{\substack{\prod_{\substack{r=1\\r \neq K}} l_r \\ r \notin K}} \mathcal{C}_{\prod_{\substack{r=1\\r \notin K}}} l_r(e_i) \prod_{\substack{r=1\\r \notin K}}^m e_r^{l_r} \Big),$$

where, $K = \{s : e_s \in M_2\} \cup \{i\}$ and $\mathcal{C}_{\prod_{r=1}^m l_r}(e_i)$ is a univariate polynomial in e_i .

Proof of Claim 3.2 . We have, $K = \{1, 2, \dots, \Delta, \Delta + 1\} \cup \{\alpha = \alpha_{i-1}\}$ and we have to find a new value to α .

Now, to find a new value to α , that is, $\alpha = \beta_i$ such that for each $e_j \in M_2$, $(e_j - \beta_i)$ divides $\mathbf{G}'(e)$ but $(e_j - \beta_i)^2$ does not divide $\mathbf{G}'(e)$, we consider the polynomials $\{\mathbf{J}_{\prod_{\substack{r=1\\r\neq i}}^m l_r}(e_j): e_j \in M_2\} \cup \{\mathbf{J}_{\prod_{\substack{r=1\\r\neq i}}^m l_r}(e_i)\}$ (as defined in (3.8) and (3.9)).

For each $e_j \in M_2$, we have

$$\mathbf{J}_{\prod_{\substack{r=1\\r\neq j}}^{m}l_{r}}(e_{j}) = \mathcal{C}_{\prod_{\substack{r=1\\r\neq j}}^{m}l_{r}}^{j}(e_{j}) \prod_{l\in\mathbb{Z}_{p}\backslash\{1,2,...,\Delta+1,\alpha_{i-1}\}}(e_{j}-l),$$

using the congruence relations (3.7) and (4.3), we get

(4.6)
$$\mathbf{J}'_{\prod_{\substack{r=1\\r\neq j}}^{m}l_r}(e_j) \equiv b_{\prod_{\substack{r=1\\r\neq j}}^{m}l_r} \prod_{l\in\mathbb{Z}_p\setminus\{\alpha_{i-1}\}} (e_j-l),$$

where, $b_{\prod_{r=1}^{m} l_r}^{j} \in \mathbb{Z}_p \setminus \{0\}.$

And we have (using the relation (4.5))

(4.7)
$$\mathbf{J}_{\prod_{\substack{r=1\\r\neq i}}^{m}l_r}(e_i) = \mathcal{C}_{\prod_{\substack{r=1\\r\neq i}}^{m}l_r}^{i}(e_i) \equiv \mathcal{C}_{\prod_{\substack{r=1\\r\notin K}}^{m}l_r}(e_i),$$

where, $C_{\prod_{\substack{r=1\\r\notin K}}^m l_r}(e_i)$ is the coefficient of some monomial $\prod_{\substack{r=1\\r\notin K}}^m e_r^{l_r}$ (from the congruence relation (4.5)).

Now, we involve in defining a subset of $\mathbb{Z}_p \setminus \{0, 1, 2, \dots, \Delta + 1, \alpha_{i-1}\}$ from which β_i is

Let $\mathcal{B} = \mathbb{Z}_p \setminus \{0, 1, 2, \dots, \Delta + 1, \alpha_{i-1}\}$. Since $p \geq m^2(2\Delta + 2)$ and $|\mathcal{B}|$ is greater than $2m(\Delta + 1)$, there exists $\beta_i \in \mathcal{B}$ such that for each $e_j \in M_2$, $e_j - \beta_i$ divides $\mathbf{J}_{\prod_{\substack{r=1\\r \neq j}}^m l_r}(e_j)$ but $(e_j - \beta_i)^2$ does not divide $\mathbf{J}_{\prod_{\substack{r=1\\r \neq j}}^m l_r}(e_j)$. And how to choose such a β_i is explained below.

