

ANOMALY CANCELLATION FORMULAS AND E_8 BUNDLES

YONG WANG, YUCHEN YANG

ABSTRACT. Using E_8 bundles, we construct some modular forms over $SL(2, \mathbf{Z})$, $\Gamma^0(2)$ and $\Gamma_0(2)$. By these modular forms, we get some new anomaly cancellation formulas of characteristic forms.

1. INTRODUCTION

In 1983, the physicists Alvarez-Gaumé and Witten [1] discovered the "miraculous cancellation" formula for gravitational anomaly which reveals a beautiful relation between the top components of the Hirzebruch \widehat{L} -form and \widehat{A} -form of a 12-dimensional smooth Riemannian manifold. Kefeng Liu [11] established higher dimensional "miraculous cancellation" formulas for $(8k+4)$ -dimensional Riemannian manifolds by developing modular invariance properties of characteristic forms. These formulas could be used to deduce some divisibility results. In [9], [10], [3], some more general cancellation formulas that involve a complex line bundle and their applications were established. In [7], using the Eisenstein series, a more general cancellation formula was derived. In [8], Han, Liu and Zhang showed that both of the Green-Schwarz anomaly factorization formula for the gauge group $E_8 \times E_8$ and the Horava-Witten anomaly factorization formula for the gauge group E_8 could be derived through modular forms of weight 14. This answered a question of J. H. Schwarz. They also established generalizations of these factorization formulas and obtained a new Horava-Witten type factorization formula on 12-dimensional manifolds. In [6], Han, Huang, Liu and Zhang introduced a modular form of weight 14 over $SL(2, \mathbf{Z})$ and a modular form of weight 10 over $SL(2, \mathbf{Z})$ by E_8 bundles and they got some interesting anomaly cancellation formulas on 12-dimensional manifolds. In [5], Chen, Han and Zhang defined an integral modular form of weight $2k$ for a $4k+2$ -dimensional $spin^c$ manifold. In this paper, we twist the Chen-Han-Zhang $SL(2, \mathbf{Z})$ modular form by E_8 bundles and get $SL(2, \mathbf{Z})$ modular forms of weight 14 and 10 for 14 and 10-dimensional $spin^c$ manifolds. In [11], Liu introduced some $\Gamma^0(2)$ and $\Gamma_0(2)$ modular forms and got some interesting anomaly cancellation formulas. In this paper, we also twist the Liu's modular form by E_8 bundles and get $\Gamma^0(2)$ and $\Gamma_0(2)$ modular forms of weight 14 and 10 for a 12-dimensional spin manifold. By these modular forms, we get some new anomaly cancellation formulas of characteristic forms.

2010 Mathematics Subject Classification: 58C20; 57R20; 53C80.

Key words and phrases: Modular forms; anomaly cancellation formulas; E_8 bundles .

This paper is organized as follows: In Section 2, we twist the Chen-Han-Zhang $SL(2, \mathbf{Z})$ modular form by E_8 bundles and get $SL(2, \mathbf{Z})$ modular forms of weight 14 and 10 for 14 and 10-dimensional $spin^c$ manifolds and we get some anomaly cancellation formulas of characteristic forms. In Section 3, we twist the Liu's modular form by E_8 bundles and get $\Gamma^0(2)$ and $\Gamma_0(2)$ modular forms of weight 14 and 10 for a 12-dimensional spin manifold. By these modular forms, we get some new anomaly cancellation formulas of characteristic forms.

2. ANOMALY CANCELLATION FORMULAS FOR 14 AND 10-DIMENSIONAL $spin^c$ MANIFOLDS

For the basic representation theory for the affine E_8 , we can see Section 1 in [8]. Here we omit it. For the principle E_8 bundle P_i , $i = 1, 2$, consider the associated bundles $\mathcal{V}_i = \sum_{k=0}^{\infty} (P_i \times_{\rho_k} V_k) q^k \in K(M)[[q]]$. We let $W_i = P_i \times_{\rho_1} V_1$. Let M be a 14-dimensional spin c manifold and L be the complex line bundle associated to the given spin c structure on M . We also consider L as a real vector bundle denoted by L_R .

Denote by $c = c_1(L) = 2\pi\sqrt{-1}u$ the first Chern class of L . Let $\varphi(\tau) = \prod_{n=1}^{\infty} (1 - q^n)$, where $q = e^{2\pi\sqrt{-1}\tau}$ and $\tau \in H$ the upper half plane. We recall the four Jacobi theta functions are defined as follows(cf. [2]):

$$(2.1) \quad \theta(v, \tau) = 2q^{\frac{1}{8}} \sin(\pi v) \prod_{j=1}^{\infty} [(1 - q^j)(1 - e^{2\pi\sqrt{-1}v} q^j)(1 - e^{-2\pi\sqrt{-1}v} q^j)],$$

$$(2.2) \quad \theta_1(v, \tau) = 2q^{\frac{1}{8}} \cos(\pi v) \prod_{j=1}^{\infty} [(1 - q^j)(1 + e^{2\pi\sqrt{-1}v} q^j)(1 + e^{-2\pi\sqrt{-1}v} q^j)],$$

$$(2.3) \quad \theta_2(v, \tau) = \prod_{j=1}^{\infty} [(1 - q^j)(1 - e^{2\pi\sqrt{-1}v} q^{j-\frac{1}{2}})(1 - e^{-2\pi\sqrt{-1}v} q^{j-\frac{1}{2}})],$$

$$(2.4) \quad \theta_3(v, \tau) = \prod_{j=1}^{\infty} [(1 - q^j)(1 + e^{2\pi\sqrt{-1}v} q^{j-\frac{1}{2}})(1 + e^{-2\pi\sqrt{-1}v} q^{j-\frac{1}{2}})],$$

