Abstract

In this paper, first we introduce the notion of a VB-Lie 2-algebroid, which can be viewed as the categorification of a VB-Lie algebroid. The tangent prolongation of a Lie 2-algebroid is a VB-Lie 2-algebroid naturally. We show that after choosing a splitting, there is a one-to-one correspondence between VB-Lie 2-algebroids and flat superconnections of a Lie 2-algebroid on a 3-term complex of vector bundles. Then we introduce the notion of a VB-CLWX 2-algebroid, which can be viewed as the categorification of a VB-Courant algebroid. We show that there is a one-to-one correspondence between split Lie 3-algebroids and split VB-CLWX 2-algebroids. The notion of a VB-Lie 2-bialgebroid is introduced and the double of a VB-Lie 2-bialgebroid is a VB-CLWX 2-algebroid. Finally, we introduce the notion of an E -CLWX 2-algebroid and show that associated to a VB-CLWX 2-algebroid, there is an E -CLWX 2-algebroid structure on the graded fat bundle naturally. By this result, we give a construction of a Lie 3-algebra from a given Lie 3-algebra, which provides interesting examples of Lie 3-algebras including the higher analogue of the string Lie 2-algebra.

1 Introduction

In this paper, we study the categorification of VB-Lie algebroids and VB-Courant algebroids, and establish the relations between these higher structures and super representations of Lie 2-algebroids, tangent prolongations of Lie 2-algebroids, N-manifolds of degree 3, tangent prolongations of CLWX 2-algebroids and higher analogues of the string Lie 2-algebra.

1.1 Lie n -algebroids, Courant algebroids and CLWX 2-algebroids

An **NQ-manifold** is an N-manifold \mathcal{M} together with a degree 1 vector field Q satisfying $[Q, Q] = 0$. It is well known that a degree 1 NQ manifold corresponds to a Lie algebroid. Thus, people usually think that

An NQ-manifold of degree n corresponds to a Lie n -algebroid.

Some work in this direction appeared in [53]. Strictly speaking, a Lie n -algebroid gives rise to an NQ-manifold only after a degree 1 shift, just as a Lie algebroid A corresponds to a degree 1 NQ manifold $A[1]$. To make the shifting manifest, and to present a Lie n -algebroid in a way more used to differential geometers, that is, to use the language of vector bundles, the authors introduced the notion of a split Lie n -algebroid in [51] to study the integration of a Courant algebroid. The equivalence between the category of split NQ manifolds and the category of split Lie n -Lie algebroids was proved in [5]. The language of split Lie n -algebroids has slowly become a useful tool for differential geometers to study problems related to NQ-manifolds ([14, 23, 24]). Since Lie 2-algebras are the categorification of Lie algebras ([4]), we will view Lie 2-algebroids as the categorification of Lie algebroids.

To study the double of a Lie bialgebroid ([41]), Liu, Weinstein and Xu introduced the notion of a Courant algebroid in [34]. See [43] for an alternative definition. There are many important applications of Courant algebroids, e.g. in generalized complex geometry ([8, 17, 21]), Poisson geometry ([32]), moment maps ([9]), Poisson-Lie T-duality ([46, 47]) and topological fields theory ([45]). In [33], the authors introduced the notion of a CLWX 2-algebroid (named after Courant-Liu-Weinstein-Xu), which can be viewed as the categorification of a Courant algebroid. Furthermore, CLWX 2-algebroids are in one-to-one correspondence with QP-manifolds (symplectic NQ-manifolds) of degree 3, and have applications in the fields theory. See [22] for more details. The underlying algebraic structure of a CLWX 2-algebroid is a Leibniz 2-algebra, or a Lie 3-algebra. There is also a close relationship between CLWX 2-algebroids and the first Pontryagin classes of quadratic Lie 2-algebroids, which are represented by closed 5-forms. More precisely, as the higher analogue of the results given in [6, 13], it was proved in [48] that the first Pontryagin class of a quadratic Lie algebroid is the obstruction of the existence of a CLWX-extension.

1.2 VB-Lie algebroids and VB-Courant algebroids

Double structures in geometry can be traced back to the work of Ehresmann on connection theory, and have been found many applications in Poisson geometry. See [39] for more details. We use the word “doublization” to indicate putting geometric structures on double vector bundles in the sequel. In [19], Gracia-Saz and Mehta introduced the notion of a VB-Lie algebroid, which is equivalent to Mackenzie’s \mathcal{LA} -vector bundle ([37]). A VB-Lie algebroid is a Lie algebroid object in the category of vector bundles and one important property is that it is closely related to superconnection (also called representation up to homotopy [1, 2]) of a Lie algebroid on a 2-term complex of vector bundles.

Recently, the relation between VB-algebroid morphism and representation up to homotopy were studied in [15].

In his PhD thesis [31], Li-Bland introduced the notion of a VB-Courant algebroid which is the doubling of a Courant algebroid [34], and established abstract correspondence between NQ-manifolds of degree 2 and VB-Courant algebroids. Then in [23], Jotz Lean provided a more concrete description of the equivalence between the category of split Lie 2-algebroids and the category of decomposed VB-Courant algebroids.

Double structures, such as double principle (vector) bundles ([12, 16, 25, 29]), double Lie algebroids ([18, 36, 37, 38, 40, 54]), double Lie groupoids ([42]), VB-Lie algebroids ([7, 19]) and VB-Lie groupoids ([7, 20]) become more and more important recently and are widely studied. In particular, the Lie theory relating VB-Lie algebroids and VB-Lie groupoids, i.e. their relation via differentiation and integration, is established in [7].

1.3 Summary of the results and outline of the paper

In this paper, we combine the aforementioned higher structures and double structures. First we introduce the notion of a VB-Lie 2-algebroid, which can be viewed as the categorification of a VB-Lie algebroid, or doubling of a Lie 2-algebroid:

We show that the tangent prolongation of a Lie 2-algebroid is a VB-Lie 2-algebroid and the graded fat bundle associated to a VB-Lie 2-algebroid is Lie 2-algebroid. Consequently, the graded jet bundle of a Lie 2-algebroid is also a Lie 2-algebroid. In [19], the authors showed that a VB-Lie algebroid is equivalent to a flat superconnection (representation up to homotopy ([1])) of a Lie algebroid on a 2-term complex of vector bundles after choosing a splitting. Now for a VB-Lie 2-algebroid, we establish a higher analogous result, namely, we show that after choosing a splitting, it is equivalent to a flat superconnection of a Lie 2-algebroid on a 3-term complex of vector bundles.

Then we introduce the notion of a VB-CLWX 2-algebroid, which can be viewed as both the doubling of a CLWX 2-algebroid and the categorification of a VB-Courant algebroid. More importantly, we show that after choosing a splitting, there is a one-to-one correspondence between VB-CLWX 2-algebroids and split Lie 3-algebroids (NQ-manifolds of degree 3). The tangent prolongation of a CLWX 2-algebroid is a VB-CLWX 2-algebroid naturally. We go on defining E -CLWX 2-algebroid, which can be viewed as the categorification of an E -Courant algebroid introduced in [11]. As a higher analogue of the result that associated to a VB-Courant algebroid, there is an E -Courant algebroid [23, 30], we show that on the graded fat bundle associated to a VB-CLWX 2-algebroid, there is an E -CLWX 2-algebroid structure naturally. Similar to the case of a CLWX 2-algebroid, an E -CLWX 2-algebroid also gives rise to a Lie 3-algebra naturally. Thus through the following procedure:

$$\text{Lie 3-algebra} \longmapsto \text{VB-CLWX 2-algebroid} \longmapsto \text{E-CLWX 2-algebroid} \longmapsto \text{Lie 3-algebra},$$

we can construct a Lie 3-algebra from a Lie 3-algebra. We obtain new interesting examples, including the higher analogue of the string Lie 2-algebra.

The paper is organized as follows. In Section 2, we recall double vector bundles, VB-Lie algebroids and VB-Courant algebroids. In Section 3, we introduce the notion of a VB-Lie 2-algebroid, and show that both the graded side bundle and the graded fat bundle are Lie 2-algebroids. The tangent prolongation of a Lie 2-algebroid is a VB-Lie 2-algebroid naturally. In Section 4, first we construct a strict Lie 3-algebroid $\text{End}(\mathcal{E}) = (\text{End}^{-2}(\mathcal{E}), \text{End}^{-1}(\mathcal{E}), \mathfrak{D}(\mathcal{E}), \mathfrak{p}, \text{d}, [\cdot, \cdot]_C)$ from a 3-term complex of vector bundles $\mathcal{E} : E_{-2} \xrightarrow{\pi} E_{-1} \xrightarrow{\pi} E_0$ and then we define a flat superconnection of a Lie 2-algebroid $\mathcal{A} = (A_{-1}, A_0, \mathfrak{a}, \mathfrak{l}_1, \mathfrak{l}_2, \mathfrak{l}_3)$ on this 3-term complex of vector bundles to be a morphism from \mathcal{A} to $\text{End}(\mathcal{E})$. We show that after choosing a splitting, VB-Lie 2-algebroids one-to-one correspond to flat superconnections of a Lie 2-algebroid on a 3-term complex of vector bundles. In Section 5, we introduce the notion of a VB-CLWX 2-algebroid and show that after choosing a splitting, there is a one-to-one correspondence between VB-CLWX 2-algebroids and Lie 3-algebroids. In Section 6, we introduce the notion of an E -CLWX 2-algebroid and show that the graded fat bundle associated to a VB-CLWX 2-algebroid is an E -CLWX 2-algebroid naturally. In particular, the graded jet bundle of a CLWX 2-algebroid, which is the graded fat bundle of the tangent prolongation of this CLWX 2-algebroid, is a T^*M -CLWX 2-algebroid. We can also obtain a Lie 3-algebra from an E -CLWX 2-algebroid. In Section 7, we construct a Lie 3-algebra from a given Lie 3-algebra using the theories established in Section 5 and Section 6, and give interesting examples. In particular, we show that associated to a quadratic Lie 2-algebra, we can obtain a Lie 3-algebra, which can be viewed as the higher analogue of the string Lie 2-algebra.

2 Preliminaries

See [39] for the precise definition of a double vector bundle. We denote a double vector bundle

$$\begin{array}{ccc} D & \xrightarrow{\pi_B} & B \\ \pi_A \downarrow & & \downarrow q_B \\ A & \xrightarrow{q_A} & M \longleftarrow C \end{array}$$

with core C by $(D; A, B; M)$. We use D^B and D^A to denote vector bundles $D \rightarrow B$ and $D \rightarrow A$ respectively. For a vector bundle A , both the tangent bundle TA and the cotangent bundle T^*A are double vector bundles:

$$\begin{array}{ccc} TA & \longrightarrow & TM \\ \downarrow & & \downarrow \\ A & \longrightarrow & M, \end{array} \quad \begin{array}{ccc} T^*A & \longrightarrow & A^* \\ \downarrow & & \downarrow \\ A & \longrightarrow & M. \end{array}$$

A morphism of double vector bundles

$$(\varphi; f_A, f_B; f_M) : (D; A, B; M) \rightarrow (D'; A', B'; M')$$

consists of maps $\varphi : D \rightarrow D'$, $f_A : A \rightarrow A'$, $f_B : B \rightarrow B'$, $f_M : M \rightarrow M'$, such that each of (φ, f_B) , (φ, f_A) , (f_A, f_M) and (f_B, f_M) is a morphism of the relevant vector bundles.

The space of sections $\Gamma_B(D)$ of the vector bundle D^B is generated as a $C^\infty(B)$ -module by core sections $\Gamma_B^c(D)$ and linear sections $\Gamma_B^l(D)$. See [40] for more details. For a section $c : M \rightarrow C$, the corresponding **core section** $c^\dagger : B \rightarrow D$ is defined as

$$c^\dagger(b_m) = \tilde{0}_{b_m} +_A \overline{c(m)}, \quad \forall m \in M, b_m \in B_m,$$

where $\bar{\cdot}$ means the inclusion $C \hookrightarrow D$. A section $\xi : B \rightarrow D$ is called **linear** if it is a bundle morphism from $B \rightarrow M$ to $D \rightarrow A$ over a section $X \in \Gamma(A)$. Given $\psi \in \Gamma(B^* \otimes C)$, there is a linear section $\tilde{\psi} : B \rightarrow D$ over the zero section $0^A : M \rightarrow A$ given by

$$\tilde{\psi}(b_m) = \tilde{0}_{b_m} +_A \overline{\psi(b_m)}.$$

Note that $\Gamma_B^l(D)$ is locally free as a $C^\infty(M)$ -module. Therefore, $\Gamma_B^l(D)$ is equal to $\Gamma(\hat{A})$ for some vector bundle $\hat{A} \rightarrow M$. The vector bundle \hat{A} is called the **fat bundle** of the double vector bundle $(D; A, B; M)$. Moreover, we have the following short exact sequence of vector bundles over M

$$0 \rightarrow B^* \otimes C \longrightarrow \hat{A} \xrightarrow{\text{pr}} A \rightarrow 0. \quad (1)$$

We will view $B^* \otimes C$ both as $\text{Hom}(B, C)$ and $\text{Hom}(C^*, B^*)$ depending on what it acts.

Definition 2.1. ([19]) *A VB-Lie algebroid is a double vector bundle $(D; A, B; M)$ equipped with a Lie algebroid structure $(D^B, a, [\cdot, \cdot]_D)$ such that the anchor $a : D \rightarrow TB$ is linear, i.e. a is a double vector bundle morphism over $\mathbf{a} : A \rightarrow TM$, and the Lie bracket $[\cdot, \cdot]_D$ is linear:*

$$[\Gamma_B^l(D), \Gamma_B^l(D)]_D \subset \Gamma_B^l(D), \quad [\Gamma_B^l(D), \Gamma_B^c(D)]_D \subset \Gamma_B^c(D), \quad [\Gamma_B^c(D), \Gamma_B^c(D)]_D = 0.$$

The vector bundle $A \rightarrow M$ is then also a Lie algebroid, with the anchor \mathbf{a} and the bracket $[\cdot, \cdot]_A$ defined as follows: if ξ_1, ξ_2 are linear over $X_1, X_2 \in \Gamma(A)$, then the bracket $[\xi_1, \xi_2]_D$ is linear over $[X_1, X_2]_A$.

Definition 2.2. ([31]) *A VB-Courant algebroid is a metric double vector bundle $(D; A, B; M)$ such that $(D^B, S, [\cdot, \cdot], \rho)$ is a Courant algebroid and the following conditions are satisfied:*

- (i) *The anchor map $\rho : D \rightarrow TB$ is linear, i.e. $\rho : (D; A, B; M) \rightarrow (TB; TM, B; M)$ is a morphism of double vector bundles;*
- (ii) *The Courant bracket is linear. That is*

$$\llbracket \Gamma_B^l(D), \Gamma_B^l(D) \rrbracket \subseteq \Gamma_B^l(D), \quad \llbracket \Gamma_B^l(D), \Gamma_B^c(D) \rrbracket \subseteq \Gamma_B^c(D), \quad \llbracket \Gamma_B^c(D), \Gamma_B^c(D) \rrbracket = 0.$$

Theorem 2.3. ([31]) *There is a one-to-one correspondence between Lie 2-algebroids and VB-Courant algebroids.*

3 VB-Lie 2-algebroids

In this section, we introduce the notion of a VB-Lie 2-algebroid, which can be viewed as the categorification of a VB-Lie algebroid introduced in [19]. First we recall the notion of a Lie n -algebroid. See [27, 28] for more information of L_∞ -algebras.

Definition 3.1. ([51]) *A split Lie n -algebroid is a non-positively graded vector bundle $\mathcal{A} = A_0 \oplus A_{-1} \oplus \cdots \oplus A_{-n+1}$ over a manifold M equipped with a bundle map $a : A_0 \rightarrow TM$ (called the anchor), and $n + 1$ many brackets $l_i : \Gamma(\wedge^i \mathcal{A}) \rightarrow \Gamma(\mathcal{A})$ with degree $2 - i$ for $1 \leq i \leq n + 1$, such that*

1. $\Gamma(\mathcal{A})$ is an n -term L_∞ -algebra:

$$\sum_{i+j=k+1} (-1)^{i(j-1)} \sum_{\sigma \in Sh_{i,k-i}^{-1}} \text{sgn}(\sigma) \text{Ksgn}(\sigma) l_j(l_i(X_{\sigma(1)}, \dots, X_{\sigma(i)}), X_{\sigma(i+1)}, \dots, X_{\sigma(k)}) = 0,$$

where the summation is taken over all $(i, k-i)$ -unshuffles $Sh_{i,k-i}^{-1}$ with $i \geq 1$ and “ $\text{Ksgn}(\sigma)$ ” is the Koszul sign for a permutation $\sigma \in S_k$, i.e.

$$X_1 \wedge \dots \wedge X_k = \text{Ksgn}(\sigma) X_{\sigma(1)} \wedge \dots \wedge X_{\sigma(k)}.$$

2. l_2 satisfies the Leibniz rule with respect to the anchor a :

$$l_2(X^0, fX) = fl_2(X^0, X) + a(X^0)(f)X, \quad \forall X^0 \in \Gamma(A_0), f \in C^\infty(M), X \in \Gamma(\mathcal{A}).$$

3. For $i \neq 2$, l_i 's are $C^\infty(M)$ -linear.

Denote a Lie n -algebroid by $(A_{-n+1}, \dots, A_0, a, l_1, \dots, l_{n+1})$, or simply by \mathcal{A} . We will only use a Lie 2-algebroid $(A_{-1}, A_0, a, l_1, l_2, l_3)$ and a Lie 3-algebroid $(A_{-2}, A_{-1}, A_0, a, l_1, l_2, l_3, l_4)$. For a Lie n -algebroid, we have a generalized Chevalley-Eilenberg complex $(\Gamma(\text{Symm}(\mathcal{A}[1])^*), \delta)$. See [5, 51] for more details. Then $\mathcal{A}[1]$ is an NQ-manifold of degree n . A split Lie n -algebroid morphism $\mathcal{A} \rightarrow \mathcal{A}'$ can be defined to be a graded vector bundle morphism $f : \text{Symm}(\mathcal{A}[1]) \rightarrow \text{Symm}(\mathcal{A}'[1])$ such that the induced map $f^* : C(\mathcal{A}'[1]) \rightarrow C(\mathcal{A}[1])$ is a morphism of NQ manifolds. However it is rather complicated to write down a morphism between split Lie n -algebroids in terms of vector bundles, anchors and brackets, please see [5, Section 4.1] for such details. We only give explicit formulas of a morphism from a Lie 2-algebroid to a strict Lie 3-algebroid ($l_3 = 0, l_4 = 0$) and this is what we will use in this paper to define flat superconnections.