For each $e_j \in M_2$, let $\mathcal{B}_j = \{ \gamma \in \mathcal{B} : (e_j - \gamma)^2 \text{ divides } \mathbf{J}_{\prod_{\substack{r=1\\r \neq j}}^m l_r}(e_j) \} \subset \mathcal{B}$. As noted earlier, for each $e_j \in M_2$, exponent of e_j in $\mathbf{J}_{\prod_{\substack{r=1\\r \neq j}}^m l_r}(e_j)$ is always $\leq (2\Delta + p - (\Delta + 2)) = p + \Delta - 2$ and congruence relation (4.6) implies number of repeated roots can be at most $\Delta - 1$. Then cardinality of \mathcal{B}_j is at most $\Delta - 1$. And let $\mathcal{B}_i = \{ \gamma \in \mathcal{B} : e_i - \gamma \text{ divides } \mathcal{C}_{\prod_{r=1}^m l_r}(e_i) \}$, then $|\mathcal{B}_i| \leq 2\Delta$.

Now, we choose a β_i from the set $\mathcal{B} \setminus \bigcup_{k=1}^i \mathcal{B}_j$, that is, $\beta_i \in \mathcal{B} \setminus \bigcup_{k=1}^i \mathcal{B}_j$.

So, for each $e_j \in M_2 \cup \{e_i\}$, $(e_j - \beta_i)$ divides $\mathbf{J}_{\prod_{\substack{r=1\\r \neq i}}^m l_r}(e_j)$ but $(e_j - \beta_i)^2$ does not divide $\mathbf{J}_{\prod_{\substack{r=1\\r\neq j}}^m l_r}(e_j).$

From the congruence relations (3.6) and (3.7), we can conclude that, for each $e_j \in M_2$, $(e_j - \beta_i)$ divides $\mathbf{G}'(e)$ but $(e_j - \beta_i)^2$ does not divide $\mathbf{G}'(e)$. From the congruence relation (4.7) and the choice of β_i , we observe that $e_i - \beta_i$ does not divide the $\mathcal{C}_{\prod_{r=1}^m l_r}(e_i)$, so $e_i - \beta_i$ does not divide $\mathbf{G}'(e)$.

Proof of Lemma 3.3. By the definition of G(e), we have

$$\mathbf{G}(\boldsymbol{e}) = \mathcal{C}^{\mathbf{P}'}(\boldsymbol{e}) \Bigg(\prod_{j=1}^{i-1} \Big(\prod_{\substack{\text{if } N_j(e_j) \neq \emptyset \\ e_l \in N_j(e_j)}} (e_j - e_l) \prod_{\substack{k \in \mathbb{Z}_p \setminus \{1, 2, \dots, \Delta + 1, \alpha = \alpha_{i-1}\}}} (e_j - k) \Big) \Bigg) \Bigg(\prod_{j=1}^k (e_{l_j} - \alpha_{i-1}) \Bigg).$$

After rearranging factors, G(e) can be rewritten as,

$$(4.8) \quad \mathbf{G}(\boldsymbol{e}) = \mathcal{C}^{\mathbf{P}'}(\boldsymbol{e}) \left(\prod_{\substack{e_j \in M_1 \\ e_l \in N_j(e_j) \neq \emptyset \\ e_l \in N_j(e_j)}} \left(e_j - e_l \right) \prod_{\substack{k \in \mathbb{Z}_p \setminus \{1, 2, \dots, \Delta + 1\} \\ e_j \in M_2}} \left(e_j - k \right) \right)$$

$$\prod_{\substack{e_j \in M_2 \\ e_l \in N_j(e_j) \neq \emptyset \\ e_l \in N_j(e_j)}} \left(e_j - e_l \right) \prod_{\substack{k \in \mathbb{Z}_p \setminus \{1, 2, \dots, \Delta + 1, \alpha_{i-1}, \beta_i\} \\ e_l \in N_j(e_j)}} \left(e_j - k \right) \right) \prod_{\substack{e_j \in M_2 \\ e_l \in N_j(e_j)}} \left(e_j - \beta_i \right).$$

