BOCHNER-SCHOENBERG-EBERLEIN-TYPE INEQUALITY OF THE DIRECT SUM, IDEALS AND QUOTIENT OF FRÉCHET ALGEBRAS

M. AMIRI AND A. REJALI

ABSTRACT. Let \mathcal{A} and \mathcal{B} be two commutative semisimple Fréchet algebras. We first give a characterization of the multiplier algebra of the direct sum of \mathcal{A} and \mathcal{B} . We then prove that $\mathcal{A} \oplus \mathcal{B}$ is a BSE-algebra if and only if \mathcal{A} and \mathcal{B} are BSE-algebras. Furthermore, for a closed ideal I of \mathcal{A} , we study multipliers of ideals and quotient algebras of \mathcal{A} and show that I and $\frac{\mathcal{A}}{I}$ are BSE-algebras, under certain conditions.

1. INTRODUCTION AND PRELIMINARIES

BSE stands for the theorem Bochner-Schoenberg-Eberlein. This theorem proved for locally compact Abelian groups [3] and was generalized for commutative Banach algebras, by Takahasi and Hatori [9, 11]. Moreover, it developed by other authors such as Inoue and Takahasi [5] and later by Kaniuth and Ülger [7]. We studied the BSE property for the commutative Fréchet algebras; see [2].

Let \mathcal{A} be a commutative Banach algebra without order and the space $\Delta(\mathcal{A})$ denotes the set of all nonzero multiplicative linear functionals on \mathcal{A} with respect to the Gelfand-topology. A bounded continuous function σ on $\Delta(\mathcal{A})$ is called a BSE-function if there exists a positive real number β such that for every finite number of complex-numbers c_1, \dots, c_n and the same number of $\varphi_1, \dots, \varphi_n$ in $\Delta(\mathcal{A})$ the inequality

$$\left|\sum_{i=1}^{n} c_{i} \sigma(\varphi_{i})\right| \leq \beta \parallel \sum_{i=1}^{n} c_{i} \varphi_{i} \parallel_{\mathcal{A}^{*}}$$

holds. Following [12], the BSE norm of σ , denoted by $\| \sigma \|_{BSE}$, is defined to be the infimum of all such β . The set of all BSE-functions is denoted by $C_{BSE}(\Delta(\mathcal{A}))$ where it is a commutative semisimple Banach algebra, under $\| \cdot \|_{BSE}$.

Let us recall from [8, 9] that a Fréchet space is a completely metrizable locally convex space where its topology is generated by a translation invariant metric. Furthermore, following [4], a complete topological algebra \mathcal{A} is a Fréchet algebra if its topology is produced by a countable family of increasing submultiplicative seminorms $(p_{\ell})_{\ell \in \mathbb{N}}$. The class of Fréchet algebras is an important class of locally convex algebras has been widely studied by many authors. Note that every Fréchet (algebra) space is not necessarily a Banach (algebra) space. Some differences between Banach and Fréchet (algebras) spaces introduced in the survey paper [1].

Let $(\mathcal{A}, p_{\ell})_{\ell \in \mathbb{N}}$ be a Fréchet algebra. Consider \mathcal{A}^* the topological dual of \mathcal{A} . The strong topology on \mathcal{A}^* is generated by seminorms (P_M) where M is a

Key words and phrases. BSE-algebra, commutative Fréchet algebra, multiplier algebra.

bounded set in \mathcal{A} ; see [9] for more details. Following [2], a bounded complexvalued continuous function σ defined on $\Delta(\mathcal{A})$ is called a BSE-function, if there exist a bounded set M in \mathcal{A} and a positive real number β_M such that for every finite number of complex-numbers c_1, \dots, c_n and the same number of $\varphi_1, \dots, \varphi_n$ in $\Delta(\mathcal{A})$ the inequality

$$\left|\sum_{i=1}^{n} c_{i} \sigma(\varphi_{i})\right| \leq \beta_{M} P_{M}(\sum_{i=1}^{n} c_{i} \varphi_{i})$$

holds. Moreover by [2, Theorem 3.3], $C_{BSE}(\Delta(\mathcal{A}))$ is a commutative semisimple Fréchet algebra and

$$C_{\rm BSE}(\Delta(\mathcal{A})) = \mathcal{A}^{**}|_{\Delta(\mathcal{A})} \cap C_b(\Delta(\mathcal{A})).$$

