# On $\boldsymbol{P}$-Interpolation in Local Theory Extensions and Applications to the Study of Interpolation in the Description Logics $\mathcal{E} \mathcal{L}, \mathcal{E} \mathcal{L}^{+}$ 

Dennis Peuter, Viorica Sofronie-Stokkermans, and Sebastian Thunert<br>University of Koblenz, Koblenz, Germany<br>\{dpeuter,sofronie\}@uni-koblenz.de, s.thunert@gmx.de

#### Abstract

We study the problem of $P$-interpolation, where $P$ is a set of binary predicate symbols, for certain classes of local extensions of a base theory. For computing the $P$-interpolating terms, we use a hierarchic approach: This allows us to compute the interpolating terms using a method for computing interpolating terms in the base theory. We use these results for proving $\leq$-interpolation in classes of semilattices with monotone operators; we show, by giving a counterexample, that $\leq$-interpolation does not hold if by "shared" symbols we mean just the common symbols. We use these results for the study of $\sqsubseteq$-interpolation in the description logics $\mathcal{E L}$ and $\mathcal{E} \mathcal{L}^{+}$.

## 1 Introduction

In this paper we study the problem of $P$-interpolation, a problem strongly related to interpolation w.r.t. logical theories. The problem can be formulated as follows:
Let $\mathcal{T}$ be a theory, $A$ and $B$ be conjunctions of ground literals in the signature of $\mathcal{T}$, possibly with additional constants, $P$ a set of binary predicate symbols in the signature of $\mathcal{T}, R \in P, a$ a constant occurring in $A$ and $b$ a constant occurring in $B$. Assume that $A \wedge B \models_{\mathcal{T}} a R b$. Can we find a ground term $t$ containing only constants and function symbols "shared" by $A$ and $B$, such that $A \wedge B \models_{\mathcal{T}} a R t \wedge t R b ?$
Interpolation has been studied in classical and non-classical logics and in extensions and combinations of theories; and is very important in program verification and also in the area of description logics. The first algorithms for interpolant generation in program verification required explicit constructions and "separations" of proofs [15]17. In [14] interpolants are computed using variants of resolution. For certain theories, the "separation" of proofs relied on the possibility of "separating" atoms, i.e. on $P$-interpolation, where $P$ is a set of binary predicate symbols. Equality interpolation is used in [36] for devising an interpolation method in combinations of theories with disjoint signatures. In [23|25] and [20], for instance, we consider interpolation problems in certain classes of extensions $\mathcal{T}_{0} \cup \mathcal{K}$ of a base theory $\mathcal{T}_{0}$ and use a hierarchical approach to compute interpolants. The method relies on the $P$-interpolation property of the base theory
$\mathcal{T}_{0}$. In most of the applications we considered, $P$ contains the equality predicate $\approx$ or a predicate $\leq$ with the property that in all models of $\mathcal{T}_{0}$, the interpretation of $\leq$ is a partial ordering.
Since at that time our main interest was the study of interpolation problems, in [23|25] and [20] $P$-interpolation is only used in order to help in giving methods for interpolation and not as a goal in itself. However, in several papers in the area of description logics (cf. e.g. 339]) when defining the notion of interpolation in description logics the authors define in fact a notion of $\sqsubseteq$-interpolation. In 9 (Theorem 4) it is proved that $\mathcal{E} \mathcal{L}^{+}$allows interpolation (in fact, the notion of $\sqsubseteq$-interpolation mentioned above) for safe role inclusions - this is related to the notion of "sharing" considered in 25, cf. also Section (4. The proof technique in (9) uses simulations. In this paper, we analyze the property of $P$-interpolation in theory extensions, propose a method for solving it based on hierarchical reasoning and formulate the $\sqsubseteq$-interpolation problem for $\mathcal{E L}$ and $\mathcal{E} \mathcal{L}^{+}$as a $\leq$-interpolation problem in a theory of semilattices with operators.
We first studied $\leq$-interpolation in [18] in the context of description logics; the $\sqsubseteq$-interpolating concept descriptions were regarded as a form of "high-level" explanations. In this paper we further extend the work in [18. The general approach we propose opens the possibility of applying similar methods to more general classes of non-classical logics (including e.g. substructural logics or the logics with monotone operators studied in [28|29]) or in verification (to consider more general theory extensions than those with uninterpreted function symbols analyzed in [20]). The main results can be summarized as follows:

- We propose variants of the definitions of convexity, $P$-interpolation and Beth definability relative to a subsignature.
- We describe a hierarchical $P$-interpolation method in certain classes of local theory extensions.
- We illustrate the applicability of these results to prove that certain classes of semilattices with monotone operators have the property of $\leq$-interpolation for a certain interpretation of "shared" function symbols.
- We show, by giving a counterexample, that $\leq$-interpolation does not hold if by "shared" symbols we mean just the common symbols.
- We indicate how these results can be used to prove or disprove various notions of interpolation for the description logics $\mathcal{E L}$ and $\mathcal{E} \mathcal{L}^{+}$.
Structure of the paper: In Section 2 basic notions in logic are briefly introduced, and some results on convex theory and the link between two versions of $\approx-$ interpolation and corresponding versions of Beth definability - needed later in the paper - are proved. In Section 3 we introduce some results on local theory extensions needed in the paper. In Section 4 we identify classes of local theory extensions allowing $P$-interpolation and propose a hierarchical method of computing $P$-interpolants. This is used in Section 5 to study the existence of $\leq-$ interpolation in classes of semilattices with monotone operators. In Section 6 we use the links between the theory of semilattices with operators and the description logics $\mathcal{E L}$ and $\mathcal{E} \mathcal{L}^{+}$, and show how the results can be used in the study of these logics. Section 7 contains the conclusions and some plans for future work.

This paper is the extended version of [19]: it provides details of proofs and additional examples.

## 2 Preliminaries

We assume known standard definitions from first-order logic such as $\Pi$-structures, models, homomorphisms, logical entailment, satisfiability, unsatisfiability.
We consider signatures of the form $\Pi=(\Sigma$, Pred $)$, where $\Sigma$ is a family of function symbols and Pred a family of predicate symbols. If $C$ is a fixed countable set of fresh constants, we denote by $\Pi^{C}$ the extension of $\Pi$ with constants in $C$. We denote "falsum" with $\perp$.
A theory $\mathcal{T}$ is described by a set of closed formulae (the axioms of the theory). We call a theory axiomatized by a set of universally quantified equations an equational theory. We denote by $\operatorname{Mod}(\mathcal{T})$ the set of all models of $\mathcal{T}$.
If $F$ and $G$ are formulae we write $F \models G$ to express the fact that every model of $F$ is a model of $G$; if $\mathcal{T}$ is a theory, we write $F \models_{\mathcal{T}} G$ to express the fact that every model of $F$ which is also a model of $\mathcal{T}$ is a model of $G$. The definitions can be extended in a natural way to the case when $F$ is a set of formulae; in this case, $F \models_{\mathcal{T}} G$ if and only if $\mathcal{T} \cup F \models G$. $F \models \perp$ means that $F$ is unsatisfiable; $F \models \mathcal{T} \perp$ means that there is no model of $\mathcal{T}$ which is also a model of $F$. If there is a model of $\mathcal{T}$ which is also a model of $F$ we say that $F$ is $\mathcal{T}$-consistent.
In the next sections we introduce notions of convexity of a theory with respect to a subset of the predicate symbols, and establish links between two versions
of $\approx$-interpolation and corresponding versions of Beth definability, results which are needed later in the paper

### 2.1 Convexity and $P$-convexity

We can define a notion of convexity w.r.t. a subset $P$ of the set of predicates.
Definition 1. A theory $\mathcal{T}$ with signature $\Pi=(\Sigma$, Pred) is convex with respect to a subset $P$ of Pred (which may include also equality $\approx$ ) if for all conjunctions $\Gamma$ of ground $\Pi^{C}$-atoms (with additional constants in a set $C$ ), relations $R_{1}, \ldots, R_{m} \in P$ and tuples of $\Pi^{C}$-terms of corresponding arity $\bar{t}_{1}, \ldots, \bar{t}_{m}$ such that $\Gamma \models \mathcal{T} \bigvee_{i=1}^{m} R_{i}\left(\bar{t}_{i}\right)$ there exists $i_{0} \in\{1, \ldots, m\}$ such that $\Gamma \models_{\mathcal{T}} R_{i_{0}}\left(\bar{t}_{i_{0}}\right)$.
We will call a theory $\mathcal{T}$ convex if it is $\operatorname{Pred} \cup\{\approx\}$-convex. The following result is well-known (cf. e.g. [5|11|34):

Theorem 1 Let $\mathcal{T}$ be a theory and let $\operatorname{Mod}(\mathcal{T})$ be the class of models of $\mathcal{T}$.
(i) If $\operatorname{Mod}(\mathcal{T})$ is closed under direct products then $\mathcal{T}$ is convex.
(ii) If $\mathcal{T}$ is a universal theory and $\mathcal{T}$ is convex, then $\mathcal{T}$ has an axiomatization given by Horn clauses, hence $\operatorname{Mod}(\mathcal{T})$ is closed under direct products.