By (2.3)-(2.7) in [8], we have that there are formal two forms y_l^i , $1 \leq l \leq 8$, $i = 1, 2$ such that

$$(2.5) \quad \varphi(\tau)^8 \text{ch}(\mathcal{V}_i) = \frac{1}{2} \left(\prod_{l=1}^8 \theta_1(y_l^i, \tau) + \prod_{l=1}^8 \theta_2(y_l^i, \tau) + \prod_{l=1}^8 \theta_3(y_l^i, \tau) \right),$$

and

$$(2.6) \quad \sum_{l=1}^8 (2\pi\sqrt{-1}y_l^i)^2 = -\frac{1}{30}c_2(W_i),$$

where $c_2(W_i)$ denotes the second Chern class of W_i . Let $E_2(\tau)$ is the Eisenstein series satisfying:

$$(2.7) \quad E_2(\tau + 1) = E_2(\tau), \quad E_2\left(-\frac{1}{\tau}\right) = \tau^2 E_2(\tau) - \frac{6\sqrt{-1}\tau}{\pi},$$

and

$$(2.8) \quad E_2(\tau) = 1 - 24q - 72q^2 + O(q^3).$$

Let $A := p_1(M) - p_1(L_R) + \frac{1}{30}(c_2(W_i) + c_2(W_j))$, where $p_1(M), p_1(L_R)$ denote the first Pontryagin classes of M and L_R . Let

$$(2.9) \quad Q(M, P_i, P_j, \tau) = \left\{ e^{\frac{1}{24}E_2(\tau)A} \widehat{A}(TX) \exp\left(\frac{c}{2}\right) \text{ch} \left[\bigotimes_{n=1}^{\infty} S_{q^n}(\widetilde{TCM}) \otimes \bigotimes_{m=1}^{\infty} \wedge_{-q^m}(\widetilde{LC}) \right] \cdot \varphi(\tau)^{16} \text{ch}(\mathcal{V}_i) \text{ch}(\mathcal{V}_j) \right\}^{(14)}.$$

Then

(2.10)

$$Q(M, P_i, P_j, \tau) = \left\{ e^{\frac{1}{24}E_2(\tau)A} \left(\prod_{j=1}^7 \frac{x_j \theta'(0, \tau)}{\theta(x_j, \tau)} \right) \frac{\sqrt{-1} \theta(u, \tau)}{\theta_1(0, \tau) \theta_2(0, \tau) \theta_3(0, \tau)} \frac{1}{4} \left(\prod_{l=1}^8 \theta_1(y_l^i, \tau) + \prod_{l=1}^8 \theta_2(y_l^i, \tau) + \prod_{l=1}^8 \theta_3(y_l^i, \tau) \right) \left(\prod_{l=1}^8 \theta_1(y_l^j, \tau) + \prod_{l=1}^8 \theta_2(y_l^j, \tau) + \prod_{l=1}^8 \theta_3(y_l^j, \tau) \right) \right\}^{(14)},$$

where $\pm 2\pi\sqrt{-1}x_j, 1 \leq j \leq 7$ denote the Chern roots of TCM . One has the following transformation laws of theta functions (cf. [2]):

$$(2.11) \quad \theta(v, \tau + 1) = e^{\frac{\pi\sqrt{-1}}{4}} \theta(v, \tau), \quad \theta\left(v, -\frac{1}{\tau}\right) = \frac{1}{\sqrt{-1}} \left(\frac{\tau}{\sqrt{-1}} \right)^{\frac{1}{2}} e^{\pi\sqrt{-1}\tau v^2} \theta(\tau v, \tau);$$

$$(2.12) \quad \theta_1(v, \tau + 1) = e^{\frac{\pi\sqrt{-1}}{4}} \theta_1(v, \tau), \quad \theta_1\left(v, -\frac{1}{\tau}\right) = \left(\frac{\tau}{\sqrt{-1}} \right)^{\frac{1}{2}} e^{\pi\sqrt{-1}\tau v^2} \theta_2(\tau v, \tau);$$

$$(2.13) \quad \theta_2(v, \tau + 1) = \theta_3(v, \tau), \quad \theta_2\left(v, -\frac{1}{\tau}\right) = \left(\frac{\tau}{\sqrt{-1}} \right)^{\frac{1}{2}} e^{\pi\sqrt{-1}\tau v^2} \theta_1(\tau v, \tau);$$

$$(2.14) \quad \theta_3(v, \tau + 1) = \theta_2(v, \tau), \quad \theta_3\left(v, -\frac{1}{\tau}\right) = \left(\frac{\tau}{\sqrt{-1}} \right)^{\frac{1}{2}} e^{\pi\sqrt{-1}\tau v^2} \theta_3(\tau v, \tau),$$

$$(2.15) \quad \theta'(v, \tau + 1) = e^{\frac{\pi\sqrt{-1}}{4}} \theta'(v, \tau), \quad \theta'\left(0, -\frac{1}{\tau}\right) = \frac{1}{\sqrt{-1}} \left(\frac{\tau}{\sqrt{-1}} \right)^{\frac{1}{2}} \tau \theta'(0, \tau).$$

Definition 2.1. A modular form over Γ , a subgroup of $SL_2(\mathbf{Z})$, is a holomorphic function $f(\tau)$ on \mathbf{H} such that

$$(2.16) \quad f(g\tau) := f\left(\frac{a\tau + b}{c\tau + d}\right) = \chi(g)(c\tau + d)^k f(\tau), \quad \forall g = \begin{pmatrix} a & b \\ c & d \end{pmatrix} \in \Gamma,$$

where $\chi : \Gamma \rightarrow \mathbf{C}^*$ is a character of Γ . k is called the weight of f .

By (2.7) and (2.11)-(2.15), we have

Lemma 2.2. $Q(M, P_i, P_j, \tau)$ is a modular form over $SL_2(\mathbf{Z})$ with the weight 14.

By

$$(2.17) \quad \text{ch}(\mathcal{V}_i) = 1 + (248 - c_2(W_i) + \cdots)q + \cdots,$$

and (2.8), we have by expanding the q -series:

$$(2.18) \quad \begin{aligned} & e^{\frac{1}{24}E_2(\tau)A} \widehat{A}(TX) \exp\left(\frac{C}{2}\right) \text{ch} \left[\bigotimes_{n=1}^{\infty} S_{q^n}(\widetilde{T_C M}) \otimes \bigotimes_{m=1}^{\infty} \wedge_{-q^m}(\widetilde{L_C}) \right] \varphi(\tau)^{16} \text{ch}(\mathcal{V}_i) \text{ch}(\mathcal{V}_j) \\ &= (e^{\frac{1}{24}A} - e^{\frac{1}{24}A} Aq + O(q^2)) \widehat{A}(TX) \exp\left(\frac{C}{2}\right) \text{ch} \left[(1 + q\widetilde{T_C M} + O(q^2))(1 - q\widetilde{L_C} + O(q^2)) \right] \\ & \cdot (1 - 16q + O(q^2))(1 + \text{ch}(W_i)q + O(q^2))(1 + \text{ch}(W_j)q + O(q^2)) \\ &= e^{\frac{1}{24}A} \widehat{A}(TX) \exp\left(\frac{C}{2}\right) + \left[e^{\frac{1}{24}A} \widehat{A}(TX) \exp\left(\frac{C}{2}\right) \text{ch}(\widetilde{T_C M} - \widetilde{L_C} - 16 + W_i + W_j) \right. \\ & \left. - e^{\frac{1}{24}A} A \widehat{A}(TX) \exp\left(\frac{C}{2}\right) \right] q + O(q^2). \end{aligned}$$