Let now (\mathcal{A}, p_{ℓ}) be a commutative Fréchet algebra. A linear operator T on \mathcal{A} is called a multiplier if it satisfies aT(b) = T(ab), for all $a, b \in \mathcal{A}$. The set $M(\mathcal{A})$ of all multipliers of \mathcal{A} with the strong operator topology, is a commutative unital complete locally convex algebra and not necessarily Fréchet algebra; see [2, Proposition 4.1]. Analogous to the Banach case, for each $T \in M(\mathcal{A})$, there exists a unique continuous function \hat{T} on $\Delta(\mathcal{A})$ such that $\varphi(T(a)) = \hat{T}(\varphi)\varphi(a)$ for all $a \in \mathcal{A}$ and $\varphi \in \Delta(\mathcal{A})$. The algebra \mathcal{A} is called BSE algebra if

$$\widetilde{\mathrm{M}}(\mathcal{A}) = C_{\mathrm{BSE}}(\Delta(\mathcal{A})),$$

where $\widehat{\mathbf{M}(\mathcal{A})} = \{\widehat{T} : T \in \mathcal{M}(\mathcal{A})\}$. A bounded net $(e_{\alpha})_{\alpha \in \Lambda}$ in \mathcal{A} is called a Δ -weak approximate identity for \mathcal{A} if it satisfies $\varphi(e_{\alpha}) \longrightarrow_{\alpha} 1$ or equivalently $\varphi(e_{\alpha}a) \longrightarrow_{\alpha} \varphi(a)$ for every $a \in \mathcal{A}$ and $\varphi \in \Delta(\mathcal{A})$. Moreover, \mathcal{A} has a bounded Δ -weak approximate identity if and only if $\widehat{\mathbf{M}(\mathcal{A})} \subseteq C_{\text{BSE}}(\Delta(\mathcal{A}))$. In addition,

 $\mathcal{M}(\mathcal{A}) = \{ \Phi : \Delta(\mathcal{A}) \to \mathbb{C} : \Phi \text{ is continuous and } \Phi \cdot \widehat{\mathcal{A}} \subseteq \widehat{\mathcal{A}} \}.$

This is another definition of the multiplier algebra of Fréchet algebras. If \mathcal{A} is a commutative semisimple Fréchet algebra, then $\mathcal{M}(\mathcal{A}) = \widehat{\mathcal{M}(\mathcal{A})} = \mathcal{M}(\mathcal{A})$. In the present paper, we show that $\mathcal{M}(\mathcal{A} \oplus \mathcal{B}) = \mathcal{M}(\mathcal{A}) \times \mathcal{M}(\mathcal{B})$ and

$$C_{\rm BSE}(\Delta(\mathcal{A} \oplus \mathcal{B})) = C_{\rm BSE}(\Delta(\mathcal{A})) \times C_{\rm BSE}(\Delta(\mathcal{B})).$$

Additionally, we prove that $\mathcal{A} \oplus \mathcal{B}$ is a BSE-algebra if and only if \mathcal{A} and \mathcal{B} are BSE. We also offer conditions under which closed ideals and quotient algebras of BSE algebras are BSE-algebras.

2. The multiplier algebra for the direct sum of Fréchet algebras

The direct sum of Banach algebras studied in [6]. In the following, we generalized it for Fréchet algebras. Let (\mathcal{A}, r_{ℓ}) and (\mathcal{B}, s_{ℓ}) be two commutative Fréchet algebras. Then, $\mathcal{A} \oplus \mathcal{B} = \mathcal{A} \times \mathcal{B}$ defined by

- (i) $(a_1, a_2) \cdot (b_1, b_2) = (a_1b_1, a_2b_2), \text{ for } a_1, a_2 \in \mathcal{A}, b_1, b_2 \in \mathcal{B};$
- (ii) $P_{\ell}(a,b) = r_{\ell}(a) + s_{\ell}(b)$, for $a \in \mathcal{A}, b \in \mathcal{B}$ and $\ell \in \mathbb{N}$;
- (iii) $(a_1, a_2) + (b_1, b_2) = (a_1 + b_1, a_2 + b_2).$

By a standard argument, the following is straightforward.

Lemma 2.1. Let (\mathcal{A}, r_{ℓ}) and (\mathcal{B}, s_{ℓ}) be two Fréchet algebras. Then,

- (i) $(\mathcal{A} \oplus \mathcal{B}, P_{\ell})$ is a Fréchet algebra.
- (ii) $(\mathcal{A} \oplus \mathcal{B})^* = \mathcal{A}^* \oplus \mathcal{B}^*$ as homeomorphism.
- (iii) $\Delta(\mathcal{A} \oplus \mathcal{B}) = (\Delta(\mathcal{A}) \times \{0\}) \bigcup (\{0\} \times \Delta(\mathcal{B})).$
- (iv) $\mathcal{A} \oplus \mathcal{B}$ is semisimple if and only if both \mathcal{A} and \mathcal{B} are semisimple.