Corollary 2 Let $\mathcal{T}_{1}, \mathcal{T}_{2}$ be two theories with signatures $\Pi_{1}, \Pi_{2}$. If $\operatorname{Mod}\left(\mathcal{T}_{1}\right)$ and $\operatorname{Mod}\left(\mathcal{T}_{2}\right)$ are closed under direct products, then $\mathcal{T}_{1} \cup \mathcal{T}_{2}$ is convex.

Proof. $\operatorname{Mod}\left(\mathcal{T}_{1} \cup \mathcal{T}_{2}\right)=\left\{\mathcal{A} \mid \mathcal{A}\right.$ is a $\left(\Pi_{1} \cup \Pi_{2}\right)$-structure with $\mathcal{A}_{\mid \Pi_{1}} \in \operatorname{Mod}\left(\mathcal{T}_{1}\right)$ and $\left.\mathcal{A}_{\mid \Pi_{2}} \in \operatorname{Mod}\left(\mathcal{T}_{2}\right)\right\}$. Let $\mathcal{A}_{i} \in \operatorname{Mod}\left(\mathcal{T}_{1} \cup \mathcal{T}_{2}\right), i \in I$. This is the case iff $\mathcal{A}_{i \mid \Pi_{1}} \in$ $\operatorname{Mod}\left(\mathcal{T}_{1}\right)$ and $\mathcal{A}_{i \mid \Pi_{2}} \in \operatorname{Mod}\left(\mathcal{T}_{2}\right)$ for all $i \in I$. Taking into account that, due to the definition of a direct product of structures, $\left(\prod_{i \in I} \mathcal{A}_{i}\right)_{\mid \Pi_{j}}=\prod_{i \in I}\left(\mathcal{A}_{i \mid \Pi_{j}}\right)$ for $j=1,2$, and the fact that $\operatorname{Mod}\left(\mathcal{T}_{1}\right)$ and $\operatorname{Mod}\left(\mathcal{T}_{2}\right)$ are closed under direct products, it follows that $\prod_{i \in I} \mathcal{A}_{i} \in \operatorname{Mod}\left(\mathcal{T}_{1} \cup \mathcal{T}_{2}\right)$, $\operatorname{so} \operatorname{Mod}\left(\mathcal{T}_{1} \cup \mathcal{T}_{2}\right)$ is closed under products. From Theorem 1 it follows that $\mathcal{T}_{1} \cup \mathcal{T}_{2}$ is convex.

Corollary 3 Let $\mathcal{T}_{1}$ and $\mathcal{T}_{2}$ be convex universal theories. Then $\mathcal{T}_{1} \cup \mathcal{T}_{2}$ is convex.
Proof: By Theorem since $\mathcal{T}_{i}$ is a universal theory and convex, $\operatorname{Mod}\left(\mathcal{T}_{i}\right)$ is closed under direct products, for $i=1,2$. By Corollary 2 it follows that $\operatorname{Mod}\left(\mathcal{T}_{1} \cup \mathcal{T}_{2}\right)$ is closed under products, hence $\mathcal{T}_{1} \cup \mathcal{T}_{2}$ is also convex.
In particular, every extension of a convex universal theory $\mathcal{T}_{0}$ with a set of new function symbols axiomatized by a set $\mathcal{K}$ of Horn clauses is convex.

### 2.2 Equality interpolation, $R$-interpolation

We now define various versions of interpolation w.r.t. certain predicates.
Definition 2. We say that a convex theory $\mathcal{T}$ has the equality interpolation property if for every conjunction of ground $\Pi^{C}$-literals $A\left(\bar{c}, \overline{a_{1}}, a\right)$ and $B\left(\bar{c}, \overline{b_{1}}, b\right)$, if $A \wedge B \models_{\mathcal{T}} a \approx b$ then there exists a term $t(\bar{c})$ containing only the constants $\bar{c}$ shared by $A\left(\bar{c}, \overline{a_{1}}, a\right)$ and $B\left(\bar{c}, \overline{b_{1}}, b\right)$ such that $A \wedge B \models_{\mathcal{T}} a \approx t(\bar{c}) \wedge t(\bar{c}) \approx b$.

Sometimes, the theories and theory extensions we study contain interpreted symbols in a set $\Pi_{0}=\left(\Sigma_{0}\right.$, Pred $)$ and non-interpreted function symbols in a set $\Sigma_{1}$. The classical definition for equality interpolation for a theory $\mathcal{T}$ mentioned above allows the term $t(\bar{c})$ to contain all function symbols in the signature of $\mathcal{T}$ - these symbols are in this case all seen as being interpreted. If we distinguish between interpreted and uninterpreted functions we might allow the intermediate term $t(\bar{c})$ to contain any interpreted function symbols, but require that $t(\bar{c})$ contains only "shared" uninterpreted functions and common constants.
If $\Sigma_{A}$ and $\Sigma_{B}$ are the uninterpreted function symbols occurring in $A$ resp. $B$, and $\Theta$ is a closure operator, by "shared" uninterpreted functions we can mean:

- Intersection-shared symbols: $\bigcap-\operatorname{Shared}(A, B)=\Sigma_{A} \cap \Sigma_{B}$, or
- $\Theta$-shared symbols: $\Theta$-Shared $(A, B)=\Theta\left(\Sigma_{A}\right) \cap \Theta\left(\Sigma_{B}\right)$.

Example 1. Let $\mathcal{T}=\mathcal{T}_{0} \cup \mathcal{K}$ be the extension of a theory $\mathcal{T}_{0}$ with set of interpreted function symbols $\Sigma_{0}$ with a set $\mathcal{K}$ of clauses containing new uninterpreted function symbols in a set $\Sigma_{1}$.

- If $A$ and $B$ are sets of atoms in the signature of $\mathcal{T}$ containing additional constants in a set $C$ and uninterpreted function symbols $\Sigma_{A}, \Sigma_{B}$ then the intersection-shared uninterpreted function symbols of $A$ and $B$ are $\Sigma_{A} \cap \Sigma_{B}$.
- For every $f, g \in \Sigma_{1}$ we define $f \sim_{\mathcal{K}} g$ iff there exists $C \in \mathcal{K}$ such that $f, g$ both occur in $C$. Let $\sim_{\mathcal{K}}^{*}$ be the equivalence relation on $\Sigma_{1}$ induced by $\sim_{\mathcal{K}}$. Let $\Theta_{\mathcal{K}}$ be defined for every $\Sigma \subseteq \Sigma_{1}$ by $\Theta_{\mathcal{K}}(\Sigma)=\bigcup_{f \in \Sigma}\left\{g \in \Sigma_{1} \mid f \sim_{\mathcal{K}}^{*} g\right\}$. Then the $\Theta_{\mathcal{K}}$-shared symbols are $\Theta_{\mathcal{K}}\left(\Sigma_{A}\right) \cap \Theta_{\mathcal{K}}\left(\Sigma_{B}\right)$.
In particular, if $A$ contains a function symbol $f$ and $B$ contains a symbol $g$ such that $f, g$ occur both in a clause in $\mathcal{K}$, then $f$ and $g$ are considered to be $\Theta_{\mathcal{K}}$-shared by $A, B$.

We are interested in similar properties for other binary relations than $\approx$. We define an $R$-interpolation property, where $R$ is a binary predicate symbol in $\Pi$.

Definition 3. Let $R \in \operatorname{Pred} \cup\{\approx\}$ be a binary predicate symbol. An $\{R\}$-convex theory $\mathcal{T}$ with uninterpreted symbols $\Sigma_{1}$ has the $R$-interpolation property if for all conjunctions of ground atoms $A\left(\bar{c}, \overline{a_{1}}, a\right)$ and $B\left(\bar{c}, \overline{b_{1}}, b\right)$, if $A \wedge B \models_{\mathcal{T}}$ aRb then there exists a term $t(\bar{c})$ containing only common constants $\bar{c}$ and only "shared" uninterpreted symbols in $\Sigma_{1}$ such that $A \wedge B \models_{\mathcal{T}} a R t(\bar{c}) \wedge t(\bar{c}) R b$.