It is well known that modular forms over $SL_2(\mathbf{Z})$ can be expressed as polynomials of the Einsentein series $E_4(\tau)$ and $E_6(\tau)$, where

$$(2.19) \quad E_4(\tau) = 1 + 240q + 2160q^2 + 6720q^3 + \cdots,$$

$$(2.20) \quad E_6(\tau) = 1 - 504q - 16632q^2 - 122976q^3 + \cdots.$$

Their weights are 4 and 6 respectively. Since $Q(M, P_i, P_j, \tau)$ is a modular form over $SL_2(\mathbf{Z})$ with the weight 14, it must be a multiple of

$$(2.21) \quad E_4(\tau)^2 E_6(\tau) = 1 - 24q - 196632q^2 + \cdots.$$

So

$$(2.22) \quad \begin{aligned} & \left\{ e^{\frac{1}{24}A} \widehat{A}(TX) \exp\left(\frac{C}{2}\right) \text{ch}(\widetilde{T_C M} - \widetilde{L_C} - 16 + W_i + W_j) - e^{\frac{1}{24}A} A \widehat{A}(TX) \exp\left(\frac{C}{2}\right) \right\}^{(14)} \\ &= -24 \left\{ e^{\frac{1}{24}A} \widehat{A}(TX) \exp\left(\frac{C}{2}\right) \right\}^{(14)}. \end{aligned}$$

By (2.22), we have

Theorem 2.3. *One has the following equality:*

(2.23)

$$\begin{aligned} & \left\{ \widehat{A}(TX) \exp\left(\frac{c}{2}\right) \text{ch}(\widetilde{T_C M} - \widetilde{L_C} + 8 + W_i + W_j) \right\}^{(14)} \\ &= A \left\{ e^{\frac{1}{24}A} \widehat{A}(TX) \exp\left(\frac{c}{2}\right) - \frac{e^{\frac{1}{24}A} - 1}{A} \widehat{A}(TX) \exp\left(\frac{c}{2}\right) \text{ch}(\widetilde{T_C M} - \widetilde{L_C} + 8 + W_i + W_j) \right\}^{(10)}. \end{aligned}$$

Corollary 2.4. *When $A = 0$, we have*

$$\begin{aligned} (2.24) \quad & \left\{ \widehat{A}(TX) \exp\left(\frac{c}{2}\right) \text{ch}(\widetilde{T_C M} - \widetilde{L_C} - 16 + W_i + W_j) \right\}^{(14)} \\ &= -24 \left\{ \widehat{A}(TX) \exp\left(\frac{c}{2}\right) \right\}^{(14)}. \end{aligned}$$

When M is a 14-dimensional spin^c manifold, then $\text{Ind}D^c \otimes (\widetilde{T_C M} - \widetilde{L_C} - 16 + W_i + W_j)_+$ is a multiply of 24.

Let $A_1 := p_1(M) - p_1(L_R) + \frac{1}{30}c_2(W_i)$. Let

$$(2.25) \quad Q(M, P_i, \tau) = \left\{ e^{\frac{1}{24}E_2(\tau)A_1} \widehat{A}(TX) \exp\left(\frac{c}{2}\right) \text{ch} \left[\bigotimes_{n=1}^{\infty} S_{q^n}(\widetilde{T_C M}) \otimes \bigotimes_{m=1}^{\infty} \wedge_{-q^m}(\widetilde{L_C}) \right] \cdot \varphi(\tau)^8 \text{ch}(\mathcal{V}_i) \right\}^{(14)}.$$

Then

$$(2.26) \quad Q(M, P_i, \tau) = \left\{ e^{\frac{1}{24}E_2(\tau)A_1} \left(\prod_{j=1}^7 \frac{x_j \theta'(0, \tau)}{\theta(x_j, \tau)} \right) \frac{\sqrt{-1} \theta(u, \tau)}{\theta_1(0, \tau) \theta_2(0, \tau) \theta_3(0, \tau)} \frac{1}{2} \left(\prod_{l=1}^8 \theta_1(y_l^i, \tau) + \prod_{l=1}^8 \theta_2(y_l^i, \tau) + \prod_{l=1}^8 \theta_3(y_l^i, \tau) \right) \right\}^{(14)}.$$

Similar to Lemma 2.2, we have

Lemma 2.5. *$Q(M, P_i, \tau)$ is a modular form over $SL_2(\mathbf{Z})$ with the weight 10.*

Similar to (2.18), we have

$$\begin{aligned} (2.27) \quad & e^{\frac{1}{24}E_2(\tau)A_1} \widehat{A}(TX) \exp\left(\frac{c}{2}\right) \text{ch} \left[\bigotimes_{n=1}^{\infty} S_{q^n}(\widetilde{T_C M}) \otimes \bigotimes_{m=1}^{\infty} \wedge_{-q^m}(\widetilde{L_C}) \right] \varphi(\tau)^8 \text{ch}(\mathcal{V}_i) \\ &= e^{\frac{1}{24}A_1} \widehat{A}(TX) \exp\left(\frac{c}{2}\right) + \left[e^{\frac{1}{24}A_1} \widehat{A}(TX) \exp\left(\frac{c}{2}\right) \text{ch}(\widetilde{T_C M} - \widetilde{L_C} - 8 + W_i) \right. \\ & \quad \left. - e^{\frac{1}{24}A_1} A_1 \widehat{A}(TX) \exp\left(\frac{c}{2}\right) \right] q + O(q^2). \end{aligned}$$

Since $Q(M, P_i, \tau)$ is a modular form over $SL_2(\mathbf{Z})$ with the weight 10, it must be a multiple of

$$(2.28) \quad E_4(\tau)E_6(\tau) = 1 - 264q - 135432q^2 + \dots$$

So

$$(2.29) \quad \left\{ e^{\frac{1}{24}A_1} \widehat{A}(TX) \exp\left(\frac{c}{2}\right) \text{ch}(\widetilde{T_C M} - \widetilde{L_C} - 8 + W_i) - e^{\frac{1}{24}A_1} A_1 \widehat{A}(TX) \exp\left(\frac{c}{2}\right) \right\}^{(14)} \\ = -264 \left\{ e^{\frac{1}{24}A_1} \widehat{A}(TX) \exp\left(\frac{c}{2}\right) \right\}^{(14)}.$$

