Abstract

LCD BCH codes are an important class of cyclic codes which have efficient encoding and decoding algorithms, but their parameters are difficult to determine. The objective of this paper is to study the LCD BCH codes of length $n = \frac{q^m+1}{\lambda}$, where $\lambda \mid (q+1)$ is an integer. Several types of LCD BCH codes with good parameters are presented, and many optimal linear codes are settled. Moreover, we present the first few largest coset leaders modulo $n = q^m + 1$, $\frac{q^m + 1}{2}$, $\frac{3^m + 1}{4}$, and partially solve two conjectures about BCH codes.

Keywords: BCH codes, LCD codes, Cyclotomic cosets, Coset leaders

1. Introduction

Throughout this paper, let p be a prime and \mathbb{F}_q be a finite field, where $q > 1$ is a p-power. An $[n, k, d]$ linear code over \mathbb{F}_q is a linear subspace of \mathbb{F}_q^n with dimension k and minimum Hamming distance d. If $(c_0, c_1, \ldots, c_{n-1}) \in \mathcal{C}$ implies $(c_{n-1}, c_0, c_1, \ldots, c_{n-2}) \in \mathcal{C}$, then \mathcal{C} is called an $[n, k]$ cyclic code. Identify any vector $(c_0, c_1, \ldots, c_{n-1}) \in \mathbb{F}_q^n$ with

$$
c_0 + c_1 x + c_2 x^2 + \dots + c_{n-1} x^{n-1} \in \mathbb{F}_q[x]/\langle x^n - 1 \rangle,
$$

then a cyclic code C over \mathbb{F}_q is equivalent to an ideal of $\mathbb{F}_q[x]/\langle x^n-1\rangle$. Note that $\mathbb{F}_q[x]/\langle x^n-1\rangle$ is a principal ideal ring, which means that every cyclic code C can be expressed as $C = \langle g(x) \rangle$. If $g(x)$ is the smallest degree monic polynomial such that $g(x)|(x^n-1)$ and $\mathcal{C}=\langle g(x)\rangle$, then $g(x)$ is called the generator polynomial, and $h(x) = (x^{n} - 1)/g(x)$ is called check polynomial of C. For a code C, its (Euclidean) dual code is denoted as $\mathcal{C}^{\perp} := \{ \mathbf{b} \in \mathbb{F}_q^n : \mathbf{b} \cdot \mathbf{c}^T = 0 \text{ for all } \mathbf{c} \in \mathcal{C} \}$, where T denotes the transposition and \cdot denotes the standard inner product. If $\mathcal{C} \cap \mathcal{C}^{\perp} = \{0\}$, then code \mathcal{C} is called an LCD code (linear code with complementary dual).

Let $\mathbb{F}_{q^m}^* = \langle \alpha \rangle$ and $\beta = \alpha^{\frac{q^m-1}{n}}$, where $m = ord_n(q)$, then β is a primitive *n*-th root of unity. Let $m_i(x)$ denote the minimal polynomial of β^i over \mathbb{F}_q , where $0 \leq i \leq n-1$. For positive integers b and δ, define

$$
g_{(n,q,\delta,b)}(x) := \text{lcm}(m_b(x), m_{b+1}(x), \dots, m_{b+\delta-2}(x)),
$$

where $2 \leq \delta \leq n$, lcm denotes the least common multiple of these $m_i(x)$, $b \leq i \leq b + \delta - 2$. Let $\mathcal{C}_{(n,q,\delta,b)}$ be the code over \mathbb{F}_q with generator polynomial $g_{(n,q,\delta,b)}(x)$, then $\mathcal{C}_{(n,q,\delta,b)}$ is called a BCH

⋆

Email address: zhangyanhui0327@163.com (Yanhui Zhang)

code of length *n* with designed distance δ , and $\mathcal{C}_{(n,q,\delta,b)}$ is called a narrow-sense BCH code for $b=1$. When $n = q^m + 1$, then $\mathcal{C}_{(n,q,\delta,b)}$ is called an antiprimitive BCH code in [\[5](#page-20-0)]. Denote $d(\mathcal{C}_{(n,q,\delta,b)})$ as the minimum distance of $\mathcal{C}_{(n,q,\delta,b)}$ and $dim(\mathcal{C}_{(n,q,\delta,b)})$ as the dimension of $\mathcal{C}_{(n,q,\delta,b)}$, then $d(\mathcal{C}_{(n,q,\delta,b)}) \geq \delta$ by employing the BCH bound.

BCH codes were first proposed by Hocquenghem in [\[8\]](#page-20-1), and then LCD codes were defined as reversible codes in [\[18](#page-21-0)]. Although many scholars have obtained a lot of conclusions on BCH codes in [\[1](#page-20-2)]-[\[7\]](#page-20-3), [\[12](#page-21-1)]-[\[17](#page-21-2)] and [\[20\]](#page-21-3)-[\[27\]](#page-21-4), but it is still hard to determine the parmeters of LCD BCH codes. Recently, the parameters of some LCD BCH codes of lengths n were extensively studied in $[9]$, $[19]$, [\[11\]](#page-21-6)-[\[16\]](#page-21-7) and [\[22\]](#page-21-8)-[\[25\]](#page-21-9), where $n = q^m - 1$, $q^m + 1$, $\frac{q^m-1}{q-1}$, $\frac{q^m+1}{q+1}$, and many researchers have developed great interest in the study of antiprimitive LCD BCH codes.

In $[12],[13],[15],[16],[22],[23],[27]]$ $[12],[13],[15],[16],[22],[23],[27]]$ $[12],[13],[15],[16],[22],[23],[27]]$ $[12],[13],[15],[16],[22],[23],[27]]$ $[12],[13],[15],[16],[22],[23],[27]]$ $[12],[13],[15],[16],[22],[23],[27]]$ $[12],[13],[15],[16],[22],[23],[27]]$ $[12],[13],[15],[16],[22],[23],[27]]$ $[12],[13],[15],[16],[22],[23],[27]]$ $[12],[13],[15],[16],[22],[23],[27]]$ $[12],[13],[15],[16],[22],[23],[27]]$ $[12],[13],[15],[16],[22],[23],[27]]$, the dimension of antiprimitive BCH code $\mathcal{C}_{(n,q,\delta,1)}$ was detemined for designed distance $2 \leq \delta \leq q^{\lceil \frac{m+2}{2} \rceil} + 1$, and the first few largest coset leaders were given when $m = 2t + 1 \geq 5$. However, it is hard to determine the first few largest coset leaders when $m = 2t \geq 2$, and some conjectures on the first few largest coset leaders were presented in [\[16](#page-21-7)]. In [\[27](#page-21-4)], the authors gave a sufficient and necessary condition for a being a coset leader, where $1 \le a \le q^m$. Based on the above necessary and sufficient condition, the first few largest odd coset leaders were obtained in [\[21\]](#page-21-13). In [\[22](#page-21-8)]-[\[24\]](#page-21-14), the dimension of LCD BCH code $\mathcal{C}_{(n,q,\delta,1)}$ with $n = \frac{q^m+1}{2}$ and $\frac{q^m+1}{q+1}$ has been studied.

We shall work on the coset leaders modulo $n = \frac{q^m+1}{\lambda}$, and get the corresponding parameters of LCD BCH codes. The structure of this article is as follows: In section 2, we give some basic concepts and known results. In section 3, we provide the first few largest coset leaders when $\lambda = 1$, and partially solve the conjectures in [\[16\]](#page-21-7). In section 4, the dimensions of $\mathcal{C}_{(n,q,\delta,1)}$ and $\mathcal{C}_{(n,q,\delta+1,0)}$ are presented by employing q-cyclotomic cosets for $2 \leq \lambda < q+1$, where $1 \leq \delta -1 \leq \frac{2q^{t+1}+2q-1}{\lambda}$ if $2 \nmid m$ and $\frac{q^{t}+1}{2} \leq \delta - 1 \leq \frac{q^{t+1}-1}{2}$ if $2 \mid m$. In addition, we provide the dimensions of $\mathcal{C}_{(n,q,\delta,1)}$ and $\mathcal{C}_{(n,q,\delta+1,0)}$ for $\lambda = q + 1$, where $q^t + 1 \leq \delta - 1 \leq \frac{2q^{t+1} + 2q - 1}{q+1}$, and obtain the first two largest coset leaders modulo n for $q = 3$. In section 5, the conclusions of the paper are given.

2. Preliminaries

In this section, we give some basic concepts and known results that will be used later in this paper.

2.1. Basic Notations

For any a with $0 \le a \le q^m - 1$, its q-adic expansion is $a = \sum_{j=0}^{m-1} a_j q^j = (a_{m-1}, a_{m-2}, \dots, a_1, a_0)$, where $0 \le a_j \le q-1$ for $0 \le j \le m-1$. Denote A, A, \ldots, A ${i \ times}$ as A, \ldots \sum_{i} and $[u, v] := \{u, u + 1, \ldots, v\},\$ where u, v are integers with $u \leq v$. Let $T = \{0 \leq i \leq n-1 : g(\beta^i) = 0\}$, where $\mathcal{C}_{(n,q,\delta,b)} = \langle g(x) \rangle$ and β is a primitive *n*-th root of unity, then T is referred as the defining set of $\mathcal{C}_{(n,q,\delta,b)}$. Denote $T^{-1} = \{n - t : i \in T\}$, then the defining set of the dual code of C^{\perp} is $Z_n n T^{-1}$ with respect to β .

For any s with $0 \leq s \leq n-1$, the set

$$
\{sq^i \pmod{n} : 0 \le i \le l-1\}
$$

is referred as the q-cyclotomic coset modulo n of representative s and is denoted by C_s , where $l =$ $\text{ord}_n(q)$ is the multiplicative order of q modulo n. The number of elements in C_s is denoted by |C_s|. In addition, we denote sq^i (mod n) by $[sq^i]_n$ for integer $0 \le i \le l-1$. We assume that $CL(s) := \min\{i : i \in C_s\}$ and $\text{MinRep}_n := \{CL(s) : 0 \le s \le n-1\}$, then $CL(s)$ is denoted as the coset leader of C_s , and $\delta_{i,n}$ is denoted as the *i*-th largest coset leader modulo *n*.

2.2. Known Results on Coset Leaders and the Dimension of BCH Code

For the BCH code of length $n = \frac{q^m+1}{\lambda}$, it is difficult to determine the coset leaders modulo n and the dimension of $\mathcal{C}_{(n,q,\delta,b)}$. We list some known conclusions as follows.

Lemma 1. *([\[27](#page-21-4)]*) Let $n = q^m + 1$, *i* and *h* be integers such that $1 \le i \le m$, $-\frac{l(q^{m-i}-1)}{q^i+1}$ $\frac{a^{m-i}-1}{q^i+1} < h < \frac{l(q^{m-i}+1)}{q^i-1}.$ *Then*

- *(1)* If 2 | q and $m \geq 2$, let $1 \leq l \leq \lfloor \frac{(q^{i}-1)q}{2(q+1)} \rfloor$ be an integer. Then a is a coset leader modulo n with $0 \le a \le q^m$ if and only if $0 \le a \le \lfloor \frac{q^{m+1}+q}{2(q+1)} \rfloor$ and $a \neq lq^{m-i}+h$.
- (2) If $2 \nmid q$, let $1 \leq l \leq \frac{q^{i}-1}{2}$ be an integer. Then a is a coset leader modulo n with $0 \leq a \leq q^{m}$ if *and only if* $a \leq \frac{q^m+1}{2}$ *and* $a \neq lq^{m-i} + h$ *.*

Lemma 2. *([\[23](#page-21-12)])* Let $n = \frac{q^m+1}{\lambda}$ and $1 \le a \le n-1$, where $2 \nmid q$ and $\lambda \mid (q+1)$ *. Then* a *is* a coset *leader of* C_a *modulo n if and only if* λa *is a coset leader of* $C_{\lambda a}$ *modulo* $q^m + 1$ *. Moreover,* $|C_a| = |C_{\lambda a}|$ *.*

Lemma 3. *([\[16\]](#page-21-7))* Let $n = q^m + 1$ and $m \ge 4$ be an integer. Then

(a) If 2 ∤ q *and* 2 ∤ m*, then*

$$
\delta_{1,n} = \frac{q^m + 1}{2}, \delta_{2,n} = \frac{(q-1)(q^m + 1)}{2(q+1)}, \delta_{3,n} = \frac{(q-1)(q^m - 2q^{m-2} - 1)}{2(q+1)}, \delta_{4,n} = \delta_{3,n} - (q-1)^2.
$$

Moreover, $|C_{\delta_{1,n}}| = 1, |C_{\delta_{2,n}}| = 2, |C_{\delta_{3,n}}| = |C_{\delta_{4,n}}| = 2m$.

(b) If $2 \nmid q$ and $m = 2^r t + 2^{r-1}$, where $r \geq 2$ and $t \geq 1$ are integers. Let $\Phi(x,q) = \frac{q-1}{2}(q^{2^x} 1)(q^{2^{x-1}}-1)\cdots(q^{2^0}-1)$ *, where* $x\geq 0$ *. Then*

$$
\delta_{1,n} = \frac{q^m + 1}{2}, \quad \delta_{2,n} = \frac{n}{q^{2^{r-1}} + 1} \cdot \Phi(r - 2, q).
$$

Moreover, $|C_{\delta_{1,n}}| = 1$ and $|C_{\delta_{2,n}}| = 2^r$.