If $P \subseteq$ Pred, we say that a theory has the $P$-interpolation property if it has the $R$-interpolation property for every $R \in P$.

In Section 5 we give examples of theories with this property and show that a theory may not have the $R$-interpolation property for a predicate symbol $R$ if we use the notion of intersection-shared symbols, but has the $R$-interpolation property if we consider the less restrictive notion of $\Theta$-shared symbols for a suitably defined closure operator $\Theta$.

### 2.3 Beth definability

Let $\mathcal{T}$ be a theory with signature $\Pi=\left(\Sigma_{0} \cup \Sigma_{1}\right.$, Pred $)$, where the function symbols in $\Sigma_{0}$ are regarded as interpreted function symbols and the function symbols in $\Sigma_{1}$ are regarded as uninterpreted function symbols, and let $C$ be a set of additional constants. We define a notion of Beth definability relative to a subset $\Sigma_{S} \subseteq \Sigma_{1} \cup C$ of non-interpreted function symbols and constants (similar to the one introduced in [33]), which we refer to as $\Sigma_{S}$-Beth definability.
Let $\Sigma_{S} \subseteq \Sigma_{1} \cup C$, let $\Sigma_{r}=\Sigma_{1} \backslash \Sigma_{S}$, and let $\Pi^{\prime}=\left(\Sigma_{0} \cup\left(\Sigma_{S} \cap \Sigma_{1}\right) \cup \Sigma_{r}^{\prime}\right.$, Pred), where $\Sigma_{r}^{\prime}=\left\{f^{\prime} \mid f \in \Sigma_{1} \backslash \Sigma_{S}\right\}$ is the signature obtained by replacing all uninterpreted function symbols in $\Sigma_{1}$ which are not in $\Sigma_{S}$ with new primed copies. If $\phi$ is a $\Pi^{C}$-formula, we will denote by $\phi^{\prime}$ the formula obtained from $\phi$ by replacing all uninterpreted function symbols in $\Sigma_{1} \backslash \Sigma_{S}$ and all constants in $C \backslash \Sigma_{S}$ with distinct, primed versions. The interpreted function symbols and the uninterpreted function symbols and constants in $\Sigma_{S}$ are not changed. We regard the theory $\mathcal{T}$ as a set of formulae; let $\mathcal{T}^{\prime}:=\left\{\phi^{\prime} \mid \phi \in \mathcal{T}\right\}$.

Definition 4. Let $A$ be a conjunction of ground $\Pi^{C}$-literals, and $a \in C$.

- We say that $a$ is implicitly defined by $A$ w.r.t. $\Sigma_{S}$ and $\mathcal{T}$ if, with the notations introduced before, $A \wedge A^{\prime} \models \mathcal{T} \cup \mathcal{T}^{\prime} a \approx a^{\prime}$.
- We say that $a$ is explicitly defined by $A$ w.r.t. $\Sigma_{S}$ and $\mathcal{T}$ if there exists a term $t$ containing only symbols in $\Sigma_{0}$, Pred and $\Sigma_{S}$ such that $A \models_{\mathcal{T}} a \approx t$.

Definition 5. Let $\mathcal{T}$ be a theory with uninterpreted function symbols in a set $\Sigma_{1}$ Let $\Sigma_{S} \subseteq \Sigma_{1} \cup C . \mathcal{T}$ has the Beth definability property w.r.t. $\Sigma_{S}\left(\Sigma_{S}-\right.$ Beth definability), if for every conjunction of literals $A$ and every $a \in C$, if $A$ implicitly defines a w.r.t. $\Sigma_{S}$ and $\mathcal{T}$ then $A$ explicitly defines a w.r.t. $\Sigma_{S}$ and $\mathcal{T}$.

In 46] it was proved that if a convex theory $\mathcal{T}$ has the $\approx$-interpolation property, then it has a version of Beth definability property which can be regarded as the extension of the classical Beth definability property [7] so as to take into account the theory $\mathcal{T}$. We give an analogous implication between $\approx$-interpolation and Beth definability w.r.t. a subsignature.

Theorem 4 Let $\mathcal{T}$ be a convex theory with signature $\Pi=\left(\Sigma_{0} \cup \Sigma_{1}\right.$, Pred), C a set of constants, and $\Sigma_{S} \subseteq \Sigma_{1} \cup C$. Let $\mathcal{T}^{\prime}$ be as defined above.
(i) If $\mathcal{T} \cup \mathcal{T}^{\prime}$ has the $\approx$-interpolation property with intersection-sharing, then $\mathcal{T}$ has the $\Sigma_{S}$-Beth definability property.
(ii) Assume that $\mathcal{T}=\mathcal{T}_{0} \cup \mathcal{K}$ where all symbols in the signature of $\mathcal{T}_{0}$ are regarded as interpreted, and $\mathcal{K}$ is a set of clauses also containing uninterpreted function symbols in $\Sigma_{1}$. Let $\Theta_{\mathcal{K}}$ be the closure operator defined in Example 1. If $\mathcal{T} \cup \mathcal{T}^{\prime}$ has the $\approx$-interpolation property with $\Theta_{\mathcal{K} \cup \mathcal{K}^{\prime} \text {-sharing, }}$ then $\mathcal{T}$ has the $\Theta_{\mathcal{K}}\left(\Sigma_{S}\right)$-Beth definability property.

Proof: (i) Assume $a$ is implicitly definable w.r.t. $\Sigma_{S}$, i.e. there exists a conjunction $A$ of literals such that if $A^{\prime}$ is obtained by renaming the symbols in $\left(\Sigma_{1} \cup C\right) \backslash \Sigma_{S}$
as explained at the beginning of this subsection, we have $A \wedge A^{\prime} \models_{\mathcal{T} \cup \mathcal{T}^{\prime}} a \approx a^{\prime}$. Since $\mathcal{T} \cup \mathcal{T}^{\prime}$ has the $\approx$-interpolation property, there exists a term $t$ using only the functions and predicate symbols common to $A$ and $A^{\prime}$ such that $A \wedge A^{\prime} \models_{\mathcal{T} \cup \mathcal{T}}{ }^{\prime}$ $a \approx t \wedge t \approx a^{\prime}$. The only function symbols shared by $A$ and $A^{\prime}$ are the symbols in $\Sigma_{0} \cup \Sigma_{S}$. We show that $A \models_{\mathcal{T}} a \approx t$. Let $\mathcal{A}$ be a model of $\mathcal{T}$ in which $A$ is true. We define new function symbols $\left\{f_{\mathcal{A}}^{\prime} \mid f^{\prime} \in \Sigma_{r}^{\prime}\right\}$ by $f_{\mathcal{A}}^{\prime}=f_{\mathcal{A}}$, and interpretations $c_{\mathcal{A}}^{\prime}:=c_{\mathcal{A}}$ for all constants not in $\Sigma_{S}$. The structure $\overline{\mathcal{A}}$ obtained this way is a model of $\left(\mathcal{T} \cup \mathcal{T}^{\prime}\right)$ and of $A \wedge A^{\prime}$. Therefore, since $A \wedge A^{\prime} \models_{\mathcal{T} \cup \mathcal{T}^{\prime}} a \approx t \wedge t \approx a^{\prime}$, we have $\overline{\mathcal{A}} \models a \approx t$, hence $\mathcal{A} \models a \approx t$. Therefore, $A \models_{\mathcal{T}} a \approx t$.
(ii) Assume $a$ is implicitly definable w.r.t. $\Theta_{\mathcal{K}}\left(\Sigma_{S}\right)$, i.e. there exists a conjunction $A$ of literals such that if $A^{\prime}$ is obtained from $A$ and $\mathcal{T}^{\prime}=\mathcal{T}_{0} \cup \mathcal{K}^{\prime}$ is obtained from $\mathcal{T}=\mathcal{T}_{0} \cup \mathcal{K}$ by renaming as explained at the beginning of this subsection, then $A \wedge A^{\prime} \models_{\mathcal{T} \cup \mathcal{T}^{\prime}} a \approx a^{\prime}$. The function symbols shared by $A$ and $A^{\prime}$ are the symbols in $\Sigma_{0} \cup \Theta_{\mathcal{K} \cup \mathcal{K}^{\prime}}\left(\Sigma_{S}\right)$, where:
$\Theta_{\mathcal{K} \cup \mathcal{K}^{\prime}}\left(\Sigma_{S}\right)=\bigcup_{f \in \Sigma_{S}}\left\{g \in \Sigma_{1} \cup \Sigma_{1}^{\prime} \mid f \sim_{\mathcal{K} \cup \mathcal{K}^{\prime}}^{*} g\right\}$