Definition 3.2. Let $\mathcal{A} = (A_{-1}, A_0, a, l_1, l_2, l_3)$ be a Lie 2-algebroid and $\mathcal{A}' = (A'_{-2}, A'_{-1}, A'_0, a', l'_1, l'_2)$ a strict Lie 3-algebroid. A morphism F from \mathcal{A} to \mathcal{A}' consists of:

- a bundle map $F^0 : A_0 \rightarrow A'_0$,
- a bundle map $F^1 : A_{-1} \rightarrow A'_{-1}$,
- a bundle map $F^2_0 : \wedge^2 A_0 \rightarrow A'_{-1}$,
- a bundle map $F^2_1 : A_0 \wedge A_{-1} \rightarrow A'_{-2}$,
- a bundle map $F^3 : \wedge^3 A_0 \rightarrow A'_{-2}$,

such that for all $X^0, Y^0, Z^0, X^i_0 \in \Gamma(A_0)$, $i = 1, 2, 3, 4$, $X^1, Y^1 \in \Gamma(A_{-1})$, we have

$$\begin{aligned} a' \circ F^0 &= a, \\ l'_1 \circ F^1 &= F^0 \circ l_1, \\ F^0 l_2(X^0, Y^0) - l'_2(F^0(X^0), F^0(Y^0)) &= l'_1 F^2_0(X^0, Y^0), \\ F^1 l_2(X^0, Y^1) - l'_2(F^0(X^0), F^1(Y^1)) &= F^2_0(X^0, l_1(Y^1)) - l'_1 F^2_1(X^0, Y^1), \\ l'_2(F^1(X^1), F^1(Y^1)) &= F^2_1(l_1(X^1), Y^1) - F^2_1(X^1, l_1(Y^1)), \\ l'_2(F^0(X^0), F^2(Y^0, Z^0)) - F^2_0(l_2(X^0, Y^0), Z^0) + c.p. &= F^1(l_3(X^0, Y^0, Z^0)) + l'_1 F^3(X^0, Y^0, Z^0), \end{aligned}$$

$$\begin{aligned}
& l'_2(F^0(X^0), F_1^2(Y^0, Z^1)) + l'_2(F^0(Y^0), F_1^2(Z^1, X^0)) + l'_2(F^1(Z^1), F_0^2(X^0, Y^0)) \\
= & F_1^2(l_2(X^0, Y^0), Z^1) + c.p. + F^3(X^0, Y^0, l_1(Z^1)),
\end{aligned}$$

and

$$\begin{aligned}
& \sum_{i=1}^4 (-1)^{i+1} \left(F_1^2(X_i^0, l_3(X_1^0, \dots, \widehat{X_i^0}, \dots, X_4^0)) + l'_2(F^0(X_i^0), F^3(X_1^0, \dots, \widehat{X_i^0}, \dots, X_4^0)) \right) \\
& + \sum_{i < j} (-1)^{i+j} \left(F^3(l_2(X_i^0, X_j^0), X_k^0, X_l^0) + c.p. - \frac{1}{2} l'_2(F_0^2(X_i^0, X_j^0), F_0^2(X_k^0, X_l^0)) \right) = 0,
\end{aligned}$$

where $k < l$ and $\{k, l\} \cap \{i, j\} = \emptyset$.

Let $(A_{-1}, A_0, a, l_1, l_2, l_3)$ be a Lie 2-algebroid. Then for all $X^0, Y^0 \in \Gamma(A_0)$ and $X^1 \in \Gamma(A_{-1})$, Lie derivatives $L_{X^0}^0 : \Gamma(A_{-i}^*) \rightarrow \Gamma(A_{-i}^*)$, $i = 0, 1$, $L_{X^1}^1 : \Gamma(A_{-1}^*) \rightarrow \Gamma(A_0^*)$ and $L_{X^0, Y^0}^3 : \Gamma(A_{-1}^*) \rightarrow \Gamma(A_0^*)$ are defined by

$$\left\{ \begin{array}{l} \langle L_{X^0}^0 \alpha^0, Y^0 \rangle = \rho(X^0) \langle Y^0, \alpha^0 \rangle - \langle \alpha^0, l_2(X^0, Y^0) \rangle, \\ \langle L_{X^0}^0 \alpha^1, Y^1 \rangle = \rho(X^0) \langle Y^1, \alpha^1 \rangle - \langle \alpha^1, l_2(X^0, Y^1) \rangle, \\ \langle L_{X^1}^1 \alpha^1, Y^0 \rangle = -\langle \alpha^1, l_2(X^1, Y^0) \rangle, \\ \langle L_{X^0, Y^0}^3 \alpha^1, Z^0 \rangle = -\langle \alpha^1, l_3(X^0, Y^0, Z^0) \rangle, \end{array} \right. \quad (2)$$

for all $\alpha^0 \in \Gamma(A_0^*)$, $\alpha^1 \in \Gamma(A_{-1}^*)$, $Y^1 \in \Gamma(A_{-1})$, $Z^0 \in \Gamma(A_0)$. If $(\mathcal{A}^*[1], \mathbf{a}, l_1, l_2, l_3)$ is also a split Lie 2-algebroid, we denote by $\mathcal{L}^0, \mathcal{L}^1, \mathcal{L}^3, \delta_*$ the corresponding operations.

A graded double vector bundle consists of a double vector bundle $(D_{-1}; A_{-1}, B_{-1}; M_{-1})$ of degree -1 and a double vector bundle $(D_0; A_0, B_0; M_0)$ of degree 0 :

$$\begin{array}{ccc} D_{-1} & \xrightarrow{\pi^{B_{-1}}} & B_{-1} \\ \pi^{A_{-1}} \downarrow & & \downarrow q^{B_{-1}} \\ A_{-1} & \xrightarrow{q^{A_{-1}}} & M_{-1} \longleftarrow C_{-1} \end{array} \qquad \begin{array}{ccc} D_0 & \xrightarrow{\pi^{B_0}} & B_0 \\ \pi^{A_0} \downarrow & & \downarrow q^{B_0} \\ A_0 & \xrightarrow{q^{A_0}} & M \longleftarrow C_0. \end{array}$$

We denote a graded double vector bundle by $\left(\begin{array}{l} D_{-1}; \quad A_{-1}, B_{-1}; \quad M_{-1} \\ D_0; \quad A_0, B_0; \quad M_0 \end{array} \right)$. Morphisms between graded double vector bundles can be defined in an obvious way. We will denote by \mathcal{D} and \mathcal{A} the graded vector bundles $D_0^B \oplus D_{-1}^B$ and $A_0 \oplus A_{-1}$ respectively. Now we are ready to introduce the main object in this section.

Definition 3.3. A VB-Lie 2-algebroid is a graded double vector bundle $\left(\begin{array}{l} D_{-1}; \quad A_{-1}, B; \quad M \\ D_0; \quad A_0, B; \quad M \end{array} \right)$ equipped with a Lie 2-algebroid structure $(D_{-1}^B, D_0^B, a, l_1, l_2, l_3)$ on \mathcal{D} such that

- (i) The anchor $a : D_0 \rightarrow TB$ is linear, i.e. we have a bundle map $\mathbf{a} : A_0 \rightarrow TM$ such that $(\mathbf{a}; \mathbf{a}, \text{id}_B; \text{id}_M)$ is a double vector bundle morphism (see Diagram (i));
- (ii) l_1 is linear, i.e. we have a bundle map $l_1 : A_{-1} \rightarrow A_0$ such that $(l_1; l_1, \text{id}_B; \text{id}_M)$ is a double vector bundle morphism (see Diagram (ii));

(iii) l_2 is linear, i.e.

$$\begin{aligned} l_2(\Gamma_B^l(D_0), \Gamma_B^l(D_0)) &\subset \Gamma_B^l(D_0), & l_2(\Gamma_B^l(D_0), \Gamma_B^c(D_0)) &\subset \Gamma_B^c(D_0), & l_2(\Gamma_B^c(D_0), \Gamma_B^c(D_0)) &= 0, \\ l_2(\Gamma_B^l(D_0), \Gamma_B^l(D_{-1})) &\subset \Gamma_B^l(D_{-1}), & l_2(\Gamma_B^l(D_0), \Gamma_B^c(D_{-1})) &\subset \Gamma_B^c(D_{-1}), \\ l_2(\Gamma_B^c(D_0), \Gamma_B^l(D_{-1})) &\subset \Gamma_B^c(D_{-1}), & l_2(\Gamma_B^c(D_0), \Gamma_B^c(D_{-1})) &= 0; \end{aligned}$$

(iv) l_3 is linear, i.e.

$$\begin{aligned} l_3(\Gamma_B^l(D_0), \Gamma_B^l(D_0), \Gamma_B^l(D_0)) &\subset \Gamma_B^l(D_{-1}), & l_3(\Gamma_B^l(D_0), \Gamma_B^l(D_0), \Gamma_B^c(D_0)) &\subset \Gamma_B^c(D_{-1}), \\ l_3(\Gamma_B^c(D_0), \Gamma_B^c(D_0), \cdot) &= 0. \end{aligned}$$

$$\begin{array}{ccccc} D_0 & \longrightarrow & B & & \\ \downarrow a & \searrow & \downarrow & \parallel & \downarrow \\ & A_0 & \longrightarrow & M & \longleftarrow C_0 \\ & \downarrow a & & \parallel & \\ TB & \longrightarrow & B & & \\ & \searrow & \downarrow & \parallel & \\ & TM & \longrightarrow & M & \longleftarrow B, \end{array}$$

Diagram (i)

$$\begin{array}{ccccc} D_{-1} & \longrightarrow & B & & \\ \downarrow l_1 & \searrow & \downarrow & \parallel & \downarrow \\ & A_{-1} & \longrightarrow & M & \longleftarrow C_{-1} \\ & \downarrow l_1 & & \parallel & \\ D_0 & \longrightarrow & B & & \\ & \searrow & \downarrow & \parallel & \\ & A_0 & \longrightarrow & M & \longleftarrow C_0. \end{array}$$

Diagram (ii)

Since Lie 2-algebroids are the categorification of Lie algebroids, VB-Lie 2-algebroids can be viewed as the categorification of VB-Lie algebroids.

Recall that if $(D; A, B; M)$ is a VB-Lie algebroid, then A is a Lie algebroid. The following result is its higher analogue.

Theorem 3.4. Let $\left(\begin{array}{ccc} D_{-1}; & A_{-1}, B; & M \\ D_0; & A_0, B; & M \end{array} \right)$ be a VB-Lie 2-algebroid. Then $(A_{-1}, A_0, \mathfrak{a}, l_1, l_2, l_3)$ is a Lie 2-algebroid, where l_2 is defined by the property that if $\xi_1^0, \xi_2^0, \xi^0 \in \Gamma_B^l(D_0)$ are linear sections over $X_1^0, X_2^0, X^0 \in \Gamma(A_0)$, and $\xi^1 \in \Gamma_B^l(D_{-1})$ is a linear section over $X^1 \in \Gamma(A_{-1})$, then $l_2(\xi_1^0, \xi_2^0) \in \Gamma_B^l(D_0)$ is a linear section over $l_2(X_1^0, X_2^0) \in \Gamma(A_0)$ and $l_2(\xi^0, \xi^1) \in \Gamma_B^l(D_{-1})$ is a linear section over $l_2(X^0, X^1) \in \Gamma(A_{-1})$. Similarly, l_3 is defined by the property that if $\xi_1^0, \xi_2^0, \xi_3^0 \in \Gamma_B^l(D_0)$ are linear sections over $X_1^0, X_2^0, X_3^0 \in \Gamma(A_0)$, then $l_3(\xi_1^0, \xi_2^0, \xi_3^0) \in \Gamma_B^l(D_{-1})$ is a linear section over $l_3(X_1^0, X_2^0, X_3^0) \in \Gamma(A_{-1})$.

Proof. Since l_2 is linear, for any $\xi^i \in \Gamma_B^l(D_{-i})$ satisfying $\pi^{A_{-i}}(\xi^i) = 0$, we have

$$\pi^{A_{-(i+j)}}(l_2(\xi^i, \eta^j)) = 0, \quad \forall \eta^j \in \Gamma_B^l(D_{-j}).$$

This implies that l_2 is well-defined. Similarly, l_3 is also well-defined.

By the fact that $l_1 : D_{-1} \rightarrow D_0$ is a double vector bundle morphism over $l_1 : A_{-1} \rightarrow A_0$, we can deduce that $(\Gamma(A_{-1}), \Gamma(A_0), l_1, l_2, l_3)$ is a Lie 2-algebra. We only give a proof of the property

$$l_1(l_2(X_0, X_1)) = l_2(X_0, l_1(X_1)), \quad \forall X^0 \in \Gamma(A_0), X^1 \in \Gamma(A_{-1}). \quad (3)$$

The other conditions in the definition of a Lie 2-algebra can be proved similarly. In fact, let $\xi^0 \in \Gamma_B^l(D_0)$, $\xi^1 \in \Gamma_B^l(D_{-1})$ be linear sections over X^0, X^1 respectively, then by the equality $l_1(l_2(\xi^0, \xi^1)) = l_2(\xi^0, l_1(\xi^1))$, we have

$$\pi^{A_0} l_1(l_2(\xi^0, \xi^1)) = \pi^{A_0} l_2(\xi^0, l_1(\xi^1)).$$

Since $l_1 : D_{-1} \longrightarrow D_0$ is a double vector bundle morphism over $l_1 : A_{-1} \longrightarrow A_0$, the left hand side is equal to

$$\pi^{A_0} l_1(l_2(\xi^0, \xi^1)) = l_1 \pi^{A_{-1}} l_2(\xi^0, \xi^1) = l_1 l_2(X^0, X^1),$$

and the right hand side is equal to

$$\pi^{A_0} l_2(\xi^0, l_1(\xi^1)) = l_2(\pi^{A_0}(\xi^0), \pi^{A_0}(l_1(\xi^1))) = l_2(X_0, l_1(X^1)).$$

Thus, we deduce that (3) holds.

Finally, for all $X^0 \in \Gamma(A_0)$, $Y^i \in \Gamma(A_{-i})$ and $f \in C^\infty(M)$, let $\xi^0 \in \Gamma_B^l(D_0)$ and $\eta^i \in \Gamma_B^l(D_{-i})$, $i = 0, 1$ be linear sections over X^0 and Y^i . Then $q_B^*(f)\eta^i$ is a linear section over fY^i . By the fact that a is a double vector bundle morphism over \mathfrak{a} , we have

$$\begin{aligned} l_2(X^0, fY^i) &= \pi^{A_{-i}} l_2(\xi^0, q_B^*(f)\eta^i) = \pi^{A_{-i}}(q_B^*(f)l_2(\xi^0, \eta^i) + a(\xi^0)(q_B^*(f))\eta^i) \\ &= fl_2(X^0, Y^i) + \mathfrak{a}(X^0)(f)Y^i. \end{aligned}$$

Therefore, $(A_{-1}, A_0, \mathfrak{a}, l_1, l_2, l_3)$ is a Lie 2-algebroid. ■

Remark 3.5. *By the above theorem, we can view a VB-Lie 2-algebroid as a Lie 2-algebroid object in the category of double vector bundles.*

Consider the associated graded fat bundle $\hat{A}_{-1} \oplus \hat{A}_0$, obviously we have

Proposition 3.6. *Let $\begin{pmatrix} D_{-1}; & A_{-1}, B; & M \\ D_0; & A_0, B; & M \end{pmatrix}$ be a VB-Lie 2-algebroid. Then $(\hat{A}_{-1}, \hat{A}_0, \hat{a}, \hat{l}_1, \hat{l}_2, \hat{l}_3)$ is a Lie 2-algebroid, where $\hat{a} = \mathfrak{a} \circ \text{pr}$ and $\hat{l}_1, \hat{l}_2, \hat{l}_3$ are the restriction of l_1, l_2, l_3 on linear sections respectively.*

Consequently, we have the following exact sequences of Lie 2-algebroids:

$$\begin{array}{ccccccc} 0 & \longrightarrow & B^* \otimes C_{-1} & \longrightarrow & \hat{A}_{-1} & \xrightarrow{\text{pr}} & A_{-1} \longrightarrow 0 \\ & & \downarrow & & \hat{l}_1 \downarrow & & l_1 \downarrow \\ 0 & \longrightarrow & B^* \otimes C_0 & \longrightarrow & \hat{A}_0 & \xrightarrow{\text{pr}} & A_0 \longrightarrow 0 \end{array} \quad (4)$$

It is helpful to give the Lie 2-algebroid structure on $B^* \otimes C_{-1} \oplus B^* \otimes C_0$. Since l_1 is linear, it induces a bundle map $l_1^C : C_{-1} \longrightarrow C_0$. The restriction of \hat{l}_1 on $B^* \otimes C_{-1}$ is given by

$$\hat{l}_1(\phi^1) = l_1^C \circ \phi^1, \quad \forall \phi^1 \in \Gamma(B^* \otimes C_{-1}) = \Gamma(\text{Hom}(B, C_{-1})). \quad (5)$$

Since the anchor $a : D_0 \longrightarrow TB$ is a double vector bundle morphism, it induces a bundle map $\varrho : C_0 \longrightarrow B$ via

$$\langle \varrho(c^0), \xi \rangle = -a(c^0)(\xi), \quad \forall c^0 \in \Gamma(C_0), \quad \xi \in \Gamma(B^*). \quad (6)$$

Then by the Leibniz rule, we deduce that the restriction of \hat{l}_2 on $\Gamma(B^* \otimes C_{-1} \oplus B^* \otimes C_0)$ is given by

$$\hat{l}_2(\phi^0, \psi^0) = \phi^0 \circ \varrho \circ \psi^0 - \psi^0 \circ \varrho \circ \phi^0, \quad (7)$$

$$\hat{l}_2(\phi^0, \psi^1) = -\hat{l}_2(\psi^1, \phi^0) = -\psi^1 \circ \varrho \circ \phi^0, \quad (8)$$

for all $\phi^0, \psi^0 \in \Gamma(B^* \otimes C_0) = \Gamma(\text{Hom}(B, C_0))$ and $\psi^1 \in \Gamma(B^* \otimes C_{-1}) = \Gamma(\text{Hom}(B, C_{-1}))$. Since l_3 is linear, the restriction of l_3 on $B^* \otimes C_{-1} \oplus B^* \otimes C_0$ vanishes. Obviously, the anchor is trivial.