Lemma 2.2. Let \mathcal{A} and \mathcal{B} be two commutative Fréchet algebras. Then,

$$C_{BSE}(\Delta(\mathcal{A} \oplus \mathcal{B})) = C_{BSE}(\Delta(\mathcal{A})) \times C_{BSE}(\Delta(\mathcal{B}))$$

Proof. Let $\sigma \in C_{BSE}(\Delta(\mathcal{A} \oplus \mathcal{B}))$. Then, by [2, Proposition 3.5(iii)] we have

$$\sigma \in C_b(\Delta(\mathcal{A} \oplus \mathcal{B})) \cap (\mathcal{A}^{**} \oplus \mathcal{B}^{**})|_{\Delta(\mathcal{A} \oplus \mathcal{B})}$$

Therefore, there exist $\sigma_1 \in \mathcal{A}^{**}$ and $\sigma_2 \in \mathcal{B}^{**}$ where $\sigma_1|_{\Delta(\mathcal{A})} \in \mathcal{A}^{**}|_{\Delta(\mathcal{A})}$, $\sigma_2|_{\Delta(\mathcal{B})} \in \mathcal{B}^{**}|_{\Delta(\mathcal{B})}$ and $\sigma = (\sigma_1, \sigma_2)$. In addition, there exist a bounded set M in $\mathcal{A} \oplus \mathcal{B}$ and a positive real number β_M such that for every finite number of $c_1, \dots, c_n \in \mathbb{C}$ and $(\varphi_1, \psi_1), \dots, (\varphi_n, \psi_n) \in \Delta(\mathcal{A} \oplus \mathcal{B})$ the inequality

$$\left|\sum_{i=1}^{n} c_{i} \sigma(\varphi_{i}, \psi_{i})\right| \leq \beta_{M} P_{M}\left(\sum_{i=1}^{n} c_{i}(\varphi_{i}, \psi_{i})\right)$$

holds. In particular, for each $(\varphi_1, 0), \dots, (\varphi_n, 0) \in \Delta(\mathcal{A} \oplus \mathcal{B})$ and $c_1, \dots, c_n \in \mathbb{C}$, there exist bounded sets $N_1 \subseteq \mathcal{A}$ and $N_2 \subseteq \mathcal{B}$ such that

$$\sum_{i=1}^{n} c_i \sigma_1(\varphi_i) \Big| = \Big| \sum_{i=1}^{n} c_i \sigma(\varphi_i, 0) \Big|$$

$$\leq \beta_M P_M \Big(\sum_{i=1}^{n} c_i(\varphi_i, 0) \Big)$$

$$= \beta_M \sup \Big\{ \Big| \sum_{i=1}^{n} c_i(\varphi_i, 0)(a, b) \Big| : (a, b) \in M \Big\}$$

$$= \beta_M \sup \Big\{ \Big| \sum_{i=1}^{n} c_i \varphi_i(a) \Big| : a \in N_1 \Big\}$$

$$= \beta_M P_{N_1} \Big(\sum_{i=1}^{n} c_i \varphi_i \Big),$$

and similarly

$$\left|\sum_{i=1}^{n} c_i \sigma_2(\psi_i)\right| = \left|\sum_{i=1}^{n} c_i \sigma(0, \psi_i)\right| \le \beta_M P_{N_2}(\sum_{i=1}^{n} c_i \psi_i).$$

We recall from [9] that $N_1 = \pi_1(M)$ and $N_2 = \pi_2(M)$ where π_1 and π_1 are projection mappings on $\mathcal{A} \oplus \mathcal{B}$. Moreover, $M \subseteq N_1 \times N_2$. By above arguments, $\sigma_1 \in C_{\text{BSE}}(\Delta(\mathcal{A}))$ and $\sigma_2 \in C_{\text{BSE}}(\Delta(\mathcal{B}))$, where $\sigma_1(\varphi) = \sigma(\varphi, 0)$ and $\sigma_2(\psi) = \sigma(0, \psi)$ for each $\varphi \in \Delta(\mathcal{A})$ and $\psi \in \Delta(\mathcal{B})$. This implies that

$$C_{\rm BSE}(\Delta(\mathcal{A}\oplus\mathcal{B}))\subseteq C_{\rm BSE}(\Delta(\mathcal{A}))\times C_{\rm BSE}(\Delta(\mathcal{B})).$$

For the reverse conclusion, let $\sigma_1 \in C_{BSE}(\Delta(\mathcal{A}))$ and $\sigma_2 \in C_{BSE}(\Delta(\mathcal{B}))$. If $\xi \in \Delta(\mathcal{A} \oplus \mathcal{B})$, then $\xi = (\varphi, 0)$ or $\xi = (0, \psi)$ for some $\varphi \in \Delta(\mathcal{A})$ or $\psi \in \Delta(\mathcal{B})$. We define

$$\sigma(\xi) := \begin{cases} \sigma_1(\varphi) & \text{if } \xi = (\varphi, 0), \\ \sigma_2(\psi) & \text{if } \xi = (0, \psi). \end{cases}$$