 $f(c)$ *If* 2 | q and $m = 2^r t + 2^{r-1}$, where $r ≥ 2$ and $t ≥ 1$ are integers. Let $\Phi'(x, q) = \frac{q}{2}(q^{2^x} - 1)(q^{2^{x-1}} - 1)$ $1) \cdots (q^{2^0} - 1)$ *, where* $x \geq 0$ *. Then*

$$
\delta_{1,n} = \frac{n}{q^{2^{r-1}} + 1} \cdot \Phi'(r-2, q).
$$

Lemma 4. *([\[12\]](#page-21-1)[\[16](#page-21-7)])* Let $n = q^m + 1$. Then

(a) If $m \geq 3$ *is an odd integer and* $1 \leq a \leq q^{\frac{m+1}{2}}$ with $a \not\equiv 0 \pmod{q}$, then a *is a coset leader with* $|C_a| = 2m$ *except that* $a = q^{\frac{m+1}{2}} - c$ *for* $1 \le c \le q - 1$ *.*

- *(b)* If $2 \nmid q$ *and* $m \geq 4$ *is integer. Then*
	- (b.1) If $m = 2t + 1$ and $1 \le a < 2q^{t+1} 2q + 1$ with $a \not\equiv 0 \pmod{q}$, then a is a coset leader and $|C_a| = 2m$ *except that*

$$
a = q^{t+1} \pm \gamma \text{ or } a = q^{t+1} + \alpha q^t \pm 1,
$$

where $\gamma, \alpha \in [1, q-1]$ *.*

- *(b.2)* If $m = 2t + 1$ and $2q^{t+1} 2q + 1 \le a \le 2q^{t+1} + 2q 1$, then a is not a coset leader.
- *(b.3)* If $m = 2t$ and $1 \le a \le 2q^t + 2$ with $a \not\equiv 0 \pmod{q}$, then a is a coset leader and $|C_a| = 2m$ *except that*

$$
a = q^t + 1
$$
 or $a = 2q^t \pm 1$ or $a = 2q^t + 2$.

Lemma 5. Let $n = \frac{q^m+1}{\lambda}$, where $m \geq 2$ and $\lambda \mid (q+1)$ with $q+1 > \lambda$, then we have $\text{ord}_n(q) = 2m$. *Moreover, let* C_s *be a cyclotomic coset modulo n containing* s*, then* $C_s = \{y_{s,k}, n-y_{s,k} : 0 \le k \le m-1\}$ *, where* $y_{s,k} = sq^k \pmod{n}$.

Proof. It is clear that $n \mid (q^{2m} - 1)$, we denote $l = ord_n(q)$, then $l \mid 2m$. Since $\frac{q+1}{\lambda} \geq 2$, then $n = \frac{q^{m}+1}{\lambda} = \frac{q+1}{\lambda} \frac{q^{m}+1}{q+1} \geq 2 \frac{q^{m}+1}{q+1} > q^{m-1} + 1$, then $l \geq m$ by $n \mid (q^{l} - 1)$. If $l = m$, then $n \mid (q^{m} - 1)$. Note that $gcd(q^m + 1, q^m - 1) = 1$ or 2, this implies $n \mid 1$ or $n \mid 2$, which is impossible. Hence, $ord_n(q) = 2m$.

For any $s \in Z_n$, then $C_s = \{y_{s,0}, y_{s,1}, \ldots, y_{s,k}, \ldots, y_{s,2m-1}\}$ by $ord_n(q) = 2m$. If $m \leq k \leq 2m-1$, then $y_{s,k} \equiv sq^k = s(q^m + 1 - 1)q^{k-m} \equiv -sq^{k-m} \equiv n - sq^{k-m}$. Therefore, C_s can be denoted as $C_s = \{y_{s,k}, n - y_{s,k} : 0 \le k \le m-1\}$. Thus we complete the proof. \square

Let $n = \frac{q^m+1}{\lambda}$, where $m \ge 2$ and $\lambda \mid (q+1)$ with $q+1 > \lambda$, we have $T \cap Z_n nT^{-1} = \emptyset$ for BCH code $\mathcal{C}_{(n,q,\delta,b)}$ by Lemma [5.](#page-3-0) Therefore, we have $\mathcal{C} \cap \mathcal{C}^{\perp} = \{0\}$, i.e., $\mathcal{C}_{(n,q,\delta,b)}$ is an LCD BCH code. Moreover, we have known that BCH code of length $n = \frac{q^m+1}{q+1}$ is an LCD BCH code in [\[22\]](#page-21-8).

3. The LCD BCH Codes of Length $n = q^m + 1$

In this section, we always assume that $n = q^m + 1$ with $m = 4t + 2 \ge 2$. This section will be divided into two subsections by the value of q. In the following, we will investigate the first few largest coset leaders $\delta_{i,n}$ and the parameters of $\mathcal{C}_{(n,q,\delta_{i,n},b)}$.

3.1. When q *is an even prime power*

Lemma 6. Let q be an even prime power and $m \equiv 2 \pmod{4}$ with $m \ge 6$, then $\delta_{1,n} = \frac{q(q-1)(q^m+1)}{2(q^2+1)}$ $2(q^2+1)$ *and* $|C_{\delta_{1,n}}| = 4$ *.*

Proof. Note that $m = 2^2t + 2$, then $\delta_{1,n} = \frac{q(q-1)(q^m+1)}{2(q^2+1)}$ $\frac{-1}{2(q^2+1)}$ by Lemma [3.](#page-2-0) It is clear that

$$
[\delta_{1,n}q]_n = \frac{(q^2 - q + 2)(q^m + 1)}{2(q^2 + 1)}, \quad [\delta_{1,n}q^2]_n = \frac{(q^2 + q + 2)(q^m + 1)}{2(q^2 + 1)},
$$

$$
[\delta_{1,n}q^3]_n = \frac{(q^2+q)(q^m+1)}{2(q^2+1)}, \quad [\delta_{1,n}q^4]_n = \frac{q(q-1)(q^m+1)}{2(q^2+1)} = \delta_{1,n},
$$

then $|C_{\delta_{1,n}}|=4$. Thus we complete the proof.

Lemma 7. Let q be an even prime power and $m \equiv 2 \pmod{4}$ with $m \ge 6$, then

$$
\delta_2 = \frac{q(q-1)(q^m - 2q^{m-4} - 1)}{2(q^2 + 1)} \text{ and } \delta_3 = \begin{cases} \delta_2 - (q-1)q^2, & \text{if } m = 6; \\ \delta_2 - q(q-1)(q^2 - 1), & \text{if } m > 6. \end{cases}
$$

are the second and third largest coset leaders modulo n. Moreover, $|C_{\delta_2}| = |C_{\delta_3}| = 2m$.

Proof. From Lemma [1,](#page-2-1) we have $a \in \text{MinRep}_n$ with $0 \le a \le \lfloor \frac{q^{m+1}+q}{2(q+1)} \rfloor$ which implies that there are no integers $1 \le i \le m-1, 1 \le l \le \lfloor \frac{(q^i-1)q}{2(q+1)} \rfloor$ and $-\frac{l(q^{m-i}-1)}{q^i+1}$ $\frac{m-i-1}{q^i+1} < h < \frac{l(q^{m-i}+1)}{q^i-1}$ such that

$$
a = lq^{m-i} + h.\tag{1}
$$

If [\(1\)](#page-4-0) holds, then

$$
\frac{l(q^m+1)}{q^i+1} < a < \frac{l(q^m+1)}{q^i-1},
$$
\n
$$
\frac{a(q^i-1)}{q^i} < l < \frac{a(q^i+1)}{q^i} \tag{2}
$$

which is equivalent to

$$
\frac{a(q^i-1)}{q^m+1} < l < \frac{a(q^i+1)}{q^m+1}.\tag{2}
$$

For any $1 \leq i \leq m-1$, suppose that

$$
aqi = ui(qm + 1) + [aqi]n.
$$

Hence, [\(2\)](#page-4-1) becomes

$$
u_i + \frac{[aq^i]_n - a}{q^m + 1} < l < u_i + \frac{[aq^i]_n + a}{q^m + 1}.\tag{3}
$$

Therefore, if there is no l such that [\(3\)](#page-4-2) holds for any $1 \le i \le m-1$, then this implies that $a \in \text{MinRep}_n$. In order to prove our results, we divide it into two steps.

Step1. We claim that δ_2 and δ_3 are coset leaders.

(1) When $m > 6$, we have

$$
\delta_2=\frac{q(q-1)(q^m-2q^{m-4}-1)}{2(q^2+1)}=\frac{q(q-1)}{2}\left(\frac{q^m+1}{q^2+1}-2\frac{q^{m-4}+1}{q^2+1}\right)<\Big\lfloor\frac{q^{m+1}+q}{2(q+1)}\Big\rfloor.
$$

Note that $\frac{q^m+1}{q^2+1} = 1 + \sum_{i=0}^{\frac{m-6}{4}} [(q-1)q + (q-1)]q^{4i+2}$, then

$$
\delta_2 = \frac{q(q-1)}{2} \left([q(q-1) + (q-1)] q^{m-4} - 1 - \sum_{i=0}^{\frac{m-6}{4}-1} [(q-1)q + (q-1)] q^{4i+2} \right)
$$

$$
= \left(\frac{q}{2} - 1, \frac{q}{2} - 1, \frac{q}{2}, \frac{q}{2} - 1, \frac{q}{2}, \frac{q}{2} - 1, \frac{q}{2} - 1, \dots, \frac{q}{2}, \frac{q}{2} \right).
$$

 \Box

(1.1) For $1 \leq i \leq 3$, we have

$$
\left\{\begin{aligned} &[\delta_2q]_n = &(\frac{q}{2}-1,\frac{q}{2},\frac{q}{2}-1,\frac{q}{2},\frac{q}{2}-1,\frac{q}{2}-1,\ldots,\frac{q}{2},\frac{q}{2}-1,\frac{q}{2}+1)>\delta_2,\\ &[\delta_2q]_n+\delta_2 = &(q-1,0,0,\underbrace{0,0,q-1,q-1,\ldots,0,0,1}_{\frac{m-6}{4}}<\cdots<\cdotsm+1.\end{aligned}\right.
$$

$$
\left\{\begin{aligned} &[\delta_2q^2]_n = &(\frac{q}{2},\frac{q}{2}-1,\underbrace{\frac{q}{2},\frac{q}{2},\frac{q}{2}-1,\frac{q}{2}-1,\ldots,\frac{q}{2},\frac{q}{2}-1,\frac{q}{2},\frac{q}{2}+1)>\delta_2,\\ &[\delta_2q^2]_n+\delta_2 = &(q-1,q-1,0,\underbrace{q-1,\ldots,q-1,1,1}_{\frac{m-6}{m-6}}<\cdotsm+1.\end{aligned}\right.
$$

$$
\left\{\begin{aligned} &[\delta_2q^3]_n = &(\frac{q}{2}-1,\underbrace{\frac{q}{2},\frac{q}{2},\frac{q}{2}-1,\frac{q}{2}-1,\ldots,\frac{q}{2},\frac{q}{2}-1,\frac{q}{2},\frac{q}{2})>\delta_2,\\ &[\delta_2q^3]_n+\delta_2 = &(q-1,0,0,q-1,\underbrace{0,0,q-1,q-1,\ldots,0,0,q-1,0,1,0)
$$

(1.2) For $4 \le i \le m-3$, we assume $1 \le k \le \frac{m-6}{4}$.

(i) For $\left[\delta_2 q^{4k}\right]_n$, we have

$$
[\delta_2 q^{4k}]_n = \begin{cases} \{\underbrace{\frac{q}{2}, \frac{q}{2}, \frac{q}{2} - 1, \frac{q}{2} - 1, \dots, \frac{q}{2}, \frac{q}{2} - 1, \frac{q}{2}, \frac{q}{2} - 1, \frac{q}{2} + 1), & or \\\\ \frac{q}{2}, \frac{q}{2}, \frac{q}{2} - 1, \frac{q}{2} - 1, \dots, \frac{q}{2}, \frac{q}{2} - 1, \frac{q}{2}, \frac{q}{2} - 1, \frac{q}{2}, \dots, \frac{q}{2} - 1, \frac{q}{2} - 1, \frac{q}{2}, \frac{q}{2} + 1). \end{cases}
$$

Clearly, $\delta_2 < [\delta_2 q^{4k}]_n$. Note that $\delta_2 < (\frac{q}{2} - 1, \frac{q}{2} - 1, \frac{q}{2})$ $\frac{q}{2}, \frac{q}{2}$ $\frac{q}{2}, 0, 0, \ldots$ $\sum_{m=6}$, 0) and $[\delta_2 q^{4k}]_n < (\frac{q}{2})$ $\frac{q}{2}, \frac{q}{2}$ $\frac{q}{2}, \frac{q}{2}$ – $1, \frac{q}{2} - 1, \frac{q}{2}, \frac{q}{2}$ $\frac{1}{2}, \ldots,$ $\sum_{m=6}$ $,\frac{q}{2}),$ then $[\delta_2 q^{4k}]_n + \delta_2 < (q-1, q-1, q-1, q-1, \frac{q}{2})$ $\frac{q}{2}, \frac{q}{2}$ $\frac{1}{2}, \ldots,$ $\sum_{m=6}$ $\frac{q}{\Omega}$ $\frac{q}{2}$) < $q^m + 1$.