Theorem 2.6. *One has the following equality:*

$$(2.30) \quad \left\{ \widehat{A}(TX) \exp\left(\frac{c}{2}\right) \text{ch}(\widetilde{T_C M} - \widetilde{L_C} + 256 + W_i) \right\}^{(14)} \\ = A_1 \left\{ e^{\frac{1}{24}A_1} \widehat{A}(TX) \exp\left(\frac{c}{2}\right) - \frac{e^{\frac{1}{24}A_1} - 1}{A_1} \widehat{A}(TX) \exp\left(\frac{c}{2}\right) \text{ch}(\widetilde{T_C M} - \widetilde{L_C} + 256 + W_i) \right\}^{(10)}.$$

Corollary 2.7. *When $A_1 = 0$, we have*

$$(2.31) \quad \left\{ \widehat{A}(TX) \exp\left(\frac{c}{2}\right) \text{ch}(\widetilde{T_C M} - \widetilde{L_C} - 8 + W_i) \right\}^{(14)} \\ = -264 \left\{ \widehat{A}(TX) \exp\left(\frac{c}{2}\right) \right\}^{(14)}.$$

When M is a 14-dimensional $spin^c$ manifold, then $\text{Ind}D^c \otimes (\widetilde{T_C M} - \widetilde{L_C} - 8 + W_i)_+$ is a multiply of 264.

If M is a 10-dimensional $spin^c$ manifold, we let

$$(2.32) \quad R(M, P_i, \tau) = \left\{ e^{\frac{1}{24}E_2(\tau)A_1} \widehat{A}(TX) \exp\left(\frac{c}{2}\right) \text{ch} \left[\bigotimes_{n=1}^{\infty} S_{q^n}(\widetilde{T_C M}) \otimes \bigotimes_{m=1}^{\infty} \wedge_{-q^m}(\widetilde{L_C}) \right] \right. \\ \left. \cdot \varphi(\tau)^8 \text{ch}(\mathcal{V}_i) \right\}^{(10)}.$$

Then

$$(2.33) \quad Q(M, P_i, \tau) = \left\{ e^{\frac{1}{24}E_2(\tau)A_1} \left(\prod_{j=1}^5 \frac{x_j \theta'(0, \tau)}{\theta(x_j, \tau)} \right) \frac{\sqrt{-1} \theta(u, \tau)}{\theta_1(0, \tau) \theta_2(0, \tau) \theta_3(0, \tau)} \right. \\ \left. \frac{1}{2} \left(\prod_{l=1}^8 \theta_1(y_l^i, \tau) + \prod_{l=1}^8 \theta_2(y_l^i, \tau) + \prod_{l=1}^8 \theta_3(y_l^i, \tau) \right) \right\}^{(10)}.$$

Similar to Lemma 2.2, we have

Lemma 2.8. *$R(M, P_i, \tau)$ is a modular form over $SL_2(\mathbf{Z})$ with the weight 8.*

By (2.27) and Lemma 2.8, it must be a multiple of

$$(2.34) \quad E_4(\tau)^2 = 1 + 480q + 61920q^2 + \cdots .$$

So

$$(2.35) \quad \left\{ e^{\frac{1}{24}A_1} \widehat{A}(TX) \exp\left(\frac{c}{2}\right) \text{ch}(\widetilde{T_C M} - \widetilde{L_C} - 8 + W_i) - e^{\frac{1}{24}A_1} A_1 \widehat{A}(TX) \exp\left(\frac{c}{2}\right) \right\}^{(10)} \\ = 480 \left\{ e^{\frac{1}{24}A_1} \widehat{A}(TX) \exp\left(\frac{c}{2}\right) \right\}^{(10)} .$$

Theorem 2.9. *One has the following equality:*

$$(2.36) \quad \left\{ \widehat{A}(TX) \exp\left(\frac{c}{2}\right) \text{ch}(\widetilde{T_C M} - \widetilde{L_C} - 488 + W_i) \right\}^{(10)} \\ = A_1 \left\{ e^{\frac{1}{24}A_1} \widehat{A}(TX) \exp\left(\frac{c}{2}\right) - \frac{e^{\frac{1}{24}A_1} - 1}{A_1} \widehat{A}(TX) \exp\left(\frac{c}{2}\right) \text{ch}(\widetilde{T_C M} - \widetilde{L_C} - 488 + W_i) \right\}^{(6)} .$$

Corollary 2.10. *When $A_1 = 0$, we have*

$$\left\{ \widehat{A}(TX) \exp\left(\frac{c}{2}\right) \text{ch}(\widetilde{T_C M} - \widetilde{L_C} + W_i) \right\}^{(10)} = 488 \left\{ \widehat{A}(TX) \exp\left(\frac{c}{2}\right) \right\}^{(10)} .$$

When M is a 10-dimensional spin^c manifold, then $\text{Ind}D^c \otimes (\widetilde{T_C M} - \widetilde{L_C} + W_i)_+$ is a multiply of 488.

In the following, we consider the q^2 -terms in the q -expansions of $Q(M, P_i, P_j, \tau)$, $Q(M, P_i, \tau)$, $R(M, P_i, \tau)$. Let $\overline{W}_i = P_i \times_{\rho_2} V_2$. We assume that $A = 0$, then

$$(2.37) \quad e^{\frac{1}{24}E_2(\tau)A} \widehat{A}(TX) \exp\left(\frac{c}{2}\right) \text{ch} \left[\bigotimes_{n=1}^{\infty} S_{q^n}(\widetilde{T_C M}) \otimes \bigotimes_{m=1}^{\infty} \wedge_{-q^m}(\widetilde{L_C}) \right] \varphi(\tau)^{16} \text{ch}(\mathcal{V}_i) \text{ch}(\mathcal{V}_j) \\ = \widehat{A}(TX) \exp\left(\frac{c}{2}\right) \text{ch} [1 + qB_1 + q^2B_2 + O(q^3)] \\ \cdot (1 - 16q + 104q^2)(1 + \text{ch}(W_i)q + q^2\text{ch}(\overline{W}_i) + O(q^3))(1 + \text{ch}(W_j)q + q^2\text{ch}(\overline{W}_j) + O(q^3)) \\ = \widehat{A}(TX) \exp\left(\frac{c}{2}\right) + \left[\widehat{A}(TX) \exp\left(\frac{c}{2}\right) \text{ch}(\widetilde{T_C M} - \widetilde{L_C} - 16 + W_i + W_j) \right] q \\ + \left\{ \widehat{A}(TX) \exp\left(\frac{c}{2}\right) (\text{ch}(\overline{W}_j) + \text{ch}(\overline{W}_i) + \text{ch}(W_i)\text{ch}(W_j) - 16\text{ch}(W_j) - 16\text{ch}(W_i) + 104 \right. \\ \left. + B_1 \wedge [\text{ch}(W_j) + \text{ch}(W_i) - 16] + B_2) \right\} q^2 + O(q^3).$$

where

$$(2.38) \quad B_1 = \widetilde{T_C M} - \widetilde{L_C}, \\ B_2 = \wedge^2 \widetilde{L_C} - \widetilde{L_C} - \widetilde{T_C M} \otimes \widetilde{L_C} + S^2 \widetilde{T_C M} + \widetilde{T_C M}.$$