From the congruence relation (4.5), we have

$$\mathbf{G}'(\boldsymbol{e}) \equiv \prod_{\substack{e_j \in M_2}} \Big(\prod_{\substack{l \in \mathbb{Z}_p \setminus \{\alpha_{i-1}\}}} (e_j - l) \Big) \Big(\sum_{\substack{\prod_{\substack{r=1 \\ r \neq K}} l_r}} \mathcal{C}_{\prod_{\substack{r=1 \\ r \notin K}}^m l_r} (e_i) \prod_{\substack{r=1 \\ r \notin K}}^m e_r^{l_r} \Big),$$

where, $K = \{s : e_s \in M_2\} \cup \{i\}$ and $C_{\prod_{r=1}^m l_r}(e_i)$ is a univariate polynomial in e_i .

After rearranging factors, G'(e) can be rewritten as,

$$\mathbf{G}'(\boldsymbol{e}) \equiv \prod_{\substack{e_j \in M_2}} \left(\prod_{\substack{l \in \mathbb{Z}_p \setminus \{\alpha_{i-1}, \beta_i\} \\ r \notin K}} (e_j - l) \right) \left(\sum_{\substack{\prod_{\substack{r=1 \\ r \notin K}}}} {}^{l_r} \mathcal{C}_{\prod_{\substack{r=1 \\ r \notin K}}} {}^{l_r} (e_i) \prod_{\substack{r=1 \\ r \notin K}}^m e_r^{l_r} \right) \prod_{\substack{e_j \in M_2}} \left(e_j - \beta_i \right),$$

where, $K = \{s : e_s \in M_2\} \cup \{i\}$ and $C_{\prod_{r=1}^m l_r}(e_i)$ is a univariate polynomial in e_i .

Now, we consider
$$\frac{\mathbf{G}(e)}{\prod_{e_j \in M_2} \left(e_j - \beta_i\right)}$$
 and $\frac{\mathbf{G}'(e)}{\prod_{e_j \in M_2} \left(e_j - \beta_i\right)}$.

From the relation (4.8), we have,

$$\frac{\mathbf{G}(e)}{\prod_{e_j \in M_2} \left(e_j - \beta_i\right)} = \mathcal{C}^{\mathbf{P}'}(e) \left(\prod_{e_j \in M_1} \left(\prod_{\substack{\text{if } N_j(e_j) \neq \emptyset \\ e_l \in N_j(e_j)}} (e_j - e_l) \prod_{\substack{k \in \mathbb{Z}_p \setminus \{1, 2, \dots, \Delta + 1\}}} (e_j - k) \right) \right)$$

$$\prod_{e_j \in M_2} \left(\prod_{\substack{\text{if } N_j(e_j) \neq \emptyset \\ e_l \in N_j(e_j)}} (e_j - e_l) \prod_{\substack{k \in \mathbb{Z}_p \setminus \{1, 2, \dots, \Delta + 1, \alpha_{i-1}, \beta_i\} \\ e_l \in N_j(e_j)}} (e_j - e_l) \right).$$

And from the relation (4.9), we have,

(4.10)

$$\frac{\mathbf{G}'(e)}{\prod_{e_j \in M_2} \left(e_j - \beta_i \right)} \equiv \prod_{e_j \in M_2} \left(\prod_{l \in \mathbb{Z}_p \setminus \{\alpha_{i-1}, \beta_i\}} (e_j - l) \right) \left(\sum_{\substack{\prod_{\substack{r=1 \ r \neq K}} l_r \in K}} \mathcal{C}_{\prod_{\substack{r=1 \ r \neq K}}^m l_r} (e_i) \prod_{\substack{r=1 \ r \neq K}}^m e_r^{l_r} \right),$$

where, $K = \{s : e_s \in M_2\} \cup \{i\}$ and $C_{\prod_{r=1}^m l_r(e_i)}$ is a univariate polynomial in e_i .