## Note that:

$\Theta_{\mathcal{K}}\left(\Sigma_{S}\right)=\bigcup_{f \in \Sigma_{S}}\left\{g \in \Sigma_{1} \mid f \sim_{\mathcal{K}}^{*} g\right\}$ and $\Theta_{\mathcal{K}^{\prime}}\left(\Sigma_{S}\right)=\bigcup_{f \in \Sigma_{S}}\left\{g \in \Sigma_{1}^{\prime} \mid f \sim_{\mathcal{K}^{\prime}}^{*} g\right\}$. It is easy to see that for every $f \in \Sigma_{1} \backslash \Sigma_{S}, f \in \Theta_{\mathcal{K}}\left(\Sigma_{S}\right)$ iff $f^{\prime}=\Theta_{\mathcal{K}^{\prime}}\left(\Sigma_{S}\right)$, and $\Theta_{\mathcal{K} \cup \mathcal{K}^{\prime}}\left(\Sigma_{S}\right)=\Theta_{\mathcal{K}}\left(\Sigma_{S}\right) \cup \Theta_{\mathcal{K}^{\prime}}\left(\Sigma_{S}\right)$.
Since we assumed that $\mathcal{T} \cup \mathcal{T}^{\prime}$ has the $\approx$-interpolation property with the notion of $\Theta_{\mathcal{K} \cup \mathcal{K}^{\prime} \text {-sharing, there exists a term } t \text { over the signature } \Sigma_{0} \cup \Theta_{\mathcal{K} \cup \mathcal{K}^{\prime}}\left(\Sigma_{S}\right) \text { such }}$ that $A \wedge A^{\prime} \models_{\mathcal{T} \cup \mathcal{T}^{\prime}} a \approx t \wedge t \approx a$. The term $t$ might contain primed versions of function symbols. We show that we can find a term $\bar{t}$ containing only terms in $\Theta_{\mathcal{K}}\left(\Sigma_{S}\right)$ such that $A \models_{\mathcal{T}} a \approx \bar{t}$. Let $\mathcal{A}$ be a $\Pi^{C}$-model of $\mathcal{T}=\mathcal{T}_{0} \cup \mathcal{K}$ in which $A$ is true. For every $f \in \Sigma_{1} \backslash \Theta_{\mathcal{K}}\left(\Sigma_{S}\right)$ we define $f_{\mathcal{A}}^{\prime}=f_{\mathcal{A}}$, and for every constant $c$ not in $\Sigma_{S}$ we define $c_{\mathcal{A}}^{\prime}:=c_{\mathcal{A}}$. The structure $\overline{\mathcal{A}}$ obtained this way is a model of $\mathcal{T}_{0} \wedge \mathcal{K}$ and of $A$ (because $\mathcal{A}$ was a model of $\mathcal{T}_{0} \cup \mathcal{K}$ and of $A$ ), a model of $\mathcal{T}_{0} \cup \mathcal{K}^{\prime}$ and of $A^{\prime}$ (because of the definition of the primed symbols), so $\overline{\mathcal{A}} \models a \approx t$. Since for $f \in \Sigma_{1} \backslash \Theta_{\mathcal{K}}\left(\Sigma_{S}\right)$ the functions $f$ and $f^{\prime}$ are defined in the same way in $\overline{\mathcal{A}}$, and the primed and unprimed versions of constants in $C \backslash \Sigma_{S}$ are interpreted the same way in $\overline{\mathcal{A}}$, we can replace in $t$ all primed function symbols with the non-primed versions, and its value does not change in $\overline{\mathcal{A}}$. Let $\bar{t}$ be the term obtained this way. The value of $\bar{t}$ in $\mathcal{A}$ is equal to the value of $t$ in $\overline{\mathcal{A}}$, i.e. is equal to the value of $a$ in $\mathcal{A}$. Hence, $\mathcal{A} \models a \approx \bar{t}$.

## 3 Local Theory Extensions

Let $\Pi_{0}=\left(\Sigma_{0}\right.$, Pred $)$ be a signature, and $\mathcal{T}_{0}$ be a "base" theory with signature $\Pi_{0}$. We consider extensions $\mathcal{T}:=\mathcal{T}_{0} \cup \mathcal{K}$ of $\mathcal{T}_{0}$ with new function symbols $\Sigma_{1}$ (extension functions) whose properties are axiomatized using a set $\mathcal{K}$ of (universally closed) clauses in the extended signature $\Pi=\left(\Sigma_{0} \cup \Sigma_{1}\right.$, Pred $)$, which contain function symbols in $\Sigma_{1}$.

If $G$ is a finite set of ground $\Pi^{C}$-clauses, where $C$ is an additional set of constants, and $\mathcal{K}$ a set of $\Pi$-clauses, we will denote by $\operatorname{st}(\mathcal{K}, G)$ the set of all ground terms
which occur in $G$ or $\mathcal{K}$, and by $\operatorname{est}(\mathcal{K}, G)$ the set of all extension ground terms, i.e. terms starting with a function in $\Sigma_{1}$ which occur in $G$ or $\mathcal{K}$.

In this paper we regard every finite set $G$ of ground clauses as the ground formula $\bigwedge_{C \in G} C$. If $T$ is a set of ground terms in the signature $\Pi^{C}$, we denote by $\mathcal{K}[T]$ the set of all instances of $\mathcal{K}$ in which the terms starting with a function symbol in $\Sigma_{1}$ are in $T$. Let $\Psi$ be a map associating with every finite set $T$ of ground terms a finite set $\Psi(T)$ of ground terms containing $T$. For any set $G$ of ground $\Pi^{C}$-clauses we write $\mathcal{K}\left[\Psi_{\mathcal{K}}(G)\right]$ for $\mathcal{K}[\Psi(\operatorname{est}(\mathcal{K}, G))]$. We define the following condition:
( Loc $_{f}^{\Psi}$ ) For every finite set $G$ of ground clauses in $\Pi^{C}$ it holds that
$\mathcal{T}_{0} \cup \mathcal{K} \cup G \models \perp$ if and only if $\mathcal{T}_{0} \cup \mathcal{K}\left[\Psi_{\mathcal{K}}(G)\right] \cup G$ is unsatisfiable.
Extensions satisfying condition $\left(\operatorname{Loc}_{f}^{\Psi}\right)$ are called $\Psi$-local. If $\Psi$ is the identity we obtain the notion of local theory extensions [22]; if in addition $\mathcal{T}_{0}$ is the theory of pure equality we obtain the notion of local theories [16[10].

### 3.1 Hierarchical reasoning in local theory extensions

Consider a $\Psi$-local theory extension $\mathcal{T}_{0} \subseteq \mathcal{T}_{0} \cup \mathcal{K}$. Condition ( $\operatorname{Loc}_{f}^{\Psi}$ ) requires that for every finite set $G$ of ground $\Pi^{C}$-clauses, $\mathcal{T}_{0} \cup \mathcal{K} \cup G \models \perp$ iff $\mathcal{T}_{0} \cup$ $\mathcal{K}\left[\Psi_{\mathcal{K}}(G)\right] \cup G \models \perp$. In all clauses in $\mathcal{K}\left[\Psi_{\mathcal{K}}(G)\right] \cup G$ the function symbols in $\Sigma_{1}$ only have ground terms as arguments, so $\mathcal{K}\left[\Psi_{\mathcal{K}}(G)\right] \cup G$ can be flattened and purified by introducing, in a bottom-up manner, new constants $c_{t} \in C$ for subterms $t=f\left(c_{1}, \ldots, c_{n}\right)$ where $f \in \Sigma_{1}$ and $c_{i}$ are constants, together with definitions $c_{t}=f\left(c_{1}, \ldots, c_{n}\right)$. We thus obtain a set of clauses $\mathcal{K}_{0} \cup G_{0} \cup$ Def, where $\mathcal{K}_{0}$ and $G_{0}$ do not contain $\Sigma_{1}$-function symbols and Def contains clauses of the form $c=f\left(c_{1}, \ldots, c_{n}\right)$, where $f \in \Sigma_{1}, c, c_{1}, \ldots, c_{n}$ are constants.