By (2.21) and (2.37), we get

Theorem 2.11. *When $A = 0$, we have*

$$(2.39) \quad \left\{ \widehat{A}(TX) \exp\left(\frac{c}{2}\right) (\text{ch}(\overline{W}_j) + \text{ch}(\overline{W}_i) + \text{ch}(W_j)\text{ch}(W_i) - 16\text{ch}(W_j) - 16\text{ch}(W_i) + 104 + B_1 \wedge [\text{ch}(W_j) + \text{ch}(W_i) - 16] + B_2) \right\}^{(14)} \\ = -196632 \left\{ \widehat{A}(TX) \exp\left(\frac{c}{2}\right) \right\}^{(14)}.$$

We assume that $A_1 = 0$, then

$$(2.40) \quad e^{\frac{1}{24}E_2(\tau)A_1} \widehat{A}(TX) \exp\left(\frac{c}{2}\right) \text{ch} \left[\bigotimes_{n=1}^{\infty} S_{q^n}(\widetilde{TCM}) \otimes \bigotimes_{m=1}^{\infty} \wedge_{-q^m}(\widetilde{LC}) \right] \varphi(\tau)^8 \text{ch}(\mathcal{V}_i) \\ = \widehat{A}(TX) \exp\left(\frac{c}{2}\right) \text{ch} [1 + qB_1 + q^2B_2 + O(q^3)] \\ \cdot (1 - 8q + 20q^2)(1 + \text{ch}(W_i)q + q^2\text{ch}(\overline{W}_i) + O(q^3)) \\ = \widehat{A}(TX) \exp\left(\frac{c}{2}\right) + \left[\widehat{A}(TX) \exp\left(\frac{c}{2}\right) \text{ch}(\widetilde{TCM} - \widetilde{LC} - 8 + W_i) \right] q \\ + \left\{ \widehat{A}(TX) \exp\left(\frac{c}{2}\right) (20 + \text{ch}(\overline{W}_i) - 8\text{ch}(W_i) + B_1 \wedge [\text{ch}(W_i) - 8] + B_2) \right\} q^2 + O(q^3).$$

By (2.28) and (2.40), we get

Theorem 2.12. *When $A_1 = 0$, we have*

$$(2.41) \quad \left\{ \widehat{A}(TX) \exp\left(\frac{c}{2}\right) (20 + \text{ch}(\overline{W}_i) - 8\text{ch}(W_i) + B_1 \wedge [\text{ch}(W_i) - 8] + B_2) \right\}^{(14)} \\ = -135432 \left\{ \widehat{A}(TX) \exp\left(\frac{c}{2}\right) \right\}^{(14)}.$$

Similarly, we have:

Theorem 2.13. *When $A_1 = 0$, we have*

$$(2.42) \quad \left\{ \widehat{A}(TX) \exp\left(\frac{c}{2}\right) (20 + \text{ch}(\overline{W}_i) - 8\text{ch}(W_i) + B_1 \wedge [\text{ch}(W_i) - 8] + B_2) \right\}^{(10)} \\ = 61920 \left\{ \widehat{A}(TX) \exp\left(\frac{c}{2}\right) \right\}^{(10)}.$$

3. ANOMALY CANCELLATION FORMULAS FOR 12-DIMENSIONAL MANIFOLDS

In this section, we let M be a 12-dimensional manifold. Let $\widehat{L}(TM, \nabla^{TM})$ be the Hirzebruch characteristic forms defined by ([13])

$$\widehat{L}(TM, \nabla^{TM}) = \det^{\frac{1}{2}} \left(\frac{\frac{\sqrt{-1}}{2\pi} R^{TM}}{\tanh\left(\frac{\sqrt{-1}}{4\pi} R^{TM}\right)} \right).$$

Let $A_2 := \frac{1}{30}(c_2(W_i) + c_2(W_j))$. Let

$$(3.1) \quad Q_1(M, P_i, P_j, \tau) = \left\{ e^{\frac{1}{24}E_2(\tau)A_2} \widehat{L}(TM, \nabla^{TM}) \text{ch} \left[\bigotimes_{n=1}^{\infty} S_{q^n}(\widetilde{TCM}) \otimes \bigotimes_{m=1}^{\infty} \wedge_{q^m}(\widetilde{TCM}) \right] \cdot \varphi(\tau)^{16} \text{ch}(\mathcal{V}_i) \text{ch}(\mathcal{V}_j) \right\}^{(12)},$$

(3.2)

$$Q_2(M, P_i, P_j, \tau) = \left\{ e^{\frac{1}{24}E_2(\tau)A_2} \widehat{A}(TM, \nabla^{TM}) \text{ch} \left[\bigotimes_{n=1}^{\infty} S_{q^n}(\widetilde{TCM}) \otimes \bigotimes_{m=1}^{\infty} \wedge_{-q^{m-\frac{1}{2}}}(\widetilde{TCM}) \right] \cdot \varphi(\tau)^{16} \text{ch}(\mathcal{V}_i) \text{ch}(\mathcal{V}_j) \right\}^{(12)},$$