(ii) For $\left[\delta_2 q^{4k+1}\right]_n$, we have

$$
[\delta_2 q^{4k+1}]_n = \begin{cases} (\frac{q}{2}, \frac{q}{2}-1, \frac{q}{2}-1, \frac{q}{2}, \frac{q}{2}-1, \frac{q}{2}-1, \ldots, \frac{q}{2}, \frac{q}{2}-1, \frac{q}{2}, \frac{q}{2}-1, \frac{q}{2}, \frac{q}{2}-1, \frac{q}{2}, \frac{q}{2}) , & or \\ \\ (\frac{q}{2}, \frac{q}{2}-1, \frac{q}{2}-1, \ldots, \frac{q}{2}, \frac{q}{2}-1, \frac{q}{2}, \frac{q}{2}, \frac{q}{2}-1, \frac{q}{2}, \ldots, \frac{q}{2}-1, \frac{q}{2}-1, \frac{q}{2}, \frac{q}{2}, \frac{q}{2}). \end{cases}
$$

Clearly, $\delta_2 < [\delta_2 q^{4k+1}]_n$. Note that $[\delta_2 q^{4k+1}]_n < [\delta_2 q^{4k}]_n$, then $[\delta_2 q^{4k+1}]_n + \delta_2 < q^m + 1$.

(iii) For $[\delta_2 q^{4k+2}]_n$ and $[\delta_2 q^{4k+3}]_n$, we have $\delta_2 < [\delta_2 q^{4k+2}]_n$, $[\delta_2 q^{4k+3}]_n$ and $[\delta_2 q^{4k+2}]_n + \delta_2$, $[\delta_2 q^{4k+3}]_n +$ $\delta_2 < q^m + 1$ by the same way of (ii).

(1.3) For $i = m - 2, m - 1$, we have

$$
\begin{cases} [\delta_2 q^{m-2}]_n = \left(\frac{q}{2}, \frac{q}{2} - 1, \frac{q}{2}, \frac{q}{2}, \frac{q}{2} - 1, \frac{q}{2}, \dots, \frac{q}{2}, \frac{q}{2} + 1\right) > \delta_2, \\ [\delta_2 q^{m-1}]_n = \left(\frac{q}{2} - 1, \frac{q}{2}, \frac{q}{2}, \frac{q}{2} - 1, \frac{q}{2}, \frac{q}{2} - 1, \dots, \frac{q}{2}, \frac{q}{2}\right) > \delta_2. \end{cases}
$$

Note that $[\delta_2 q^{m-2}]_n, [\delta_2 q^{m-1}]_n < [\delta_2 q^{4k}]_n$, then $[\delta_2 q^{m-2}]_n + \delta_2, [\delta_2 q^{m-1}]_n + \delta_2 < q^m + 1$.

Concluding all discussions above, we have $0 < \frac{[\delta_2 q^i]_n - \delta_2}{q^m + 1} < \frac{[\delta_2 q^i]_n + \delta_2}{q^m + 1} < 1$ for any $1 \le i \le m - 1$. Hence, there is no l such that [\(3\)](#page-4-2) holds, this implies that $\delta_2 \in \text{MinRep}_n$. On one hand, $\delta_2 < [\delta_2 q^i]_n$ for $1 \leq i \leq m-1$, and

$$
[\delta_2 q^m]_n = \left(\frac{q}{2}, \frac{q}{2}, \frac{q}{2} - 1, \frac{q}{2}, \frac{q}{2} - 1, \frac{q}{2} - 1, \dots, \frac{q}{2} - 1, \frac{q}{2} + 1\right) > \delta_2,
$$

then $|C_{\delta_2}| > m$. On the other hand, $|C_{\delta_2}|$ is a divisor of $2m$, then $|C_{\delta_2}| = 2m$. Note that

$$
\delta_3 = \delta_2 - q(q-1)(q^2-1)
$$

= $(\frac{q}{2} - 1, \frac{q}{2} - 1, \frac{q}{2}, \frac{q}{2} - 1, \frac{q}{2}, \frac{q}{2} - 1, \frac{q}{2} - 1, \frac{q}{2} - 1, \dots, \frac{q}{2}, \frac{q}{2} - 1, \frac{q}{2}, \frac{q}{2} - 1, \frac{q}{2}).$

Then the proof of $\delta_3 \in \text{MinRep}_n$ and $|C_{\delta_3}| = 2m$ are similar to δ_2 , and details are omitted here. (2) When $m = 6$, we have

$$
\begin{cases} \n\delta_2 = \left(\frac{q}{2} - 1, \frac{q}{2} - 1, \frac{q}{2}, \frac{q}{2} - 1, \frac{q}{2}, \frac{q}{2}\right), \\
\delta_3 = \left(\frac{q}{2} - 1, \frac{q}{2} - 1, \frac{q}{2} - 1, \frac{q}{2}, \frac{q}{2}, \frac{q}{2}\right). \n\end{cases}
$$

We can calculate that $\delta_2 \leq [\delta_2 q^i]_n$, $n - [\delta_2 q^i]_n$ and $\delta_3 \leq [\delta_3 q^i]_n$, $n - [\delta_3 q^i]_n$ for any $0 \leq i \leq 5$, then δ_2 , $\delta_3 \in \text{MinRep}_n \text{ and } |C_{\delta_2}| = |C_{\delta_3}| = 2m.$

Step2. We claim that $\delta_{2,n} = \delta_2$ and $\delta_{3,n} = \delta_3$.

(1) When $m > 6$, we assume that there is an integer a such that $a \in \text{MinRep}_n$ and $\delta_2 < a < \delta_{1,n}$. From Lemma [6,](#page-3-1) we have

$$
\delta_{1,n} = \frac{q(q-1)(q^m+1)}{2(q^2+1)} = \frac{q(q-1)}{2} \frac{q^m+1}{q^2+1} = \underbrace{\left(\frac{q}{2}-1, \frac{q}{2}-1, \frac{q}{2}, \frac{q}{2}, \dots, \frac{q}{2}-1, \frac{q}{2}\right)}_{\frac{m-2}{4}}.
$$

Let $a = \sum_{i=0}^{m-1} a_i q^i$, where $0 \le a_i \le q-1$. Note that $a \in \text{MinRep}_n$ and $\delta_2 < a < \delta_{1,n}$, then $a_{m-1} = \frac{q}{2} - 1, a_{m-2} = \frac{q}{2} - 1, a_{m-3} = \frac{q}{2}$ $\frac{q}{2}, a_{m-4} = \frac{q}{2} - 1$ or $\frac{q}{2}, a_0 \neq 0$.

- (1.1) Suppose there exists an integer k such that $a_k \notin \{\frac{q}{2}-1,\frac{q}{2}\}$ $\frac{q}{2}$, where $0 \leq k \leq m-5$.
	- (i) If $a_k \leq \frac{q}{2} 2$, then $[aq^{m-k-1}]_n < (\frac{q}{2} 2, q 1, q 1, \ldots, q 1) < \delta_2 < a$, which is a contradiction to the assumption of $a \in \text{MinRep}_n$.

(ii) If $a_k \geq \frac{q}{2} + 1$, then

$$
\begin{cases} [aq^{m-k-1}]_n > (\frac{q}{2}, \frac{q}{2}, \frac{q}{2}, \frac{q}{2} - 1, 0, \dots, 0), & \text{if } k = 0; \\ [aq^{m-k-1}]_n > (\frac{q}{2} + 1, 0, 0, \dots, 0), & \text{if } k \neq 0. \end{cases}
$$

Note that $n - [aq^{m-k-1}]_n \in C_a$, but

$$
n - [aq^{m-k-1}]_n < (\frac{q}{2} - 1, \frac{q}{2} - 1, \frac{q}{2} - 1, \frac{q}{2}, 0, 0, \dots, 0) + 2 < \delta_{2,n} < a,
$$

which gives a contradiction to $a \in \text{MinRep}_n$.

(1.2) For $a_i \in \{\frac{q}{2}-1,\frac{q}{2}\}\$, where $0 \le i \le m-5$. Let the q-expansion $\delta_{1,n} = \sum_{i=0}^{m-1} b_i q^i$ and $\delta_2 = \sum_{i=0}^{m-1} c_i q^i$, where $0 \le b_i, c_i \le q-1$.

(i) If $a_{m-4} = \frac{q}{2}$ $\frac{q}{2}$, since $a < \delta_{1,n}$ then there exists an integer k such that $a_k = \frac{q}{2} - 1$, $b_k = \frac{q}{2}$ $\frac{q}{2}$ and $a_i = b_i$ for any $k < i \leq m - 1$.

When $k = 0$, then

$$
[aq^{m-1}]_n = (\frac{q}{2} - 2, \underbrace{\frac{q}{2}, \frac{q}{2}, \frac{q}{2} - 1, \frac{q}{2} - 1, \dots, \frac{q}{2}}_{\frac{m-2}{4}} + 1) < \delta_2 < a.
$$

When $k \neq 0$, then we have $a_{k+2} = a_{k+1} = a_k = \frac{q}{2} - 1$ or $\sqrt{ }$ \int \overline{a} $a_{k+3} = a_{k+2} = a_k = \frac{q}{2} - 1$ $a_{k+1} = \frac{q}{2}$ 2 . It is easy to check that $[aq^{m-k-3}]_n < a$ or $[aq^{m-k-4}]_n < a$, this contradicts to $a \in \text{MinRep}_n$.

(ii) If $a_{m-4} = \frac{q}{2} - 1$, since $\delta_2 < a$ then there exists an integer k such that $a_k = \frac{q}{2}$, $c_k = \frac{q}{2} - 1$ and $a_i = c_i$ for any $k < i \leq m-1$. Since $c_1 = c_0 = \frac{q}{2}$ $\frac{q}{2}$, then 2 $\leq k$, then we have $a_{k+2} = a_{k+1} = a_k = \frac{q}{2}$ 2 or $\sqrt{ }$ \int \mathbf{I} $a_{k+3} = a_{k+2} = a_k = \frac{q}{2}$ 2 $a_{k+1} = \frac{q}{2} - 1$. It is easy to check that $n - [aq^{m-k-3}]_n < a$ or $n - [aq^{m-k-4}]_n < a$,

this contradicts to the assumption of $a \in \text{MinRep}_n$.

(2) When $m = 6$, we have

$$
\delta_{1,n} = (\frac{q}{2} - 1, \frac{q}{2} - 1, \frac{q}{2}, \frac{q}{2}, \frac{q}{2} - 1, \frac{q}{2}).
$$

Suppose $a \in \text{MinRep}_n$ and $\delta_2 < a < \delta_{1,n}$, let $a = \sum_{i=0}^{m-1} a_i q^i$, where $0 \le a_i \le q-1$. We can get $a_i \in \{\frac{q}{2}-1,\frac{q}{2}\}\$ by the similar way of (1.2) , then $a = (\frac{q}{2}-1,\frac{q}{2}-1,\frac{q}{2},\frac{q}{2},\frac{q}{2}-1,\frac{q}{2}-1)$. But $[aq^5]_n < a$, which contradicts to the assumption of $a \in \text{MinRep}_n$.

Collecting all discussions above, we have $\delta_{2,n} = \delta_2$ and we can prove $\delta_{3,n} = \delta_3$ similarly. Thus we \Box complete the proof.

Lemma 8. Let $n = q^2 + 1$ and q be an even prime power. Then $a \in \text{MinRep}_n$ if and only if $a \in [l(q+1)+1, (l+1)(q-1)],$ where $0 \le l \le \frac{q}{2}-1$. Moreover, $|C_a| = 4$ for any $a \in \text{MinRep}_n$.

Proof. If q | a and $a \neq 1$, we have $a \in C_1$, i.e., $a \notin \text{MinRep}_n$. For $1 \leq a \leq q-1$, it is clear that $a < aq$, $a < n - aq$ and $a < n - a$, i.e., $a \in \text{MinRep}_n$.

For $q + 1 \le a \le n - 1$, let $a = a_1q + a_0$, where $1 \le a_0, a_1 \le q - 1$. Note that

$$
C_a = \{a, a_0q - a_1, (q - a_1)q - (a_0 - 1), (q - a_0)q + a_1 + 1\}.
$$

If $a \in \text{MinRep}_n$, then

$$
\begin{cases}\na_1q + a_0 \le a_0q - a_1, \\
a_1q + a_0 \le (q - a_1)q - (a_0 - 1), \\
a_1q + a_0 \le (q - a_0)q + a_1 + 1, \\
a_1 + a_0 < q.\n\end{cases}\n\Rightarrow\n\begin{cases}\na_1 < a_0, \\
a_1 < \frac{q}{2}, \\
a_1 + a_0 < q.\n\end{cases}
$$

Collecting all discussions above, we have $a \in \text{MinRep}_n$ if and only if $a \in [l(q+1)+1, (l+1)(q-1)],$ where $0 \leq l \leq \frac{q}{2} - 1$.