From the Claim 3.2, for each $e_j \in M_2$, $(e_j - \beta_i)$ divides $\mathbf{J}_{\prod_{r=1}^m l_r}(e_j)$ but $(e_j - \beta_i)^2$ does not divide $\mathbf{J}_{\prod_{r=1}^m l_r}(e_j)$. Moreover, for each $e_j \in M_2$, $(e_j - \beta_i)$ divides $\mathbf{G}'(\mathbf{e})$ but $(e_j - \beta_i)^2$ does not divide $\mathbf{G}'(\mathbf{e})$. And $e_i - \beta_i$ does not divide $\mathbf{G}'(\mathbf{e})$ as well. Therefore, we can conclude that,

$$\frac{\mathbf{G}(e)}{\prod_{e_j \in M_2} \left(e_j - \beta_i\right)} \equiv \frac{\mathbf{G}'(e)}{\prod_{e_j \in M_2} \left(e_j - \beta_i\right)}$$

that is,

$$\mathcal{C}^{\mathbf{P}'}(e) \left(\prod_{e_j \in M_1} \left(\prod_{\substack{\text{if } N_j(e_j) \neq \emptyset \\ e_l \in N_j(e_j)}} (e_j - e_l) \prod_{k \in \mathbb{Z}_p \setminus \{1, 2, \dots, \Delta + 1\}} (e_j - k) \right) \right. \\
\left. \prod_{e_j \in M_2} \left(\prod_{\substack{\text{if } N_j(e_j) \neq \emptyset \\ e_l \in N_j(e_j)}} (e_j - e_l) \prod_{k \in \mathbb{Z}_p \setminus \{1, 2, \dots, \Delta + 1, \alpha_{i-1}, \beta_i\}} (e_j - k) \right) \right) \\
\equiv \prod_{e_j \in M_2} \left(\prod_{\substack{l \in \mathbb{Z}_p \setminus \{\alpha_{i-1}, \beta_i\} \\ l \in \mathbb{Z}_p \setminus \{\alpha_{i-1}, \beta_i\}}} (e_j - l) \right) \left(\sum_{\substack{\prod m_{l=1} \\ r \neq k}} \mathcal{C}_{\prod_{\substack{r=1 \\ r \neq k}}} l_r(e_i) \prod_{\substack{r=1 \\ r \notin K}}^m e_r^{l_r} \right), \right.$$

where, $K = \{s : e_s \in M_2\} \cup \{i\}$ and $\mathcal{C}_{\prod_{r=1}^m l_r}(e_i)$ is a univariate polynomial in e_i . \square

Proof of Claim 3.1. Let us consider a polynomial $\mathbf{K}(e)$ as follows,

$$\mathbf{K}(e) = \left(\frac{\mathbf{G}'(e)}{\prod_{e_j \in M_2} (e_j - \beta_i)}\right) \prod_{e_j \in M_2} \left(e_j - \alpha_{i-1}\right) \prod_{l \in \mathbb{Z}_p \setminus \{1, 2, \dots, \Delta + 1, \alpha = \beta_i\}} (e_i - l),$$

using congruence relation (4.10), the polynomial $\mathbf{K}(e)$ can be rewritten as,

$$\mathbf{K}(\boldsymbol{e}) \equiv \prod_{e_j \in M_2} \left(\left(\prod_{l \in \mathbb{Z}_p \setminus \{\alpha_{i-1}, \beta_i\}} (e_j - l) \right) \left(e_j - \alpha_{i-1} \right) \right) \left(\sum_{\substack{\prod_{r=1}^m l_r \\ r \notin K}} \left(\mathcal{C}_{\prod_{r=1}^m l_r} \left(e_i \right) \prod_{l \in \mathbb{Z}_p \setminus \{1, 2, \dots, \Delta + 1, \alpha = \beta_i\}} (e_i - l) \right) \prod_{\substack{r=1 \\ r \notin K}}^m e_r^{l_r} \right).$$

Now, we can conclude that $\mathbf{K}'(e) \not\equiv 0 \mod p$ as explained below. The exponent of each e_i in the following product,

$$(4.11) \quad \prod_{e_j \in M_2} \left(\prod_{l \in \mathbb{Z}_p \setminus \{\alpha_{i-1}, \beta_i\}} (e_j - l) (e_j - \alpha_{i-1}) \right) = \prod_{e_j \in M_2} \left(\prod_{l \in \mathbb{Z}_p \setminus \{\beta_i\}} (e_j - l) \right),$$

is $\leq p-1$.