Then

(3.3)

$$Q_1(M, P_i, P_j, \tau) = 2^6 \left\{ e^{\frac{1}{24}E_2(\tau)A_2} \left(\prod_{j=1}^6 \frac{x_j \theta'(0, \tau) \theta_1(x_j, \tau)}{\theta(x_j, \tau) \theta_1(0, \tau)} \right) \frac{1}{4} \left(\prod_{l=1}^8 \theta_1(y_l^i, \tau) + \prod_{l=1}^8 \theta_2(y_l^i, \tau) + \prod_{l=1}^8 \theta_3(y_l^i, \tau) \right) \left(\prod_{l=1}^8 \theta_1(y_l^j, \tau) + \prod_{l=1}^8 \theta_2(y_l^j, \tau) + \prod_{l=1}^8 \theta_3(y_l^j, \tau) \right) \right\}^{(12)},$$

and

(3.4)

$$Q_2(M, P_i, P_j, \tau) = \left\{ e^{\frac{1}{24}E_2(\tau)A_2} \left(\prod_{j=1}^6 \frac{x_j \theta'(0, \tau) \theta_2(x_j, \tau)}{\theta(x_j, \tau) \theta_2(0, \tau)} \right) \frac{1}{4} \left(\prod_{l=1}^8 \theta_1(y_l^i, \tau) + \prod_{l=1}^8 \theta_2(y_l^i, \tau) + \prod_{l=1}^8 \theta_3(y_l^i, \tau) \right) \left(\prod_{l=1}^8 \theta_1(y_l^j, \tau) + \prod_{l=1}^8 \theta_2(y_l^j, \tau) + \prod_{l=1}^8 \theta_3(y_l^j, \tau) \right) \right\}^{(12)},$$

Let

$$\Gamma_0(2) = \left\{ \begin{pmatrix} a & b \\ c & d \end{pmatrix} \in SL_2(\mathbf{Z}) \mid c \equiv 0 \pmod{2} \right\},$$

$$\Gamma^0(2) = \left\{ \begin{pmatrix} a & b \\ c & d \end{pmatrix} \in SL_2(\mathbf{Z}) \mid b \equiv 0 \pmod{2} \right\},$$

be the two modular subgroups of $SL_2(\mathbf{Z})$. Writing $\theta_j = \theta_j(0, \tau)$, $1 \leq j \leq 3$, we introduce four explicit modular forms ([11]),

$$(3.5) \quad \begin{aligned} \delta_1(\tau) &= \frac{1}{8}(\theta_2^4 + \theta_3^4), \quad \varepsilon_1(\tau) = \frac{1}{16}\theta_2^4\theta_3^4, \\ \delta_2(\tau) &= -\frac{1}{8}(\theta_1^4 + \theta_3^4), \quad \varepsilon_2(\tau) = \frac{1}{16}\theta_1^4\theta_3^4. \end{aligned}$$

They have the following Fourier expansions in $q^{\frac{1}{2}}$:

$$(3.6) \quad \begin{aligned} \delta_1(\tau) &= \frac{1}{4} + 6q + 6q^2 + \cdots, \quad \varepsilon_1(\tau) = \frac{1}{16} - q + 7q^2 + \cdots, \\ 8\delta_2(\tau) &= -1 - 24q^{\frac{1}{2}} - 24q - 96q^{\frac{3}{2}} + \cdots, \quad \varepsilon_2(\tau) = q^{\frac{1}{2}} + 8q + 28q^{\frac{3}{2}} + \cdots. \end{aligned}$$

They also satisfy the transformation laws,

$$(3.7) \quad \delta_2\left(-\frac{1}{\tau}\right) = \tau^2 \delta_1(\tau), \quad \varepsilon_2\left(-\frac{1}{\tau}\right) = \tau^4 \varepsilon_1(\tau),$$

Lemma 3.1. ([11]) $\delta_1(\tau)$ (resp. $\varepsilon_1(\tau)$) is a modular form of weight 2 (resp. 4) over $\Gamma_0(2)$, $\delta_2(\tau)$ (resp. $\varepsilon_2(\tau)$) is a modular form of weight 2 (resp. 4) over $\Gamma^0(2)$ and moreover $\mathcal{M}_{\mathbf{R}}(\Gamma^0(2)) = \mathbf{R}[\delta_2(\tau), \varepsilon_2(\tau)]$.

By (2.11)-(2.15) and (2.7), we have

Lemma 3.2. $Q_1(M, P_i, P_j, \tau)$ is a modular form of weight 14 over $\Gamma_0(2)$, while $Q_2(M, P_i, P_j, \tau)$ is a modular form of weight 14 over $\Gamma^0(2)$. Moreover, the following identity holds,

$$(3.8) \quad Q_1\left(M, P_i, P_j, -\frac{1}{\tau}\right) = 2^6 \tau^{14} Q_2(M, P_i, P_j, \tau).$$

Theorem 3.3. We have the following equality:

$$(3.9) \quad \begin{aligned} 32 \left\{ e^{\frac{1}{24}A_2} \widehat{L}(TM) \right\}^{(12)} &= \left\{ e^{\frac{1}{24}A_2} \widehat{A}(TM) \text{ch}[2240 + 309\widetilde{T_C M} + 24(\wedge^2 \widetilde{T_C M} + W_i + W_j) \right. \\ &\quad \left. + \widetilde{T_C M} \otimes \widetilde{T_C M} + \widetilde{T_C M} \otimes (W_i + W_j) + \wedge^3 \widetilde{T_C M}] - \frac{1}{24} e^{\frac{1}{24}A_2} A_2 \widehat{A}(TX) \text{ch}(576 + 24\widetilde{T_C M}) \right\}^{(12)}. \end{aligned}$$

Proof. By Lemmas 3.1 and 3.2, we have

$$(3.10) \quad Q_2(M, P_i, P_j, \tau) = h_0(8\delta_2)^7 + h_1(8\delta_2)^5 \varepsilon_2 + h_2(8\delta_2)^3 \varepsilon_2^2 + h_3(8\delta_2) \varepsilon_2^3,$$

$$(3.11) \quad Q_1(M, P_i, P_j, \tau) = 2^6 [h_0(8\delta_1)^7 + h_1(8\delta_1)^5 \varepsilon_1 + h_2(8\delta_1)^3 \varepsilon_1^2 + h_3(8\delta_1) \varepsilon_1^3],$$

where each h_r , $0 \leq r \leq 3$, is a real multiple of the volume form at x .