For any $a \in \text{MinRep}_n$, let $|C_a| = l$. Note that $\text{ord}_n(q) = 4$, then $l = 1, 2$ or 4. If $l = 2$, then $aq^2 \equiv a$ (mod $q^2 + 1$), i.e., $q^2 + 1 | a(q^2 - 1)$. Since $gcd(q^2 + 1, q^2 - 1) = 1$, then $q^2 + 1 | a$, which is impossible. Similarly, we can get $l \neq 1$. Hence, $|C_a| = 4$ for any $a \in \text{MinRep}_n$. Thus we complete the proof. \Box

Based on the above Lemmas, we can obtain the parameters of $\mathcal{C}_{(n,q,\delta,1)}$ and $\mathcal{C}_{(n,q,\delta+1,0)}$ for $\delta_{3,n}+1 \leq$ $\delta \leq \delta_{1,n}$ as follows.

Theorem 1. Let $n = q^m + 1$, where $m = 4t + 2 \ge 2$ and q is an even prime power, then the following *statements hold:*

(1) The LCD BCH code $\mathcal{C}_{(n,q,\delta,1)}$ *has parameters*

$$
\begin{cases} [n,5,d\geq \delta_{2,n}], &\textit{if $\delta_{2,n}+1\leq \delta\leq \delta_{1,n}$;}\\ [n,2m+5,d\geq \delta_{3,n}], &\textit{if $\delta_{3,n}+1\leq \delta\leq \delta_{2,n}$.}\end{cases}
$$

(2) The LCD BCH code $\mathcal{C}_{(n,q,\delta+1,0)}$ has parameters

$$
\begin{cases} [n, 4, d \ge 2\delta_{2,n}], & \text{if } \delta_{2,n} + 1 \le \delta \le \delta_{1,n}; \\ [n, 2m+4, d \ge 2\delta_{3,n}], & \text{if } \delta_{3,n} + 1 \le \delta \le \delta_{2,n}. \end{cases}
$$

Proof. For any $a \in C_i$, it is easy to check that $n-a \in C_i$. From the BCH bound, we have $d(C_{(n,q,\delta,1)}) \ge$ δ and $d(C_{(n,q,\delta+1,0)}) \geq 2\delta$. The dimensions of $C_{(n,q,\delta,1)}$ and $C_{(n,q,\delta+1,0)}$ can be obtained directly from Lemmas [3,](#page-2-0) [7](#page-4-3) and [8.](#page-7-0) \Box

Example 1. *We provide the following examples based on Theorem [1.](#page-8-0)*

• Let $(q, m) = (4, 2)$, we have $n = 17$ and $\delta_{1,n} = 6$. Then LCD BCH code $\mathcal{C}_{(n,q,\delta_{1,n}+1,0)}$ has parameters [17, 4, 12]*, the code is distance-optimal according to the tables of best codes known in ([\[10](#page-20-5)]).*

• Let $(q, m) = (8, 2)$, we have $n = 65$ and $\delta_{1,n} = 28$. Then LCD BCH code $\mathcal{C}_{(n,q,\delta_{1,n}+1,0)}$ has parameters [65, 4, 56]*, the code is distance-optimal according to the tables of best codes known in ([\[10](#page-20-5)]).*

3.2. When q *is an odd prime power*

Lemma 9. ([\[21\]](#page-21-13), [\[24](#page-21-14)]) Let $n = \frac{q^m+1}{\lambda}$ and q be an odd prime power, where $m \ge 2$. Then

(a) If $\lambda = 1$ and $q^m \equiv 1 \pmod{4}$, we have the first two largest odd coset leaders modulo n are

$$
\delta_1 = \frac{q^m + 1}{2}, \quad \delta_2 = \frac{q^m - 1}{2} - q^{m-1}.
$$

Moreover, $|C_{\delta_1}| = 1$ *and* $|C_{\delta_2}| = 2m$ *.*

(b) If $\lambda = 2$ *and* $m = 4t + 2 \ge 6$ *, we have*

$$
\delta_{1,n} = \frac{(q-1)^2(q^m+1)}{4(q^2+1)}, \quad \delta_{2,n} = \frac{(q-1)^2(q^m-2q^{m-4}-1)}{4(q^2+1)}.
$$

Moreover, $|C_{\delta_{1,n}}| = 4$ *and* $|C_{\delta_{2,n}}| = 2m$ *.*

Lemma 10. Let q be an odd prime power and $m \equiv 2 \pmod{4}$ with $m \ge 6$, then

$$
\delta_3 = \frac{(q-1)^2(q^m - 2q^{m-4} - 1)}{2(q^2 + 1)} \text{ and } \delta_4 = \begin{cases} \delta_3 - q(q-1)^2, & \text{if } m = 6; \\ \delta_3 - (q-1)^2(q^2 - 1), & \text{if } m > 6. \end{cases}
$$

are the third and fourth largest coset leaders modulo n. Moreover, $|C_{\delta_3}| = |C_{\delta_4}| = 2m$.

Proof. We prove this Lemma in two steps.

Step1. We first prove that $\delta_{3,n} = \delta_3$. From Lemmas [2](#page-2-2) and [9,](#page-9-0) we have $\delta_3 = 2\delta_{2,\frac{n}{2}} \in \text{MinRep}_n$ and $|C_{\delta_3}| = |C_{\delta_2, \frac{n}{2}}| = 2m$, where $C_{\delta_2, \frac{n}{2}}$ is the q-cyclotomic coset modulo $\frac{n}{2}$ of representative $\delta_{2, \frac{n}{2}}$.

Next we claim that δ_3 is the third largest coset leader. Suppose there exists an integer a such that $a \in \text{MinRep}_n$ and $\delta_3 < a < \delta_{2,n}$, where $\delta_{2,n} = \frac{(q-1)^2(q^m+1)}{2(q^2+1)}$ $\frac{(q+1)(q+1)}{2(q^2+1)}$ by Lemma [3.](#page-2-0)

- (1) Note that q is an odd prime power, then $q^m \equiv 3 \pmod{4}$ or $q^m \equiv 1 \pmod{4}$, but $q^m \equiv 3 \pmod{4}$ if and only if $q \equiv 3 \pmod{4}$ and $2 \nmid m$, then $q^m \equiv 1 \pmod{4}$. Hence, $\frac{q^m+1}{2}$ and $\frac{q^m-1}{2} - q^{m-1}$ are the first two largest odd coset leaders by Lemma [9.](#page-9-0) Since $\frac{q^m-1}{2} - q^{m-1} < \delta_3 < a < \frac{q^m+1}{2}$ and $a \in \text{MinRep}_n$, then a is not odd.
- (2) If 2 | a, then $\frac{a}{2} \in \text{MinRep}_{\frac{q^m+1}{2}}$ and $\frac{\delta_3}{2} < \frac{a}{2} < \frac{\delta_{2,n}}{2}$ $\frac{2}{2}$ by Lemma [2.](#page-2-2) Note that $\delta_{2,\frac{q^m+1}{2}} = \frac{\delta_3}{2}$ and $\delta_{1,\frac{q^m+1}{2}}=\frac{\delta_{2,n}}{2}$ ^{2,n} by Lemma [9,](#page-9-0) which contradicts to $\frac{a}{2} \in \text{MinRep}_{\frac{q^m+1}{2}}$.

Therefore, δ_3 is the third largest coset leader.

Step2. We prove that $\delta_{4,n} = \delta_4$.

Case 1. When $m > 6$, it is clear that

$$
\begin{cases} \delta_3 = (\frac{q-3}{2}, \frac{q-1}{2}, \frac{q+1}{2}, \frac{q-3}{2}, \frac{q+1}{2}, \frac{q-1}{2}, \frac{q-3}{2}, \frac{q-1}{2}, ..., \frac{q+1}{2}, \frac{q-1}{2}), \\ \\ \delta_4 = (\frac{q-3}{2}, \frac{q-1}{2}, \frac{q+1}{2}, \frac{q-3}{2}, \frac{q+1}{2}, \frac{q-1}{2}, \frac{q-3}{2}, \frac{q-1}{2}, ..., \frac{q+1}{2}, \frac{q-3}{2}, \frac{q+1}{2}, \frac{q-1}{2}, \frac{q-3}{2}, \frac{q+1}{2}). \end{cases}
$$

From the Lemma [1,](#page-2-1) we can get $\delta_4 \in \text{MinRep}_n$ and $|C_{\delta_4}| = 2m$ by the same way of Lemma [7.](#page-4-3)

We assume that $a \in \text{MinRep}_n$ and $\delta_4 < a < \delta_3$, then the q-adic expansion of a can be written as

$$
a = (\frac{q-3}{2}, \frac{q-1}{2}, \frac{q+1}{2}, \frac{q-3}{2}, \underbrace{\frac{q+1}{2}, \frac{q-1}{2}, \frac{q-3}{2}, \frac{q-1}{2}, \ldots, \frac{q+1}{2}, a_4, a_3, a_2, a_1, a_0)}_{\frac{m-10}{4}},
$$

where $a_4 \leq \frac{q-1}{2}$ and $a_0 \neq 0$. Similar to the proof of Lemma [7,](#page-4-3) we have $a_i \in \{\frac{q-3}{2}, \frac{q-1}{2}, \frac{q+1}{2}\}\$ for $0 \le i \le 4$. Since $a \le [aq^{m-1}]_n$, then $\frac{q-1}{2} \le a_0$.

(1) If $a_4 = \frac{q-1}{2}$. Note that $a < \delta_{3,n}$, then we have $a_3 = \frac{q-3}{2}$, $a_2 = \frac{q-1}{2}$ or $\frac{q-3}{2}$, and it must have $a_1 = \frac{q-1}{2}$ or $\frac{q-3}{2}$ when $a_2 = \frac{q-1}{2}$. Clearly, we have

$$
[aq^{m-4}]_n \leq (\frac{q-3}{2}, \frac{q-1}{2}, \frac{q-1}{2}, \underbrace{q-1, \ldots, q-1}_{m-4}) < a.
$$

(2) If $a_4 = \frac{q-3}{2}$. Note that $\delta_{4,n} < a$, then we have $a_3 = \frac{q+1}{2}$, $a_2 = \frac{q+1}{2}$ or $\frac{q-1}{2}$, and it must have $a_1 = \frac{q+1}{2}$ or $\frac{q-1}{2}$ when $a_2 = \frac{q-1}{2}$. Clearly, we have

$$
n - [aq^{m-4}]_n \leq (\frac{q-3}{2}, \frac{q-1}{2}, \frac{q-1}{2}, \underbrace{q-1, \ldots, q-1}_{m-4}) < a.
$$

Hence, δ_4 is the fourth largest coset leader.

Case 2. When $m = 6$, it is clear that $\delta_4 \leq [\delta_4 q^i]_n$, $n - [\delta_4 q^i]_n$ for any $0 \leq i \leq 5$, then $\delta_4 \in \text{MinRep}_n$ and $|C_{\delta_4}| = 2m$. Similar to **Case 1**, we can get $\delta_{4,n} = \delta_4$.

Thus we complete the proof.

Lemma 11. Let $n = q^2 + 1$ and q be an odd prime power. Then $a \in \text{MinRep}_n$ if and only if $a \in [l(q+1)+1, (l+1)(q-1)]$ *or* $a = \frac{q^2+1}{2}$, where $0 \le l \le \frac{q-3}{2}$. Moreover, $|C_{\frac{q^2+1}{2}}| = 1$ and $|C_a| = 4$ *for any* $a \in \text{MinRep}_n n \{ \frac{q^2+1}{2} \}.$

Proof. The proof is similar to Lemma [8,](#page-7-0) hence we omit the proof.

Based on the above Lemmas, we can obtain the parameters of $\mathcal{C}_{(n,q,\delta,1)}$ and $\mathcal{C}_{(n,q,\delta+1,0)}$ for $\delta_{4,n}+1 \leq$ $\delta \leq \delta_{2,n}$ as follows.

Theorem 2. Let $n = q^m + 1$, where $m = 4t + 2 \ge 2$ and q is an odd prime power, then the following *statements hold:*

(1) The LCD BCH code $C_{(n,q,\delta,1)}$ *has parameters*

$$
\begin{cases} [n,6,d\geq \delta_{3,n}], & \text{if } \delta_{3,n}+1\leq \delta \leq \delta_{2,n};\\ [n,2m+6,d\geq \delta_{4,n}], & \text{if } \delta_{4,n}+1\leq \delta \leq \delta_{3,n}. \end{cases}
$$

(2) The LCD BCH code $C_{(n,q,\delta+1,0)}$ has parameters

□

 \Box

$$
\begin{cases} [n,5,d \ge 2\delta_{3,n}], & \text{if } \delta_{3,n}+1 \le \delta \le \delta_{2,n}; \\ [n,2m+5,d \ge 2\delta_{4,n}], & \text{if } \delta_{4,n}+1 \le \delta \le \delta_{3,n}. \end{cases}
$$

Proof. The results can be obtained directly by Lemmas [3,](#page-2-0) [10](#page-9-1) and [11,](#page-10-0) hence we omit the details. \Box

Example 2. *We provide the following examples based on Theorem [2.](#page-10-1)*

• Let $(q, m) = (7, 2)$ *, we have* $n = 50$ *and* $\delta_{3,n} = 17$ *. Then LCD BCH code* $\mathcal{C}_{(n,q,\delta_{3,n}+1,0)}$ *has parameters* [50, 9, 34]*, the code is distance-optimal according to the tables of best codes known in ([\[10](#page-20-5)]).* • Let $(q, m) = (9, 2)$ *, we have* $n = 82$ *and* $\delta_{3,n} = 31$ *. Then LCD BCH code* $\mathcal{C}_{(n,q,\delta_{3,n}+1,0)}$ *has parameters* [82, 9, 62]*, the code is distance-optimal according to the tables of best codes known in ([\[10](#page-20-5)]).*

4. The LCD BCH Codes of Length $n = \frac{q^m + 1}{\lambda}$ with $\lambda \neq 1$

Throughout this section, let $n = \frac{q^m+1}{\lambda}$ and $\lambda \neq 1$ be a positive divisor of $q+1$, where q is an odd prime power.