Theorem $5([\mathbf{2 2} \mathbf{1 2} \mathbf{1 3}])$ Let $\mathcal{K}$ be a set of clauses. Assume that $\mathcal{T}_{0} \subseteq \mathcal{T}_{0} \cup \mathcal{K}$ is a $\Psi$-local theory extension. For any finite set $G$ of flat ground clauses (with no nestings of extension functions), let $\mathcal{K}_{0} \cup G_{0} \cup$ Def be obtained from $\mathcal{K}\left[\Psi_{\mathcal{K}}(G)\right] \cup G$ by flattening and purification, as explained above. Then the following are equivalent to $\mathcal{T}_{0} \cup \mathcal{K} \cup G \models \perp$ :
(i) $\mathcal{T}_{0} \cup \mathcal{K}\left[\Psi_{\mathcal{K}}(G)\right] \cup G \models \perp$.
(ii) $\mathcal{T}_{0} \cup \mathcal{K}_{0} \cup G_{0} \cup$ Con $_{0} \models \perp$, where Con $_{0}=\left\{\bigwedge_{i=1}^{n} c_{i} \approx d_{i} \rightarrow c \approx d \left\lvert\, \begin{array}{l}f\left(c_{1}, \ldots, c_{n}\right) \approx c \in \operatorname{Def} \\ f\left(d_{1}, \ldots, d_{n}\right) \approx d \in \operatorname{Def}\end{array}\right.\right\}$.

The locality of a theory extension can be recognized by proving embeddability of partial models into total models [22|29|12]. In [13] we showed that for extensions with sets of flat and linear clauses $\Psi$-locality can be checked by checking whether an embeddability condition of partial into total models holds. In 27] we mention (without proof) that the proof in [13] can be extended to situations in which the clauses in $\mathcal{K}$ are not linear. A full proof of this result is given in Section 3.4. For presenting the proof we need to introduce notions such as partial structures and truth in partial structures.

### 3.2 Partial structures, weak validity

We first introduce notions such as partial structures, truth in partial structures, and weak partial models for clauses resp. for sets of clauses.
Definition 6. $A$ partial $\Pi$-structure is a structure $\mathcal{A}=\left(A,\left\{f_{\mathcal{A}}\right\}_{f \in \Sigma},\left\{p_{\mathcal{A}}\right\}_{p \in \operatorname{Pred}}\right)$, where $A$ is a non-empty set and for every $f \in \Sigma$ with arity $n$, $f_{\mathcal{A}}$ is a partial function from $A^{n}$ to $A$ and for every $p \in \operatorname{Pred}$ with arity $m, p_{\mathcal{A}} \subseteq A^{m}$. $A$ (total) $\Pi$-structure is a partial $\Pi$-structure where all functions $f_{\mathcal{A}}$ are total.

The notion of evaluating a term $t$ w.r.t. a variable assignment $\beta: X \rightarrow \mathcal{A}$ for its variables in a partial structure $\mathcal{A}$ is the same as for a total structure, except that this evaluation is undefined if $t=f\left(t_{1}, \ldots, t_{n}\right)$ and either one of $\beta\left(t_{i}\right)$ is undefined, or else $\left(\beta\left(t_{1}\right), \ldots, \beta\left(t_{n}\right)\right)$ is not in the domain of definition of $f_{\mathcal{A}}$.

Definition 7. Let $D$ be a clause. We say that $(\mathcal{A}, \beta)$ is a weak partial model of $D$ (notation: $\left.(\mathcal{A}, \beta) \models_{w} D\right)$ if either at least one term in $D$ is not defined in $\beta$ or all terms are defined and at least one literal $L$ of $D$ holds in $(\mathcal{A}, \beta)$.

Definition 8. A total map $h: A \rightarrow B$ between partial $\Pi$-structures $\mathcal{A}$ and $\mathcal{B}$ is called $a$ weak $\Pi$-homomorphism if whenever $f_{A}\left(a_{1}, \ldots, a_{n}\right)$ is defined in $A$, also $f_{B}\left(h\left(a_{1}\right), \ldots, h\left(a_{n}\right)\right)$ is defined in $B$ and $h\left(f_{A}\left(a_{1}, \ldots, a_{n}\right)\right)=f_{B}\left(h\left(a_{1}\right), \ldots, h\left(a_{n}\right)\right)$. A partial structure $\mathcal{A}$ weakly embeds into a (total) structure $\mathcal{B}$ if there exists an injective weak $\Pi$-homomorphism $h$ from $\mathcal{A}$ to $\mathcal{B}$ such that for every $R \in \operatorname{Pred}$ and for every $a, b \in \mathcal{A}$ we have: $a R b$ iff $h(a) R h(b)$.

### 3.3 Flat and linear clauses; Flattening and purification

We define flatness for non-ground clauses and for ground clauses.
Definition 9 (Flatness and linearity for non-ground clauses). A nonground clause is $\Sigma_{1}$-flat if function symbols (including constants) do not occur as arguments of function symbols in $\Sigma_{1} . A \Sigma_{1}$-flat non-ground clause is called $\Sigma_{1}$-linear if whenever a variable occurs in two terms in the clause which start with function symbols in $\Sigma_{1}$, the two terms are identical, and if no term which starts with a function symbol in $\Sigma_{1}$ contains two occurrences of the same variable.

Definition 10 (Flatness and linearity for ground clauses). We say that a ground clause is $\Sigma_{1}$-flat if only constants appear as arguments of function symbols in $\Sigma_{1}$. A $\Sigma_{1}$-flat ground clause is $\Sigma_{1}$-linear if whenever a constant occurs in two terms in the clause starting with function symbols in $\Sigma_{1}$, the two terms are identical, and if no term starting with a function symbol in $\Sigma_{1}$ contains two occurrences of the same constant.

Any set $G$ of ground clauses in a signature $\Sigma$ containing $\Sigma_{1}$ can be transformed into a set $G_{f l \operatorname{lin}\left(\Sigma_{1}\right)}$ of ground clauses in which subterms starting with function symbols in $\Sigma_{1}$ are flat and linear. This can be done by introducing, in a bottomup manner, new constants for subterms occurring below functions in $\Sigma_{1}$, and adding the corresponding definitions to the set of clauses.

A set $G$ of ground clauses can be transformed into a purified set of clauses $G_{\operatorname{sep}\left(\Sigma_{1}\right)}$ (i.e. the function symbols in $\Sigma_{1}$ are separated from the other symbols) by introducing, in a bottom-up manner, new constants $c_{t}$ for subterms $t=f\left(g_{1}, \ldots, g_{n}\right)$ with $f \in \Sigma_{1}, g_{i}$ ground $\Sigma_{0} \cup \Sigma_{c}$-terms (where $\Sigma_{c}$ is a set of constants which contains the constants introduced by flattening), together with corresponding definitions $c_{t} \approx t$. These transformations preserves satisfiability and unsatisfiability with respect to total algebras, and also with respect to partial algebras in which all ground subterms which are flattened are defined.

### 3.4 Recognizing locality and $\Psi$-locality

We now give a semantic criterion for $\Psi$-locality.
Definition 11. With the above notations, let $\Psi$ be a map associating with $\mathcal{K}$ and a set of ground terms $T$ a set $\Psi_{\mathcal{K}}(T)$ of ground terms. We call $\Psi_{\mathcal{K}} a$ term closure operator if the following holds for all sets of ground terms $T, T^{\prime}$ :
(i) $\operatorname{est}(\mathcal{K}, T) \subseteq \Psi_{\mathcal{K}}(T)$,
(ii) $T \subseteq T^{\prime} \Rightarrow \Psi_{\mathcal{K}}(T) \subseteq \Psi_{\mathcal{K}}\left(T^{\prime}\right)$,
(iii) $\Psi_{\mathcal{K}}\left(\Psi_{\mathcal{K}}(T)\right) \subseteq \Psi_{\mathcal{K}}(T)$,
(iv) for any map $h: C \rightarrow C$, $\bar{h}\left(\Psi_{\mathcal{K}}(T)\right)=\Psi_{\mathcal{K}}(\bar{h}(T))$, where $\bar{h}$ is the canonical extension of $h$ to extension ground terms.