By assumption, there exist a bounded set N_1 of \mathcal{A} and a positive real number β_{N_1} such that for every finite number of complex-numbers c_1, \dots, c_n and the same number of $\varphi_1, \dots, \varphi_n$ in $\Delta(\mathcal{A})$ the inequality

$$\left|\sum_{i=1}^{n} c_i \sigma_1(\varphi_i)\right| \leq \beta_{N_1} P_{N_1}(\sum_{i=1}^{n} c_i \varphi_i)$$

holds. Also, there exist a bounded set N_2 of \mathcal{B} and a positive real number β_{N_2} such that for every finite number of complex-numbers c_1, \dots, c_n and the same number of ψ_1, \dots, ψ_n in $\Delta(\mathcal{B})$ the inequality

$$\left|\sum_{i=1}^{n} c_i \sigma_2(\psi_i)\right| \le \beta_{N_2} P_{N_2}\left(\sum_{i=1}^{n} c_i \psi_i\right)$$

holds. Therefore,

$$\left|\sum_{i=1}^{n} c_i \sigma(\xi)\right| \leq \beta_M P_M(\sum_{i=1}^{n} c_i(\xi)),$$

where $M = N_1 \times N_2$ and $\beta_M = \max\{\beta_{N_1}, \beta_{N_2}\}$. Consequently,

 $\sigma \in C_{\rm BSE}(\Delta(\mathcal{A} \oplus \mathcal{B})),$

which completes the proof.

Proposition 2.3. Let \mathcal{A} and \mathcal{B} be two commutative Fréchet algebras. Then,

$$\mathcal{M}(\mathcal{A} \oplus \mathcal{B}) = \mathcal{M}(\mathcal{A}) imes \mathcal{M}(\mathcal{B})$$

Proof. Let $\Phi \in \mathcal{M}(\mathcal{A})$ and $\Psi \in \mathcal{M}(\mathcal{B})$. Since $\Phi \cdot \widehat{\mathcal{A}} \subseteq \widehat{\mathcal{A}}$ and $\Psi \cdot \widehat{\mathcal{B}} \subseteq \widehat{\mathcal{B}}$, for all $(a, b) \in \mathcal{A} \oplus \mathcal{B}$ there are elements $c \in \mathcal{A}$ and $d \in \mathcal{B}$ such that

$$((\Phi, \Psi) \cdot \widehat{(a, b)})(\varphi, 0) = (\Phi, \Psi)(\varphi, 0) \widehat{(a, b)}(\varphi, 0)$$

= $\Phi(\varphi)\widehat{a}(\varphi)$
= $\widehat{c}(\varphi),$

where $(\Phi, \Psi)(\varphi, 0) = \Phi(\varphi)$ for each $(\varphi, 0) \in \Delta(\mathcal{A}) \times \{0\}$. Similarly,

$$((\Phi, \Psi) \cdot (a, b))(0, \psi) = (\Phi, \Psi)(0, \psi)(a, b)(0, \psi)$$
$$= \Psi(\psi)\widehat{b}(\psi)$$
$$= \widehat{d}(\psi),$$

where $(\Phi, \Psi)(0, \psi) = \Psi(\psi)$ for each $(0, \psi) \in \{0\} \times \Delta(\mathcal{B})$. Hence,

$$((\Phi, \Psi) \cdot \widehat{(a, b)})(\varphi, 0) = \widehat{(c, d)}(\varphi, 0),$$

and

$$\left((\Phi,\Psi)\cdot\widehat{(a,b)}\right)(0,\psi)=\widehat{(c,d)}(0,\psi).$$

Thus, $(\Phi, \Psi) \cdot (\widehat{\mathcal{A}} \oplus \widehat{\mathcal{B}}) \subseteq (\widehat{\mathcal{A}} \oplus \widehat{\mathcal{B}})$ and $(\Phi, \Psi) \in \mathcal{M}(\mathcal{A} \oplus \mathcal{B})$.

Now, suppose that $F \in \mathcal{M}(\mathcal{A} \oplus \mathcal{B})$. Define $\Phi(\varphi) = F(\varphi, 0)$ and $\Psi(\psi) = F(0, \psi)$ for all $\varphi \in \Delta(\mathcal{A})$ and $\psi \in \Delta(\mathcal{B})$. Therefore, $F = (\Phi, \Psi)$. It is enough to show that $\Phi \in \mathcal{M}(\mathcal{A})$ and $\Psi \in \mathcal{M}(\mathcal{B})$. For each $a \in \mathcal{A}$, there exists $(a', b') \in \mathcal{A} \oplus \mathcal{B}$ such that

$$\Phi(\varphi)\widehat{a}(\varphi) = F(\varphi, 0)(\widehat{a, 0})(\varphi, 0) = (\widehat{a', b'})(\varphi, 0) = \widehat{a'}(\varphi).$$

Consequently, $\Phi \cdot \widehat{\mathcal{A}} \subseteq \widehat{\mathcal{A}}$ and $\Phi \in \mathcal{M}(\mathcal{A})$. Similarly, $\Psi \in \mathcal{M}(\mathcal{B})$. Hence,

$$\mathcal{M}(\mathcal{A} \oplus \mathcal{B}) = \left\{ (\Phi, \Psi) : \Phi \in \mathcal{M}(\mathcal{A}), \ \Psi \in \mathcal{M}(\mathcal{B})
ight\}.$$

and completes the proof.