4.1. The case of $q + 1 > \lambda \ge 2$

In this subsection, we discuss the coset leaders based on the value of m. We first consider the case of $m = 2t + 1 \geq 5$, where t is an integer.

Lemma 12. Let $n = \frac{q^m+1}{\lambda}$, where $m = 2t + 1 \ge 5$. Let $f(a, b, c) = \frac{q^{t+1}+1}{\lambda} + a\frac{q^t-1}{\lambda} + bq^t + c$ and $g(a, b, c, d) = \frac{q^{t+1}-1}{\lambda} + a\frac{q^t+1}{\lambda} + bq^t + c$, where a, b, c, d are integers. We assume that

$$
If \ 2 \mid t, \begin{cases} T_1 = \{f(0,0,c) : -\frac{q}{\lambda} \le c \le \frac{q-2}{\lambda} \}; \\ T_2 = \{f(0,b,0) : 1 \le b \le \frac{q-1}{\lambda} \}; \\ T_3 = \{f(2,b,0) : 0 \le b \le \frac{q-3}{\lambda} \}. \end{cases} \quad \quad \text{if} \ 2 \nmid t, \begin{cases} T_1 = \{g(0,0,c) : -\frac{q-2}{\lambda} \le c \le \frac{q}{\lambda} \}; \\ T_2 = \{g(0,b,0) : 1 \le b \le \frac{q-1}{\lambda} \}; \\ T_3 = \{g(2,b,0) : 0 \le b \le \frac{q-3}{\lambda} \}. \end{cases}
$$

Then we have

 (1) If $1 \leq i < \frac{2q^{t+1}-2q+1}{\lambda}$ with $i \not\equiv 0 \pmod{q}$, then i is a coset leader modulo $\frac{q^m+1}{\lambda}$ except $i \in$ $T_1 \cup T_2 \cup T_3$ and $|C_i| = 2m$.

(2) If
$$
\frac{2q^{t+1}-2q+1}{\lambda} \leq i \leq \frac{2q^{t+1}+2q-1}{\lambda}
$$
, then *i* is not a coset leader.

Proof. We only prove the conclusion (1), as the proof of (2) is similar. If $1 \leq i < \frac{2q^{t+1}-2q+1}{\lambda}$ with $i \not\equiv 0 \pmod{q}$, we know that $i \notin \text{MinRep}_n$ if and only if $\lambda i \notin \text{MinRep}_{q^m+1}$ with $\lambda i \not\equiv 0 \pmod{q}$ by Lemma [2.](#page-2-2) From Lemma [4,](#page-2-3) we know that $\lambda i \notin \text{MinRep}_{q^m+1}$ with $\lambda i \not\equiv 0 \pmod{q}$ only when

$$
\lambda i = q^{t+1} \pm \gamma \text{ or } \lambda i = q^{t+1} + \alpha q^t \pm 1,
$$

where $\gamma, \alpha \in [1, q-1]$.

We divide t into two cases to get our results.

(i) If 2 | t, then $\lambda | (q^{t+1} + 1)$ and $\lambda | (q^t - 1)$.

For $\lambda i = q^{t+1} \pm \gamma$ with $1 \leq \gamma \leq q-1$, then $i = \frac{q^{t+1}+1}{\lambda} + \frac{l}{\lambda}$ with $l \in [-q, -2] \cup [0, q-2]$. Since $\lambda \geq 2$, then $\frac{-1}{\lambda}$ is not an integer, i.e., $\{i = \frac{q^{t+1}+1}{\lambda} + c : -\frac{q}{\lambda} \leq c \leq \frac{q-2}{\lambda}\} = T_1$. For $\lambda i = q^{t+1} + \alpha q^t + 1$, we get that $i = \frac{q^{t+1}+1}{\lambda} + \frac{\alpha}{\lambda} q^t$. Note that $1 \leq \alpha \leq q-1$, then we have $\frac{1}{\lambda} \leq \frac{\alpha}{\lambda} \leq \frac{q-1}{\lambda}$. Since $\lambda \geq 2$, then $\{i = \frac{q^{t+1}+1}{\lambda} + bq^t : 1 \leq b \leq \frac{q-1}{\lambda}\} = T_2$. For $\lambda i = q^{t+1} + \alpha q^t - 1 = (q^{t+1} + 1) + (\alpha - 2)q^t + 2(q^t - 1)$, we get that $i = \frac{q^{t+1} + 1}{\lambda} + \frac{2(q^t - 1)}{\lambda} + \frac{\alpha - 2}{\lambda}q^t$. Since $\lambda \ge 2$ and $1 \le \alpha \le q-1$, then $\{i = \frac{q^{t+1}+1}{\lambda} + \frac{2(q^t-1)}{\lambda} + bq^t : 0 \le b \le \frac{q-3}{\lambda}\} = T_3$.

(ii) If $2 \nmid t$, then $\lambda \mid (q^{t} + 1)$ and $\lambda \mid (q^{t+1} - 1)$. With the same discussion of the case $2 \nmid t$, we can obtain T_1, T_2 and T_3 .

Moreover, we have $|C_i| = |C_{\lambda i}| = 2m$ $|C_i| = |C_{\lambda i}| = 2m$ $|C_i| = |C_{\lambda i}| = 2m$ by Lemmas 2 and [4.](#page-2-3) Thus we complete the proof.

 \Box

Corollary 1. Let $n = \frac{q^m+1}{\lambda}$ and $m = 2t + 1 \ge 5$, then

- *(1)* If 2 | t, the smallest i such that $i \not\equiv 0 \pmod{q}$ and $i \notin \text{MinRep}_n$ is $\frac{q^{t+1}+1}{\lambda} \lfloor \frac{q}{\lambda} \rfloor$.
- *(2)* If $2 \nmid t$, the smallest i such that $i \not\equiv 0 \pmod{q}$ and $i \notin \text{MinRep}_n$ is $\frac{q^{t+1}-1}{\lambda} \lfloor \frac{q-2}{\lambda} \rfloor$.

Proof. Note that $t \geq 2$ and $2 \leq \lambda \leq \frac{q+1}{2}$, it is clear that $min(T_1, T_2, T_3)$ $\sqrt{ }$ \int \mathcal{L} $\frac{q^{t+1}+1}{\lambda}-\lfloor \frac{q}{\lambda} \rfloor, \qquad if \; 2 \mid t$ $\frac{q^{t+1}-1}{\lambda}-\lfloor \frac{q-2}{\lambda} \rfloor, \quad if \; 2 \nmid t$, where the definition of T_1, T_2, T_3 are given by Lemma [12.](#page-11-0) Thus we complete the

Next we will investigate the parameters of the BCH codes $\mathcal{C}_{(n,q,\delta,1)}$ and $\mathcal{C}_{(n,q,\delta+1,0)}$, where $1 \leq$ $\delta - 1 \leq \frac{2q^{t+1} + 2q - 1}{\lambda}$.

Theorem 3. Let $n = \frac{q^m+1}{\lambda}$ and $\epsilon = \lfloor (\delta-1)(1-q^{-1}) \rfloor$, where $m = 2t + 1 \ge 5$ and $2 \le \lambda < q + 1$. If $2 \mid t \text{ and } 1 \leq \delta - 1 \leq \frac{2q^{t+1}+2q-1}{\lambda}, \text{ then } LCD \text{ } BCH \text{ } code \text{ } \mathcal{C}_{(n,q,\delta,1)} \text{ has parameters } [\frac{q^m+1}{\lambda}, k, d \geq \delta] \text{ and }$ $\mathcal{C}_{(n,q,\delta+1,0)}$ has parameters $\left[\frac{q^m+1}{\lambda}, k-1, d\geq 2\delta\right]$, where k is given as follows. *(1)* If $2 \le \delta \le \frac{q^{t+1}+1}{\lambda} + \frac{2(q^t-1)}{\lambda}$ $\frac{d^2-1}{\lambda}$, define $v = \lfloor \frac{q-2}{\lambda} \rfloor + \lfloor \frac{q}{\lambda} \rfloor$. Then

$$
k = \begin{cases} n - 2m\epsilon, & \text{if } 2 \le \delta \le \frac{q^{t+1} + 1}{\lambda} - \lfloor \frac{q}{\lambda} \rfloor; \\ n - 2m\epsilon + 2m(\delta - \frac{q^{t+1} + 1}{\lambda} + \lfloor \frac{q}{\lambda} \rfloor), & \text{if } \frac{q^{t+1} + 1}{\lambda} - \lfloor \frac{q}{\lambda} \rfloor < \delta \le \frac{q^{t+1} + 1}{\lambda} + \lfloor \frac{q-2}{\lambda} \rfloor; \\ n - 2m(\epsilon - \upsilon - 1), & \text{if } \frac{q^{t+1} + 1}{\lambda} + \lfloor \frac{q-2}{\lambda} \rfloor < \delta \le \frac{q^{t+1} + 1}{\lambda} + \frac{2(q^t - 1)}{\lambda}. \end{cases}
$$

 $\left(\begin{array}{c} \mathcal{L} \end{array}\right)$ $\neq 0$ and $\frac{q^{t+1}+1}{\lambda} + \frac{2(q^t-1)}{\lambda} < \delta \leq \frac{q^{t+1}+1}{\lambda} + \frac{2(q^t-1)}{\lambda} + \left[\frac{q-3}{\lambda}\right]q^t$, let $a \in [0, \lfloor \frac{q-3}{\lambda} \rfloor - 1]$ be an *integer. Then*

$$
k = \begin{cases} n - 2m(\epsilon - \upsilon - 2a - 2), & \text{if } \frac{q^{t+1} + 1}{\lambda} + \frac{2(q^t - 1)}{\lambda} + aq^t < \delta \le \frac{q^{t+1} + 1}{\lambda} + (a+1)q^t; \\ n - 2m(\epsilon - \upsilon - 2a - 3), & \text{if } \frac{q^{t+1} + 1}{\lambda} + (a+1)q^t < \delta \le \frac{q^{t+1} + 1}{\lambda} + \frac{2(q^t - 1)}{\lambda} + (a+1)q^t. \end{cases}
$$
\n
$$
(3) \text{ If } \frac{q^{t+1} + 1}{\lambda} + \frac{2(q^t - 1)}{\lambda} + \left[\frac{q - 3}{\lambda}\right]q^t < \delta \le \frac{2q^{t+1} + 2q - 1}{\lambda} + 1, \text{ define } \kappa = 2\frac{q^{t+1} + 1}{\lambda} - \left[\frac{2q + 1}{\lambda}\right] \text{ and } \tau = \lceil (\kappa - 1)(1 - q^{-1}) \rceil.
$$

(i) If $\left\lfloor \frac{q-1}{\lambda} \right\rfloor = \left\lfloor \frac{q-3}{\lambda} \right\rfloor$ *, then*

$$
k = \begin{cases} n - 2m(\epsilon - \upsilon - 2\lfloor \frac{q-1}{\lambda} \rfloor - 2), & \text{if } \frac{q^{t+1}+1}{\lambda} + \frac{2(q^t-1)}{\lambda} + \lfloor \frac{q-3}{\lambda} \rfloor q^t < \delta \le \kappa; \\ n - 2m(\tau - \upsilon - 2\lfloor \frac{q-1}{\lambda} \rfloor - 2), & \text{if } \kappa < \delta \le \frac{2q^{t+1}+2q-1}{\lambda} + 1. \end{cases}
$$

(ii) If $\left\lfloor \frac{q-1}{\lambda} \right\rfloor = \left\lfloor \frac{q-3}{\lambda} \right\rfloor + 1$ *, then*

$$
k = \begin{cases} n - 2m(\epsilon - \upsilon - 2\lfloor \frac{q-1}{\lambda} \rfloor), & \text{if } \frac{q^{t+1} + 1}{\lambda} + \frac{2(q^t - 1)}{\lambda} + \lfloor \frac{q-3}{\lambda} \rfloor q^t < \delta \le \frac{q^{t+1} + 1}{\lambda} + \lfloor \frac{q-1}{\lambda} \rfloor q^t; \\ n - 2m(\epsilon - \upsilon - 2\lfloor \frac{q-1}{\lambda} \rfloor - 1), & \text{if } \frac{q^{t+1} + 1}{\lambda} + \lfloor \frac{q-1}{\lambda} \rfloor q^t < \delta \le \kappa; \\ n - 2m(\tau - \upsilon - 2\lfloor \frac{q-1}{\lambda} \rfloor - 1), & \text{if } \kappa < \delta \le \frac{2q^{t+1} + 2q - 1}{\lambda} + 1. \end{cases}
$$

Proof. We only prove the conclusion (3) , as the proofs for other cases are similar. It is clear that $d(C_{(n,q,\delta,1)}) \geq \delta$ and $d(C_{(n,q,\delta+1,0)}) \geq 2\delta$ by the BCH bound. T and T' are denoted as the defining sets of $\mathcal{C}_{(n,q,\delta,1)}$ and $\mathcal{C}_{(n,q,\delta+1,0)}$, respectively. Note that $T = T' n\{0\}$, we have $dim(\mathcal{C}_{(n,q,\delta,1)}) =$ $dim(\mathcal{C}_{(n,q,\delta+1,0)}) + 1$, then we only need to discuss the dimension of $\mathcal{C}_{(n,q,\delta,1)}$.