From Claim 3.2, $e_i - \beta_i$ does not divide $\mathbf{G}'(e)$ and congruence relation (4.7) guarantee that existence of a $\mathcal{C}_{\prod_{r=1}^m l_r}(e_i)$ in $\mathbf{G}'(e)$ such that $e_i - \beta_i$ does not divide $\mathcal{C}_{\prod_{r=1}^m l_r}(e_i)$. Therefore, the following polynomial is not a zero polynomial, after applying Fermat's theorem to e_i , that is,

$$(4.12) \qquad \sum_{\substack{\prod_{r=1}^{m} l_r \\ r \notin K}} \left(\mathcal{C}_{\prod_{r=1}^{m} l_r} (e_i) \prod_{l \in \mathbb{Z}_p \setminus \{1, 2, \dots, \Delta + 1, \alpha = \beta_i\}} (e_i - l) \right) \prod_{\substack{r=1 \\ r \notin K}}^m e_r^{l_r} \not\equiv 0 \bmod p,$$

and the exponent of each e_r $(r \neq i)$ and exponent of e_i (after applying Fermat's theorem) is $\leq p-1$.

So, $\mathbf{K}'(e) \not\equiv 0 \mod p$, as $\{e_r : r \notin K, 1 \leq r \leq m\} \cap \{e_r : r \in K\} = \emptyset \text{ and } \mathbf{K}'(e) \text{ is the product of above polynomials (4.11) and (4.12).}$

Since $\mathbf{K}'(e) \not\equiv 0 \mod p$, to each of the variable e_1, e_2, \ldots, e_m , we associate the sets $\mathcal{A}_1 = \mathbb{Z}_p, \mathcal{A}_2 = \mathbb{Z}_p, \ldots, \mathcal{A}_m = \mathbb{Z}_p$ respectively. Then there exists $\beta'_{e_1} \in \mathcal{A}_1, \beta'_{e_2} \in \mathcal{A}_2, \ldots, \beta'_{e_m} \in \mathcal{A}_m$ such that

(4.13)
$$\mathbf{K}'(\beta'_{e_1}, \beta'_{e_2}, \dots, \beta'_{e_r}, \dots, \beta'_{e_m}) \not\equiv 0 \bmod p.$$

From the above congruence relation (4.13), we can also conclude that $\mathbf{K}'(e) \not\equiv 0 \mod p$, and $\mathbf{K}'(e)$ can be rewritten as,

$$\mathbf{K}'(e) \equiv \prod_{e_j \in M_2} \left(e_j - \alpha_{i-1} \right) \left(\prod_{e_j \in M_2} \left(\prod_{l \in \mathbb{Z}_p \setminus \{\alpha_{i-1}, \beta_i\}} (e_j - l) \right) \left(\sum_{\substack{\prod_{r=1}^m l_r \\ r \notin K}} \left(\mathcal{C}_{\prod_{r=1}^m l_r} (e_i) \right) \prod_{\substack{r=1 \\ r \notin K}}^m e_r^{l_r} \right) \right)$$

$$\prod_{l \in \mathbb{Z}_p \setminus \{1, 2, \dots, \Delta + 1, \alpha = \beta_i\}} (e_i - l).$$