Thus, the Lie 2-algebroid structure on $B^* \otimes C_{-1} \oplus B^* \otimes C_0$ is exactly given by (5), (7) and (8). Therefore, $B^* \otimes C_{-1} \oplus B^* \otimes C_0$ is a graded bundle of strict Lie 2-algebras.

An important example of VB-Lie algebroids is the tangent prolongation of a Lie algebroid. Now we explore the tangent prolongation of a Lie 2-algebroid. Recall that for a Lie algebroid $A \rightarrow M$, TA is a Lie algebroid over TM . A section $\sigma : M \rightarrow A$ gives rise to a linear section $\sigma_T \triangleq d\sigma : TM \rightarrow TA$ and a core section $\sigma_C : TM \rightarrow TA$ by contraction. Any section of TA over TM is generated by such sections. A function $f \in C^\infty(M)$ induces two types of functions on TM by

$$f_C = q^* f, \quad f_T = df,$$

where $q : TM \rightarrow M$ is the projection. We have the following relations about the module structure:

$$(f\sigma)_C = f_C\sigma_C, \quad (f\sigma)_T = f_T\sigma_C + f_C\sigma_T. \quad (9)$$

In particular, for $A = TM$, we have

$$X_T(f_T) = X(f)_T, \quad X_T(f_C) = X(f)_C, \quad X_C(f_T) = X(f)_C, \quad X_C(f_C) = 0, \quad \forall X \in \mathfrak{X}(M). \quad (10)$$

See [31, Example 2.5.4] and [39] for more details.

Now for Lie 2-algebroids, we have

Proposition 3.7. *Let $\mathcal{A} = (A_{-1}, A_0, \mathfrak{a}, \mathfrak{l}_1, \mathfrak{l}_2, \mathfrak{l}_3)$ be a Lie 2-algebroid. Then $(TA_{-1}, TA_0, a, l_1, l_2, l_3)$ is a Lie 2-algebroid over TM , where $a : TA_0 \rightarrow TTM$ is given by*

$$a(\sigma_T^0) = \mathfrak{a}(\sigma^0)_T, \quad a(\sigma_C^0) = \mathfrak{a}(\sigma^0)_C, \quad (11)$$

$l_1 : \Gamma_{TM}(TA_{-1}) \rightarrow \Gamma_{TM}(TA_0)$ is given by

$$l_1(\sigma_T^1) = \mathfrak{l}_1(\sigma^1)_T, \quad l_1(\sigma_C^1) = \mathfrak{l}_1(\sigma^1)_C, \quad (12)$$

$l_2 : \Gamma_{TM}(TA_{-i}) \times \Gamma_{TM}(TA_{-j}) \rightarrow \Gamma_{TM}(TA_{-(i+j)})$ is given by

$$\begin{aligned} l_2(\sigma_T^0, \tau_T^0) &= \mathfrak{l}_2(\sigma^0, \tau^0)_T, \quad l_2(\sigma_T^0, \tau_C^0) = \mathfrak{l}_2(\sigma^0, \tau^0)_C, \quad l_2(\sigma_C^0, \tau_C^0) = 0, \\ l_2(\sigma_T^0, \tau_T^1) &= \mathfrak{l}_2(\sigma^0, \tau^1)_T, \quad l_2(\sigma_T^0, \tau_C^1) = \mathfrak{l}_2(\sigma^0, \tau^1)_C, \quad l_2(\sigma_C^0, \tau_T^1) = \mathfrak{l}_2(\sigma^0, \tau^1)_C, \quad l_2(\sigma_C^0, \tau_C^1) = 0, \end{aligned}$$

and $l_3 : \wedge^3 \Gamma_{TM}(TA_0) \rightarrow \Gamma_{TM}(TA_{-1})$ is given by

$$l_3(\sigma_T^0, \tau_T^0, \varsigma_T^0) = \mathfrak{l}_3(\sigma^0, \tau^0, \varsigma^0)_T, \quad l_3(\sigma_T^0, \tau_T^0, \varsigma_C^0) = \mathfrak{l}_3(\sigma^0, \tau^0, \varsigma^0)_C, \quad l_3(\sigma_T^0, \tau_C^0, \varsigma_C^0) = 0, \quad (13)$$

for all $\sigma^0, \tau^0, \varsigma^0 \in \Gamma(A_0)$ and $\sigma^1, \tau^1 \in \Gamma(A_{-1})$.

Moreover, we have the following VB-Lie 2-algebroid:

$$\begin{array}{ccccc} TA_{-1} & \longrightarrow & TM & & \\ \downarrow & \searrow & \downarrow & \searrow & \\ & A_{-1} & \longrightarrow & M & \longleftarrow A_{-1} \\ \downarrow & \downarrow & \downarrow & \downarrow & \\ TA_0 & \longrightarrow & TM & & \\ \downarrow & \searrow & \downarrow & \searrow & \\ & A_0 & \longrightarrow & M & \longleftarrow A_0. \end{array}$$

Proof. By the fact that $\mathcal{A} = (A_{-1}, A_0, \mathbf{a}, l_1, l_2, l_3)$ is a Lie 2-algebroid, it is straightforward to deduce that $(TA_{-1}, TA_0, a, l_1, l_2, l_3)$ is a Lie 2-algebroid over TM . Moreover, a, l_1, l_2, l_3 are all linear, which implies that we have a VB-Lie 2-algebroid. ■

The associated fat bundles of double vector bundles $(TA_{-1}; A_{-1}, TM; M)$ and $(TA_0; A_0, TM; M)$ are the jet bundles $\mathfrak{J}A_{-1}$ and $\mathfrak{J}A_0$ respectively. By Proposition 3.7 and Proposition 3.6, we obtain the following result, which is the higher analogue of the fact that the jet bundle of a Lie algebroid is a Lie algebroid.

Corollary 3.8. *Let $(A_{-1}, A_0, \mathbf{a}, l_1, l_2, l_3)$ be a Lie 2-algebroid. Then $(\mathfrak{J}A_{-1}, \mathfrak{J}A_0, \hat{a}, \hat{l}_1, \hat{l}_2, \hat{l}_3)$ is a Lie 2-algebroid, where $\hat{a}, \hat{l}_1, \hat{l}_2, \hat{l}_3$ is given by*

$$\begin{aligned}\hat{a}(\sigma_T^0) &= \mathbf{a}(\sigma^0), \\ \hat{l}_2(\sigma_T^0, \tau_T^0) &= l_2(\sigma^0, \tau^0)_T, \\ \hat{l}_2(\sigma_T^0, \tau_T^1) &= l_2(\sigma^0, \tau^1)_T, \\ \hat{l}_3(\sigma_T^0, \tau_T^0, \zeta_T^0) &= l_3(\sigma^0, \tau^0, \zeta^0)_T,\end{aligned}$$

for all $\sigma^0, \tau^0, \zeta^0 \in \Gamma(A_0)$ and $\tau^1 \in \Gamma(A_{-1})$.

4 Superconnections of a Lie 2-algebroid on a 3-term complex of vector bundles

In the section, we introduce the notion of a superconnection of a Lie 2-algebroid on a 3-term complex of vector bundles, which generalizes the notion of a superconnection of a Lie algebroid on a 2-term complex of vector bundles studied in [19]. We show that a VB-Lie 2-algebroid structure on a split graded double vector bundle is equivalent to a flat superconnection of a Lie 2-algebroid on a 3-term complex of vector bundles.

Denote a 3-term complex of vector bundles $E_{-2} \xrightarrow{-\pi} E_{-1} \xrightarrow{-\pi} E_0$ by \mathcal{E} . Then the covariant differential operator bundle $\mathfrak{D}(\mathcal{E})$ fits the following exact sequence:

$$0 \longrightarrow \text{End}(E_0) \oplus \text{End}(E_{-1}) \oplus \text{End}(E_{-2}) \longrightarrow \mathfrak{D}(\mathcal{E}) \longrightarrow TM \longrightarrow 0. \quad (14)$$

Sections of $\mathfrak{D}(\mathcal{E})$ are of the form $\mathfrak{d} = (\mathfrak{d}_0, \mathfrak{d}_1, \mathfrak{d}_2)$, where $\mathfrak{d}_i : \Gamma(E_{-i}) \longrightarrow \Gamma(E_{-i})$ are \mathbb{R} -linear maps such that there exists $X \in \mathfrak{X}(M)$ satisfying

$$\mathfrak{d}_i(fe^i) = f\mathfrak{d}_i(e^i) + X(f)e^i, \quad \forall f \in C^\infty(M), e^i \in \Gamma(E_{-i}).$$

Equivalently, $\mathfrak{D}(\mathcal{E}) = \mathfrak{D}(E_0) \times_{TM} \mathfrak{D}(E_{-1}) \times_{TM} \mathfrak{D}(E_{-2})$. Define $\mathfrak{p} : \mathfrak{D}(\mathcal{E}) \longrightarrow TM$ by

$$\mathfrak{p}(\mathfrak{d}_0, \mathfrak{d}_1, \mathfrak{d}_2) = X. \quad (15)$$

Denote by $\text{End}^{-1}(\mathcal{E}) = \text{Hom}(E_0, E_{-1}) \oplus \text{Hom}(E_{-1}, E_{-2})$ and $\text{End}^{-2}(\mathcal{E}) = \text{Hom}(E_0, E_{-2})$. Define $\mathfrak{d} : \text{End}^{-2}(\mathcal{E}) \longrightarrow \text{End}^{-1}(\mathcal{E})$ by

$$\mathfrak{d}(\theta^2) = \pi \circ \theta^2 - \theta^2 \circ \pi, \quad \forall \theta^2 \in \Gamma(\text{Hom}(E_0, E_{-2})), \quad (16)$$

and define $\mathfrak{d} : \text{End}^{-1}(\mathcal{E}) \longrightarrow \mathfrak{D}(\mathcal{E})$ by

$$\mathfrak{d}(\theta^1) = \pi \circ \theta^1 + \theta^1 \circ \pi, \quad \forall \theta^1 \in \Gamma(\text{Hom}(E_0, E_{-1}) \oplus \text{Hom}(E_{-1}, E_{-2})). \quad (17)$$

Then we define a degree 0 graded symmetric bracket operation $[\cdot, \cdot]_C$ on the section space of the graded bundle $\text{End}^{-2}(\mathcal{E}) \oplus \text{End}^{-1}(\mathcal{E}) \oplus \mathfrak{D}(\mathcal{E})$ by

$$[\mathfrak{d}, \mathfrak{t}]_C = \mathfrak{d} \circ \mathfrak{t} - \mathfrak{t} \circ \mathfrak{d}, \quad \forall \mathfrak{d}, \mathfrak{t} \in \Gamma(\mathfrak{D}(\mathcal{E})), \quad (18)$$

$$[\mathfrak{d}, \theta^i]_C = \mathfrak{d} \circ \theta^i - \theta^i \circ \mathfrak{d}, \quad \forall \mathfrak{d} \in \Gamma(\mathfrak{D}(\mathcal{E})), \theta^i \in \Gamma(\text{End}^{-i}(\mathcal{E})), \quad (19)$$

$$[\theta^1, \vartheta^1]_C = \theta^1 \circ \vartheta^1 + \vartheta^1 \circ \theta^1, \quad \forall \theta^1, \vartheta^1 \in \Gamma(\text{End}^{-1}(\mathcal{E})). \quad (20)$$

Denote by $\mathfrak{D}_\pi(\mathcal{E}) \subset \mathfrak{D}(\mathcal{E})$ the subbundle of $\mathfrak{D}(\mathcal{E})$ whose section $\mathfrak{d} \in \Gamma(\mathfrak{D}_\pi(\mathcal{E}))$ satisfying $\pi \circ \mathfrak{d} = \mathfrak{d} \circ \pi$, or in term of components,

$$\mathfrak{d}_0 \circ \pi = \pi \circ \mathfrak{d}_1, \quad \mathfrak{d}_1 \circ \pi = \pi \circ \mathfrak{d}_2.$$

It is obvious that $\Gamma(\mathfrak{D}_\pi(\mathcal{E}))$ is closed under the bracket operation $[\cdot, \cdot]_C$ and $\text{d}(\text{End}^{-1}(\mathcal{E})) \subset \mathfrak{D}_\pi(\mathcal{E})$. Then it is straightforward to verify that

Theorem 4.1. *Let $E_{-2} \xrightarrow{\pi} E_{-1} \xrightarrow{\pi} E_0$ be a 3-term complex of vector bundles over M . Then $(\text{End}^{-2}(\mathcal{E}), \text{End}^{-1}(\mathcal{E}), \mathfrak{D}_\pi(\mathcal{E}), \mathfrak{p}, \text{d}, [\cdot, \cdot]_C)$ is a strict Lie 3-algebroid.*

With above preparations, we give the definition of a superconnection of a Lie 2-algebroid on a 3-term complex of vector bundles as follows.

Definition 4.2. *A superconnection of a Lie 2-algebroid $(A_{-1}, A_0, \mathfrak{a}, l_1, l_2, l_3)$ on a 3-term complex of vector bundles $E_{-2} \xrightarrow{\pi} E_{-1} \xrightarrow{\pi} E_0$ consists of:*

- a bundle morphism $F^0 : A_0 \longrightarrow \mathfrak{D}_\pi(\mathcal{E})$,
- a bundle morphism $F^1 : A_{-1} \longrightarrow \text{End}^{-1}(\mathcal{E})$,
- a bundle morphism $F_0^2 : \wedge^2 A_0 \longrightarrow \text{End}^{-1}(\mathcal{E})$,
- a bundle morphism $F_1^2 : A_0 \wedge A_{-1} \longrightarrow \text{End}^{-2}(\mathcal{E})$,
- a bundle morphism $F^3 : \wedge^3 A_0 \longrightarrow \text{End}^{-2}(\mathcal{E})$.

A superconnection is called **flat** if $(F^0, F^1, F_0^2, F_1^2, F^3)$ is a Lie n -algebroid morphism from the Lie 2-algebroid $(A_{-1}, A_0, \mathfrak{a}, l_1, l_2, l_3)$ to the strict Lie 3-algebroid $(\text{End}^{-2}(\mathcal{E}), \text{End}^{-1}(\mathcal{E}), \mathfrak{D}_\pi(\mathcal{E}), \mathfrak{p}, \text{d}, [\cdot, \cdot]_C)$.

Remark 4.3. *If the Lie 2-algebroid reduces to a Lie algebroid A and the 3-term complex reduces to a 2-term complex $E_{-1} \xrightarrow{\pi} E_0$, a superconnection will only consists of*

- a bundle morphism $F^0 = (F_0^0, F_1^0) : A \longrightarrow \mathfrak{D}_\pi(\mathcal{E})$,
- a bundle morphism $F_0^2 : \wedge^2 A_0 \longrightarrow \text{Hom}(E_0, E_{-1})$.

Thus, we recover the notion of a superconnection (also called representation up to homotopy if it is flat) of a Lie algebroid on a 2-term complex of vector bundles. See [1, 19] for more details.

Now we come back to VB-Lie 2-algebroids. Let $(D_{-1}^B, D_0^B, a, l_1, l_2, l_3)$ be a VB-Lie 2-algebroid structure on the graded double vector bundle $\begin{pmatrix} D_{-1}; & A_{-1}, B; & M \\ D_0; & A_0, B; & M \end{pmatrix}$. Recall from Theorem 3.4 and Proposition 3.6 that both $(A_{-1}, A_0, \mathfrak{a}, l_1, l_2, l_3)$ and $(\hat{A}_{-1}, \hat{A}_0, \hat{a}, \hat{l}_1, \hat{l}_2, \hat{l}_3)$ are Lie 2-algebroids.

Choose a horizontal lift $s = (s_0, s_1) : A_0 \oplus A_{-1} \longrightarrow \hat{A}_0 \oplus \hat{A}_{-1}$ of the short exact sequence of Lie 2-algebroids (4). Define $\nabla^B : A_0 \longrightarrow \mathfrak{D}(B)$ by

$$\langle \nabla_{X^0}^B b, \xi \rangle = \mathbf{a}(X^0) \langle \xi, b \rangle - \langle b, \hat{a}(s_0(X^0))(\xi) \rangle, \quad \forall X^0 \in \Gamma(A_0), b \in \Gamma(B), \xi \in \Gamma(B^*). \quad (21)$$

Since for all $\phi^0 \in \Gamma(B^* \otimes C_0)$, we have $\hat{a}(\phi^0) = 0$, it follows that ∇^B is well-defined.

We define $\nabla^0 : A_0 \longrightarrow \mathfrak{D}(C_0)$ and $\nabla^1 : A_0 \longrightarrow \mathfrak{D}(C_{-1})$ by

$$\nabla_{X^0}^0 c^0 = l_2(s_0(X^0), c^0), \quad \nabla_{X^0}^1 c^1 = l_2(s_0(X^0), c^1), \quad \forall X^0 \in \Gamma(A_0), c^0 \in \Gamma(C_0), c^1 \in \Gamma(C_{-1}). \quad (22)$$

Define $\Upsilon^1 : A_{-1} \longrightarrow \text{Hom}(B, C_0)$ and $\Upsilon^2 : A_{-1} \longrightarrow \text{Hom}(C_0, C_{-1})$ by

$$\Upsilon_{X^1}^1 = s_0(l_1(X^1)) - \hat{l}_1(s_1(X^1)), \quad \Upsilon_{X^1}^2 c^0 = l_2(s_1(X^1), c^0), \quad \forall X^1 \in \Gamma(A_{-1}), c^0 \in \Gamma(C_0). \quad (23)$$

Since l_2 is linear, ∇^0 , ∇^1 and Υ are well-defined.