Corollary 2.4. Let \mathcal{A} and \mathcal{B} be two commutative semisimple Fréchet algebras. Then,

$$M(\mathcal{A} \oplus \mathcal{B}) = M(\mathcal{A}) \oplus M(\mathcal{B}).$$

We now state the main result of this paper.

Theorem 2.5. Let (\mathcal{A}, r_{ℓ}) and (\mathcal{B}, s_{ℓ}) be two commutative semisimple Fréchet algebras. Then, $\mathcal{A} \oplus \mathcal{B}$ is a BSE-algebra if and only if \mathcal{A} and \mathcal{B} are BSE-algebras.

Proof. Let \mathcal{A} and \mathcal{B} be BSE-algebras. By applying [2, Theorem 4.5], \mathcal{A} and \mathcal{B} have bounded Δ -weak approximate identities. Suppose that $(e_{\alpha})_{\alpha}$ and $(f_{\beta})_{\beta}$ are bounded Δ -weak approximate identities of \mathcal{A} and \mathcal{B} , respectively. Therefore, $\{(e_{\alpha}, f_{\beta})\}_{(\alpha,\beta)}$ is a bounded Δ -weak approximate identity for $\mathcal{A} \oplus \mathcal{B}$. Indeed, for all $\xi \in \Delta(\mathcal{A} \oplus \mathcal{B})$ there exists $\varphi \in \Delta(\mathcal{A})$ or $\psi \in \Delta(\mathcal{B})$, where $\xi = (\varphi, 0)$ or $\xi = (0, \psi)$. Thus,

$$\lim_{(\alpha,\beta)} \xi(e_{\alpha}, f_{\beta}) = \lim_{(\alpha,\beta)} (\varphi, 0)(e_{\alpha}, f_{\beta}) = \lim_{\alpha} \varphi(e_{\alpha}) = 1,$$

or

$$\lim_{(\alpha,\beta)} \xi(e_{\alpha}, f_{\beta}) = \lim_{(\alpha,\beta)} (0, \psi)(e_{\alpha}, f_{\beta}) = \lim_{\beta} \psi(f_{\beta}) = 1.$$

Moreover, for each $\ell \in \mathbb{N}$ we have $\sup_{\alpha} r_{\ell}(e_{\alpha}) < \infty$ and $\sup_{\beta} s_{\ell}(f_{\beta}) < \infty$. Also, $(\mathcal{A} \oplus \mathcal{B}, P_{\ell})$ is a Fréchet algebra, where $P_{\ell}(a, b) = r_{\ell}(a) + s_{\ell}(b)$ for each $\ell \in \mathbb{N}$. Therefore,

$$\sup_{(\alpha,\beta)} P_{\ell}(e_{\alpha}, f_{\beta}) = \sup_{\alpha} r_{\ell}(e_{\alpha}) + \sup_{\beta} s_{\ell}(f_{\beta}) < \infty.$$

Hence, for all $\xi \in \Delta(\mathcal{A} \oplus \mathcal{B})$ we have $\lim_{(\alpha,\beta)} \xi(e_{\alpha}, f_{\beta}) = 1$ and $\{(e_{\alpha}, f_{\beta})\}_{(\alpha,\beta)}$ is a Δ -weak approximate identity for $\mathcal{A} \oplus \mathcal{B}$. Consequently,

$$\mathcal{M}(\mathcal{A} \oplus \mathcal{B}) \subseteq C_{\mathrm{BSE}}(\Delta(\mathcal{A} \oplus \mathcal{B})).$$

For the reverse conclusion, let $\sigma \in C_{BSE}(\Delta(\mathcal{A} \oplus \mathcal{B}))$. Hence, there exist $\sigma_1 \in C_{BSE}(\Delta(\mathcal{A}))$ and $\sigma_2 \in C_{BSE}(\Delta(\mathcal{B}))$ such that $\sigma(\varphi, \psi) = \sigma_1(\varphi) + \sigma_2(\psi)$ for all $\varphi \in \Delta(\mathcal{A})$ and $\psi \in \Delta(\mathcal{B})$. Since \mathcal{A} and \mathcal{B} are BSE algebras, $\sigma_1 \in \mathcal{M}(\mathcal{A})$ and $\sigma_2 \in \mathcal{M}(\mathcal{B})$, by applying Proposition 2.3. Therefore, $\sigma \in \mathcal{M}(\mathcal{A}) \times \mathcal{M}(\mathcal{B})$. Thus, $\sigma \in \mathcal{M}(\mathcal{A} \oplus \mathcal{B})$ and

$$C_{\rm BSE}(\Delta(\mathcal{A}\oplus\mathcal{B}))\subseteq\mathcal{M}(\mathcal{A}\oplus\mathcal{B}).$$

Consequently, $\mathcal{A} \oplus \mathcal{B}$ is a BSE-algebra.