And from the Lemma 3.3 $\mathbf{K}'(e)$ can be rewritten as,

$$\mathbf{K}(\boldsymbol{e}) = \prod_{e_j \in M_2} \left(e_j - \alpha_{i-1} \right) \left(\mathcal{C}^{\mathbf{P}'}(\boldsymbol{e}) \prod_{e_j \in M_1} \left(\prod_{\substack{\text{if } N_j(e_j) \neq \emptyset \\ e_l \in N_j(e_j)}} (e_j - e_l) \prod_{\substack{k \in \mathbb{Z}_p \setminus \{1, 2, \dots, \Delta + 1\}}} (e_j - k) \right)$$

$$\prod_{\substack{e_j \in M_2 \\ e_l \in N_i(e_j) \neq \emptyset \\ e_l \in N_i(e_j)}} \left(\prod_{\substack{k \in \mathbb{Z}_p \setminus \{1, 2, \dots, \Delta + 1, \alpha_{i-1}, \beta_i\} \\ e_l \in N_i(e_j)}} (e_j - k)\right) \prod_{\substack{k \in \mathbb{Z}_p \setminus \{1, 2, \dots, \Delta + 1, \alpha = \beta_i\} \\ e_l \in N_i(e_j)}} (e_i - k).$$

So,

(4.14)

$$\mathbf{K}(\boldsymbol{e}) \equiv \left(\mathcal{C}^{\mathbf{P}'}(\boldsymbol{e}) \prod_{j=1}^{i-1} \left(\prod_{\substack{\text{if } N_j(e_j) \neq \emptyset \\ e_l \in N_j(e_j)}} (e_j - e_l) \prod_{\substack{k \in \mathbb{Z}_p \setminus \{1, 2, \dots, \Delta + 1, \beta_i\}}} (e_j - k) \right) \right) \prod_{\substack{k \in \mathbb{Z}_p \setminus \{1, 2, \dots, \Delta + 1, \alpha = \beta_i\}}} (e_i - k).$$

In other words,

$$\mathbf{K}(\boldsymbol{e}) \equiv \mathbf{Q}_{i-1}(\boldsymbol{e}) \prod_{k \in \mathbb{Z}_p \setminus \{1, 2, \dots, \Delta+1, \alpha = \beta_i\}} (e_i - k) \not\equiv 0 \bmod p.$$

From the congruence relation (4.13), we have $\mathbf{K}(\beta'_{e_1}, \beta'_{e_2}, \dots, \beta'_{e_{i-1}}, \beta'_{e_i}, e_{i+1}, \dots, e_m) \not\equiv 0 \mod p$. The following products in $\mathbf{K}(\boldsymbol{e})$ make sure that $\beta_{e_j} \in \mathcal{K} = \{1, 2, \dots, \Delta + 1, \alpha = \beta_i\}$

$$\prod_{j=1}^{i} \Big(\prod_{k \in \mathbb{Z}_p \setminus \{1, 2, \dots, \Delta + 1, \beta_i\}} (e_j - k) \Big).$$

We can see that the exponent of each variable e_j (j>i) in the polynomial $\mathbf{K}(\beta'_{e_1},\ldots,\beta'_{e_{i-1}},\beta'_{e_i},e_{i+1},\ldots,e_m)$ is always less than or equal to 2Δ . Let $\prod_{j=i+1}^m e_j^{l_j}$ $(0 \leq l_j \leq 2\Delta)$ be a monomial of maximum degree in $\mathbf{K}(\beta'_{e_1},\ldots,\beta'_{e_{i-1}},\beta'_{e_i},e_{i+1},\ldots,e_m)$, and we have that $\prod_{e_l \in N_i(e_i)} e_l$ is the only monomial (unique) of maximum degree in

$$\prod_{\substack{\text{if } N_i(e_i) \neq \emptyset \\ e_l \in N_i(e_i)}} (\beta'_{e_i} - e_l).$$

The product of the above two monomials give a unique monomial of maximum degree whose coefficient is non-zero $(\not\equiv 0 \bmod p)$ in the following product of polynomials (4.15). Therefore, the following product of polynomials is not a zero polynomial,

(4.15)
$$\mathbf{K}(\beta'_{e_1}, \beta'_{e_2}, \dots, \beta'_{e_{i-1}}, \beta'_{e_i}, e_{i+1}, \dots, e_m) \prod_{\substack{\text{if } N_i(e_i) \neq \emptyset \\ e_l \in N_i(e_i)}} (\beta'_{e_i} - e_l) \not\equiv 0 \mod p.$$