Define $R^0 : \wedge^2 \Gamma(A_0) \longrightarrow \Gamma(\text{Hom}(B, C_0))$, $\Lambda : \wedge^2 \Gamma(A_0) \longrightarrow \Gamma(\text{Hom}(C_0, C_{-1}))$ and $R^1 : \Gamma(A_0) \wedge \Gamma(A_{-1}) \longrightarrow \Gamma(\text{Hom}(B, C_{-1}))$ by

$$R^0(X^0, Y^0) = s_0 l_2(X^0, Y^0) - \hat{l}_2(s_0(X^0), s_0(Y^0)), \quad (24)$$

$$\Lambda(X^0, Y^0)(c^0) = -l_3(s_0(X^0), s_0(Y^0), c^0), \quad (25)$$

$$R^1(X^0, Y^1) = s_1 l_2(X^0, Y^1) - \hat{l}_2(s_0(X^0), s_1(Y^1)), \quad (26)$$

for all $X^0, Y^0 \in \Gamma(A_0)$ and $Y^1 \in \Gamma(A_{-1})$

Finally, define $\Xi : \wedge^3 \Gamma(A_0) \longrightarrow \text{Hom}(B, C_{-1})$ by

$$\Xi(X^0, Y^0, Z^0) = s_1 l_3(X^0, Y^0, Z^0) - \hat{l}_3(s_0(X^0), s_0(Y^0), s_0(Z^0)), \quad \forall X^0, Y^0, Z^0 \in \Gamma(A_0). \quad (27)$$

By the equality $l_1 l_2(s_0(X^0), c^1) = l_2(s_0(X^0), l_1^C(c^1))$, we obtain

$$l_1^C \circ \nabla_{X^0}^1 = \nabla_{X^0}^0 \circ l_1^C. \quad (28)$$

By the fact that $a : D_0 \longrightarrow TB$ preserves the bracket operation, we obtain

$$\begin{aligned} \langle \nabla_{X^0}^B \varrho(c^0), \xi \rangle &= \mathbf{a}(X^0) \langle \varrho(c^0), \xi \rangle - \langle \varrho(c^0), a(s_0(X^0))(\xi) \rangle \\ &= -[a(s_0(X^0)), a(c^0)]_{TB}(\xi) = -a(l_2(s_0(X^0), c^0))(\xi) = \langle \varrho \nabla_{X^0}^0 c^0, \xi \rangle, \end{aligned}$$

which implies that

$$\nabla_{X^0}^B \circ \varrho = \varrho \circ \nabla_{X^0}^0. \quad (29)$$

By (28) and (29), we deduce that $(\nabla_{X^0}^B, \nabla_{X^0}^0, \nabla_{X^0}^1) \in \mathfrak{D}(\mathcal{E})$, where \mathcal{E} is the 3-term complex of vector bundles $C_{-1} \xrightarrow{l_1^C} C_0 \xrightarrow{a} B$. Then we obtain a superconnection $(F^0, F^1, F_0^2, F_1^2, F^3)$ of the Lie 2-algebroid $(A_{-1}, A_0, \mathbf{a}, l_1, l_2, l_3)$ on the 3-term complex of vector bundles $C_{-1} \xrightarrow{l_1^C} C_0 \xrightarrow{a} B$, where

$$F^0 = (\nabla^B, \nabla^0, \nabla^1), \quad F^1 = (\Upsilon^1, \Upsilon^2), \quad F_0^2 = (R^0, \Lambda), \quad F_1^2 = R^1, \quad F^3 = \Xi.$$

Theorem 4.4. *After choosing a horizontal lift $s = (s_0, s_1) : A_0 \oplus A_{-1} \longrightarrow \hat{A}_0 \oplus \hat{A}_{-1}$, there is a one-to-one correspondence between VB-Lie 2-algebroids $\begin{pmatrix} D_{-1}; & A_{-1}, B; & M \\ D_0; & A_0, B; & M \end{pmatrix}$ and flat superconnections $(F^0, F^1, F_0^2, F_1^2, F^3)$ of the Lie 2-algebroid $(A_{-1}, A_0, \mathbf{a}, l_1, l_2, l_3)$ on the 3-term complex of vector bundles $C_{-1} \xrightarrow{l_1^C} C_0 \xrightarrow{a} B$.*

Proof. First it is obvious that

$$\mathbf{p} \circ F^0 = \mathbf{a}. \quad (30)$$

Using equalities $\mathbf{a} \circ \mathfrak{l}_1 = 0$ and $a \circ l_1 = 0$, we have

$$\langle \nabla_{\mathfrak{l}_1 X^1}^B b, \xi \rangle = \mathbf{a}(\mathfrak{l}_1(X^1))\langle b, \xi \rangle - \langle b, a(s_0(\mathfrak{l}_1(X^1))) \rangle(\xi) = -\langle b, a(\Upsilon_{X^1}^1) \rangle(\xi),$$

which implies that

$$\nabla_{\mathfrak{l}_1 X^1}^B = \varrho \circ \Upsilon_{X^1}^1. \quad (31)$$

For ∇^0 , we can obtain

$$\nabla_{\mathfrak{l}_1(X^1)}^0 = l_2(s_0 \mathfrak{l}_1(X^1), \cdot)|_{C_0} = l_2(l_1(s_1(X^1)) + \Upsilon_{X^1}^1, \cdot)|_{C_0} = l_1^C \circ \Upsilon_{X^1}^2 + \Upsilon_{X^1}^1 \circ \varrho. \quad (32)$$

For ∇^1 , we have

$$\nabla_{\mathfrak{l}_1(X^1)}^1 = l_2(s_0 \mathfrak{l}_1(X^1), \cdot)|_{C_1} = l_2(l_1(s_1(X^1)) + \Upsilon_{X^1}^1, \cdot)|_{C_1} = \Upsilon_{X^1}^2 \circ l_1^C. \quad (33)$$

By (31), (32) and (33), we deduce that

$$F^0 \circ \mathfrak{l}_1 = d \circ F^1. \quad (34)$$

By straightforward computation, we have

$$\begin{aligned} \langle \nabla_{\mathfrak{l}_2(X^0, Y^0)}^B b - \nabla_{X^0}^B \nabla_{Y^0}^B b + \nabla_{Y^0}^B \nabla_{X^0}^B b, \xi \rangle &= \langle b, a(\hat{l}_2(s_0(X^0), s_0(Y^0)) - s_0 \mathfrak{l}_2(X^0, Y^0)) \rangle(\xi) \\ &= \langle b, -a(R^0(X^0, Y^0)) \rangle(\xi), \end{aligned}$$

which implies that

$$\nabla_{\mathfrak{l}_2(X^0, Y^0)}^B - \nabla_{X^0}^B \nabla_{Y^0}^B + \nabla_{Y^0}^B \nabla_{X^0}^B = \varrho \circ R^0(X^0, Y^0). \quad (35)$$

Similarly, we have

$$\begin{aligned} &\nabla_{\mathfrak{l}_2(X^0, Y^0)}^0 c^0 - \nabla_{X^0}^0 \nabla_{Y^0}^0 c^0 + \nabla_{Y^0}^0 \nabla_{X^0}^0 c^0 \\ &= l_2(s_0 \mathfrak{l}_2(X^0, Y^0), c^0) - l_2(s_0(X^0), l_2(s_0(Y^0), c^0)) + l_2(s_0(Y^0), l_2(s_0(X^0), c^0)) \\ &= -l_3(s_0(X^0), s_0(Y^0), c^0) + l_2(R^0(X^0, Y^0), c^0), \end{aligned}$$

which implies that

$$\nabla_{\mathfrak{l}_2(X^0, Y^0)}^0 - \nabla_{X^0}^0 \nabla_{Y^0}^0 + \nabla_{Y^0}^0 \nabla_{X^0}^0 = l_1^C \circ \Lambda(X^0, Y^0) + R^0(X^0, Y^0) \circ \varrho, \quad (36)$$

and

$$\begin{aligned} &\nabla_{\mathfrak{l}_2(X^0, Y^0)}^1 c^1 - \nabla_{X^0}^1 \nabla_{Y^0}^1 c^1 + \nabla_{Y^0}^1 \nabla_{X^0}^1 c^1 \\ &= l_2(s_0 \mathfrak{l}_2(X^0, Y^0), c^1) - l_2(s_0(X^0), l_2(s_0(Y^0), c^1)) + l_2(s_0(Y^0), l_2(s_0(X^0), c^1)) \\ &= -l_3(s_0(X^0), s_0(Y^0), l_1(c^1)) + l_2(R^0(X^0, Y^0), c^1), \end{aligned}$$

which implies that

$$\nabla_{\mathfrak{l}_2(X^0, Y^0)}^1 - \nabla_{X^0}^1 \nabla_{Y^0}^1 + \nabla_{Y^0}^1 \nabla_{X^0}^1 = \Lambda(X^0, Y^0) \circ l_1^C. \quad (37)$$

By (35), (36) and (37), we obtain

$$F^0(l_2(X^0, Y^0)) - [F^0(X^0), F^0(Y^0)]_C = dF_0^2(X^0, Y^0). \quad (38)$$

By the equality

$$l_2(s_0(X^0), l_2(s_1(Y^1), c^0)) + c.p. = \hat{l}_3(s_0(X^0), l_1(s_1(Y^1)), c^0),$$

we obtain

$$[F^0(X^0), \Upsilon_{Y^1}^2]_C - \Upsilon_{l_2(X^0, Y^1)}^2 = -\Lambda(X^0, l_1(Y^1)) - R^1(X^0, Y^1) \circ \varrho. \quad (39)$$

Furthermore, we have

$$\begin{aligned} \Upsilon_{l_2(X^0, Y^1)}^1 &= s_0 l_1(l_2(X^0, Y^1)) - \hat{l}_1 s_1(l_2(X^0, Y^1)) \\ &= s_0 l_2(X^0, l_1(Y^1)) - \hat{l}_1 \hat{l}_2(s_0(X^0), s_1(Y^1)) - \hat{l}_1 R^1(X^0, Y^1) \\ &= s_0 l_2(X^0, l_1(Y^1)) - \hat{l}_2(s_0(X^0), \hat{l}_1 s_1(Y^1)) - l_1^C \circ R^1(X^0, Y^1) \\ &= s_0 l_2(X^0, l_1(Y^1)) - \hat{l}_2(s_0(X^0), s_0 l_1(Y^1) - \Upsilon_{Y^1}^1) - l_1^C \circ R^1(X^0, Y^1) \\ &= [F^0(X^0), \Upsilon_{Y^1}^1]_C + R^0(X^0, l_1(Y^1)) - l_1^C \circ R^1(X^0, Y^1). \end{aligned} \quad (40)$$

By (39) and (40), we deduce that

$$F^1(l_2(X^0, Y^1)) - [F^0(X^0), F^1(Y^1)]_C = F_0^2(X^0, l_1(Y^1)) - dF_1^2(X^0, Y^1). \quad (41)$$

By straightforward computation, we have

$$\begin{aligned} &R^1(l_1(X^1), Y^1) - R^1(X^1, l_1(Y^1)) \\ &= s_1 l_2(l_1(X^1), Y^1) - \hat{l}_2(s_0 l_1(X^1), s_1(Y^1)) - s_1 l_2(X^1, l_1(Y^1)) + \hat{l}_2(s_1(X^1), s_0 l_1(Y^1)) \\ &= \hat{l}_2(s_1(X^1), \hat{l}_1 s_1(Y^1)) + \hat{l}_2(s_1(X^1), \Upsilon_{Y^1}^1) - \hat{l}_2(s_0 l_1(X^1), s_1(Y^1)) \\ &= -\hat{l}_2(\Upsilon_{X^1}^1, s_1(Y^1)) + \hat{l}_2(s_1(X^1), \Upsilon_{Y^1}^1) \\ &= [\Upsilon_{X^1}^1 + \Upsilon_{X^1}^2, \Upsilon_{Y^1}^1 + \Upsilon_{Y^1}^2]_C. \end{aligned} \quad (42)$$

By the equality

$$\hat{l}_2(s_0(X^0), \hat{l}_2(s_0(Y^0), s_0(Z^0))) + c.p. = \hat{l}_1 \hat{l}_3(s_0(X^0), s_0(Y^0), s_0(Z^0)),$$

we deduce that

$$[F^0(X^0), R^0(Y^0, Z^0)]_C + R^0(X^0, l_2(Y^0, Z^0)) + c.p. = \Upsilon_{l_3(X^0, Y^0, Z^0)}^1 + l_1^C \circ \Xi(X^0, Y^0, Z^0). \quad (43)$$

By the equality

$$l_2(s_0(X^0), l_3(s_0(Y^0), s_0(Z^0), c^0)) - l_3(l_2(s_0(X^0), s_0(Y^0)), s_0(Z^0), c^0) + c.p. = 0,$$

we deduce that

$$- [F^0(X^0), \Lambda(Y^0, Z^0)]_C + \Lambda(l_2(X^0, Y^0), Z^0) + c.p. + \Upsilon_{l_3(X^0, Y^0, Z^0)}^2 - \Xi(X^0, Y^0, Z^0) \circ \varrho = 0. \quad (44)$$

By (43) and (44), we obtain

$$[F^0(X^0), F_0^2(Y^0, Z^0)]_C + F_0^2(X^0, l_2(Y^0, Z^0)) + c.p. = F^1(l_3(X^0, Y^0, Z^0)) + dF^3(X^0, Y^0, Z^0). \quad (45)$$

Then by the equality

$$\hat{l}_2(s_0(X^0), \hat{l}_2(s_0(Y^0), s_1(Z^1))) + c.p. = \hat{l}_3(s_0(X^0), s_0(Y^0), \hat{l}_1(s_1(Z^1))),$$

we deduce that

$$\begin{aligned} & [F^0(X^0), R^1(Y^0, Z^1)]_C + [F^0(Y^0), R^1(Z^1, X^0)]_C + [\Upsilon_{Z^1}^2, R^0(X^0, Y^0)]_C \\ & + R^1(X^0, l_2(Y^0, Z^1)) + R^1(Y^0, l_2(Z^1, X^0)) + R^1(Z^1, l_2(X^0, Y^0)) \\ = & \Xi(X^0, Y^0, l_1(Z^1)) - [\Lambda(X^0, Y^0), \Upsilon_{Z^1}^1]_C. \end{aligned} \quad (46)$$

Finally, by the equality

$$\begin{aligned} & \sum_{i=1}^4 (-1)^{i+1} \hat{l}_2(s_0(X_i^0), \hat{l}_3(s_0(X_1^0), \dots, \widehat{s_0(X_i^0)}, \dots, s_0(X_4^0))) \\ & + \sum_{i<j,k<l} (-1)^{i+j} \hat{l}_3(\hat{l}_2(s_0(X_i^0), s_0(X_j^0)), s_0(X_k^0), s_0(X_l^0)) = 0, \end{aligned}$$

we deduce that

$$\begin{aligned} & \sum_{i=1}^4 (-1)^{i+1} \left([F^0(X_i^0), \Xi(X_1^0, \dots, \widehat{X_i^0}, \dots, X_4^0)]_C + R^1(X_i^0, l_3(X_1^0, \dots, \widehat{X_i^0}, \dots, X_4^0)) \right) \\ & + \sum_{i<j} (-1)^{i+j} \left(\Xi(l_2(X_i^0, X_j^0), X_1^0, \dots, \widehat{X_i^0}, \dots, \widehat{X_j^0}, \dots, X_4^0) \right. \\ & \left. - [R^0(X_i^0, X_j^0), \Lambda(X_1^0, \dots, \widehat{X_i^0}, \dots, \widehat{X_j^0}, \dots, X_4^0)]_C \right) = 0. \end{aligned} \quad (47)$$

By (30), (34), (38), (41), (42), (45), (46) and (47), we deduce that $(F^0, F^1, F_0^2, F_1^2, F^3)$ is a morphism from the Lie 2-algebroid $(A_{-1}, A_0, \mathfrak{a}, l_1, l_2, l_3)$ to the strict Lie 3-algebroid

$$(\text{End}^{-2}(\mathcal{E}), \text{End}^{-1}(\mathcal{E}), \mathfrak{D}_\pi(\mathcal{E}), \mathfrak{p}, d, [\cdot, \cdot]_C).$$

Conversely, let $(A_{-1}, A_0, \mathfrak{a}, l_1, l_2, l_3)$ be a Lie 2-algebroid and $(F^0, F^1, F_0^2, F_1^2, F^3)$ a flat superconnection on the 3-term complex $C_{-1} \xrightarrow{l_1^C} C_0 \xrightarrow{e} B$. Then we can obtain a VB-Lie 2-algebroid structure on the split graded double vector bundle $\begin{pmatrix} A_{-1} \oplus B \oplus C_{-1}; & A_{-1}, B; & M \\ A_0 \oplus B \oplus C_0; & A_0, B; & M \end{pmatrix}$. We leave the details to readers. The proof is finished. ■

5 VB-CLWX 2-algebroids

In this section, first we recall the notion of a CLWX 2-algebroid, and then explore what is a metric graded double vector bundle, introduce the notion of a VB-CLWX 2-algebroid, which can be viewed as the categorification of a VB-Courant algebroid introduced in [31].

As a model for ‘‘Leibniz algebras that satisfy Jacobi identity up to all higher homotopies’’, the notion of a strongly homotopy Leibniz algebra, or a Lod_∞ -algebra was given in [35] by Livernet, which was further studied by Ammar and Poncin in [3]. In [49], the authors introduced the notion of a Leibniz 2-algebra, which is the categorification of a Leibniz algebra, and proved that the category of Leibniz 2-algebras and the category of 2-term Lod_∞ -algebras are equivalent. Due to this reason, a 2-term Lod_∞ -algebra will be called a Leibniz 2-algebra directly in the sequel.