Conversely, suppose that $\mathcal{A} \oplus \mathcal{B}$ is a BSE-algebra. Then,

$$\mathcal{M}(\mathcal{A} \oplus \mathcal{B}) = \mathcal{M}(\mathcal{A} \oplus \mathcal{B}) = C_{\mathrm{BSE}}(\Delta(\mathcal{A} \oplus \mathcal{B})).$$

Let $\sigma_1 \in C_{BSE}(\Delta(\mathcal{A}))$ and $\sigma_2 \in C_{BSE}(\Delta(\mathcal{B}))$. Then $(\sigma_1, 0)$ and $(0, \sigma_2)$ belong to $C_{BSE}(\Delta(\mathcal{A} \oplus \mathcal{B}))$. Also, $\sigma_1 \in \mathcal{M}(\mathcal{A})$ and $\sigma_2 \in \mathcal{M}(\mathcal{B})$ and so

$$C_{\mathrm{BSE}}(\Delta(\mathcal{A})) \subseteq \mathcal{M}(\mathcal{A}) \quad \mathrm{and} \quad C_{\mathrm{BSE}}(\Delta(\mathcal{B})) \subseteq \mathcal{M}(\mathcal{B}).$$

Conversely, suppose that $\sigma_1 \in \mathcal{M}(\mathcal{A})$ and $\sigma_2 \in \mathcal{M}(\mathcal{B})$. Thus, $(0, \sigma_2)$ and $(\sigma_1, 0)$ belong to $\mathcal{M}(\mathcal{A}) \times \mathcal{M}(\mathcal{B})$, where

$$\mathcal{M}(\mathcal{A}) \times \mathcal{M}(\mathcal{B}) = \mathcal{M}(\mathcal{A} \oplus \mathcal{B})$$
$$= C_{\text{BSE}}(\Delta(\mathcal{A} \oplus \mathcal{B}))$$
$$= C_{\text{BSE}}(\Delta(\mathcal{A})) \times C_{\text{BSE}}(\Delta(\mathcal{B})).$$

Thus, $\sigma_1 \in C_{BSE}(\Delta(\mathcal{A}))$ and $\sigma_2 \in C_{BSE}(\Delta(\mathcal{B}))$. Hence, $\mathcal{M}(\mathcal{A}) \subseteq C_{BSE}(\Delta(\mathcal{A}))$ and $\mathcal{M}(\mathcal{B}) \subseteq C_{BSE}(\Delta(\mathcal{B}))$. Consequently, \mathcal{A} and \mathcal{B} are BSE algebras. \Box

3. Ideals and Quotient Algebras of BSE-Fréchet Algerbras

Let (\mathcal{A}, p_{ℓ}) be a commutative Fréchet algebra and I be a closed ideal of \mathcal{A} . Then, $(I, p_{\ell}|_{I})$ and $(\frac{\mathcal{A}}{I}, s_{\ell})$ are also Fréchet algebras where

$$s_{\ell}(x+I) := \inf\{p_{\ell}(x+y) : y \in I\}$$

In the sequel we will call I an essential ideal, when I equals the closed linear span of $\{ax : a \in \mathcal{A}, x \in I\}$. Moreover, we will give conditions under which I and $\frac{\mathcal{A}}{I}$ are BSE algebras.

Following [9, Corollary 26.25], if \mathcal{A} is a Fréchet Schwartz space and I be a closed ideal of \mathcal{A} , then

$$I^* \cong \frac{\mathcal{A}^*}{I^\circ} \quad and \quad (\frac{\mathcal{A}}{I})^* \cong I^\circ,$$

where $I^{\circ} = \{f \in \mathcal{A}^* : |f(x)| \le 1, \text{ for all } x \in I\}$ and equivalently

 $I^{\circ} = \{ f \in \mathcal{A}^* : f(x) = 0, \text{ for all } x \in I \}.$

Analogous to the Banach case, if \mathcal{A} is a BSE-algerbra with discrete carrier space, then $C_b(\Delta(\mathcal{A})) = \ell_{\infty}(\Delta(\mathcal{A}))$. Hence, $C_{\text{BSE}}(\Delta(\mathcal{A})) = \mathcal{A}^{**}|_{\Delta(\mathcal{A})}$. Moreover, by similar arguments to the proof of [10, Theorem 3.1.18], if I is a closed ideal of \mathcal{A} , then $\Delta(I)$ is discrete.