Case 1: For $\frac{q^{t+1}+1}{\lambda}+\frac{2(q^t-1)}{\lambda}+\left[\frac{q-3}{\lambda}\right]q^t < \delta \leq \kappa$, let $\Gamma = \{a: 1 \leq a \leq \delta-1, a \not\equiv 0 \pmod{q}\}$, then $i \in \Gamma$ is a coset leader except $i \in T_1 \cup T_2 \cup T_3$ and $|C_i| = 2m$ for any $\delta \leq \lceil \frac{2q^{t+1}-2q+1}{\lambda} \rceil = \kappa$ by Lemma [12,](#page-11-0) where T_1, T_2, T_3 are given by Lemma [12.](#page-11-0) Then

$$
k = n - 2m(|\Gamma| - \sum_{i=1}^{3} |\Gamma \cap T_i|),
$$
\n(4)

it is clear that $|\Gamma| = |(\delta - 1)(1 - q^{-1})|$, then we need to calculate the values of $|\Gamma \cap T_i|$.

(i) If $\left\lfloor \frac{q-1}{\lambda} \right\rfloor = \left\lfloor \frac{q-3}{\lambda} \right\rfloor$, we have $max\{T_1, T_2, T_3\} = \frac{q^{t+1}+1}{\lambda} + \frac{2(q^t-1)}{\lambda} + \left\lfloor \frac{q-3}{\lambda} \right\rfloor q^t \leq \delta - 1$. Then

$$
\Gamma \cap T_1 = \{ \frac{q^{t+1} + 1}{\lambda} + c : -\lfloor \frac{q}{\lambda} \rfloor \le c \le \lfloor \frac{q-2}{\lambda} \rfloor \},
$$

$$
\Gamma \cap T_2 = \{ \frac{q^{t+1} + 1}{\lambda} + bq^t : 1 \le b \le \lfloor \frac{q-1}{\lambda} \rfloor \},
$$

$$
\Gamma \cap T_3 = \{ \frac{q^{t+1} + 1}{\lambda} + \frac{2(q^t - 1)}{\lambda} + bq^t : 0 \le b \le \lfloor \frac{q-3}{\lambda} \rfloor \}.
$$

It is clear that $|\Gamma \cap T_1| = \lfloor \frac{q-2}{\lambda} \rfloor + \lfloor \frac{q}{\lambda} \rfloor + 1 = \nu + 1, |\Gamma \cap T_2| = \lfloor \frac{q-1}{\lambda} \rfloor$ and $|\Gamma \cap T_3| = \lfloor \frac{q-1}{\lambda} \rfloor + 1$, then $dim(\mathcal{C}_{(n,q,\delta,1)})$ can be obtained by [\(4\)](#page-13-0).

(ii) If $\left\lfloor \frac{q-1}{\lambda} \right\rfloor = \left\lfloor \frac{q-3}{\lambda} \right\rfloor + 1$, note that $i \in T_1 \cup T_2 \cup T_3$ and $\frac{q^{t+1}+1}{\lambda} + \frac{2(q^t-1)}{\lambda} + \left\lfloor \frac{q-3}{\lambda} \right\rfloor q^t < i$ if and only if $i = \frac{q^{t+1}+1}{\lambda} + \lfloor \frac{q-1}{\lambda} \rfloor q^t \in T_2$. Then we have

$$
\Gamma \cap T_1 = \left\{ \frac{q^{t+1}+1}{\lambda} + c : -\left\lfloor \frac{q}{\lambda} \right\rfloor \leq c \leq \left\lfloor \frac{q-2}{\lambda} \right\rfloor \right\},
$$
\n
$$
\Gamma \cap T_3 = \left\{ \frac{q^{t+1}+1}{\lambda} + \frac{2(q^t-1)}{\lambda} + bq^t : 0 \leq b \leq \left\lfloor \frac{q-3}{\lambda} \right\rfloor \right\},
$$
\n
$$
\Gamma \cap T_2 = \left\{ \frac{q^{t+1}+1}{\lambda} + bq^t : 1 \leq b \leq \left\lfloor \frac{q-3}{\lambda} \right\rfloor \right\}, \quad \text{if } \omega < \delta \leq \frac{q^{t+1}+1}{\lambda} + \left\lfloor \frac{q-1}{\lambda} \right\rfloor q^t;
$$
\n
$$
\left\{ \frac{q^{t+1}+1}{\lambda} + bq^t : 1 \leq b \leq \left\lfloor \frac{q-1}{\lambda} \right\rfloor \right\}, \quad \text{if } \frac{q^{t+1}+1}{\lambda} + \left\lfloor \frac{q-1}{\lambda} \right\rfloor q^t < \delta \leq \kappa,
$$

where $\omega = \frac{q^{t+1}+1}{\lambda} + \frac{2(q^t-1)}{\lambda} + \left[\frac{q-3}{\lambda}\right]q^t$, then $dim(\mathcal{C}_{(n,q,\delta,1)})$ can be obtaioned by [\(4\)](#page-13-0).

Case 2: For $\kappa < \delta \leq \frac{2q^{t+1}+2q-1}{\lambda}+1$, we have $i \notin \text{MinRep}_n$ for any $i \in [\kappa, \delta-1]$, then $dim(\mathcal{C}_{(n,q,\delta,1)})=$ $dim(\mathcal{C}_{(n,q,\kappa,1)}).$

Thus we complete the proof.

Theorem 4. Let $n = \frac{q^m+1}{\lambda}$ and $\epsilon = \lfloor (\delta-1)(1-q^{-1}) \rfloor$, where $m = 2t + 1 \ge 5$ and $2 \le \lambda < q + 1$. If $2 \nmid t$ and $1 \leq \delta - 1 \leq \frac{2q^{t+1} + 2q - 1}{\lambda}$, then LCD BCH code $\mathcal{C}_{(n,q,\delta,1)}$ has parameters $\left[\frac{q^m+1}{\lambda}, k, d \geq \delta\right]$ and $\mathcal{C}_{(n,q,\delta+1,0)}$ has parameters $\left[\frac{q^m+1}{\lambda}, k-1, d \geq 2\delta\right]$, where k is given as follows. *(1) If* $2 \le \delta \le \frac{q^{t+1}-1}{\lambda} + \frac{2(q^t+1)}{\lambda}$ $\frac{\sqrt{t+1}}{\lambda}$, define $v = \lfloor \frac{q-2}{\lambda} \rfloor + \lfloor \frac{q}{\lambda} \rfloor$. Then

$$
k = \begin{cases} n - 2m\epsilon, & \text{if } 2 \le \delta \le \frac{q^{t+1} - 1}{\lambda} - \left\lfloor \frac{q-2}{\lambda} \right\rfloor; \\ n - 2m\epsilon + 2m(\delta - \frac{q^{t+1} - 1}{\lambda} + \left\lfloor \frac{q-2}{\lambda} \right\rfloor), & \text{if } \frac{q^{t+1} - 1}{\lambda} - \left\lfloor \frac{q-2}{\lambda} \right\rfloor < \delta \le \frac{q^{t+1} - 1}{\lambda} + \left\lfloor \frac{q}{\lambda} \right\rfloor; \\ n - 2m(\epsilon - \upsilon - 1), & \text{if } \frac{q^{t+1} - 1}{\lambda} + \left\lfloor \frac{q}{\lambda} \right\rfloor < \delta \le \frac{q^{t+1} - 1}{\lambda} + \frac{2(q^t + 1)}{\lambda}. \end{cases}
$$

 $\left(\begin{array}{c}2\end{array}\right)$ *H* $\left\lfloor \frac{q-3}{\lambda} \right\rfloor \neq 0$ and $\frac{q^{t+1}-1}{\lambda} + \frac{2(q^t+1)}{\lambda} < \delta \leq \frac{q^{t+1}-1}{\lambda} + \frac{2(q^t+1)}{\lambda} + \left\lfloor \frac{q-3}{\lambda} \right\rfloor q^t$, let $a \in [0, \left\lfloor \frac{q-3}{\lambda} \right\rfloor - 1]$ be an *integer. Then*

$$
k = \begin{cases} n - 2m(\epsilon - \upsilon - 2a - 2), & \text{if } \frac{q^{t+1} - 1}{\lambda} + \frac{2(q^t + 1)}{\lambda} + aq^t < \delta \le \frac{q^{t+1} - 1}{\lambda} + (a+1)q^t; \\ n - 2m(\epsilon - \upsilon - 2a - 3), & \text{if } \frac{q^{t+1} - 1}{\lambda} + (a+1)q^t < \delta \le \frac{q^{t+1} - 1}{\lambda} + \frac{2(q^t + 1)}{\lambda} + (a+1)q^t. \end{cases}
$$
\n
$$
(3) \text{ If } \frac{q^{t+1} - 1}{\lambda} + \frac{2(q^t + 1)}{\lambda} + \left[\frac{q - 3}{\lambda}\right]q^t < \delta \le \frac{2q^{t+1} + 2q - 1}{\lambda} + 1, \text{ define } \kappa = 2\frac{q^{t+1} - 1}{\lambda} - \left[\frac{2q - 3}{\lambda}\right] \text{ and } \tau = \lceil (\kappa - 1)(1 - q^{-1}) \rceil.
$$

(i) If
$$
\left\lfloor \frac{q-1}{\lambda} \right\rfloor = \left\lfloor \frac{q-3}{\lambda} \right\rfloor
$$
, then
\n
$$
k = \begin{cases} n - 2m(\epsilon - \upsilon - 2\left\lfloor \frac{q-1}{\lambda} \right\rfloor - 2), & \text{if } \frac{q^{t+1} - 1}{\lambda} + \frac{2(q^t + 1)}{\lambda} + \left\lfloor \frac{q-3}{\lambda} \right\rfloor q^t < \delta \le \kappa; \\ n - 2m(\tau - \upsilon - 2\left\lfloor \frac{q-1}{\lambda} \right\rfloor - 2), & \text{if } \kappa < \delta \le \frac{2q^{t+1} + 2q - 1}{\lambda} + 1. \end{cases}
$$

(ii) If $\left\lfloor \frac{q-1}{\lambda} \right\rfloor = \left\lfloor \frac{q-3}{\lambda} \right\rfloor + 1$ *, then*

$$
k = \begin{cases} n - 2m(\epsilon - \upsilon - 2\lfloor \frac{q-1}{\lambda} \rfloor), & \text{if } \frac{q^{t+1} - 1}{\lambda} + \frac{2(q^t + 1)}{\lambda} + \lfloor \frac{q-3}{\lambda} \rfloor q^t < \delta \le \frac{q^{t+1} - 1}{\lambda} + \lfloor \frac{q-1}{\lambda} \rfloor q^t; \\ n - 2m(\epsilon - \upsilon - 2\lfloor \frac{q-1}{\lambda} \rfloor - 1), & \text{if } \frac{q^{t+1} - 1}{\lambda} + \lfloor \frac{q-1}{\lambda} \rfloor q^t < \delta \le \kappa; \\ n - 2m(\tau - \upsilon - 2\lfloor \frac{q-1}{\lambda} \rfloor - 1), & \text{if } \kappa < \delta \le \frac{2q^{t+1} + 2q - 1}{\lambda} + 1. \end{cases}
$$

Proof. From Lemma [12,](#page-11-0) we can obtain the results following the same way of Theorem [3.](#page-12-0)

 \Box

Theorem 5. Let $n = \frac{q^3+1}{2}$ and $\epsilon = \lfloor (\delta-1)(1-q^{-1}) \rfloor$. For any integer δ with $1 \leq \delta - 1 \leq \frac{q^2-1}{2}$, then $\mathcal{C}_{(n,q,\delta,1)}$ *has parameters* $\left[\frac{q^3+1}{2},k,d\geq \delta\right]$ *and* $\mathcal{C}_{(n,q,\delta+1,0)}$ *has parameters* $\left[\frac{q^3+1}{2},k-1,d\geq 2\delta\right]$ *, where*

$$
k = \begin{cases} n - 6\epsilon, & \text{if } 2 \le \delta \le \frac{q^2 - 1}{2} - \frac{q - 3}{2}; \\ n - 6\epsilon + 6(\delta - \frac{q^2 - 1}{2} + \lfloor \frac{q - 2}{2} \rfloor), & \text{if } \frac{q^2 - 1}{2} - \frac{q - 3}{2} < \delta \le \frac{q^2 - 1}{2} + 1. \end{cases}
$$

Proof. If $1 \leq i \leq \frac{q^2-1}{2}$ and $i \not\equiv 0 \pmod{q}$, then we have $i \in \text{MinRep}_n$ with $|C_i| = 2m = 6$ except that $i = \frac{q^2-1}{2} - a$ by Lemmas [2](#page-2-2) and [4,](#page-2-3) where $0 \le a \le \lfloor \frac{q-2}{2} \rfloor$ is an integer. Following the same way of Theorem [3,](#page-12-0) we can obtain the results. \Box

 \Box

Remark 1. *For* $n = \frac{q^m+1}{2}$, where $q \equiv 3 \pmod{4}$ and $m = 2t + 1 \ge 5$. We have

$$
\delta_1 = \frac{q^m + 1}{4}, \ \delta_2 = \frac{q^m - 1}{4} - \frac{q^{m-1}}{2}, \ \delta_3 = \delta_2 - \frac{q-1}{2}.
$$

are the first there largest coset leaders modulo n. Moreover, $|C_{\delta_1}| = 1$ *and* $|C_{\delta_2}| = |C_{\delta_3}| = 2m$.