Definition 5.1. ([33]) A **CLWX 2-algebroid** is a graded vector bundle $\mathcal{E} = E_{-1} \oplus E_0$ over M equipped with a non-degenerate graded symmetric bilinear form S on \mathcal{E} , a bilinear operation $\diamond : \Gamma(E_{-i}) \times \Gamma(E_{-j}) \rightarrow \Gamma(E_{-(i+j)})$, $0 \leq i + j \leq 1$, which is skewsymmetric on $\Gamma(E_0) \times \Gamma(E_0)$, an E_{-1} -valued 3-form Ω on E_0 , two bundle maps $\partial : E_{-1} \rightarrow E_0$ and $\rho : E_0 \rightarrow TM$, such that E_{-1} and E_0 are isotropic and the following axioms are satisfied:

- (i) $(\Gamma(E_{-1}), \Gamma(E_0), \partial, \diamond, \Omega)$ is a Leibniz 2-algebra;
- (ii) for all $e \in \Gamma(\mathcal{E})$, $e \diamond e = \frac{1}{2} \mathcal{D}S(e, e)$, where $\mathcal{D} : C^\infty(M) \rightarrow \Gamma(E_{-1})$ is defined by

$$S(\mathcal{D}f, e^0) = \rho(e^0)(f), \quad \forall f \in C^\infty(M), e^0 \in \Gamma(E_0); \quad (48)$$

- (iii) for all $e_1^1, e_2^1 \in \Gamma(E_{-1})$, $S(\partial(e_1^1), e_2^1) = S(e_1^1, \partial(e_2^1))$;
- (iv) for all $e_1, e_2, e_3 \in \Gamma(\mathcal{E})$, $\rho(e_1)S(e_2, e_3) = S(e_1 \diamond e_2, e_3) + S(e_2, e_1 \diamond e_3)$;
- (v) for all $e_1^0, e_2^0, e_3^0, e_4^0 \in \Gamma(E_0)$, $S(\Omega(e_1^0, e_2^0, e_3^0), e_4^0) = -S(e_3^0, \Omega(e_1^0, e_2^0, e_4^0))$.

Denote a CLWX 2-algebroid by $(E_{-1}, E_0, \partial, \rho, S, \diamond, \Omega)$, or simply by \mathcal{E} . Since the section space of a CLWX 2-algebroid is a Leibniz 2-algebra, the section space of a Courant algebroid is a Leibniz algebra and Leibniz 2-algebras are the categorification of Leibniz algebras, we can view CLWX 2-algebroids as the categorification of Courant algebroids.

As a higher analogue of Roytenberg's result about symplectic NQ manifolds of degree 2 and Courant algebroids ([44]), we have

Theorem 5.2. ([33]) Let $(T^*[3]A^*[2], \Theta)$ be a symplectic NQ manifold of degree 3, where A is an ordinary vector bundle and Θ is a degree 4 function on $T^*[3]A^*[2]$ satisfying $\{\Theta, \Theta\} = 0$. Here $\{\cdot, \cdot\}$ is the canonical Poisson bracket on $T^*[3]A^*[2]$. Then $(A^*[1], A, \partial, \rho, S, \diamond, \Omega)$ is a CLWX 2-algebroid, where the bilinear form S is given by

$$S(X + \alpha, Y + \beta) = \langle X, \beta \rangle + \langle Y, \alpha \rangle, \quad \forall X, Y \in \Gamma(A), \alpha, \beta \in \Gamma(A^*),$$

and ∂, ρ, \diamond and Ω are given by derived brackets. More precisely, we have

$$\begin{aligned} \partial\alpha &= \{\alpha, \Theta\}, \quad \forall \alpha \in \Gamma(A^*), \\ \rho(X)(f) &= \{f, \{X, \Theta\}\}, \quad \forall X \in \Gamma(A), f \in C^\infty(M), \\ X \diamond Y &= \{Y, \{X, \Theta\}\}, \quad \forall X, Y \in \Gamma(A), \\ X \diamond \alpha &= \{\alpha, \{X, \Theta\}\}, \quad \forall X \in \Gamma(A), \alpha \in \Gamma(A^*), \\ \alpha \diamond X &= -\{X, \{\alpha, \Theta\}\}, \quad \forall X \in \Gamma(A), \alpha \in \Gamma(A^*), \\ \Omega(X, Y, Z) &= \{Z, \{Y, \{X, \Theta\}\}\}, \quad \forall X, Y, Z \in \Gamma(A). \end{aligned}$$

See [26, 52] for more information of derived brackets.

Definition 5.3. A **metric graded double vector bundle** is a graded double vector bundle $\left(\begin{array}{ccc} D_{-1}; & A_{-1}, B; & M \\ D_0; & A_0, B; & M \end{array} \right)$ equipped with a degree 1 nondegenerate graded symmetric bilinear form S on the graded bundle $D_{-1}^B \oplus D_0^B$ such that it induces an isomorphism between graded double

vector bundles

$$\begin{array}{ccc}
D_{-1} \longrightarrow B & & \text{and} \quad D_0^{\star B}[1] \longrightarrow B \\
\searrow & & \searrow \\
A_{-1} \longrightarrow M \longleftarrow C_{-1} & & C_0^{\star} \longrightarrow M \longleftarrow A_0^{\star}
\end{array}$$

$$\begin{array}{ccc}
D_0 \longrightarrow B & & D_{-1}^{\star B}[1] \longrightarrow B \\
\searrow & & \searrow \\
A_0 \longrightarrow M \longleftarrow C_0 & & C_{-1}^{\star} \longrightarrow M \longleftarrow A_{-1}^{\star},
\end{array}$$

where $\star B$ means dual over B .

Given a metric graded double vector bundle, we have

$$C_0 \cong A_{-1}^{\star}, \quad C_{-1} \cong A_0^{\star}.$$

In the sequel, we will always identify C_0 with A_{-1}^{\star} , C_{-1} with A_0^{\star} . Thus, a metric graded double vector bundle is of the following form:

$$\begin{array}{ccc}
D_{-1} \longrightarrow B & & \\
\searrow & & \searrow \\
A_{-1} \longrightarrow M \longleftarrow A_0^{\star} & & \\
\\
D_0 \longrightarrow B & & \\
\searrow & & \searrow \\
A_0 \longrightarrow M \longleftarrow A_{-1}^{\star}. & &
\end{array}$$

Now we are ready to put a CLWX 2-algebroid structure on a graded double vector bundle.

Definition 5.4. A VB-CLWX 2-algebroid is a metric graded double vector bundle

$$\left(\left(\begin{array}{ccc} D_{-1}; & A_{-1}, B; & M \\ D_0; & A_0, B; & M \end{array} \right), S \right),$$

equipped with a CLWX 2-algebroid structure $(D_{-1}^B, D_0^B, \partial, \rho, S, \diamond, \Omega)$ such that

- (i) ∂ is linear, i.e. there exists a unique bundle map $\bar{\partial} : A_{-1} \rightarrow A_0$ such that $\partial : D_{-1} \rightarrow D_0$ is a double vector bundle morphism over $\bar{\partial} : A_{-1} \rightarrow A_0$ (see Diagram (iii));
- (ii) the anchor ρ is a linear, i.e. there exists a unique bundle map $\bar{\rho} : A_0 \rightarrow TM$ such that $\rho : D_0 \rightarrow TB$ is a double vector bundle morphism over $\bar{\rho} : A_0 \rightarrow TM$ (see Diagram (iv));

$$\begin{array}{ccccc}
D_{-1} & \longrightarrow & B & & \\
\partial \downarrow & \searrow & \parallel & \searrow & \\
A_{-1} & \longrightarrow & M & \longleftarrow & A_0^{\star} \\
\bar{\partial} \downarrow & \searrow & \parallel & \searrow & \\
D_0 & \longrightarrow & B & & \\
\downarrow & \searrow & \parallel & \searrow & \\
A_0 & \longrightarrow & M & \longleftarrow & A_{-1}^{\star}
\end{array}$$

Diagram (iii)

$$\begin{array}{ccccc}
D_0 & \longrightarrow & B & & \\
\rho \downarrow & \searrow & \parallel & \searrow & \\
A_0 & \longrightarrow & M & \longleftarrow & A_{-1}^{\star} \\
\bar{\rho} \downarrow & \searrow & \parallel & \searrow & \\
TB & \longrightarrow & B & & \\
\downarrow & \searrow & \parallel & \searrow & \\
TM & \longrightarrow & M & \longleftarrow & B,
\end{array}$$

Diagram (iv)

(iii) the operation \diamond is linear;

(iv) Ω is linear.

Since a CLWX 2-algebroid can be viewed as the categorification of a Courant algebroid, we can view a VB-CLWX 2-algebroid as the categorification of a VB-Courant algebroid.

Example 5.5. Let $(A_{-1}, A_0, a, l_1, l_2, l_3)$ be a Lie 2-algebroid. Let $E_0 = A_0 \oplus A_{-1}^*$, $E_{-1} = A_{-1} \oplus A_0^*$ and $\mathcal{E} = E_0 \oplus E_{-1}$. Then $(E_{-1}, E_0, \partial, \rho, S, \diamond, \Omega)$ is a CLWX 2-algebroid, where $\partial : E_{-1} \rightarrow E_0$ is given by

$$\partial(X^1 + \alpha^0) = l_1(X^1) + l_1^*(\alpha^0), \quad \forall X^1 \in \Gamma(A_{-1}), \alpha^0 \in \Gamma(A_0^*),$$

$\rho : E_0 \rightarrow TM$ is given by

$$\rho(X^0 + \alpha^1) = a(X^0), \quad \forall X^0 \in \Gamma(A_0), \alpha^1 \in \Gamma(A_{-1}^*),$$

the symmetric bilinear form $S = (\cdot, \cdot)_+$ is given by

$$(X^0 + \alpha^1 + X^1 + \alpha^0, Y^0 + \beta^1 + Y^1 + \beta^0)_+ = \langle X^0, \beta^0 \rangle + \langle Y^0, \alpha^0 \rangle + \langle X^1, \beta^1 \rangle + \langle Y^1, \alpha^1 \rangle, \quad (49)$$

the operation \diamond is given by

$$\begin{cases} (X^0 + \alpha^1) \diamond (Y^0 + \beta^1) &= l_2(X^0, Y^0) + L_{X^0}^0 \beta^1 - L_{Y^0}^0 \alpha^1, \\ (X^0 + \alpha^1) \diamond (X^1 + \alpha^0) &= l_2(X^0, X^1) + L_{X^0}^0 \alpha^0 + \iota_{X^1} \delta(\alpha^1), \\ (X^1 + \alpha^0) \diamond (X^0 + \alpha^1) &= l_2(X^1, X^0) + L_{X^1}^1 \alpha^1 - \iota_{X^0} \delta(\alpha^0), \end{cases} \quad (50)$$

and the E_{-1} -valued 3-form Ω is defined by

$$\Omega(X^0 + \alpha^1, Y^0 + \beta^1, Z^0 + \zeta^1) = l_3(X^0, Y^0, Z^0) + L_{X^0, Y^0}^3 \zeta^1 + L_{Z^0, X^0}^3 \beta^1 + L_{Y^0, Z^0}^3 \alpha^1, \quad (51)$$

where L^0, L^1, L^3 are given by (2). It is straightforward to see that this CLWX 2-algebroid gives rise to a VB-CLWX 2-algebroid:

$$\begin{array}{ccccc} A_{-1} \times_M A_0^* & \rightarrow & M & & \\ \downarrow & \searrow & \parallel & \searrow & \\ & A_{-1} & \rightarrow & M & \\ A_0 \times_M A_{-1}^* & \rightarrow & M & & \\ \downarrow & \searrow & \parallel & \searrow & \\ & A_0 & \rightarrow & M & \end{array}$$

Example 5.6. For any manifold M , $(T^*[1]M, TM, \partial = 0, \rho = \text{id}, S, \diamond, \Omega = 0)$ is a CLWX 2-algebroid, where S is the natural symmetric pairing between TM and T^*M , and \diamond is the standard Dorfman bracket given by

$$(X + \alpha) \diamond (Y + \beta) = [X, Y] + L_X \beta - \iota_Y \alpha, \quad \forall X, Y \in \mathfrak{X}(M), \alpha, \beta \in \Omega^1(M). \quad (52)$$

See [33, Remark 3.4] for more details. In particular, for any vector bundle E , $(T^*E^*, TE^*, \partial = 0, \rho = \text{id}, S, \diamond, \Omega = 0)$ is a CLWX 2-algebroid, which gives rise to a VB-CLWX 2-algebroid:

$$\begin{array}{ccccc} T^*E^* & \rightarrow & E^* & & \\ \downarrow & \searrow & \parallel & \searrow & \\ & E & \rightarrow & M & \leftarrow T^*M \\ TE^* & \rightarrow & E^* & & \\ \downarrow & \searrow & \parallel & \searrow & \\ & TM & \rightarrow & M & \leftarrow E^* \end{array}$$

We have a higher analogue of Theorem 2.3:

Theorem 5.7. *There is a one-to-one correspondence between split Lie 3-algebroids and split VB-CLWX 2-algebroids.*

Proof. Let $\mathcal{A} = (A_{-2}, A_{-1}, A_0, a, l_1, l_2, l_3, l_4)$ be a split Lie 3-algebroid. Then $T^*[3]\mathcal{A}[1]$ is a symplectic NQ manifold of degree 3. Note that

$$T^*[3]\mathcal{A}[1] = T^*[3](A_0 \times_M A_{-1}^* \times_M A_{-2}^*)[1],$$

where $A_0 \times_M A_{-1}^* \times_M A_{-2}^*$ is viewed as a vector bundle over the base A_{-2}^* and $A_{-1} \times_M A_0^* \times_M A_{-2}^*$ is its dual bundle. Denote by $(x^i, \mu_j, \xi^k, \theta_l, p_i, \mu^j, \xi_k, \theta^l)$ a canonical (Darboux) coordinate on $T^*[3](A_0 \times_M A_{-1}^* \times_M A_{-2}^*)[1]$, where x^i is a smooth coordinate on M , $\mu_j \in \Gamma(A_{-2})$ is a fibre coordinate on A_{-2}^* , $\xi^k \in \Gamma(A_0^*)$ is a fibre coordinate on A_0 , $\theta_l \in \Gamma(A_{-1})$ is a fibre coordinate on A_{-1}^* and $(p_i, \mu^j, \xi_k, \theta^l)$ are the momentum coordinates for $(x^i, \mu_j, \xi^k, \theta_l)$. About their degrees, we have

$$\begin{pmatrix} x^i & \mu_j & \xi^k & \theta_l & p_i & \mu^j & \xi_k & \theta^l \\ 0 & 0 & 1 & 1 & 3 & 3 & 2 & 2 \end{pmatrix}$$

The symplectic structure is given by

$$\omega = dx^i dp_i + d\mu_j d\mu^j + d\xi^k d\xi_k + d\theta_l d\theta^l,$$

which is degree 3. The Lie 3-algebroid structure gives rise to a degree 4 function Θ satisfying $\{\Theta, \Theta\} = 0$. By Theorem 5.2, we obtain a CLWX 2-algebroid $(D_{-1}, D_0, \partial, \rho, S, \diamond, \Omega)$, where $D_{-1} = A_{-1} \times_M A_0^* \times_M A_{-2}^*$ and $D_0 = A_0 \times_M A_{-1}^* \times_M A_{-2}^*$ are vector bundles over A_{-2}^* . Obviously, they give the graded double vector bundle

$$\begin{pmatrix} A_{-1} \times_M A_0^* \times_M A_{-2}^*; & A_{-1}, A_{-2}^*; & M \\ A_0 \times_M A_{-1}^* \times_M A_{-2}^*; & A_0, A_{-2}^*; & M \end{pmatrix}.$$

The section space $\Gamma_{A_{-2}^*}(D_0)$ are generated by $\Gamma(A_{-1}^*)$ (the space of core sections) and $\Gamma(A_{-2} \otimes A_{-1}^*) \oplus \Gamma(A_0)$ (the space of linear sections) as $C^\infty(A_{-2}^*)$ -module. Similarly, The section space $\Gamma_{A_{-2}^*}(D_{-1})$ are generated by $\Gamma(A_0^*)$ and $\Gamma(A_{-2} \otimes A_0^*) \oplus \Gamma(A_{-1})$ as $C^\infty(A_{-2}^*)$ -module. Thus, in the sequel we only consider core sections and linear sections.

The graded symmetric bilinear form S is given by

$$S(e^0, e^1) = S(X^0 + \psi^1 + \alpha^1, X^1 + \psi^0 + \alpha^0) = \langle \alpha_1, X^1 \rangle + \langle \alpha^0, X_0 \rangle + \psi^1(X^1) + \psi^0(X^0), \quad (53)$$

for all $e^0 = X^0 + \psi^1 + \alpha^1 \in \Gamma_{A_{-2}^*}(D_0)$ and $e^1 = X^1 + \psi^0 + \alpha^0 \in \Gamma_{A_{-2}^*}(D_{-1})$, where $X^i \in \Gamma(A_{-i})$, $\psi^i \in \Gamma(A_{-2} \otimes A_{-i}^*)$ and $\alpha^i \in \Gamma(A_{-i}^*)$. Then it is obvious that

$$\left(\begin{pmatrix} A_{-1} \times_M A_0^* \times_M A_{-2}^*; & A_{-1}, A_{-2}^*; & M \\ A_0 \times_M A_{-1}^* \times_M A_{-2}^*; & A_0, A_{-2}^*; & M \end{pmatrix}, S \right)$$

is a metric graded double vector bundle.

The bundle map $\partial : D_{-1} \rightarrow D_0$ is given by

$$\partial(X^1 + \psi^0 + \alpha^0) = l_1(X^1) + l_2(X^1, \cdot)|_{A_{-1}} + \psi^0 \circ l_1 + l_1^*(\alpha^0).$$

Thus, $\partial : D_{-1} \rightarrow D_0$ is a double vector bundle morphism over $l_1 : A_{-1} \rightarrow A_0$.

Note that functions on A_{-2}^* are generated by fibrewise constant functions $C^\infty(M)$ and fibrewise linear functions $\Gamma(A_{-2})$. For all $f \in C^\infty(M)$ and $X^2 \in \Gamma(A_{-2})$, the anchor $\rho : D_0 \rightarrow TA_{-2}^*$ is given by

$$\rho(X^0 + \psi^1 + \alpha^1)(f + X^2) = a(X^0)(f) + \langle \alpha^1, l_1(X^2) \rangle + l_2(X^0, X^2) + \psi^1(l_1(X^2)).$$

Therefore, for a linear section $X^0 + \psi^1 \in \Gamma_{A_{-2}^*}^l(D_0)$, the image $\rho(X^0 + \psi^1)$ is a linear vector field and for a core section $\alpha^1 \in \Gamma(A_{-1}^*)$, the image $\rho(\alpha^1)$ is a constant vector field. Thus, ρ is linear.