So, we can also conclude that,

$$\mathbf{K}(e) \prod_{\substack{\text{if } N_i(e_i) \neq \emptyset \\ e_l \in N_i(e_i)}} (e_i - e_l) \not\equiv 0 \bmod p.$$

Replacing $\mathbf{K}(e)$ by the relation (4.14), we get

$$\left(\mathcal{C}^{\mathbf{P}'}(\boldsymbol{e})\prod_{j=1}^{i-1}\left(\prod_{\substack{\text{if }N_{j}(e_{j})\neq\emptyset\\e_{l}\in N_{j}(e_{j})}}(e_{j}-e_{l})\prod_{\substack{k\in\mathbb{Z}_{p}\backslash\{1,2,\ldots,\Delta+1,\beta_{i}\}\\e_{l}\in N_{i}(e_{i})}}(e_{j}-k)\right)\right)\prod_{\substack{\text{if }N_{i}(e_{i})\neq\emptyset\\e_{l}\in N_{i}(e_{i})}}(e_{i}-e_{l})\prod_{\substack{k\in\mathbb{Z}_{p}\backslash\{1,2,\ldots,\Delta+1,\alpha=\beta_{i}\}\\e_{l}\in N_{i}(e_{i})}}(e_{i}-k),$$

that is, $\mathbf{Q}_{i-1}(e)\mathbf{E}^{i}(e_i, e_{i+1}, \dots, e_m)$, this is nothing but, $\mathbf{Q}_{i}(e)$

From the congruence relation (4.15), we can conclusively say that, there exist $\beta'_{e_j} \in \mathcal{K} = \{1, 2, \dots, \Delta + 1, \alpha = \beta_i\}$ such that

$$\mathbf{Q}'_{i}(\beta'_{e_{1}}, \beta'_{e_{2}}, \dots, \beta'_{e_{i-1}}, \beta'_{e_{i}}, e_{i+1}, \dots, e_{m}) \not\equiv 0 \mod p.$$

Proof of Theorem 3.2. By the Result 3.1, we have $\mathbf{Q}_m(\beta_{e_1}, \beta_{e_2}, \dots, \beta_{e_m}) \not\equiv 0 \mod p$. And from the earlier stated definition, we have

$$\mathbf{Q}_m(\beta_{e_1},\beta_{e_2},\ldots,\beta_{e_m}) = \mathcal{C}^{\mathbf{P}'}(\beta_{e_1},\beta_{e_2},\ldots,\beta_{e_m}) \prod_{j=1}^m (\mathbf{E}^j(\beta_{e_j},\beta_{e_{j+1}},\ldots,\beta_{e_m})) \not\equiv 0 \bmod p.$$

This can also be written as

$$\mathbf{Q}_m(\beta_{e_1}, \beta_{e_2}, \dots, \beta_{e_m}) = \mathcal{C}^{\mathbf{P}'}(\beta_{e_1}, \beta_{e_2}, \dots, \beta_{e_m}) \mathbf{E}_m(\beta_{e_1}, \beta_{e_2}, \dots, \beta_{e_m}) \not\equiv 0 \bmod p.$$

If $\mathbf{Q}_m(\beta_{e_1}, \beta_{e_2}, \dots, \beta_{e_m}) \not\equiv 0 \mod p$, the mapping $f(e_i) = \beta_{e_i} (1 \leq i \leq m)$, as explained earlier, defines the *edge coloring* of the given graph by using $\Delta + 2$ colors. And we have that $\mathcal{C}^{\mathbf{P}'}(\beta_{e_1}, \beta_{e_2}, \dots, \beta_{e_m}) \not\equiv 0 \mod p$ which is the coefficient of $\prod_{i=1}^n v_i^{l_i}$ (for some $l_i \geq 0$) in $\mathbf{P}'(v_1, v_2, \dots, v_n, e_1, e_2, \dots, e_m)$. Therefore, the polynomial $\mathbf{P}'(v_1, v_2, \dots, v_n, \beta_{e_1}, \beta_{e_2}, \dots, \beta_{e_m}) \not\equiv 0 \mod p$.