Proof. By Lemmas [2](#page-2-2) and [3,](#page-2-0) we can get $\delta_1 \in \text{MinRep}_n$ with $|C_{\delta_1}| = 1$ and there is no coset leader in $[\delta_1 + 1, n - 1]$, i.e., $\delta_{1,n} = \delta_1$. When $q \equiv 3 \pmod{4}$ and $m = 2t + 1 \ge 5$, we have $\frac{q^{m}-1}{2} - q^{m-1} \in$ MinRep_q_{m+1}and $\frac{q^m-1}{2} - q^{m-1} + 2\mu \notin \text{MinRep}_{q^m+1}$ for $1 \leq \mu \leq \frac{q^{m-1}-1}{2}$ by the same way of [[\[21\]](#page-21-13), Lemma 22, which implies that $\delta_2 \in \text{MinRep}_n$ with $|C_{\delta_2}| = 2m$ and there is no coset leader in $[\delta_2 + 1, \delta_1 - 1]$ $[\delta_2 + 1, \delta_1 - 1]$ $[\delta_2 + 1, \delta_1 - 1]$ by Lemma [2,](#page-2-2) i.e., $\delta_{2,n} = \delta_2$. From Lemma [2](#page-2-2) and [[\[21](#page-21-13)], Lemma 23], we have $\delta_{3,n} = \delta_3$ and $|C_{\delta_3}| = 2m$ similarly. \Box

Example 3. *Based on the above theorems, we have the following examples.* • Let $(q, m) = (5, 3)$ and $\lambda = 2$, we have $n = \frac{q^3 + 1}{2} = 63$. The LCD BCH code $\mathcal{C}_{(n,q,3,0)}$ has parameters [63, 56, 4]*, the code is distance-optimal according to the tables of best codes known in ([\[10](#page-20-5)]).* • Let $(q, m) = (5, 5)$ and $\lambda = 3$, we have $n = \frac{q^5 + 1}{3} = 1042$. The LCD BCH code $\mathcal{C}_{(n,q,51,0)}$ has *parameters* [1042, 671, ≥ 100]*, the dimension is consistent with what was given in Theorem [3.](#page-12-0)*

Next we will consider the case of $m = 2t \geq 4$, where t is an integer. In this case, we only cosider that $\lambda = 2$. For $n = \frac{q^m + 1}{2}$, we already know all coset leaders for $1 \leq i \leq \frac{q^t}{2}$ $\frac{1}{2}$ in [\[23\]](#page-21-12).

Lemma 13. *([\[22](#page-21-8)])* Let $n = q^m + 1$ and $m = 2t \ge 8$. For $q^t \le a \le q^{t+1}$ with $a \not\equiv 0 \pmod{q}$, then a is *a* coset leader and $|C_a| = 2m$ *except that* $a \in A_1 \cup A_2 \cup A_3$ *, where*

$$
\begin{cases}\nA_1 = \{a_t q^t + a_0 : 1 \le a_0 \le a_t \le q - 1\}, \\
A_2 = \{a_t q^t - a_0 : 1 \le a_0 < a_t \le q - 1\}, \\
A_3 = \{a : q^{t+1} - q^2 + 1 \le a \le q^{t+1}, q \nmid a\}.\n\end{cases}
$$

Lemma 14. Let $n = \frac{q^m + 1}{2}$ and $m = 2t \ge 4$.

- *(1)* If $\frac{q^t+1}{2} \leq i \leq q^t + 1$ and $i \not\equiv 0 \pmod{q}$. Then *i* is a coset leader and $|C_i| = 2m$ except $i = \frac{q^t+1}{2}$ *or* $i = q^t + 1$ *.*
- (2) If $m = 2t \geq 8$ and $\frac{q^t+1}{2} \leq i \leq \frac{q^{t+1}-1}{2}$ with $i \not\equiv 0 \pmod{q}$. Then i is a coset leader and $|C_i| = 2m$ $except i \in X_1 \cup X_2 \cup X_3 \cup X_4 \cup X_5$ *, where*

$$
\begin{cases}\nX_1 = \{aq^t + b : 1 \le b \le a \le \frac{q-1}{2}\}, \\
X_2 = \{aq^t - b : 1 \le b < a \le \frac{q-1}{2}\}, \\
X_3 = \{aq^t + \frac{q^t - 1}{2} + b, aq^t + \frac{q^t + 1}{2} - b : 1 \le b \le a < \frac{q-1}{2}\}, \\
X_4 = \{a(q^t + 1) + \frac{q^t + 1}{2} : 0 \le a < \frac{q-1}{2}\}, \\
X_5 = \{i : \frac{q^{t+1} - q^2}{2} + 1 \le i \le \frac{q^{t+1} - 1}{2} \text{ and } q \nmid i\}.\n\end{cases}
$$

Proof. We only prove the conclusion (2), as (1) can be similarly obtained by Lemma [4.](#page-2-3) By Lemma [2,](#page-2-2) we have $i \in \text{MinRep}_n$ with $\frac{q^t+1}{2} \leq i \leq \frac{q^{t+1}-1}{2}$ and $i \not\equiv 0 \pmod{q}$ except that $2i \in A_1 \cup A_2 \cup A_3$, where A_1, A_2, A_3 are defined in the Lemma [13.](#page-15-0)

We divide i into three cases to prove our results.

(i) If $2i \in A_1$, then $2i = a_t q^t + a_0$, where $1 \le a_0 \le a_t \le q - 1$. If $2 \mid a_t$, then $2 \mid a_0$. Denote that $a_t = 2a$ and $a_0 = 2b$, then $i = aq^t + b$, where $1 \le b \le a \le \frac{q-1}{2}$. That is X_1 .

If $2 \nmid a_t$, then we can assume that $a_t = 2a + 1$, where $0 \le a < \frac{q-1}{2}$. Note that $2i = a_t(q^t - 1) +$ $a_t + a_0$, then $a_t + a_0 \equiv 0 \pmod{2}$, then we can assume that $a_0 = 2b - 1$, where $b \ge 1$. Since $a_t - a_0 = 2(a - b) + 2 \ge 0$, then $a - b \ge -1$. We will continue our discussion by distinguishing between the following two subcases.

- If $a - b \ge 0$, then we have $1 \le b \le a < \frac{q-1}{2}$ and $2i = (2a+1)q^t + 2b - 1$, i.e., $\{aq^t + \frac{q^t-1}{2} + b$: $1 \leq b \leq a < \frac{q-1}{2} \} \subset X_3.$ - If $a - b = -1$, then we have $0 \le a < \frac{q-1}{2}$ and $2i = (2a+1)q^t + 2a+1$, i.e., $\{a(q^t+1) + \frac{q^t+1}{2}$: $0 \leq a < \frac{q-1}{2}$ } = X_4 .

(ii) If $2i \in A_2$, then we can get $i \in X_2 \cup \{aq^t + \frac{q^t+1}{2} + b : 1 \le b \le a < \frac{q-1}{2}\}\$ by the same way of (i).

(iii) If $2i \in A_3$, then we have $q^{t+1}-q^2+1 \leq 2i \leq q^{t+1}$ and $q \nmid 2i$, i.e., $\{i : \frac{q^{t+1}-q^2}{2}+1 \leq i \leq \frac{q^{t+1}-1}{2}, q \nmid 2i \leq j \leq t+1\}$ i } = X_5 .

By Lemmas [2](#page-2-2) and [13,](#page-15-0) we have $|C_i| = 2m$ for any $i \in \text{MinRep}_n$ with $\frac{q^t + 1}{2} \le i \le \frac{q^{t+1}-1}{2}$. Thus we complete the proof. \Box

Theorem 6. Let $n = \frac{q^m + 1}{2}$ and $\epsilon = \lfloor (\delta - 1)(1 - q^{-1}) \rfloor$. Then we have

- (1) If $m = 2t \geq 4$ and $\frac{q^t+1}{2} \leq \delta 1 \leq q^t$, then LCD BCH code $\mathcal{C}_{(n,q,\delta,1)}$ has parameters $\left[\frac{q^m+1}{2},k,d\right]$ δ] *and* $\mathcal{C}_{(n,q,\delta+1,0)}$ *has parameters* $\left[\frac{q^m+1}{2}, k-1, d \ge 2\delta\right]$ *, where* $k = n - 2m(\epsilon - 1)$ *.*
- (2) If $m = 2t \geq 8$ and $q^t + 1 \leq \delta 1 \leq \frac{q^{t+1}-1}{2}$, where $q \geq 5$. Then LCD BCH code $\mathcal{C}_{(n,q,\delta,1)}$ has $parameters\ [\frac{q^m+1}{2}, k, d \geq \delta]$ and $\mathcal{C}_{(n,q,\delta+1,0)}$ has parameters $[\frac{q^m+1}{2}, k-1, d \geq 2\delta]$, where

$$
k = \begin{cases} n - 2m(\epsilon - 2a^2), & \text{if } a(q^t + 1) < \delta \le a(q^t - 1) + \frac{q^t + 1}{2}; \\ n - 2m(\epsilon - 2a^2) + 2m(\delta - [a(q^t - 1) + \frac{q^t + 1}{2}]), & \text{if } a(q^t - 1) + \frac{q^t + 1}{2} < \delta \le a(q^t + 1) + \frac{q^t + 1}{2}; \\ n - 2m(\epsilon - 2a^2 - 2a - 1), & \text{if } a(q^t + 1) + \frac{q^t + 1}{2} < \delta \le (a + 1)(q^t - 1) + 1; \\ n - 2m(\epsilon + (a + 1)q^t - \delta - 2a^2 - 3a - 1), & \text{if } (a + 1)(q^t - 1) + 1 < \delta \le (a + 1)(q^t + 1), \\ \text{and } 1 \le a < \frac{q - 1}{2}. \end{cases}
$$

Proof. From Lemma [14,](#page-15-1) we can obtain the results following the same way of Theorem [3.](#page-12-0)

 \Box

Example 4. *Based on the above theorems, we have the following examples.*

• Let $(q, m) = (3, 4)$, we have $n = \frac{q^4 + 1}{2} = 41$. Then LCD BCH code $\mathcal{C}_{(n,q,9,0)}$ has parameters [41, 8, 22], *the code is distance-optimal according to the tables of best codes known in ([\[10](#page-20-5)]).*

• Let $(q, m) = (5, 4)$, we have $n = \frac{q^4 + 1}{2} = 313$. Then LCD BCH code $\mathcal{C}_{(n,q,40,0)}$ has parameters $[313, 96, \geq 78]$, the dimension is consistent with what was given in Theorem [6.](#page-16-0)

4.2. The the case of $\lambda = q + 1$

In this subsection, we assume that $n = \frac{q^m+1}{q+1}$ and denote the q-cyclotomic coset modulo n of representative s as $C_{s,n}$, where $m = 2t + 1 \geq 5$ is an integer.

Lemma 15. *([\[22](#page-21-8)],[\[24\]](#page-21-14))* Let $n = \frac{q^m + 1}{\lambda}$ and $2 \nmid m$, then

- *(a)* If $\lambda = 2$ and $q \equiv 3 \pmod{4}$, we have $\delta_{1,n} = \frac{q^m + 1}{4}$ with $|C_{\delta_{1,n}}| = 1$ and $\delta_{2,n} = \frac{(q-1)q^{m-1}}{2} \frac{q^m + 1}{4}$ *with* $|C_{\delta_{2,n}}| = 2m$.
- *(b)* If $\lambda = q + 1$ and $1 \le a \le q^{\frac{m-1}{2}}$ with $a \equiv 0 \pmod{q}$, then a is a coset leader with $|C_a| = 2m$ *except that* $a = \frac{q^{\frac{m+1}{2}} - (-1)^{\frac{m+1}{2}}}{q+1}$.