The bracket operation \diamond is given by

$$\begin{aligned} & (X^0 + \psi^1 + \alpha^1) \diamond (Y^0 + \phi^1 + \beta^1) \\ = & l_2(X^0, Y^0) + l_3(X^0, Y^0, \cdot)|_{A_{-1}} + l_2(X^0, \phi^1(\cdot)) - \phi^1 \circ l_2(X^0, \cdot)|_{A_{-1}} + L_{X^0}^0 \beta^1 \\ & + \psi^1 \circ l_2(Y^0, \cdot)|_{A_{-1}} - l_2(Y^0, \psi^1(\cdot)) + \psi^1 \circ l_1 \circ \phi^1 - \phi^1 \circ l_1 \circ \psi^1 - \beta^1 \circ l_1 \circ \psi^1 \\ & - L_{Y^0}^0 \alpha^1 + \alpha^1 \circ l_1 \circ \phi^1, \\ & (X^0 + \psi^1 + \alpha^1) \diamond (Y^1 + \phi^0 + \beta^0) \\ = & l_2(X^0, Y^1) + l_3(X^0, \cdot, Y^1)|_{A_0} + l_2(X^0, \phi^0(\cdot)) - \phi^0 \circ l_2(X^0, \cdot)|_{A_0} + L_{X^0}^0 \beta^0 \\ & - \psi^1 l_2(\cdot, Y^1)|_{A_0} + \delta(\psi^1(Y^1)) + \psi^1 \circ l_1 \circ \phi^0 + \iota_{Y^1} \delta \alpha^1 + \alpha^1 \circ l_1 \circ \phi^0, \\ & (Y^1 + \phi^0 + \beta^0) \diamond (X^0 + \psi^1 + \alpha^1) \\ = & l_2(Y^1, X^0) - l_3(X^0, \cdot, Y^1)|_{A_0} - l_2(X^0, \phi^0(\cdot)) + \phi^0 \circ l_2(X^0, \cdot)|_{A_0} + \delta(\phi^0(X^0)) \\ & - \iota_{X^0} \delta \beta^0 + \psi^1 l_2(\cdot, Y^1)|_{A_0} - \psi^1 \circ l_1 \circ \phi^0 + L_{Y^1}^1 \alpha^1 - \alpha^1 \circ l_1 \circ \phi^0. \end{aligned}$$

Then it is straightforward to see that the operation \diamond is linear.

Finally, Ω is given by

$$\begin{aligned} & \Omega(X^0 + \psi^1 + \alpha^1, Y^0 + \phi^1 + \beta^1, Z^0 + \varphi^1 + \gamma^1) \\ = & l_3(X^0, Y^0, Z^0) + l_4(X^0, Y^0, Z^0, \cdot) \\ & - \varphi^1 \circ l_3(X^0, Y^0, \cdot)|_{A_0} - \phi^1 \circ l_3(Z^0, X^0, \cdot)|_{A_0} - \psi^1 \circ l_3(Y^0, Z^0, \cdot)|_{A_0} \\ & + L_{X^0, Y^0}^3 \gamma^1 + L_{Y^0, Z^0}^3 \alpha^1 + L_{Z^0, X^0}^3 \beta^1, \end{aligned}$$

which implies that Ω is also linear.

Thus, a split Lie 3-algebroid gives rise to a split VB-CLWX 2-algebroid:

$$\begin{array}{ccccc} A_{-1} \times_M A_0^* \times_M A_{-2}^* & \longrightarrow & A_{-2}^* & & \\ \downarrow \vartheta & \searrow & \parallel & \searrow & \\ & A_{-1} & \longrightarrow & M & \longleftarrow A_0^* \\ & \downarrow & \parallel & \parallel & \\ A_0 \times_M A_{-1}^* \times_M A_{-2}^* & \xrightarrow{\iota_1} & A_{-2}^* & & \\ & \searrow & \parallel & \parallel & \\ & A_0 & \longrightarrow & M & \longleftarrow A_{-1}^*. \end{array}$$

Conversely, given a split VB-CLWX 2-algebroid:

$$\begin{array}{ccccc}
A_{-1} \times_M A_0^* \times_M B & \xrightarrow{\quad} & B & & \\
\downarrow \partial & \searrow & \parallel & \searrow & \\
& & A_{-1} & \xrightarrow{\quad} & M \longleftarrow A_0^* \\
& & \parallel & & \parallel \\
A_0 \times_M A_{-1}^* \times_M B & \xrightarrow{\quad} & B & & \\
& \searrow & \parallel & \searrow & \\
& & A_0 & \xrightarrow{\quad} & M \longleftarrow A_{-1}^*
\end{array}$$

then we can deduce that the corresponding symplectic NQ-manifold of degree 3 is $T^*[3]\mathcal{A}[1]$, where $\mathcal{A} = A_0 \oplus A_{-1} \oplus B$ is a graded vector bundle in which B is of degree -2 , and the Q -structure gives rise to a Lie 3-algebroid structure on \mathcal{A} . We omit details. ■

Remark 5.8. *Since every double vector bundle is splittable, every VB-CLWX 2-algebroid is isomorphic to a split one. Meanwhile, by choosing a splitting, we obtain a split Lie 3-algebroid from an NQ-manifold of degree 3 (Lie 3-algebroid). Thus, we can enhance the above result to be a one-to-one correspondence between Lie 3-algebroids and VB-CLWX 2-algebroids. We omit such details.*

Recall that the tangent prolongation of a Courant algebroid is a VB-Courant algebroid ([31, Proposition 3.4.1]). Now we show that the tangent prolongation of a CLWX 2-algebroid is a VB-CLWX 2-algebroid. The notations used below is the same as the ones used in Section 3.

Proposition 5.9. *Let $(E_{-1}, E_0, \partial, \rho, S, \diamond, \Omega)$ be a CLWX 2-algebroid. Then $(TE_{-1}, TE_0, \tilde{\partial}, \tilde{\rho}, \tilde{S}, \tilde{\diamond}, \tilde{\Omega})$ is a CLWX 2-algebroid over TM , where the bundle map $\tilde{\partial} : TE_{-1} \rightarrow TE_0$ is given by*

$$\tilde{\partial}(\sigma_T^1) = \partial(\sigma^1)_T, \quad \tilde{\partial}(\sigma_C^1) = \partial(\sigma^1)_C, \quad (54)$$

the bundle map $\tilde{\rho} : TE_0 \rightarrow TTM$ is given by

$$\tilde{\rho}(\sigma_T^0) = \rho(\sigma^0)_T, \quad \tilde{\rho}(\sigma_C^0) = \rho(\sigma^0)_C, \quad (55)$$

the degree 1 bilinear form \tilde{S} is given by

$$\tilde{S}(\sigma_T^0, \tau_T^1) = S(\sigma^0, \tau^1)_T, \quad \tilde{S}(\sigma_T^0, \tau_C^1) = S(\sigma^0, \tau^1)_C, \quad \tilde{S}(\sigma_C^0, \tau_T^1) = S(\sigma^0, \tau^1)_C, \quad \tilde{S}(\sigma_C^0, \tau_C^1) = 0, \quad (56)$$

the bilinear operation $\tilde{\diamond}$ is given by

$$\begin{aligned}
\sigma_T^0 \tilde{\diamond} \tau_T^0 &= (\sigma^0 \diamond \tau^0)_T, & \sigma_T^0 \tilde{\diamond} \tau_C^0 &= -\tau_C^0 \tilde{\diamond} \sigma_T^0 = (\sigma^0 \diamond \tau^0)_C, & \sigma_C^0 \tilde{\diamond} \tau_C^0 &= 0, \\
\sigma_T^0 \tilde{\diamond} \tau_T^1 &= (\sigma^0 \diamond \tau^1)_T, & \sigma_T^0 \tilde{\diamond} \tau_C^1 &= \sigma_C^0 \tilde{\diamond} \tau_T^1 = (\sigma^0 \diamond \tau^1)_C, & \sigma_C^0 \tilde{\diamond} \tau_C^1 &= 0, \\
\tau_T^1 \tilde{\diamond} \sigma_T^0 &= (\tau^1 \diamond \sigma^0)_T, & \tau_C^1 \tilde{\diamond} \sigma_T^0 &= \tau_T^1 \tilde{\diamond} \sigma_C^0 = (\tau^1 \diamond \sigma^0)_C, & \tau_C^1 \tilde{\diamond} \sigma_C^0 &= 0,
\end{aligned}$$

and $\tilde{\Omega} : \wedge^3 TE_0 \rightarrow TE_{-1}$ is given by

$$\tilde{\Omega}(\sigma_T^0, \tau_T^0, \varsigma_T^0) = \Omega(\sigma^0, \tau^0, \varsigma^0)_T, \quad \tilde{\Omega}(\sigma_T^0, \tau_T^0, \varsigma_C^0) = \Omega(\sigma^0, \tau^0, \varsigma^0)_C, \quad \tilde{\Omega}(\sigma_T^0, \tau_C^0, \varsigma_C^0) = 0,$$

for all $\sigma^0, \tau^0, \zeta^0 \in \Gamma(E_0)$ and $\sigma^1, \tau^1 \in \Gamma(E_{-1})$.

Moreover, we have the following VB-CLWX 2-algebroid:

$$\begin{array}{ccccc}
TE_{-1} & \longrightarrow & TM & & \\
\downarrow & \searrow & \downarrow & \searrow & \\
& & E_{-1} & \longrightarrow & M \longleftarrow E_{-1} \\
& & \downarrow & & \downarrow \\
TE_0 & \longrightarrow & TM & & \\
\downarrow & \searrow & \downarrow & \searrow & \\
& & E_0 & \longrightarrow & M \longleftarrow E_0.
\end{array}$$

Proof. Since $(E_{-1}, E_0, \partial, \rho, S, \diamond, \Omega)$ is a CLWX 2-algebroid, we deduce that $(TE_{-1}, TE_0, \tilde{\partial}, \tilde{\rho}, \tilde{S}, \tilde{\diamond}, \tilde{\Omega})$ is a CLWX 2-algebroid over TM . Moreover, it is obvious that $\tilde{\partial}, \tilde{\rho}, \tilde{S}, \tilde{\diamond}, \tilde{\Omega}$ are all linear, which implies that we have a VB-CLWX 2-algebroid. ■

At the end of this section, we give the definition of a VB-Lie 2-bialgebroid and show that the double of a VB-Lie 2-bialgebroid is a VB-CLWX 2-algebroid. Let us recall the notion of a split Lie 2-bialgebroid briefly. A split Lie 2-algebroid can be described by a degree 4 function μ on $T^*[3]\mathcal{A}[1] = T^*[3](A_0 \oplus A_{-1}^*)[1]$ satisfying $\{\mu, \mu\} = 0$, where $\{\cdot, \cdot\}$ is the canonical graded Poisson bracket on $T^*[3](A_0 \oplus A_{-1}^*)[1]$. Denote by $(x^i, \xi^j, \theta_k, p_i, \xi_j, \theta^k)$ a canonical Darboux coordinate on $T^*[3](A_0 \oplus A_{-1}^*)[1]$, where x^i is a coordinate on M , (ξ^j, θ_k) is the fiber coordinate on $A_0 \oplus A_{-1}^*$, (p_i, ξ_j, θ^k) is the momentum coordinate on \mathcal{M} for (x^i, ξ^j, θ_k) . The degree of the symplectic structure $\omega = dx^i dp_i + d\xi^j d\xi_j + d\theta_k d\theta^k$ is 3 and the degree of the corresponding graded Poisson structure is -3 . The degree 4 function μ is given by

$$\mu = \mu_{1j}^i(x) p_i \xi^j + \mu_{2j}^i(x) \xi_i \theta^j + \frac{1}{2} \mu_{3ij}^k(x) \xi_k \xi^i \xi^j + \mu_{4ij}^k \theta^j \xi^i \theta_k + \frac{1}{6} \mu_{5ijk}^l(x) \theta_l \xi^i \xi^j \xi^k. \quad (57)$$

We will write $\mu_2 = \mu_{2j}^i(x) \xi_i \theta^j$.

Definition 5.10. ([33]) Let $\mathcal{A} = (A_{-1}, A_0, a, l_1, l_2, l_3)$ and $\mathcal{A}^*[1] = (A_0^*[1], A_{-1}^*[1], \mathbf{a}, l_1, l_2, l_3)$ be split Lie 2-algebroids with the structure functions μ and γ respectively. The pair $(\mathcal{A}, \mathcal{A}^*[1])$ is called a split Lie 2-bialgebroid if $\gamma_2 = \mu_2$ and

$$\{\mu + \gamma - \mu_2, \mu + \gamma - \mu_2\} = 0. \quad (58)$$

Denote a split Lie 2-bialgebroid by $(\mathcal{A}, \mathcal{A}^*[1])$. There is a close relationship between split Lie 2-bialgebroids and CLWX 2-algebroids. Assume that $(A_{-1}, A_0, a, l_1, l_2, l_3)$ and $(A_0^*[1], A_{-1}^*[1], \mathbf{a}, l_1, l_2, l_3)$ are Lie 2-algebroids. Let $E_0 = A_0 \oplus A_{-1}^*$, $E_{-1} = A_{-1} \oplus A_0^*$ and $\mathcal{E} = E_0 \oplus E_{-1}$.

Let $\partial : E_{-1} \rightarrow E_0$ and $\rho : E_0 \rightarrow TM$ be bundle maps defined by

$$\partial(X^1 + \alpha^0) = l_1(X^1) + l_1(\alpha^0), \quad (59)$$

$$\rho(X^0 + \alpha^1) = a(X^0) + \mathbf{a}(\alpha^1). \quad (60)$$

On $\Gamma(\mathcal{E})$, define the operation \diamond by

$$\left\{ \begin{array}{l}
(X^0 + \alpha^1) \diamond (Y^0 + \beta^1) = l_2(X^0, Y^0) + L_{X^0}^0 \beta^1 - L_{Y^0}^0 \alpha^1 + l_2(\alpha^1, \beta^1) + \mathcal{L}_{\alpha^1}^0 Y^0 - \mathcal{L}_{\beta^1}^0 X^0, \\
(X^0 + \alpha^1) \diamond (X^1 + \alpha^0) = l_2(X^0, X^1) + L_{X^0}^0 \alpha^0 + \iota_{X^1} \delta(\alpha^1) \\
\quad + l_2(\alpha^1, \alpha^0) + \mathcal{L}_{\alpha^1}^0 X^1 + \iota_{\alpha^0} \delta_*(X^0), \\
(X^1 + \alpha^0) \diamond (X^0 + \alpha^1) = l_2(X^1, X^0) + L_{X^1}^1 \alpha^1 - \iota_{X^0} \delta(\alpha^0) \\
\quad + l_2(\alpha^0, \alpha^1) + \mathcal{L}_{\alpha^0}^1 X^0 - \iota_{\alpha^1} \delta_*(X^1).
\end{array} \right. \quad (61)$$

An E_{-1} -valued 3-form Ω on E_0 is defined by

$$\begin{aligned} \Omega(X^0 + \alpha^1, Y^0 + \beta^1, Z^0 + \zeta^1) &= l_3(X^0, Y^0, Z^0) + L_{X^0, Y^0}^3 \zeta^1 + L_{Y^0, Z^0}^3 \alpha^1 + L_{Z^0, X^0}^3 \beta^1 \\ &\quad + l_3(\alpha^1, \beta^1, \zeta^1) + \mathcal{L}_{\alpha^1, \beta^1}^3 Z^0 + \mathcal{L}_{\beta^1, \zeta^1}^3 X^0 + \mathcal{L}_{\zeta^1, \alpha^1}^3 Y^0, \end{aligned} \quad (62)$$

where $X^0, Y^0, Z^0 \in \Gamma(A_0)$, $\alpha^1, \beta^1, \zeta^1 \in \Gamma(A_{-1}^*)$. Here L^0, L^1, L^3 are the Lie derivatives for the Lie 2-algebroid \mathcal{A} given by (2) and $\mathcal{L}^0, \mathcal{L}^1, \mathcal{L}^3$ are the Lie derivatives for the Lie 2-algebroid $\mathcal{A}^*[1]$.

Theorem 5.11. ([33]) *Let $(\mathcal{A}, \mathcal{A}^*[1])$ be a split Lie 2-bialgebroid. Then $(E_{-1}, E_0, \partial, \rho, (\cdot, \cdot)_+, \diamond, \Omega)$ is a CLWX 2-algebroid, where $E_0 = A_0 \oplus A_{-1}^*$, $E_{-1} = A_{-1} \oplus A_0^*$, ∂ is given by (59), ρ is given by (60), $(\cdot, \cdot)_+$ is given by (49), \diamond is given by (61) and Ω is given by (62).*

Definition 5.12. *The following two VB-Lie 2-algebroids*

$$\begin{array}{ccc} \begin{array}{ccccc} D_{-1} & \longrightarrow & B & & \\ \downarrow & \searrow & \downarrow & \searrow & \\ & A_{-1} & \longrightarrow & M & \longleftarrow C_{-1} \\ \downarrow & \downarrow & \downarrow & \downarrow & \\ D_0 & \longrightarrow & B & & \\ \downarrow & \searrow & \downarrow & \searrow & \\ & A_0 & \longrightarrow & M & \longleftarrow C_0, \end{array} & \begin{array}{ccccc} D_0^{*B} & \longrightarrow & B & & \\ \downarrow & \searrow & \downarrow & \searrow & \\ & C_0^* & \longrightarrow & M & \longleftarrow A_0^* \\ \downarrow & \downarrow & \downarrow & \downarrow & \\ D_{-1}^{*B} & \longrightarrow & B & & \\ \downarrow & \searrow & \downarrow & \searrow & \\ & C_{-1}^* & \longrightarrow & M & \longleftarrow A_{-1}^* \end{array} & (63) \end{array}$$

constitute a VB-Lie 2-bialgebroid if the underlying Lie 2-algebroids $(D_{-1}^B, D_0^B, a, l_1, l_2, l_3)$ and $(D_0^{*B}, D_{-1}^{*B}, a, l_1, l_2, l_3)$ constitute a Lie 2-bialgebroid.