We will use the following notation: If $A$ is a set (for instance the support of a $\Pi$-structure), we denote by $\Pi^{A}$ the extension of $\Pi$ with the elements in $A$, seen as additional constants. Let $\mathcal{T}=\mathcal{T}_{0} \cup \mathcal{K}$ be a theory extension with set of clauses $\mathcal{K}$ and let $\Psi_{\mathcal{K}}$ be a closure operator.
In what follows, $\operatorname{PMod}_{\mathrm{w}}^{\Psi}\left(\Sigma_{1}, \mathcal{T}\right)$ denotes the class of all partial structures $\mathcal{A}=$ $\left(A,\left\{f_{\mathcal{A}}\right\}_{f \in \Sigma_{0} \cup \Sigma_{1}},\left\{p_{\mathcal{A}}\right\}_{p \in \text { Pred }}\right)$ in which the $\Sigma_{0}$-functions are total, and $\mathcal{A}_{\mid \Pi_{0}}$ is a model of $\mathcal{T}_{0}$, the $\Sigma_{1}$-functions are partial and $\mathcal{A}$ is a weak partial model of all the clauses in $\mathcal{K}$, and in which the set of $\Pi^{A}$ terms

$$
\operatorname{Def}(A)=\left\{f\left(a_{1}, \ldots, a_{n}\right) \mid a_{1}, \ldots, a_{n} \in A, f_{\mathcal{A}}\left(a_{1}, \ldots, a_{n}\right) \text { defined }\right\}
$$

is closed under $\Psi_{\mathcal{K}}$.
For extensions $\mathcal{T}_{0} \subseteq \mathcal{T}=\mathcal{T}_{0} \cup \mathcal{K}$, where $\mathcal{K}$ is a set of clauses, we consider the condition:
$\left(\operatorname{Emb}_{\mathrm{w}}^{\Psi}\right)$ Every $A \in \operatorname{PMod}_{\mathrm{w}}^{\Psi}\left(\Sigma_{1}, \mathcal{T}\right)$ weakly embeds into a total model of $\mathcal{T}$.
Theorem 6 Let $\mathcal{K}$ be a set of $\Sigma_{1}$-flat clauses, and $\Psi_{\mathcal{K}}$ be a term closure operator, which satisfies conditions (i)-(iv) above and also satisfies the additional condition that for every set $T$ of ground terms and for every clause $D$ in $\mathcal{K}$, if a variable occurs in two terms in $D$ then either the two terms are identical, or the variable occurs below two different unary function symbols $f$ and $g$ and, for every constant $c$, $f(c)$ is in $\Psi_{\mathcal{K}}(T)$ iff $g(c)$ is in $\Psi_{\mathcal{K}}(T)$. If the extension $\mathcal{T}_{0} \subseteq \mathcal{T}=\mathcal{T}_{0} \cup \mathcal{K}$ satisfies $\left(\mathrm{Emb}_{\mathrm{w}}^{\Psi}\right)$ then the extension satisfies $\left(\mathrm{Loc}^{\Psi}\right)$.

Proof: Assume that $\mathcal{T}_{0} \cup \mathcal{K}$ is not a $\Psi$-local extension of $\mathcal{T}_{0}$. Then there exists a set $G$ of ground clauses (with additional constants) such that $\mathcal{T}_{0} \cup \mathcal{K} \cup G \models \perp$ but $\mathcal{T}_{0} \cup \mathcal{K}\left[\Psi_{\mathcal{K}}(G)\right] \cup G$ has a model $\mathcal{B}$. We assume w.l.o.g. that $G=G_{0} \cup G_{1}$, where $G_{0}$ contains no function symbols in $\Sigma_{1}$ and $G_{1}$ consists of ground unit clauses of the form $f\left(c_{1}, \ldots, c_{n}\right) \approx c$, where $c_{i}, c$ are constants in $\Sigma_{0} \cup C$ and $f \in \Sigma_{1}$.
We construct another structure, $\mathcal{A}$, having the same support $U_{\mathcal{A}}$ as $\mathcal{B}$, which inherits all relations in Pred and all maps in $\Sigma_{0} \cup C$ from $\mathcal{B}$, but on which the domains of definition of the $\Sigma_{1}$-functions are restricted as follows: for every $f \in \Sigma_{1}, f_{\mathcal{A}}\left(a_{1}, \ldots, a_{n}\right)$ is defined if and only if there exist constants $c^{1}, \ldots, c^{n}$ such that $f\left(c^{1}, \ldots, c^{n}\right)$ is in $\Psi_{\mathcal{K}}(G)$ and $a_{i}=c_{\mathcal{B}}^{i}$ for all $i \in\{1, \ldots, n\}$. In this case we define $f_{\mathcal{A}}\left(a_{1}, \ldots, a_{n}\right):=f_{\mathcal{B}}\left(c_{\mathcal{B}}^{1}, \ldots, c_{\mathcal{B}}^{n}\right)$. The reduct of $\mathcal{A}$ to $\left(\Sigma_{0} \cup C\right.$, Pred) coincides with that of $\mathcal{B}$. Thus, $\mathcal{A}$ is a model of $\mathcal{T}_{0} \cup G_{0}$. By the way the operations in $\Sigma_{1}$ are defined in $\mathcal{A}$ it is clear that $\mathcal{A}$ satisfies $G_{1}$, so $\mathcal{A}$ satisfies $G$.

We show that $\mathcal{A} \models_{w} \mathcal{K}$. Let $D$ be a clause in $\mathcal{K}$. If $D$ is ground then all its terms are defined (and all terms starting with an extension function are contained in $\Psi_{\mathcal{K}}(G)$ ), i.e. $D \in \mathcal{K}\left[\Psi_{\mathcal{K}}(G)\right]$, so $D$ is true in $\mathcal{B}$, hence it is also true in $\mathcal{A}$.

Now consider the case in which $D$ is not ground. Let $\beta: X \rightarrow \mathcal{A}$ be an arbitrary valuation. Again, if there is a term $t$ in $D$ such that $\beta(t)$ is undefined, we immediately have that $(\mathcal{A}, \beta)$ weakly satisfies $D$. So let us suppose that for all terms $t$ occurring in $D, \beta(t)$ is defined. We associate with $\beta$ a substitution $\sigma$ as follows: Let $x$ be a variable. We have the following possibilities:

Case 1: $x$ does not occur below any extension function. This case is unproblematic. We can define $\sigma(x)$ arbitrarily.

Case 2: $x$ occurs in a unique term $t=f(\ldots x \ldots y \ldots)$ (which may occur more than once in the clause $D$ ). From the fact that $\beta(t)$ is defined, we know that there are ground terms (in fact constants) which we will denote by $t_{x}, t_{y}, \ldots$ such that $\beta(x)=\left(t_{x}\right)_{\mathcal{B}}, \beta(y)=\left(t_{y}\right)_{\mathcal{B}}, \ldots, \beta(t)=f_{A}\left(\ldots\left(t_{x}\right)_{\mathcal{B}} \ldots\left(t_{y}\right)_{\mathcal{B}} \ldots\right)$, and $f\left(\ldots, t_{x}, \ldots, t_{y}, \ldots\right) \in \Psi_{\mathcal{K}}(G)$. We can define $\sigma(x)=t_{x}$.

Case 3: $x$ occurs in two terms of the form $f(x), g(x)$ in the clause $D$. By assumption, $\Psi_{\mathcal{K}}$ has the property that for every constant $c, f(c) \in \Psi_{\mathcal{K}}(G)$ iff $g(c) \in$ $\Psi_{\mathcal{K}}(G)$. From the fact that $\beta(f(x))$ and $\beta(g(x))$ are defined, we know that there are ground terms which we will denote by $t_{x}, s_{x}$ such that $\beta(x)=\left(t_{x}\right)_{\mathcal{B}}=\left(s_{x}\right)_{\mathcal{B}}$, $\beta(f(x))=f\left(t_{x}\right)_{\mathcal{B}}$ and $\beta(g(x))=g\left(s_{x}\right)_{\mathcal{B}}$, and $f\left(t_{x}\right), g\left(s_{x}\right) \in \Psi_{\mathcal{K}}(G)$. Since all terms in $\Psi_{\mathcal{K}}(G)$ are flat, $t_{x}$ and $s_{x}$ are constants. Assume that $t_{x}=c$. We know that if $f(c) \in \Psi_{\mathcal{K}}(G)$ then $g(c) \in \Psi_{\mathcal{K}}(G)$ and if $g(c) \in \Psi_{\mathcal{K}}(G)$ then $f(c) \in \Psi_{\mathcal{K}}(G)$, so we can choose $s_{x}=t_{x}=c$. Also in this case we can define $\sigma(x)=t_{x}=c$.