(3.12)

$$\begin{aligned}
& e^{\frac{1}{24}E_2(\tau)A_2} \widehat{A}(TM, \nabla^{TM}) \text{ch} \left[\bigotimes_{n=1}^{\infty} S_{q^n}(\widetilde{T_C M}) \otimes \bigotimes_{m=1}^{\infty} \wedge_{-q^{m-\frac{1}{2}}}(\widetilde{T_C M}) \right] \cdot \varphi(\tau)^{16} \text{ch}(\mathcal{V}_i) \text{ch}(\mathcal{V}_j) \\
&= (e^{\frac{1}{24}A_2} - e^{\frac{1}{24}A_2} A_2 q + O(q^2)) \widehat{A}(TM) \text{ch} \left[(1 + q \widetilde{T_C M} + O(q^2)) \right. \\
&\quad \left. \otimes (1 - q^{\frac{1}{2}} \widetilde{T_C M} + q \wedge^2 \widetilde{T_C M} - q^{\frac{3}{2}} \wedge^3 \widetilde{T_C M} + O(q^2)) \otimes (1 - q^{\frac{3}{2}} \widetilde{T_C M}) \right] \\
&\quad \cdot (1 - 16q + O(q^2))(1 + \text{ch}(W_i)q + O(q^2))(1 + \text{ch}(W_j)q + O(q^2)) \\
&= e^{\frac{1}{24}A_2} \widehat{A}(TM) - q^{\frac{1}{2}} e^{\frac{1}{24}A_2} \widehat{A}(TX) \text{ch}(\widetilde{T_C M}) \\
&\quad + q [e^{\frac{1}{24}A_2} \widehat{A}(TM) \text{ch}(\widetilde{T_C M} + \wedge^2 \widetilde{T_C M} + W_i + W_j - 16) - e^{\frac{1}{24}A_2} A_2 \widehat{A}(TM)] \\
&\quad + q^{\frac{3}{2}} \left[-e^{\frac{1}{24}A_2} \widehat{A}(TX) \text{ch}(\widetilde{T_C M} \otimes \widetilde{T_C M} + \widetilde{T_C M} \otimes (W_i + W_j - 16) + \widetilde{T_C M} + \wedge^3 \widetilde{T_C M}) \right. \\
&\quad \left. + e^{\frac{1}{24}A_2} A_2 \widehat{A}(TM) \text{ch}(\widetilde{T_C M}) \right] + O(q^2).
\end{aligned}$$

By (3.10), (3.12) and (3.6), comparing the the constant term, $q^{\frac{1}{2}}$, q , $q^{\frac{3}{2}}$ terms in (3.10), we get

(3.13)

$$\begin{aligned}
h_0 &= - \left\{ e^{\frac{1}{24}A_2} \widehat{A}(TM) \right\}^{(12)} \\
h_1 &= \left\{ e^{\frac{1}{24}A_2} \widehat{A}(TM) \text{ch}(\widetilde{T_C M} + 168) \right\}^{(12)} \\
h_2 &= \left\{ e^{\frac{1}{24}A_2} \widehat{A}(TM) \text{ch}(-9224 - 129 \widetilde{T_C M} - \wedge^2 \widetilde{T_C M} - W_i - W_j) + e^{\frac{1}{24}A_2} A_2 \widehat{A}(TM) \right\}^{(12)} \\
h_3 &= \left\{ e^{\frac{1}{24}A_2} \widehat{A}(TM) \text{ch}(\widetilde{T_C M} \otimes \widetilde{T_C M} + \widetilde{T_C M} \otimes (W_i + W_j - 16) + \widetilde{T_C M} + \wedge^3 \widetilde{T_C M} \right. \\
&\quad + 508704 - 6868(\widetilde{T_C M} + 168) + 88 \times 9224 + 88 \times 129 \widetilde{T_C M} \\
&\quad \left. + 88 \wedge^2 \widetilde{T_C M} + 88W_i + 88W_j) - e^{\frac{1}{24}A_2} A_2 \widehat{A}(TM) \text{ch}(\widetilde{T_C M} + 88) \right\}^{(12)}.
\end{aligned}$$

By (3.13), (3.11) and (3.6), comparing the the constant term in (3.11), we get Theorem 3.3. \square

Corollary 3.4. *We have the following equality when $A_2 = 0$:*

$$\begin{aligned}
(3.14) \quad 32 \left\{ \widehat{L}(TM) \right\}^{(12)} &= \left\{ \widehat{A}(TM) \text{ch}[2240 + 309 \widetilde{T_C M} + 24(\wedge^2 \widetilde{T_C M} + W_i + W_j) \right. \\
&\quad \left. + \widetilde{T_C M} \otimes \widetilde{T_C M} + \widetilde{T_C M} \otimes (W_i + W_j) + \wedge^3 \widetilde{T_C M}] \right\}^{(12)}.
\end{aligned}$$

When M is spin, then the characteristic number of the right hand of (3.14) is a multiple of 32.

Let $A_3 := \frac{1}{30}c_2(W_i)$. Let

$$(3.15) \quad Q_1(M, P_i, \tau) = \left\{ e^{\frac{1}{24}E_2(\tau)A_3} \widehat{L}(TM, \nabla^{TM}) \text{ch} \left[\bigotimes_{n=1}^{\infty} S_{q^n}(\widetilde{TCM}) \otimes \bigotimes_{m=1}^{\infty} \wedge_{q^m}(\widetilde{TCM}) \right] \cdot \varphi(\tau)^8 \text{ch}(\mathcal{V}_i) \right\}^{(12)},$$

(3.16)

$$Q_2(M, P_i, \tau) = \left\{ e^{\frac{1}{24}E_2(\tau)A_3} \widehat{A}(TM, \nabla^{TM}) \text{ch} \left[\bigotimes_{n=1}^{\infty} S_{q^n}(\widetilde{TCM}) \otimes \bigotimes_{m=1}^{\infty} \wedge_{-q^{m-\frac{1}{2}}}(\widetilde{TCM}) \right] \cdot \varphi(\tau)^8 \text{ch}(\mathcal{V}_i) \right\}^{(12)}.$$

Then

$$(3.17) \quad Q_1(M, P_i, \tau) = 2^6 \left\{ e^{\frac{1}{24}E_2(\tau)A_3} \left(\prod_{j=1}^6 \frac{x_j \theta'(0, \tau) \theta_1(x_j, \tau)}{\theta(x_j, \tau) \theta_1(0, \tau)} \right) \frac{1}{2} \left(\prod_{l=1}^8 \theta_1(y_l^i, \tau) + \prod_{l=1}^8 \theta_2(y_l^i, \tau) + \prod_{l=1}^8 \theta_3(y_l^i, \tau) \right) \right\}^{(12)},$$

and

$$(3.18) \quad Q_2(M, P_i, \tau) = \left\{ e^{\frac{1}{24}E_2(\tau)A_3} \left(\prod_{j=1}^6 \frac{x_j \theta'(0, \tau) \theta_2(x_j, \tau)}{\theta(x_j, \tau) \theta_2(0, \tau)} \right) \frac{1}{2} \left(\prod_{l=1}^8 \theta_1(y_l^i, \tau) + \prod_{l=1}^8 \theta_2(y_l^i, \tau) + \prod_{l=1}^8 \theta_3(y_l^i, \tau) \right) \right\}^{(12)}.$$