Since $\mathbf{P}'(v_1, v_2, \dots, v_n, \beta_{e_1}, \beta_{e_2}, \dots, \beta_{e_m}) \not\equiv 0 \mod p$, to each variable v_1, v_2, \dots, v_n we associate the set $\mathcal{A}_1 = \mathbb{Z}_p$, $\mathcal{A}_2 = \mathbb{Z}_p$, ..., $\mathcal{A}_n = \mathbb{Z}_p$ respectively. Then there exists $\beta_{v_1} \in \mathcal{A}_1$, $\beta_{v_2} \in \mathcal{A}_2$, ..., $\beta_{v_n} \in \mathcal{A}_n$ such that $\mathbf{P}'(\beta_{v_1}, \beta_{v_2}, \dots, \beta_{v_n}, \beta_{e_1}, \beta_{e_2}, \dots, \beta_{e_m}) \not\equiv 0$ mod p.

We get $\mathbf{P}(\beta_{v_1}, \beta_{v_2}, \dots, \beta_{v_n}, \beta_{e_1}, \beta_{e_2}, \dots, \beta_{e_m}) \equiv \mathbf{P}'(\beta_{v_1}, \beta_{v_2}, \dots, \beta_{v_n}, \beta_{e_1}, \beta_{e_2}, \dots, \beta_{e_m}) \not\equiv 0 \mod p$. The following products in $\mathbf{P}(v_1, v_2, \dots, v_n, e_1, e_2, \dots, e_m)$ make sure that $\beta_{v_i} \in \{1, 2, \dots, \Delta + 1\}$

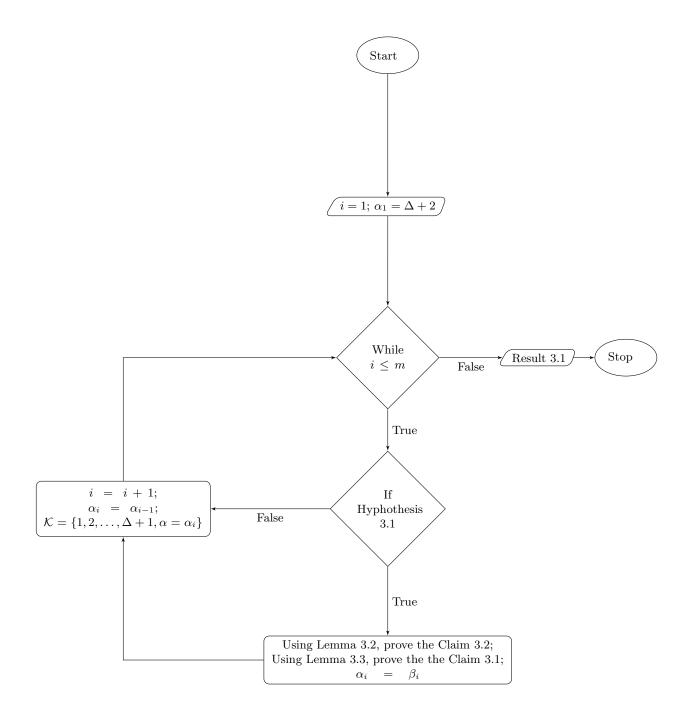

$$\prod_{i=1}^{n} \left(\prod_{l=\Delta+2}^{p} (\beta_{v_i} - l) \right).$$

Proof of Corollary 3.1. By the Result 3.1 the mapping $f(e_i) = \beta_{e_i} (1 \le i \le m)$ defines the edge coloring of the given graph by using $\Delta + 2$ colors. Further the previous Theorem 3.2 make sure that no two adjacent vertices have the same color and no edge has the same color as one of its end vertices.

Therefore, the mapping $f(v_i) = \beta_{v_i} (1 \le i \le n)$ and $f(e_i) = \beta_{e_i} (1 \le i \le m)$, will conclusively define that the *total coloring* of the given graph can be achieved by using $\Delta + 2$ colors.