Thus, we can construct a substitution $\sigma$ with $\sigma(D) \in \mathcal{K}\left[\Psi_{\mathcal{K}}(G)\right]$ and $\beta \circ \sigma=\beta$. As $(\mathcal{B}, \beta) \models \sigma(D)$ we can infer $(\mathcal{A}, \beta) \models_{w} D$. We now show that

$$
\operatorname{Def}(\mathcal{A})=\left\{f\left(a_{1}, \ldots, a_{n}\right) \mid a_{1}, \ldots, a_{n} \in U_{\mathcal{A}}, f_{\mathcal{A}}\left(a_{1}, \ldots, a_{n}\right) \text { defined }\right\}
$$

is closed under $\Psi_{\mathcal{K}}$. By definition, $f\left(a_{1}, \ldots, a_{n}\right) \in \operatorname{Def}(\mathcal{A})$ iff there exist constants $c_{1}, \ldots, c_{n}$ with $c_{i \mathcal{A}}=a_{i}$ for all $i$ and $f\left(c_{1}, \ldots, c_{n}\right) \in \Psi_{\mathcal{K}}(G)$. Thus,

$$
\begin{array}{rlrl}
\operatorname{Def}(\mathcal{A}) & =\left\{f\left(a_{1}, \ldots, a_{n}\right) \mid a_{1}, \ldots, a_{n} \in U_{\mathcal{A}}, f_{\mathcal{A}}\left(a_{1}, \ldots, a_{n}\right) \text { defined }\right\} \\
& =\left\{f\left(c_{1 \mathcal{A}}, \ldots, c_{n \mathcal{A}}\right) \mid c_{i} \text { constants with } f\left(c_{1}, \ldots, c_{n}\right) \in \Psi_{\mathcal{K}}(G)\right\} \\
& =\bar{h}\left(\Psi_{\mathcal{K}}(G)\right) & & \text { where } h\left(c_{i}\right)=a_{i} \text { for all } i \\
\Psi_{\mathcal{K}}(\operatorname{Def}(\mathcal{A})) & =\Psi_{\mathcal{K}}\left(\bar{h}\left(\Psi_{\mathcal{K}}(G)\right)\right)=\bar{h}\left(\Psi_{\mathcal{K}}\left(\Psi_{\mathcal{K}}(G)\right)\right) & & \text { by property (iv) of } \Psi \\
& \subseteq \bar{h}\left(\Psi_{\mathcal{K}}(G)\right)=\operatorname{Def}(\mathcal{A}) & & \text { by property (iii) of } \Psi
\end{array}
$$

As $\mathcal{A} \models_{w} \mathcal{K}, \mathcal{A}$ weakly embeds into a total structure $\overline{\mathcal{A}}$ satisfying $\mathcal{T}_{0} \cup \mathcal{K}$. But then $\overline{\mathcal{A}} \models G$, so $\overline{\mathcal{A}} \models \mathcal{T}_{0} \cup \mathcal{K} \cup G$, which is a contradiction.

## $4 \boldsymbol{R}$-interpolation in local theory extensions

In [25] we considered convex and $P$-interpolating theories $\mathcal{T}_{0}$ with signature $\Pi_{0}=\left(\Sigma_{0}\right.$, Pred) (where $P \subseteq$ Pred). We studied $\Psi$-local extensions $\mathcal{T}=\mathcal{T}_{0} \cup \mathcal{K}$ of a theory $\mathcal{T}_{0}$ with new function symbols in a set $\Sigma_{1}$ axiomatized by a set $\mathcal{K}$ of clauses, with the property that all clauses in $\mathcal{K}$ are of the form:

$$
\left\{\begin{array}{l}
x_{1} R_{1} s_{1} \wedge \cdots \wedge x_{n} R_{n} s_{n} \rightarrow f\left(x_{1}, \ldots, x_{n}\right) R g\left(y_{1}, \ldots, y_{n}\right)  \tag{1}\\
x_{1} R_{1} y_{1} \wedge \cdots \wedge x_{n} R_{n} y_{n} \rightarrow f\left(x_{1}, \ldots, x_{n}\right) R f\left(y_{1}, \ldots, y_{n}\right)
\end{array}\right.
$$

where $n \geq 1, x_{1}, \ldots, x_{n}, y_{1}, \ldots, y_{n}$ are variables, $f, g \in \Sigma_{1}, R_{1}, \ldots, R_{n}, R$ are binary relations with $R_{1}, \ldots, R_{n} \in P$ and $R$ transitive, and for each $i \in\{1, \ldots, n\}$, the term $s_{i}$ is either a variable among the arguments of $g$, or a term of the form $h_{i}\left(z_{1}, \ldots, z_{k}\right)$, where $h_{i} \in \Sigma_{1}$ and all the arguments of $h_{i}$ are variables occurring among the arguments of $g$.

Example 2. A set $\mathcal{K}$ of axioms containing clauses of the form:

$$
\left\{\begin{aligned}
x_{1} \leq h\left(y_{1}\right) & \rightarrow f\left(x_{1}\right) \leq g\left(y_{1}\right) \\
x_{1} \leq y_{1} & \rightarrow f\left(x_{1}\right) \leq f\left(y_{1}\right)
\end{aligned}\right.
$$

satisfies the conditions above: $n=1, R_{1}=R=\leq, s_{1}=h\left(y_{1}\right), f, g, h \in \Sigma_{1}$.
We make the following assumptions (which were also made in [25]) on the theory $\mathcal{T}_{0}$ and its theory extension $\mathcal{T}_{0} \cup \mathcal{K}$ :

A1: $\mathcal{T}_{0}$ is convex and has the $P$-interpolation property.
A2: Satisfiability of ground clauses w.r.t. $\mathcal{T}_{0}$ is decidable.
A3: All clauses in $\mathcal{K}$ are of the form (1).
A4: $\mathcal{T}_{0} \subseteq \mathcal{T}_{0} \cup \mathcal{K}$ is a $\Psi$-local extension.
In [25], we proved that if $\mathcal{T}_{0}$ allows ground interpolation, then $\mathcal{T}$ allows ground interpolation, and that the interpolants can be computed in a hierarchical way, using a method for ground interpolation in $\mathcal{T}_{0}$.

We show that under the conditions above, the property of $P$-interpolation can be transferred from the theory $\mathcal{T}_{0}$ to the extension $\mathcal{T}=\mathcal{T}_{0} \cup \mathcal{K}$ of $\mathcal{T}_{0}$. The function
symbols in the signature of $\mathcal{T}_{0}$ are considered to be interpreted, and will always be considered to be shared. For the function symbols in the signature $\Sigma_{1}-$ considered to be "quasi"-interpreted - we use the notion of $\Theta_{\mathcal{K}}$-sharing introduced in Section 2
In order to show that $\mathcal{T}$ has the $P$-interpolation property, we need to prove that if $A, B$ are conjunctions of atoms and $A\left(\bar{c}, \bar{a}_{1}, a\right) \wedge B\left(\bar{c}, \bar{b}_{1}, b\right) \models \mathcal{T} a R b$, where $R \in P$, then there exists a term $t$ containing only the constants common to $A$ and $B$ and only function symbols which are $\Theta_{\mathcal{K}}$-shared by $A$ and $B$, such that $A\left(\bar{c}, \bar{a}_{1}, a\right) \wedge B\left(\bar{c}, \bar{b}_{1}, b\right) \models_{\mathcal{T}} a R t \wedge t R b$.
Note that

$$
A\left(\bar{c}, \bar{a}_{1}, a\right) \wedge B\left(\bar{c}, \bar{b}_{1}, b\right) \models_{\mathcal{T}} a R b \text { iff } A\left(\bar{c}, \bar{a}_{1}, a\right) \wedge B\left(\bar{c}, \bar{b}_{1}, b\right) \wedge \neg(a R b) \models_{\mathcal{T}} \perp
$$

By Assumption A4, $\mathcal{T}_{0} \cup \mathcal{K}$ is a $\Psi$-local extension of $\mathcal{T}_{0}$. We can purify and flatten this conjunction and obtain a conjunction of unit clauses $A_{0} \wedge B_{0} \wedge \operatorname{Def} \wedge \neg(a R b)$, where Def is a set of definitions of newly introduced constants. Let $T$ be the extension terms in Def. We introduce new constants and definitions also for all extension terms in $\Psi(T)$. This new set of definitions can be written as a conjunction $D_{A} \wedge D_{B}$ of its $A$-part and its $B$-part. By the $\Psi$-locality of the extension $\mathcal{T}_{0} \subseteq \mathcal{T}_{0} \cup \mathcal{K}$ and Theorem 5
$A_{0} \wedge B_{0} \wedge \operatorname{Def} \wedge \neg(a R b) \models \mathcal{T} \perp$ iff $\mathcal{K}_{0} \wedge A_{0} \wedge B_{0} \wedge \operatorname{Con}\left[D_{A} \wedge D_{B}\right]_{0} \wedge \neg(a R b) \models \tau_{0} \perp$, where $\mathcal{K}_{0}$ is obtained from $\mathcal{K}\left[D_{A} \wedge D_{B}\right]$ by replacing the $\Sigma_{1}$-terms with the corresponding constants contained in the definitions $D_{A} \wedge D_{B}$ and
$\operatorname{Con}\left[D_{A} \wedge D_{B}\right]_{0}=\bigwedge\left\{\begin{array}{ll}n & c_{i} \approx d_{i} \rightarrow c \approx d \left\lvert\, \begin{array}{l}f\left(c_{1}, \ldots, c_{n}\right) \approx c \in D_{A} \cup D_{B}, \\ f\left(d_{1}, \ldots, d_{n}\right) \\ i=1\end{array}\right.\end{array}\right\}$.
$\operatorname{Con}\left[D_{A} \wedge D_{B}\right]_{0}=\operatorname{Con}_{0}^{A} \wedge \operatorname{Con}_{0}^{B} \wedge \operatorname{Con}_{\text {mix }}$ and $\mathcal{K}_{0}=\mathcal{K}_{0}^{A} \wedge \mathcal{K}_{0}^{B} \wedge \mathcal{K}_{\text {mix }}$, where