Lemma 16. *If* $m = 2t + 1 \ge 5$, *let i be an integer with* $q^t + 1 \le i \le \frac{2q^{t+1} + 2q - 1}{q+1}$ *and* $i \not\equiv 0 \pmod{q}$. *Then i is a coset leader and* $|C_i| = 2m$ *except* $i \in Y_1 \cup Y_2$ *.*

(1) If 2 ∤ t*, then*

$$
\begin{cases}\nY_1 = \{2\frac{q^{t+1}-1}{q+1} + c : c = -1, 0\}, & \text{if } q = 3; \\
Y_1 = \{2\frac{q^{t+1}-1}{q+1} + c : c = \pm 1, 0\}, & \text{if } q \ge 5.\n\end{cases}\n\text{ and }\nY_2 = \{\frac{q^{t+1} + 2q^t + 1}{q+1}\}.
$$

(2) If 2 | t*, then*

$$
\begin{cases}\nY_1 = \{2\frac{q^{t+1}+1}{q+1} + c : c = -1, 0\}, & \text{if } q = 3; \\
Y_1 = \{2\frac{q^{t+1}+1}{q+1} + c : c = \pm 1, 0\}, & \text{if } q \ge 5,\n\end{cases}\n\text{ and }\nY_2 = \{\frac{q^{t+1}+2q^t-1}{q+1}\}.
$$

Proof. From Lemmas [2](#page-2-2) and [4,](#page-2-3) we can obtain the results following the same way of Lemma [12.](#page-11-0) \Box

Theorem 7. *If* $m = 2t + 1 \ge 5$ *and* $q \ge 5$ *, let* $\epsilon = \lfloor (\delta - 1)(1 - q^{-1}) \rfloor$ *and*

$$
\left\{\n\begin{aligned}\nA &= \frac{q^{t+1} + 2q^t + 1}{q+1}, \ B = 2\frac{q^{t+1} - 1}{q+1} - 1, \qquad \text{if} \quad 2 \nmid t; \\
A &= \frac{q^{t+1} + 2q^t - 1}{q+1}, \ B = 2\frac{q^{t+1} + 1}{q+1} - 1, \qquad \text{if} \quad 2 \mid t.\n\end{aligned}\n\right.
$$

Then LCD BCH code $\mathcal{C}_{(n,q,\delta,1)}$ *has parameters* $\left[\frac{q^m+1}{q+1}, k, d \geq \delta\right]$ *and* $\mathcal{C}_{(n,q,\delta+1,0)}$ *has parameters* $\left[\frac{q^m+1}{q+1}, k-\delta\right]$ $1, d \geq 2\delta$, where ϵ

$$
k = \begin{cases} n - 2m(\epsilon - 1), & \text{if } q^t + 2 \le \delta \le A; \\ n - 2m(\epsilon - 2), & \text{if } A + 1 \le \delta \le B. \end{cases}
$$

 \Box

Proof. From Lemmas [15](#page-17-0) and [16,](#page-17-1) we can obtain the results by the same way of Theorem [3.](#page-12-0)

Next we will investigate the largest and second largest coset leaders modulo n when $q = 3$, and obtain parameters of the BCH code $\mathcal{C}_{(q,n,\delta_{i,n},b)}$.

Lemma 17. Let $n = \frac{3^m+1}{4}$ and $1 \le a < n$ be an integer, then a is a coset leader of C_a modulo $\frac{3^m+1}{4}$ *if and only if* $2a$ *is a coset leader of* C_{2a} *modulo* $\frac{3^m+1}{2}$ *. Moreover,* $|C_a| = |C_{2a}|$ *.*

Proof. From Lemma [2,](#page-2-2) we can get the result directly.

Lemma 18. Let $n = \frac{3^m + 1}{4}$, where $m \geq 5$ is an odd integer. Then

$$
\delta_1 = \frac{3^{m-1} - 1}{8}, \quad \delta_2 = \frac{3^{m-1} - 1}{8} - 2.
$$

are the first and second largest coset leaders modulo n. Moreover, $|C_{\delta_1}| = |C_{\delta_2}| = 2m$.

Proof. In order to prove this, we divide it into two steps.

Step1. We claim that $\delta_1, \delta_2 \in \text{MinRep}_n$. From Lemma [15,](#page-17-0) we have $\delta_{2,2n} = \frac{3^{m-1}-1}{4}$. Note that $2 \mid \frac{3^{m-1}-1}{4}$, then $\delta_1 = \frac{3^{m-1}-1}{8} \in \text{MinRep}_n$ and $|C_{\delta_1}| = 2m$ by Lemma [17.](#page-18-0)

Note that $\delta_2 \in \text{MinRep}_n$ if and only if $\delta = 4\delta_2 = \frac{3^{m-1}-1}{2} - 8 \in \text{MinRep}_{3^m+1}$ by Lemma [2.](#page-2-2) It is clear that $C_{\delta} = \{ [q^k \delta]_{3m+1}, 3^m + 1 - [q^k \delta]_{3m+1} : 0 \leq k \leq m-1 \}$, then we need to prove that $[q^k \delta]_{3^m+1} - \delta \ge 0$ and $3^m + 1 - [q^k \delta]_{3^m+1} - \delta \ge 0$ for any $0 \le k \le m-1$. It is easy to get that

$$
\delta = \frac{3^{m-1} - 1}{3 - 1} - 8 = 3^{m-2} + 3^{m-3} + \dots + 3^3 + 3 + 2,
$$

$$
3^m + 1 - [q^0 \delta]_{3^m + 1} - \delta = 2 \cdot 3^{m-1} + 18 > 0.
$$

For $k = 1$, we have

$$
[q\delta]_{3^m+1} - \delta = 3^{m-1} + 3^{m-2} + \dots + 3^1 + (3 - 3^3) - \delta
$$

$$
= 3^{m-1} - 2 \cdot 3^2 + 1 > 0,
$$

$$
3^m + 1 - [q\delta]_{3^m+1} - \delta = 3^m + 1 - (2\delta + 3^{m-1} - 2 \cdot 3^2 + 1)
$$

$$
= 3^{m-1} + 3^3 + 3^2 - 1 > 0.
$$

For $2 \leq k \leq m-3$, we have

$$
[qk \delta]_{3^m+1} - \delta = \sum_{t=k}^{m-1} 3^t - 3^{k+2} + 3^k - \sum_{t=0}^{k-2} 3^t - \delta
$$

\n
$$
\ge 3^{m-2} + 2 \cdot 3^{m-3} - \sum_{t=0}^{m-5} 3^t - \delta
$$

\n
$$
= 3^{m-4} + 3^2 > 0,
$$

$$
3m + 1 - [qk \delta]_{3m+1} - \delta = 3m + 1 - (\sum_{t=k}^{m-1} 3t - 3k+2 + 3k - \sum_{t=0}^{k-2} 3t + \delta)
$$

\n
$$
\geq 3m + 1 - (\sum_{t=2}^{m-1} 3t - 34 + 32 - 1 + \delta)
$$

\n
$$
= 3m-1 + 34 - 2 > 0.
$$

For $k = m - 2$, we have

$$
[q^{m-2}\delta]_{3^m+1} - \delta = 3^{m-1} + 2 \cdot 3^{m-2} - \sum_{t=1}^{m-4} 3^t - \delta
$$

$$
= 3^{m-1} + 3^{m-3} + 3^2 > 0,
$$

$$
3^m + 1 - [q^{m-2}\delta]_{3^m+1} - \delta = 3^m + 1 - (2\delta + 3^{m-1} + 3^{m-3} + 3^2)
$$

$$
= 3^{m-1} - 3^{m-3} + 3^2 - 1 > 0.
$$

For $k = m - 1$, we have

$$
[q^{m-1}\delta]_{3^m+1} - \delta = 2 \cdot 3^{m-1} - \sum_{t=2}^{m-3} 3^t - 1 - \delta
$$

= $3^{m-1} + 3^{m-2} + 3^2 + 2 \cdot 3 + 1 > 0$,

$$
3m + 1 - [qm-1 \delta]_{3m+1} - \delta = 3m + 1 - (2\delta + 3m-1 + 3m-2 + 32 + 2 \cdot 3 + 1)
$$

= 2 \cdot 3^{m-3} + 5 > 0.

Therefore, $\delta \in \text{MinRep}_{3^m+1}$ and $|C_{\delta}| = 2m$, i.e., $\delta_2 \in \text{MinRep}_n$ and $|C_{\delta_2}| = 2m$ by Lemma [2.](#page-2-2)

Step2. We claim that $\delta_{1,n} = \delta_1$ and $\delta_{2,n} = \delta_2$. Suppose there exists an integer a such that $a \in \mathbb{R}$ MinRep_n and $\delta_1 < a < n$, which implies that $2a \in \text{MinRep}_{\frac{q^m+1}{2}}$ with $\delta_{2,\frac{q^m+1}{2}} = \frac{3^{m-1}-1}{4} < 2a < \frac{q^m+1}{2}$ by Lemma [17,](#page-18-0) then $2a = \delta_{1,\frac{q^m+1}{2}} = \frac{3^m+1}{4}$ by Lemma [15,](#page-17-0) which contradicts to the fact that $2 \nmid \frac{3^m+1}{4}$. Therefore, $\delta_{1,n} = \delta_1$.

Note that $3 \mid \frac{3^{m-1}-1}{8} - 1$ and $\frac{3^{m-1}-1}{8} - 2 \in \text{MinRep}_n$, then we have $\delta_{2,n} = \frac{3^{m-1}-1}{8} - 2$. Thus we complete the proof. \Box

According to the previous results on the coset leaders, we give the following theorem.

Theorem 8. Let $n = \frac{3^m+1}{4}$, where $m = 2t + 1 \ge 5$, then LCD BCH code $\mathcal{C}_{(\frac{3^m+1}{4},3,6,1)}$ has parameters $[n, 2m+1, d \geq \delta_{2,n}]$ and $\mathcal{C}_{(\frac{3^m+1}{4},3,\delta+1,0)}$ has parameters $[n, 2m, d \geq 2\delta_{2,n}]$, where $\delta_{2,n} + 1 \leq \delta \leq \delta_{1,n}$.

 \Box

Proof. From Lemma [18,](#page-18-1) we can obtain the results directly.

Example 5. *Based on the above theorems, we have the following examples.* • Let $(q, m) = (3, 5)$, we have $n = \frac{q^5 + 1}{q + 1} = 61$. The LCD BCH code $\mathcal{C}_{(n,q,3,0)}$ has parameters [61, 50, 6], *the code is distance-optimal according to the tables of best codes known in ([\[10](#page-20-5)]).*

• Let $(q, m) = (5, 5)$, we have $n = \frac{q^5 + 1}{q+1} = 521$. The LCD BCH code $\mathcal{C}_{(n,q,29,0)}$ has parameters $[521, 320, \geq 56]$, the dimension is consistent with what was given in Theorem [7.](#page-17-2)

5. Conclusions

The main contributions of this paper are as follows:

• For the LCD BCH codes of length $n = q^m + 1$ with $m = 4t + 2 \ge 2$, we found the first few largest coset leaders $\delta_{i,n}$, and investigated the parameters of $\mathcal{C}_{(n,q,\delta,1)}$ and $\mathcal{C}_{(n,q,\delta+1,0)}$ with $\delta_{i,n} + 1 \leq \delta \leq n$ $\delta_{i,n} + 1 \leq \delta \leq n$ $\delta_{i,n} + 1 \leq \delta \leq n$ (see Theorems 1 and [2\)](#page-10-1).

- For the LCD BCH codes of length $n = \frac{q^m+1}{\lambda}$ with $q+1 > \lambda \ge 2$. When $m = 2t + 1 \ge 5$ and $1 \leq \delta - 1 \leq \frac{2q^{t+1} + 2q - 1}{\lambda}$, we completely provided the dimensions of $\mathcal{C}_{(n,q,\delta,1)}$ and $\mathcal{C}_{(n,q,\delta+1,0)}$ (see Theorems [3](#page-12-0) and [4\)](#page-14-0). When $\lambda = 2$ and $m = 2t \ge 8$, we provided the dimensions of $\mathcal{C}_{(n,q,\delta,1)}$ and $\mathcal{C}_{(n,q,\delta+1,0)}$ for $\frac{q^t+1}{2} \leq \delta - 1 \leq \frac{q^{t+1}-1}{2}$ (see Theorem [6\)](#page-16-0).
- For the LCD BCH codes of length $n = \frac{q^m+1}{q+1}$ with $m = 2t + 1 \ge 5$, we presented the dimensions of $\mathcal{C}_{(n,q,\delta,1)}$ and $\mathcal{C}_{(n,q,\delta+1,0)}$ for $q^t+1 \leq \delta-1 \leq \frac{2q^{t+1}+2q-1}{q+1}$ (see Theorem [7\)](#page-17-2). For $q=3$, the first two largest coset leaders $\delta_{1,n}$ and $\delta_{2,n}$ modulo n were presented, and the parameters of $\mathcal{C}_{(n,q,\delta,1)}$ and $\mathcal{C}_{(n,q,\delta+1,0)}$ with $\delta_{2,n}+1 \leq \delta \leq \delta_{1,n}$ were studied (see Theorem [8\)](#page-19-0).