The double of a VB-Lie bialgebroid is a VB-Courant algebroid. The following result is its higher analogue.

Theorem 5.13. *Given a VB-Lie 2-bialgebroid as in (63), we have a VB-CLWX 2-algebroid:*

$$\begin{array}{ccccc} D_{-1} \oplus D_0^{*B} & \longrightarrow & B & & \\ \downarrow & \searrow & \downarrow & \searrow & \\ & A_{-1} \oplus C_0^* & \longrightarrow & M & \longleftarrow C_{-1} \oplus A_0^* \\ \downarrow & \downarrow & \downarrow & \downarrow & \\ D_0 \oplus D_{-1}^{*B} & \longrightarrow & B & & \\ \downarrow & \searrow & \downarrow & \searrow & \\ & A_0 \oplus C_{-1}^* & \longrightarrow & M & \longleftarrow C_0 \oplus A_{-1}^*. \end{array}$$

Proof. By Theorem 5.11, $(D_{-1}^B \oplus D_0^{*B}, D_0^B \oplus D_{-1}^{*B}, \partial, \rho, S, \diamond, \Omega)$ is a CLWX 2-algebroid, where ∂ is given by (59), ρ is given by (60), $(\cdot, \cdot)_+$ is given by (49), \diamond is given by (61) and Ω is given by (62). Then it is not hard to see that the structure maps $\partial, \rho, S, \diamond, \Omega$ are all linear. Thus, the double of a VB-Lie 2-bialgebroid is a VB-CLWX 2-algebroid. ■

6 E -CLWX 2-algebroid

In this section, we introduce the notion of an E -CLWX 2-algebroid as the categorification of an E -Courant algebroid introduced in [11]. We show that associated to a VB-CLWX 2-algebroid, there is an E -CLWX 2-algebroid structure on the corresponding graded fat bundle.

There is an E -valued pairing $\langle \cdot, \cdot \rangle_E$ between the jet bundle $\mathfrak{J}E$ and the first order covariant differential operator bundle $\mathfrak{D}E$ defined by

$$\langle \mu, \mathfrak{d} \rangle_E \triangleq \mathfrak{d}(u), \quad \forall \mathfrak{d} \in (\mathfrak{D}E)_m, \mu \in (\mathfrak{J}E)_m, u \in \Gamma(E) \text{ satisfying } \mu = [u]_m.$$

Definition 6.1. *Let E be a vector bundle. An E -CLWX 2-algebroid is a 6-tuple $(\mathcal{K}, \partial, \rho, \mathcal{S}, \diamond, \Omega)$, where $\mathcal{K} = K_{-1} \oplus K_0$ is a graded vector bundle over M and*

- $\partial : K_{-1} \rightarrow K_0$ is a bundle map;
- $\mathcal{S} : \mathcal{K} \otimes \mathcal{K} \rightarrow E$ is a surjective graded symmetric nondegenerate E -valued pairing of degree 1, which induces an embedding: $\mathcal{K} \hookrightarrow \text{Hom}(\mathcal{K}, E)$;
- $\rho : K_0 \rightarrow \mathfrak{D}E$ is a bundle map, called the anchor, such that $\rho^*(\mathfrak{J}E) \subset K_{-1}$, i.e.

$$\mathcal{S}(\rho^*(\mu), e^0) = \langle \mu, \rho(e^0) \rangle_E, \quad \forall \mu \in \Gamma(\mathfrak{J}E), e^0 \in \Gamma(K_0);$$

- $\diamond : \Gamma(K_{-i}) \times \Gamma(K_{-j}) \rightarrow \Gamma(K_{-(i+j)})$, $0 \leq i + j \leq 1$ is an \mathbb{R} -bilinear operation;
- $\Omega : \wedge^3 K_0 \rightarrow K_{-1}$ is a bundle map,

such that the following properties hold:

(E1) $(\Gamma(\mathcal{K}), \partial, \diamond, \Omega)$ is a Leibniz 2-algebra;

(E2) for all $e \in \Gamma(\mathcal{K})$, $e \diamond e = \frac{1}{2} \mathcal{D}\mathcal{S}(e, e)$, where $\mathcal{D} : \Gamma(E) \rightarrow \Gamma(K_{-1})$ is defined by

$$\mathcal{S}(\mathcal{D}u, e^0) = \rho(e^0)(u), \quad \forall u \in \Gamma(E), e^0 \in \Gamma(K_0); \quad (64)$$

(E3) for all $e_1^1, e_2^1 \in \Gamma(K_{-1})$, $\mathcal{S}(\partial(e_1^1), e_2^1) = \mathcal{S}(e_1^1, \partial(e_2^1))$;

(E4) for all $e_1, e_2, e_3 \in \Gamma(\mathcal{K})$, $\rho(e_1)\mathcal{S}(e_2, e_3) = \mathcal{S}(e_1 \diamond e_2, e_3) + \mathcal{S}(e_2, e_1 \diamond e_3)$;

(E5) for all $e_1^0, e_2^0, e_3^0, e_4^0 \in \Gamma(K_0)$, $\mathcal{S}(\Omega(e_1^0, e_2^0, e_3^0), e_4^0) = -\mathcal{S}(e_3^0, \Omega(e_1^0, e_2^0, e_4^0))$;

(E6) for all $e_1^0, e_2^0 \in \Gamma(K_0)$, $\rho(e_1^0 \diamond e_2^0) = [\rho(e_1^0), \rho(e_2^0)]_{\mathfrak{D}}$, where $[\cdot, \cdot]_{\mathfrak{D}}$ is the commutator bracket on $\Gamma(\mathfrak{D}E)$.

A CLWX 2-algebroid can give rise to a Lie 3-algebra ([33, Theorem 3.11]). Similarly, an E -CLWX 2-algebroid can also give rise to a Lie 3-algebra. Consider the graded vector space $\mathfrak{e} = \mathfrak{e}_{-2} \oplus \mathfrak{e}_{-1} \oplus \mathfrak{e}_0$, where $\mathfrak{e}_{-2} = \Gamma(E)$, $\mathfrak{e}_{-1} = \Gamma(K_{-1})$ and $\mathfrak{e}_0 = \Gamma(K_0)$. We introduce a skew-symmetric bracket on $\Gamma(\mathcal{K})$,

$$[[e_1, e_2]] = \frac{1}{2}(e_1 \diamond e_2 - e_2 \diamond e_1), \quad \forall e_1, e_2 \in \Gamma(\mathcal{K}), \quad (65)$$

which is the skew-symmetrization of \diamond .

Theorem 6.2. An E -CLWX 2-algebroid $(\mathcal{K}, \partial, \rho, \mathcal{S}, \diamond, \Omega)$ gives rise to a Lie 3-algebra $(\mathfrak{e}, \mathfrak{l}_1, \mathfrak{l}_2, \mathfrak{l}_3, \mathfrak{l}_4)$, where \mathfrak{l}_i are given by

$$\begin{aligned}
\mathfrak{l}_1(u) &= \mathcal{D}(u), & \forall u \in \Gamma(E), \\
\mathfrak{l}_1(e^1) &= \partial(e^1), & \forall e^1 \in \Gamma(K_{-1}), \\
\mathfrak{l}_2(e_1^0, e_2^0) &= \llbracket e_1^0, e_2^0 \rrbracket, & \forall e_1^0, e_2^0 \in \Gamma(K_0), \\
\mathfrak{l}_2(e^0, e^1) &= \llbracket e^0, e^1 \rrbracket, & \forall e^0 \in \Gamma(K_0), e^1 \in \Gamma(K_{-1}), \\
\mathfrak{l}_2(e^0, f) &= \frac{1}{2}\mathcal{S}(e^0, \mathcal{D}f), & \forall e^0 \in \Gamma(K_0), f \in \Gamma(E), \\
\mathfrak{l}_2(e_1^1, e_2^1) &= 0, & \forall e_1^1, e_2^1 \in \Gamma(K_{-1}), \\
\mathfrak{l}_3(e_1^0, e_2^0, e_3^0) &= \Omega(e_1^0, e_2^0, e_3^0), & \forall e_1^0, e_2^0, e_3^0 \in \Gamma(K_0), \\
\mathfrak{l}_3(e_1^0, e_2^0, e^1) &= -T(e_1^0, e_2^0, e^1), & \forall e_1^0, e_2^0 \in \Gamma(K_0), e^1 \in \Gamma(K_{-1}), \\
\mathfrak{l}_4(e_1^0, e_2^0, e_3^0, e_4^0) &= \overline{\Omega}(e_1^0, e_2^0, e_3^0, e_4^0), & \forall e_1^0, e_2^0, e_3^0, e_4^0 \in \Gamma(K_0),
\end{aligned}$$

where the totally skew-symmetric $T : \Gamma(K_0) \times \Gamma(K_0) \times \Gamma(K_{-1}) \rightarrow \Gamma(E)$ is given by

$$T(e_1^0, e_2^0, e^1) = \frac{1}{6}(\mathcal{S}(e_1^0, \llbracket e_2^0, e^1 \rrbracket) + \mathcal{S}(e^1, \llbracket e_1^0, e_2^0 \rrbracket) + \mathcal{S}(e_2^0, \llbracket e^1, e_1^0 \rrbracket)), \quad (66)$$

and $\overline{\Omega} : \wedge^4 \Gamma(K_0) \rightarrow \Gamma(E)$ is given by

$$\overline{\Omega}(e_1^0, e_2^0, e_3^0, e_4^0) = \mathcal{S}(\Omega(e_1^0, e_2^0, e_3^0), e_4^0).$$

Proof. The proof is totally parallel to the proof of [33, Theorem 3.11], we omit the details. ■

Let $(D_{-1}^B, D_0^B, \partial, \rho, S, \diamond, \Omega)$ be a VB-CLWX 2-algebroid on the graded double vector bundle $\begin{pmatrix} D_{-1}; & A_{-1}, B; & M \\ D_0; & A_0, B; & M \end{pmatrix}$. Then we have the associated graded fat bundles $\hat{A}_{-1} \oplus \hat{A}_0$, which fit the exact sequences:

$$\begin{aligned}
0 \rightarrow B^* \otimes A_0^* &\rightarrow \hat{A}_{-1} \rightarrow A_{-1} \rightarrow 0, \\
0 \rightarrow B^* \otimes A_{-1}^* &\rightarrow \hat{A}_0 \rightarrow A_0 \rightarrow 0.
\end{aligned}$$

Since the bundle map ∂ is linear, it induces a bundle map $\hat{\partial} : \hat{A}_{-1} \rightarrow \hat{A}_0$. Since the anchor ρ is linear, it induces a bundle map $\hat{\rho} : \hat{A}_0 \rightarrow \mathfrak{D}B^*$, where sections of $\mathfrak{D}B^*$ are viewed as linear vector fields on B . Furthermore, the restriction of S on linear sections will give rise to linear functions on B . Thus, we obtain a B^* -valued degree 1 graded symmetric bilinear form \hat{S} on the graded fat bundle $\hat{A}_{-1} \oplus \hat{A}_0$. Since the operation \diamond is linear, it induces an operation $\hat{\diamond} : \hat{A}_{-i} \times \hat{A}_{-j} \rightarrow \hat{A}_{-(i+j)}$, $0 \leq i+j \leq 1$. Finally, since Ω is linear, it induces an $\hat{\Omega} : \Gamma(\wedge^3 \hat{A}_0) \rightarrow \hat{A}_{-1}$. Then we obtain:

Theorem 6.3. A VB-CLWX 2-algebroid gives rise to a B^* -CLWX 2-algebroid structure on the corresponding graded fat bundle. More precisely, let $(D_{-1}^B, D_0^B, \partial, \rho, S, \diamond, \Omega)$ be a VB-CLWX 2-algebroid on the graded double vector bundle $\begin{pmatrix} D_{-1}; & A_{-1}, B; & M \\ D_0; & A_0, B; & M \end{pmatrix}$ with the associated graded fat bundle $\hat{A}_{-1} \oplus \hat{A}_0$. Then $(\hat{A}_{-1}, \hat{A}_0, \hat{\partial}, \hat{\rho}, \hat{S}, \hat{\diamond}, \hat{\Omega})$ is a B^* -CLWX 2-algebroid.

Proof. Since all the structures defined on the graded fat bundle $\hat{A}_{-1} \oplus \hat{A}_0$ are the restriction of the structures in the VB-CLWX 2-algebroid, it is straightforward to see that all the axioms in Definition 6.1 hold. ■

Example 6.4. Consider the VB-CLWX 2-algebroid given in Example 5.6, the corresponding E -CLWX 2-algebroid is $((\mathfrak{J}E)[1], \mathfrak{D}E, \partial = 0, \rho = \text{id}, \mathcal{S} = (\cdot, \cdot)_E, \diamond, \Omega = 0)$, where the graded symmetric nondegenerate E -valued pairing $(\cdot, \cdot)_E$ is given by

$$(\mathfrak{d} + \mu, \mathfrak{t} + \nu)_E = \langle \mu, \mathfrak{t} \rangle_E + \langle \nu, \mathfrak{d} \rangle_E, \quad \forall \mathfrak{d} + \mu, \mathfrak{t} + \nu \in \mathfrak{D}E \oplus \mathfrak{J}E,$$

and \diamond is given by

$$(\mathfrak{d} + \mu) \diamond (\mathfrak{r} + \nu) = [\mathfrak{d}, \mathfrak{r}]_{\mathfrak{D}} + \mathfrak{L}_{\mathfrak{d}}\nu - \mathfrak{L}_{\mathfrak{r}}\mu + \mathfrak{d} \langle \mu, \mathfrak{r} \rangle_E.$$

See [10] for more details.

Example 6.5. Consider the VB-CLWX 2-algebroid given in Proposition 5.9. The graded fat bundle is $\mathfrak{J}E_{-1} \oplus \mathfrak{J}E_0$. It follows that the graded jet bundle associated to a CLWX 2-algebroid is a T^*M -CLWX 2-algebroid. This is the higher analogue of the result that the jet bundle of a Courant algebroid is T^*M -Courant algebroid given in [11]. See also [23] for more details.

7 From Lie 3-algebras to Lie 3-algebras

As applications of E -CLWX 2-algebroids introduced in the last section, we construct Lie 3-algebras from Lie 3-algebras in this section. Let $(\mathfrak{g}_{-2}, \mathfrak{g}_{-1}, \mathfrak{g}_0, l_1, l_2, l_3, l_4)$ be a Lie 3-algebra. By Theorem 5.7, the corresponding VB-CLWX 2-algebroid is given by

$$\begin{array}{ccccc}
 \mathfrak{g}_{-1} \oplus \mathfrak{g}_0^* \oplus \mathfrak{g}_{-2}^* & \xrightarrow{\quad} & \mathfrak{g}_{-2}^* & & \\
 \downarrow \partial & \searrow & \parallel & \searrow & \\
 & \mathfrak{g}_{-1} & \xrightarrow{\quad} & pt & \longleftarrow \mathfrak{g}_0^* \\
 & \downarrow & \parallel & \parallel & \\
 \mathfrak{g}_0 \oplus \mathfrak{g}_{-1}^* \oplus \mathfrak{g}_{-2}^* & \xrightarrow{\iota_{\mathfrak{r}}} & \mathfrak{g}_{-2}^* & & \\
 & \searrow & \downarrow & \searrow & \\
 & \mathfrak{g}_0 & \xrightarrow{\quad} & pt & \longleftarrow \mathfrak{g}_{-1}^*
 \end{array}$$

By Theorem 6.3, we obtain:

Proposition 7.1. *Let $(\mathfrak{g}_{-2}, \mathfrak{g}_{-1}, \mathfrak{g}_0, l_1, l_2, l_3, l_4)$ be a Lie 3-algebra. Then there is an E -CLWX 2-algebroid $(\text{Hom}(\mathfrak{g}_0, \mathfrak{g}_{-2}) \oplus \mathfrak{g}_{-1}, \text{Hom}(\mathfrak{g}_{-1}, \mathfrak{g}_{-2}) \oplus \mathfrak{g}_0, \partial, \rho, \mathcal{S}, \diamond, \Omega)$, where for all $x^i, y^i, z^i \in \mathfrak{g}_{-i}$, $\phi^i, \psi^i, \varphi^i \in \text{Hom}(\mathfrak{g}_{-i}, \mathfrak{g}_{-2})$, $\partial : \text{Hom}(\mathfrak{g}_0, \mathfrak{g}_{-2}) \oplus \mathfrak{g}_{-1} \longrightarrow \text{Hom}(\mathfrak{g}_{-1}, \mathfrak{g}_{-2}) \oplus \mathfrak{g}_0$ is given by*

$$\partial(\phi^0 + x^1) = \phi^0 \circ l_1 + l_2(x^1, \cdot)|_{\mathfrak{g}_{-1}} + l_1(x^1), \quad (67)$$