We have

Lemma 3.5. $Q_1(M, P_i, \tau)$ is a modular form of weight 10 over $\Gamma_0(2)$, while $Q_2(M, P_i, \tau)$ is a modular form of weight 10 over $\Gamma^0(2)$. Moreover, the following identity holds,

$$(3.19) \quad Q_1(M, P_i, -\frac{1}{\tau}) = 2^6 \tau^{10} Q_2(M, P_i, \tau).$$

Theorem 3.6. We have the following equality:

$$(3.20) \quad \left\{ e^{\frac{1}{24}A_3} \widehat{L}(TM) \right\}^{(12)} = -\frac{1}{2} \left\{ e^{\frac{1}{24}A_3} \widehat{A}(TM) \text{ch}[17\widetilde{TCM} + \wedge^2 \widetilde{TCM} + W_i + 128] \right\}^{(12)} + \frac{1}{60} \left\{ c_2(W_i) e^{\frac{1}{24}A_3} \widehat{A}(TX) \right\}^{(12)}.$$

Proof. By Lemmas 3.1 and 3.5, we have

$$(3.21) \quad Q_2(M, P_i, \tau) = h'_0(8\delta_2)^5 + h'_1(8\delta_2)^3 \varepsilon_2 + h'_2(8\delta_2) \varepsilon_2^2,$$

$$(3.22) \quad Q_1(M, P_i, \tau) = 2^6 [h'_0(8\delta_1)^5 + h'_1(8\delta_1)^3 \varepsilon_1 + h'_2(8\delta_1) \varepsilon_1^2],$$

where each h'_r , $0 \leq r \leq 2$, is a real multiple of the volume form at x .

$$\begin{aligned}
(3.23) \quad & e^{\frac{1}{24}E_2(\tau)A_3} \widehat{A}(TM, \nabla^{TM}) \text{ch} \left[\bigotimes_{n=1}^{\infty} S_{q^n}(\widetilde{T_C M}) \otimes \bigotimes_{m=1}^{\infty} \wedge_{-q^{m-\frac{1}{2}}}(\widetilde{T_C M}) \right] \cdot \varphi(\tau)^8 \text{ch}(\mathcal{V}_i) \\
&= (e^{\frac{1}{24}A_3} - e^{\frac{1}{24}A_3} A_3 q + O(q^2)) \widehat{A}(TM) \text{ch} \left[(1 + q\widetilde{T_C M} + O(q^2)) \right. \\
&\quad \otimes (1 - q^{\frac{1}{2}}\widetilde{T_C M} + q \wedge^2 \widetilde{T_C M} + O(q^{\frac{3}{2}})) \\
&\quad \cdot (1 - 8q + O(q^2))(1 + \text{ch}(W_i)q + O(q^2)) \\
&= e^{\frac{1}{24}A_3} \widehat{A}(TM) - q^{\frac{1}{2}} e^{\frac{1}{24}A_3} \widehat{A}(TM) \text{ch}(\widetilde{T_C M}) \\
&\quad \left. + q[e^{\frac{1}{24}A_3} \widehat{A}(TM) \text{ch}(\widetilde{T_C M} + \wedge^2 \widetilde{T_C M} + W_i - 8) - e^{\frac{1}{24}A_3} A_3 \widehat{A}(TM)] + O(q^{\frac{3}{2}}) \right]
\end{aligned}$$

By (3.21), (3.23) and (3.6), comparing the the constant term, $q^{\frac{1}{2}}, q$ terms in (3.21), we get

$$\begin{aligned}
(3.24) \quad & h'_0 = - \left\{ e^{\frac{1}{24}A_3} \widehat{A}(TM) \right\}^{(12)} \\
& h'_1 = \left\{ e^{\frac{1}{24}A_3} \widehat{A}(TM) \text{ch}(\widetilde{T_C M} + 120) \right\}^{(12)} \\
& h'_2 = \left\{ -e^{\frac{1}{24}A_3} \widehat{A}(TM) \text{ch}(3712 + 81\widetilde{T_C M} + \wedge^2 \widetilde{T_C M} + W_i) + e^{\frac{1}{24}A_3} A_3 \widehat{A}(TM) \right\}^{(12)}
\end{aligned}$$

By (3.22), (3.24) and (3.6), comparing the the constant term in (3.22), we get Theorem 3.6. \square

Corollary 3.7. *We have the following equality when $c_2(W_i) = 0$:*

$$-2 \left\{ \widehat{L}(TM) \right\}^{(12)} = \left\{ \widehat{A}(TM) \text{ch}[17\widetilde{T_C M} + \wedge^2 \widetilde{T_C M} + W_i + 128] \right\}^{(12)}.$$

When M is a spin manifold, then $\text{Ind}(D \otimes (17\widetilde{T_C M} + \wedge^2 \widetilde{T_C M} + W_i + 128)_+)$ is a multiple of 2.

Comparing the coefficient of q in (3.22), by (3.24), we have

Theorem 3.8. *We have the following equality:*

$$\begin{aligned}
(3.25) \quad & \left\{ e^{\frac{1}{24}A_3} \widehat{L}(TM) [-A_3 + 2\text{ch}(\widetilde{T_C M}) - 8 + \text{ch}(W_i)] \right\}^{(12)} \\
&= \left\{ e^{\frac{1}{24}A_3} \widehat{A}(TM) \text{ch}[2116\widetilde{T_C M} + 4 \wedge^2 \widetilde{T_C M} + 4W_i - 15872] \right\}^{(12)} \\
&\quad - \frac{2}{15} \left\{ c_2(W_i) e^{\frac{1}{24}A_3} \widehat{A}(TX) \right\}^{(12)}.
\end{aligned}$$

Corollary 3.9. *We have the following equality when $c_2(W_i) = 0$:*

$$(3.26) \quad \left\{ \widehat{L}(TM)[2\text{ch}(\widetilde{T_C M}) - 8 + \text{ch}(W_i)] \right\}^{(12)} \\ = \left\{ \widehat{A}(TM)\text{ch}[2116\widetilde{T_C M} + 4 \wedge^2 \widetilde{T_C M} + 4W_i - 15872] \right\}^{(12)}.$$

Remark: In [4], Chen and Han constructed some modular forms on odd dimensional manifolds. We can construct some new modular forms on odd dimensional manifolds by twist the Chen-Han modular forms by E_8 bundles.