Lemma 3.1. If the Fréchet algebra \mathcal{A} has a bounded Δ -weak approximate identity and I is a closed essential ideal of \mathcal{A} , then $\frac{\mathcal{A}}{I}$ has a bounded Δ -weak approximate identity.

Proof. Let $(e_{\alpha})_{\alpha}$ be a bounded Δ -weak approximate identity of \mathcal{A} . Then, for each $\varphi \in \Delta(\mathcal{A}), \ \varphi(e_{\alpha}) \longrightarrow_{\alpha} 1$. For each α , we define $f_{\alpha} := e_{\alpha} + I$ and show that the net $(f_{\alpha})_{\alpha}$ is a bounded Δ -weak approximate identity for $\frac{\mathcal{A}}{I}$. Suppose that $\psi \in \Delta(\frac{\mathcal{A}}{I})$. Therefore, there exists $\varphi \in \Delta(\mathcal{A})$ such that $\varphi|_{I} = 0$ and $\psi(a+I) := \varphi(a)$, for each $a \in \mathcal{A}$. Hence,

$$\psi(f_{\alpha}) = \varphi(e_{\alpha}) \longrightarrow_{\alpha} 1.$$

Thus, $(f_{\alpha})_{\alpha}$ is a bounded Δ -weak approximate identity for $\frac{A}{I}$.

Let (\mathcal{A}, p_{ℓ}) be a Fréchet algebra. For each $\ell \in \mathbb{N}$, consider

$$M_{\ell} = \{ a \in \mathcal{A} : p_{\ell}(a) < 1 \},$$

and

$$M_{\ell}^{\circ} = \{ f \in \mathcal{A}^* : |f(a)| \le 1 \text{ for all } a \in M_{\ell} \}$$

As mentioned in section ??, by applying [2, Theorem 3.3], $(C_{BSE}(\Delta(\mathcal{A})), r_{\ell})$ is a commutative semisimple Fréchet algebra such that for each $\ell \in \mathbb{N}$ and $\sigma \in \Delta(\mathcal{A})$ we have

$$r_{\ell}(\sigma) = \sup\{|\sigma(f)| : f \in M_{\ell}^{\circ} \cap < \Delta(\mathcal{A}) > \}.$$

Now, the following result is immediate.

Theorem 3.2. Let \mathcal{A} be a BSE-Fréchet Schwartz algebra with discrete carrier space and I be an essential closed ideal of \mathcal{A} . Then,

- (i) $C_{BSE}(\Delta(I)) \subseteq \widehat{M}(I)$.
- (ii) $\widetilde{\mathrm{M}}(\frac{A}{I}) = C_{BSE}(\Delta(\frac{A}{I})).$

Proof. (i) Suppose that $w \in C_{BSE}(\Delta(I))$. Note that

$$\Delta(I) = \{\varphi|_I : \varphi \in \Delta(\mathcal{A}) \setminus I^\circ\}.$$

We define $\sigma \in \Delta(\mathcal{A})$ as follow

$$\sigma(\varphi) := \begin{cases} w(\varphi|_I) & \varphi \in \Delta(\mathcal{A}) \setminus I^{\circ}, \\ 0 & \varphi \in \Delta(\mathcal{A}) \cap I^{\circ}. \end{cases}$$

We show that $\sigma \in C_{BSE}(\Delta(\mathcal{A}))$. In fact, there exists a bounded set M in I and a positive real number β_M such that for every finite number of complex-numbers c_1, \dots, c_n and the same number of $\varphi_1, \dots, \varphi_n$ in $\Delta(\mathcal{A})$, we have

$$\begin{aligned} \left|\sum_{i=1}^{n} c_{i}\sigma(\varphi_{i})\right| &= \left|\sum_{\varphi_{i}\in\Delta(\mathcal{A})\setminus I^{\circ}} c_{i}\sigma(\varphi_{i})\right| \\ &= \left|\sum_{\varphi_{i}\in\Delta(\mathcal{A})\setminus I^{\circ}} c_{i}w(\varphi_{i}|_{I})\right| \\ &\leq \beta_{M}P_{M}\left(\sum_{\varphi_{i}\in\Delta(\mathcal{A})\setminus I^{\circ}} c_{i}\varphi_{i}|_{I}\right) \\ &= \beta_{M}P_{M}\left(\sum_{i=1}^{n} c_{i}\varphi_{i}|_{I}\right) \\ &\leq \beta_{M}P_{M}\left(\sum_{i=1}^{n} c_{i}\varphi_{i}\right). \end{aligned}$$

Thus, $\sigma \in C_{BSE}(\Delta(\mathcal{A}))$. Since \mathcal{A} is BSE-algebra, take $T \in M(\mathcal{A})$ such that $\widehat{T} = \sigma$ and put $S = T|_I$. Then, $S \in M(I)$. Also, for any $x \in I$ and $\varphi \in \Delta(\mathcal{A}) \setminus I^\circ$, we have

$$\widehat{S}(\varphi|_{I})\widehat{x}(\varphi|_{I}) = (\widehat{S}x)(\varphi|_{I}) = (\widehat{T}x)(\varphi) = \widehat{T}(\varphi)\widehat{x}(\varphi) = \sigma(\varphi)\widehat{x}(\varphi|_{I}) = w(\varphi|_{I})\widehat{x}(\varphi|_{I}).$$