$\rho : \text{Hom}(\mathfrak{g}_{-1}, \mathfrak{g}_{-2}) \oplus \mathfrak{g}_0 \longrightarrow \mathfrak{gl}(\mathfrak{g}_{-2})$ is given by

$$\rho(\phi^1 + x^0) = \phi^1 \circ l_1 + l_2(x^0, \cdot)|_{\mathfrak{g}_{-2}}, \quad (68)$$

the \mathfrak{g}_{-2} -valued pairing \mathcal{S} is given by

$$\mathcal{S}(\phi^1 + x^0, \psi^0 + y^1) = \phi^1(y^1) + \psi^0(x^0), \quad (69)$$

the operation \diamond is given by

$$\left\{ \begin{array}{l} (x^0 + \psi^1) \diamond (y^0 + \phi^1) = l_2(x^0, y^0) + l_3(x^0, y^0, \cdot)|_{\mathfrak{g}_{-1}} + l_2(x^0, \phi^1(\cdot)) - \phi^1 \circ l_2(x^0, \cdot)|_{\mathfrak{g}_{-1}} \\ \quad + \psi^1 \circ l_2(y^0, \cdot)|_{\mathfrak{g}_{-1}} - l_2(y^0, \psi^1(\cdot)) + \psi^1 \circ l_1 \circ \phi^1 - \phi^1 \circ l_1 \circ \psi^1, \\ (x^0 + \psi^1) \diamond (y^1 + \phi^0) = l_2(x^0, y^1) + l_3(x^0, \cdot, y^1)|_{\mathfrak{g}_0} + l_2(x^0, \phi^0(\cdot)) - \phi^0 \circ l_2(x^0, \cdot)|_{\mathfrak{g}_0} \\ \quad - \psi^1 l_2(\cdot, y^1)|_{\mathfrak{g}_0} + \delta(\psi^1(y^1)) + \psi^1 \circ l_1 \circ \phi^0, \\ (y^1 + \phi^0) \diamond (x^0 + \psi^1) = l_2(y^1, x^0) - l_3(x^0, \cdot, y^1)|_{\mathfrak{g}_0} - l_2(x^0, \phi^0(\cdot)) + \phi^0 \circ l_2(x^0, \cdot)|_{\mathfrak{g}_0} \\ \quad + \delta(\phi^0(x^0)) + \psi^1 l_2(\cdot, y^1)|_{\mathfrak{g}_0} - \psi^1 \circ l_1 \circ \phi^0, \end{array} \right. \quad (70)$$

and Ω is given by

$$\begin{aligned} \Omega(\phi^1 + x^0, \psi^1 + y^0 + \varphi^1 + z^0) &= l_3(x^0, y^0, z^0) + l_4(x^0, y^0, z^0, \cdot) \\ &\quad - \varphi^1 \circ l_3(x^0, y^0, \cdot)|_{\mathfrak{g}_0} - \phi^1 \circ l_3(z^0, x^0, \cdot)|_{\mathfrak{g}_0} - \psi^1 \circ l_3(y^0, z^0, \cdot)|_{\mathfrak{g}_0}. \end{aligned} \quad (71)$$

By (68), it is straightforward to deduce that the corresponding $\mathcal{D} : \mathfrak{g}_{-2} \rightarrow \text{Hom}(\mathfrak{g}_0, \mathfrak{g}_{-2}) \oplus \mathfrak{g}_{-1}$ is given by

$$\mathcal{D}(x^2) = l_2(\cdot, x^2) + l_1(x^2) \quad (72)$$

Then by Theorem 6.2, we obtain:

Proposition 7.2. *Let $(\mathfrak{g}_{-2}, \mathfrak{g}_{-1}, \mathfrak{g}_0, l_1, l_2, l_3, l_4)$ be a Lie 3-algebra. Then there is a Lie 3-algebra $(\bar{\mathfrak{g}}_{-2}, \bar{\mathfrak{g}}_{-1}, \bar{\mathfrak{g}}_0, \bar{l}_1, \bar{l}_2, \bar{l}_3, \bar{l}_4)$, where $\bar{\mathfrak{g}}_{-2} = \mathfrak{g}_{-2}$, $\bar{\mathfrak{g}}_{-1} = \text{Hom}(\mathfrak{g}_0, \mathfrak{g}_{-2}) \oplus \mathfrak{g}_{-1}$, $\bar{\mathfrak{g}}_0 = \text{Hom}(\mathfrak{g}_{-1}, \mathfrak{g}_{-2}) \oplus \mathfrak{g}_0$, and \bar{l}_i are given by*

$$\begin{array}{lll} \bar{l}_1(x^2) & = & \mathcal{D}(x^2), & \forall x^2 \in \mathfrak{g}_{-2}, \\ \bar{l}_1(\phi^0 + x^1) & = & \phi^0 \circ l_1 + l_2(x^1, \cdot)|_{\mathfrak{g}_{-1}} + l_1(x^1), & \forall \phi^0 + x^1 \in \bar{\mathfrak{g}}_{-1}, \\ \bar{l}_2(e_1^0, e_2^0) & = & e_1^0 \diamond e_2^0, & \forall e_1^0, e_2^0 \in \bar{\mathfrak{g}}_0, \\ \bar{l}_2(e^0, e^1) & = & \frac{1}{2}(e^0 \diamond e^1 - e^1 \diamond e^0), & \forall e^0 \in \bar{\mathfrak{g}}_0, e^1 \in \bar{\mathfrak{g}}_{-1}, \\ \bar{l}_2(e^0, x^2) & = & \frac{1}{2}\mathcal{S}(e^0, \mathcal{D}x^2), & \forall e^0 \in \bar{\mathfrak{g}}_0, x^2 \in \mathfrak{g}_{-2}, \\ \bar{l}_2(e_1^1, e_2^1) & = & 0, & \forall e_1^1, e_2^1 \in \bar{\mathfrak{g}}_{-1}, \\ \bar{l}_3(e_1^0, e_2^0, e_3^0) & = & \Omega(e_1^0, e_2^0, e_3^0), & \forall e_1^0, e_2^0, e_3^0 \in \bar{\mathfrak{g}}_0, \\ \bar{l}_3(e_1^0, e_2^0, e^1) & = & -T(e_1^0, e_2^0, e^1), & \forall e_1^0, e_2^0 \in \bar{\mathfrak{g}}_0, e^1 \in \bar{\mathfrak{g}}_{-1}, \\ \bar{l}_4(e_1^0, e_2^0, e_3^0, e_4^0) & = & \bar{\Omega}(e_1^0, e_2^0, e_3^0, e_4^0), & \forall e_1^0, e_2^0, e_3^0, e_4^0 \in \bar{\mathfrak{g}}_0, \end{array}$$

where the operation \mathcal{D} , \diamond , Ω are given by (72), (70), (71) respectively, $T : \bar{\mathfrak{g}}_0 \times \bar{\mathfrak{g}}_0 \times \bar{\mathfrak{g}}_{-1} \rightarrow \mathfrak{g}_{-2}$ is given by

$$T(e_1^0, e_2^0, e^1) = \frac{1}{6}(\mathcal{S}(e_1^0, l_2(e_2^0, e^1)) + \mathcal{S}(e^1, l_2(e_1^0, e_2^0)) + \mathcal{S}(e_2^0, l_2(e^1, e_1^0))),$$

and $\bar{\Omega} : \wedge^4 \bar{\mathfrak{g}}_0 \rightarrow \mathfrak{g}_{-2}$ is given by

$$\bar{\Omega}(e_1^0, e_2^0, e_3^0, e_4^0) = \mathcal{S}(\Omega(e_1^0, e_2^0, e_3^0), e_4^0).$$

By Proposition 7.2, we can give interesting examples of Lie 3-algebras.

Example 7.3. We view a 3-term complex of vector spaces $V_{-2} \xrightarrow{l_1} V_{-1} \xrightarrow{l_1} V_0$ as an abelian Lie 3-algebra. By Proposition 7.2, we obtain the Lie 3-algebra

$$(V_{-2}, \text{Hom}(V_0, V_{-2}) \oplus V_{-1}, \text{Hom}(V_{-1}, V_{-2}) \oplus V_0, l_1, l_2, l_3, l_4 = 0),$$

where $\mathfrak{l}_i, i = 1, 2, 3$ are given by

$$\begin{aligned}
\mathfrak{l}_1(x^2) &= l_1(x^2), \\
\mathfrak{l}_1(\phi^0 + y^1) &= \phi^0 \circ l_1 + l_1(y^1), \\
\mathfrak{l}_2(\psi^1 + x^0, \phi^1 + y^0) &= \psi^1 \circ l_1 \circ \phi^1 - \phi^1 \circ l_1 \circ \psi^1, \\
\mathfrak{l}_2(\psi^1 + x^0, \phi^0 + y^1) &= \frac{1}{2}l_1(\psi^1(y^1) - \phi^0(x^0)) + \psi^1 \circ l_1 \circ \phi^0, \\
\mathfrak{l}_2(\psi^1 + x^0, x^2) &= \frac{1}{2}\psi^1(l_1(x^2)), \\
\mathfrak{l}_2(\psi^0 + x^1, \phi^0 + y^1) &= 0, \\
\mathfrak{l}_3(\psi^1 + x^0, \phi^1 + y^0, \varphi^1 + z^0) &= 0, \\
\mathfrak{l}_3(\psi^1 + x^0, \phi^1 + y^0, \varphi^0 + z^1) &= -\frac{1}{4}\left(\psi^1 \circ l_1 \circ \phi^1(z^1) - \phi^1 \circ l_1 \circ \psi^1(z^1) \right. \\
&\quad \left. - \psi^1 \circ l_1 \circ \varphi^0(y^0) + \phi^1 \circ l_1 \circ \varphi^0(x^0)\right),
\end{aligned}$$

for all $x^2 \in V_{-2}$, $\psi^0 + x^1, \phi^0 + y^1, \varphi^0 + z^1 \in \text{Hom}(V_0, V_{-2}) \oplus V_{-1}$, $\psi^1 + x^0, \phi^1 + y^0, \varphi^1 + z^0 \in \text{Hom}(V_{-1}, V_{-2}) \oplus V_0$.

Example 7.4. (Higher analogue of the Lie 2-algebra of string type)

A Lie 2-algebra $(\mathfrak{g}_{-1}, \mathfrak{g}_0, \tilde{l}_1, \tilde{l}_2, \tilde{l}_3)$ gives rise to a Lie 3-algebra $(\mathbb{R}, \mathfrak{g}_{-1}, \mathfrak{g}_0, l_1, l_2, l_3, l_4 = 0)$ naturally, where $l_i, i = 1, 2, 3$ is given by

$$\begin{aligned}
l_1(r) &= 0, \quad l_1(x^1) = \tilde{l}_1(x^1), \\
l_2(x^0, y^0) &= \tilde{l}_2(x^0, y^0), \quad l_2(x^0, y^1) = \tilde{l}_2(x^0, y^1), \quad l_2(x^0, r) = 0, \quad l_2(x^1, y^1) = 0, \\
l_3(x^0, y^0, z^0) &= \tilde{l}_3(x^0, y^0, z^0), \quad l_3(x^0, y^0, z^1) = 0,
\end{aligned}$$

for all $x^0, y^0, z^0 \in \mathfrak{g}_0$, $x^1, y^1, z^1 \in \mathfrak{g}_{-1}$, and $r, s \in \mathbb{R}$. By Proposition 7.2, we obtain the Lie 3-algebra $(\mathbb{R}, \mathfrak{g}_{-1} \oplus \mathfrak{g}_0^*, \mathfrak{g}_0 \oplus \mathfrak{g}_{-1}^*, l_1, l_2, l_3, l_4)$, where $l_i, i = 1, 2, 3, 4$ are given by

$$\begin{aligned}
l_1(r) &= 0, \\
l_1(x^1 + \alpha^0) &= l_1(x^1) + l_1^*(\alpha^0), \\
l_2(x^0 + \alpha^1, y^0 + \beta^1) &= l_2(x^0, y^0) + \text{ad}_{x^0}^{0*}\beta^1 - \text{ad}_{y^0}^{0*}\alpha^1, \\
l_2(x^0 + \alpha^1, y^1 + \beta^0) &= l_2(x^0, y^1) + \text{ad}_{x^0}^{0*}\beta^0 - \text{ad}_{y^1}^{1*}\alpha^1, \\
l_2(x^1 + \alpha^0, y^1 + \beta^0) &= 0, \\
l_2(x^0 + \alpha^1, r) &= 0, \\
l_3(x^0 + \alpha^1, y^0 + \beta^1, z^0 + \zeta^1) &= l_3(x^0, y^0, z^0) + \text{ad}_{x^0, y^0}^{3*}\zeta^1 + \text{ad}_{y^0, z^0}^{3*}\alpha^1 + \text{ad}_{z^0, x^0}^{3*}\beta^1, \\
l_3(x^0 + \alpha^1, y^0 + \beta^1, z^1 + \zeta^0) &= \frac{1}{2}(\langle \alpha^1, l_2(y^0, z^1) \rangle + \langle \beta^1, l_2(z^1, x^0) \rangle + \langle \zeta^0, l_2(x^0, y^0) \rangle), \\
l_4(x^0 + \alpha^1, y^0 + \beta^1, z^0 + \zeta^1, u^0 + \gamma^1) &= \langle \gamma^1, l_3(x^0, y^0, z^0) \rangle - \langle \zeta^1, l_3(x^0, y^0, u^0) \rangle \\
&\quad - \langle \alpha^1, l_3(y^0, z^0, u^0) \rangle - \langle \beta^1, l_3(z^0, x^0, u^0) \rangle
\end{aligned}$$

for all $x^0, y^0, z^0, u^0 \in \mathfrak{g}_0$, $x^1, y^1, z^1 \in \mathfrak{g}_{-1}$, $\alpha^1, \beta^1, \zeta^1, \gamma^1 \in \mathfrak{g}_{-1}^*$, $\alpha^0, \beta^0 \in \mathfrak{g}_0^*$, where $\text{ad}_{x^0}^{0*} : \mathfrak{g}_{-i}^* \rightarrow \mathfrak{g}_{-i}^*$, $\text{ad}_{x^1}^{1*} : \mathfrak{g}_{-1}^* \rightarrow \mathfrak{g}_0^*$ and $\text{ad}_{x^0, y^0}^{3*} : \mathfrak{g}_{-1}^* \rightarrow \mathfrak{g}_0^*$ are defined respectively by

$$\begin{aligned}
\langle \text{ad}_{x^0}^{0*}\alpha^1, x^1 \rangle &= -\langle \alpha^1, l_2(x^0, x^1) \rangle, \quad \langle \text{ad}_{x^0}^{0*}\alpha^0, y^0 \rangle = -\langle \alpha^0, l_2(x^0, y^0) \rangle, \\
\langle \text{ad}_{x^1}^{1*}\alpha^1, y^0 \rangle &= -\langle \alpha^1, l_2(x^1, y^0) \rangle, \quad \langle \text{ad}_{x^0, y^0}^{3*}\alpha^1, z^0 \rangle = -\langle \alpha^1, l_3(x^0, y^0, z^0) \rangle.
\end{aligned}$$

Remark 7.5. For any Lie algebra $(\mathfrak{h}, [\cdot, \cdot]_{\mathfrak{h}})$, we have the semidirect product Lie algebra $(\mathfrak{h} \ltimes_{\text{ad}^*} \mathfrak{h}^*, [\cdot, \cdot]_{\text{ad}^*})$, which is a quadratic Lie algebra naturally. Consequently, one can construct the corresponding Lie 2-algebra $(\mathbb{R}, \mathfrak{h} \ltimes_{\text{ad}^*} \mathfrak{h}^*, l_1 = 0, l_2 = [\cdot, \cdot]_{\text{ad}^*}, l_3)$, where l_3 is given by

$$l_3(x + \alpha, y + \beta, z + \gamma) = \langle \gamma, [x, y]_{\mathfrak{h}} \rangle + \langle \beta, [z, x]_{\mathfrak{h}} \rangle + \langle \alpha, [y, z]_{\mathfrak{h}} \rangle, \quad \forall x, y, z \in \mathfrak{h}, \alpha, \beta, \gamma \in \mathfrak{h}^*.$$

This Lie 2-algebra is called the Lie 2-algebra of string type in [50]. On the other hand, associated to a Lie 2-algebra $(\mathfrak{g}_{-1}, \mathfrak{g}_0, \tilde{l}_1, \tilde{l}_2, \tilde{l}_3)$, there is a naturally a quadratic Lie 2-algebra structure on $(\mathfrak{g}_{-1} \oplus \mathfrak{g}_0^*) \oplus (\mathfrak{g}_0 \oplus \mathfrak{g}_{-1}^*)$ ([33, Example 4.8]). Thus, the Lie 3-algebra given in the above example can be viewed as the higher analogue of the Lie 2-algebra of string type.

Motivated by the above example, we show that one can obtain a Lie 3-algebra associated to a quadratic Lie 2-algebra in the sequel. This result is the higher analogue of the fact that there is a Lie 2-algebra, called the string Lie 2-algebra, associated to a quadratic Lie algebra.

A **quadratic Lie 2-algebra** is a Lie 2-algebra $(\mathfrak{g}_{-1}, \mathfrak{g}_0, l_1, l_2, l_3)$ equipped with a degree 1 graded symmetric nondegenerate bilinear form S which induces an isomorphism between \mathfrak{g}_{-1} and \mathfrak{g}_0^* , such that the following invariant conditions hold:

$$S(l_1(x^1), y^1) = S(l_1(y^1), x^1), \quad (73)$$

$$S(l_2(x^0, y^0), z^1) = -S(l_2(x^0, z^1), y^0), \quad (74)$$

$$S(l_3(x^0, y^0, z^0), u^0) = -S(l_3(x^0, y^0, u^0), z^0), \quad (75)$$

for all $x^0, y^0, z^0, u^0 \in \mathfrak{g}_0, x^1, y^1 \in \mathfrak{g}_{-1}$.

Let $(\mathfrak{g}_{-1}, \mathfrak{g}_0, l_1, l_2, l_3, S)$ be a quadratic Lie 2-algebra. On the 3-term complex of vector spaces $\mathbb{R} \oplus \mathfrak{g}_{-1} \oplus \mathfrak{g}_0$, where \mathbb{R} is of degree -2 , we define $l_i, i = 1, 2, 3, 4$, by

$$\left\{ \begin{array}{ll} l_1(r) = 0, & l_1(x^1) = l_1(x^1), \\ l_2(x^0, y^0) = l_2(x^0, y^0), & l_2(x^0, y^1) = l_2(x^0, y^1), \\ l_2(x^0, r) = 0, & l_2(x^1, y^1) = 0, \\ l_3(x^0, y^0, z^0) = l_3(x^0, y^0, z^0), & l_3(x^0, y^0, z^1) = \frac{1}{2}S(z^1, l_2(x^0, y^0)), \\ l_4(x^0, y^0, z^0, u^0) = S(l_3(x^0, y^0, z^0), u^0), & \end{array} \right. \quad (76)$$

for all $x^0, y^0, z^0, u^0 \in \mathfrak{g}_0, x^1, y^1, z^1 \in \mathfrak{g}_{-1}$ and $r \in \mathbb{R}$.

Theorem 7.6. Let $(\mathfrak{g}_{-1}, \mathfrak{g}_0, l_1, l_2, l_3, S)$ be a quadratic Lie 2-algebra. Then $(\mathbb{R}, \mathfrak{g}_{-1}, \mathfrak{g}_0, l_1, l_2, l_3, l_4)$ is a Lie 3-algebra, called **the higher analogue of the string Lie 2-algebra**.

Proof. It follows from direct verification of the coherence conditions for l_3 and l_4 using the invariant conditions (73)-(75). We omit details. ■