Since $\varphi|_I \in \Delta(\mathcal{A})$, there exists $x \in I$ such that $\varphi|_I(x) \neq 0$. Then, $\widehat{x}(\varphi|_I) \neq 0$. Therefore, $\widehat{S}(\varphi|_I) = w(\varphi|_I)$. Consequently, $w = \widehat{S}$, where $\widehat{S} \in \widehat{M(I)}$. Hence, $C_{BSE}(\Delta(I)) \subseteq \widehat{M(I)}$.

(ii) Since \mathcal{A} is BSE algebra, it has a bounded Δ -weak approximate identity and by Lemma 3.1, $\frac{\mathcal{A}}{I}$ also has an approximate identity. Thus, $\widehat{\mathcal{M}(\frac{\mathcal{A}}{I})} \subseteq C_{\text{BSE}}(\Delta(\frac{\mathcal{A}}{I}))$. To show the reverse inclusion, let $\sigma' \in C_{\text{BSE}}(\Delta(\frac{\mathcal{A}}{I}))$. Since both $\Delta(\mathcal{A})$ and $\Delta(\frac{\mathcal{A}}{I})$ are discrete,

$$C_{\rm BSE}(\Delta(\mathcal{A})) = \mathcal{A}^{**}|_{\Delta(\mathcal{A})},$$

and

$$C_{\rm BSE}(\Delta(\frac{\mathcal{A}}{I})) = (\frac{\mathcal{A}}{I})^{**}|_{\Delta(\frac{\mathcal{A}}{I})}.$$

Thus, we can take $F' \in (\frac{A}{I})^{**}$ with $F'|_{\Delta(\frac{A}{I})} = \sigma'$. Set $I^{\circ} = \{f \in \mathcal{A}^* : f|_I = 0\}$. For each $f \in I^{\circ}$, define f' by the relation f'(a') = f(a) $(a' = a + I \in \frac{A}{I})$. The map $f \mapsto f'$ is an isometric isomorphism of I° onto $(\frac{A}{I})^*$. We define $\widetilde{F'}$ by the relation $\widetilde{F'}(f) = F'(f')$ $(f \in I^{\circ})$. Then, $\widetilde{F'} \in (I^{\circ})^*$ and there exists $F \in \mathcal{A}^{**}$ such that $r_{\ell}(F) = r_{\ell}(\widetilde{F'})$ and $F|_{I^{\circ}} = \widetilde{F'}$ by using the general framework of the Hahn-Banach theorem [9, Proposition 22.12]. By the BSE property of \mathcal{A} , there exists $T \in \mathcal{M}(\mathcal{A})$ with $\widehat{T} = F|_{\Delta(\mathcal{A})}$. Since I is essential and T(ab) = aTb for all $a, b \in \mathcal{A}$, we have $T(I) \subseteq I$. Then, T' defined by $T'(a') = (Ta)' \ (a \in \mathcal{A})$ belongs to $\mathcal{M}(\frac{\mathcal{A}}{I})$. In this case, $\widehat{T'} = \sigma'$. Actually for any $a \in \mathcal{A}$ and $\varphi \in \Delta(\mathcal{A}) \cap I^{\circ}$, we have

$$\begin{split} \widehat{a}(\varphi)\widehat{T'}(\varphi') &= \widehat{a'}(\varphi')\widehat{T'}(\varphi') = \widehat{(T'a')}(\varphi') \\ &= \widehat{(Ta)'}(\varphi') = \widehat{(Ta)}(\varphi) = \widehat{a}(\varphi)\widehat{T}(\varphi), \end{split}$$

so that $\widehat{T'}=\widehat{T}(\varphi)$ and

$$\sigma'(\varphi') = F'(\varphi') = \widetilde{F'}(\varphi) = F(\varphi) = \widehat{T}(\varphi) = \widehat{T'}(\varphi').$$

Therefore, $\sigma' = \widehat{T'}$, since $\Delta(\frac{A}{I}) = \{\varphi' : \varphi \in \Delta(\mathcal{A}) \cap I^{\circ}\}$. Thus, $\sigma' \in \widehat{\mathrm{M}(\frac{A}{I})}$. Hence, $C_{\mathrm{BSE}}(\Delta(\frac{A}{I})) \subseteq \widehat{\mathrm{M}(\frac{A}{I})}$. Consequently, $\frac{A}{I}$ is BSE.

Corollary 3.3. In above Theorem, if I has a bounded Δ -weak approximate identity, then I is a BSE algebra.