- $\operatorname{Con}_{0}^{A}, \mathcal{K}_{0}^{A}$ only contain extension functions and constants which occur in $A$,
- $\operatorname{Con}_{0}^{B}, \mathcal{K}_{0}^{B}$ only contain extension functions and constants which occur in $B$,
- Con $_{\text {mix }}, \mathcal{K}_{\text {mix }}$ contain mixed clauses with constants occurring in $A$ and in $B$.

Our goal is to separate $\operatorname{Con}_{\text {mix }}$ and $\mathcal{K}_{\text {mix }}$ into an $A$-part and a $B$-part, which would allow us to use the $P$-interpolation property of theory $\mathcal{T}_{0}$.

Proposition 7 Assume that $\mathcal{T}_{0}$ is convex and P-interpolating and the intermediate terms can be effectively computed. Assume that ground satisfiability w.r.t. $\mathcal{T}_{0}$ is decidable.
Let $\mathcal{H}$ be a set of Horn clauses $\left(\bigwedge_{i=1}^{n} c_{i} R_{i} d_{i}\right) \rightarrow c R_{0} d$ in the signature $\Pi_{0}^{C}$ (with $R_{0}$ transitive and $R_{i} \in P$ ) which are instances of flattened and purified clauses of type (1) and of congruence axioms. Let $\mathcal{H}_{\text {mix }}$ be the mixed clauses in $\mathcal{H}$ :
$\mathcal{H}_{\text {mix }}=\left\{\bigwedge_{i=1}^{n} c_{i} R_{i} d_{i} \rightarrow c R_{0} d \in \mathcal{H} \mid c_{i}, c\right.$ constants in $A, d_{i}, d$ constants in $\left.B\right\} \cup$

$$
\left\{\bigwedge_{i=1}^{n} c_{i} R_{i} d_{i} \rightarrow c R_{0} d \in \mathcal{H} \mid c_{i}, c \text { constants in } B, d_{i}, d \text { constants in } A\right\}
$$

Let $A_{0}$ and $B_{0}$ be conjunctions of ground literals in the signature $\Pi_{0}^{C}$ such that $A_{0} \wedge B_{0} \wedge \mathcal{H} \wedge \neg(a R b) \models \mathcal{T}_{0} \perp$. Then $\mathcal{H}$ can be separated into an $A$ - and a $B$-part by replacing the set $\mathcal{H}_{\text {mix }}$ of mixed clauses with a separated set of formulae $\mathcal{H}_{\text {sep }}$ :
(i) There exists a set $T$ of $\left(\Sigma_{0} \cup C\right)$-terms containing only constants common to $A_{0}$ and $B_{0}$ such that $A_{0} \wedge B_{0} \wedge\left(\mathcal{H} \backslash \mathcal{H}_{\text {mix }}\right) \wedge \mathcal{H}_{\text {sep }} \wedge \neg(a R b) \models \mathcal{T}_{0} \perp$, where

$$
\begin{aligned}
\mathcal{H}_{\text {sep }}= & \left\{\left(\bigwedge_{i=1}^{n} c_{i} R_{i} t_{i} \rightarrow c R c_{f\left(t_{1}, \ldots, t_{n}\right)}\right) \wedge\left(\bigwedge_{i=1}^{n} t_{i} R_{i} d_{i} \rightarrow c_{f\left(t_{1}, \ldots, t_{n}\right)} R d\right) \mid\right. \\
& \bigwedge_{i=1}^{n} c_{i} R_{i} d_{i} \rightarrow c R d \in \mathcal{H}_{\text {mix }}, d_{i} \approx s_{i}\left(e_{1}, \ldots, e_{n}\right), d \approx g\left(e_{1}, \ldots, e_{n}\right) \in D_{B}, \\
& \left.c \approx f\left(c_{1}, \ldots, c_{n}\right) \in D_{A} \text { or vice versa }\right\}=\mathcal{H}_{\text {sep }}^{A} \wedge \mathcal{H}_{\text {sep }}^{B}
\end{aligned}
$$

and $c_{f\left(t_{1}, \ldots, t_{n}\right)}$ are new constants in $\Sigma_{c}$ (considered to be common) introduced for the corresponding terms $f\left(t_{1}, \ldots, t_{n}\right)$, where for $i \in\{1, \ldots, n\}, t_{i}$ separates the atom $c_{i} R_{i} d_{i}$, which is entailed by the already deduced atoms.
(ii) $A_{0} \wedge B_{0} \wedge\left(\mathcal{H} \backslash \mathcal{H}_{\text {mix }}\right) \wedge \mathcal{H}_{\text {sep }} \wedge \neg(a R b)$ is logically equivalent with respect to $\mathcal{T}_{0}$ with the following separated conjunction of ground literals:

$$
\begin{aligned}
& \bar{A}_{0} \wedge \bar{B}_{0} \wedge \neg(a R b)=A_{0} \wedge B_{0} \wedge \neg(a R b) \wedge \wedge\left\{c R d \mid \Gamma \rightarrow c R d \in \mathcal{H} \backslash \mathcal{H}_{\text {mix }}\right\} \wedge \\
& \wedge\left\{c R c_{f(\bar{t})} \wedge c_{f(\bar{t})} R d \mid\left(\Gamma \rightarrow c R c_{f(\bar{t})}\right) \wedge\left(\Gamma \rightarrow c_{f(\bar{t})} R d\right) \in \mathcal{H}_{\text {sep }}\right\} .
\end{aligned}
$$

Proof: The proof is similar to that of Proposition 5.7 in [25]. (i) and (ii) are proved simultaneously by induction on the number of clauses in $\mathcal{H}$. If $\mathcal{H}=\emptyset$, it is already separated into an $A$ and a $B$ part so we are done. Assume that $\mathcal{H}$ contains at least one clause, and that for every $\mathcal{H}^{\prime}$ with fewer clauses and all conjunctions of literals $A_{0}^{\prime}, B_{0}^{\prime}$ with $A_{0}^{\prime} \wedge B_{0}^{\prime} \wedge \mathcal{H}^{\prime} \wedge \neg a R b \models \mathcal{T}_{0} \perp$, (i) and (ii) hold.

Let $\mathcal{D}$ be the set of all atoms $c_{i} R_{i} d_{i}$ occurring in premises of clauses in $\mathcal{H}$. As every model of $A_{0} \wedge B_{0} \wedge \bigwedge_{\left(c R^{\prime} d\right) \in \mathcal{D}} \neg\left(c R^{\prime} d\right) \wedge \neg a R b$ is also a model for $\mathcal{H} \wedge A_{0} \wedge B_{0} \wedge \neg a R b$ and since $\mathcal{H} \wedge A_{0} \wedge B_{0} \wedge \neg a R b \models_{\mathcal{T}_{0}} \perp$, it follows that $A_{0} \wedge B_{0} \wedge \bigwedge_{\left(c R^{\prime} d\right) \in \mathcal{D}} \neg\left(c R^{\prime} d\right) \wedge \neg(a R b) \models \mathcal{T}_{0} \perp$.
Let $\left(A_{0} \wedge B_{0}\right)^{+}$be the conjunction of all atoms in $A_{0} \wedge B_{0}$, and $\left(A_{0} \wedge B_{0}\right)^{-}$be the set of all negative literals in $A_{0} \wedge B_{0}$. Then

$$
\left(A_{0} \wedge B_{0}\right)^{+} \models \mathcal{T}_{0} \bigvee_{(c R d) \in \mathcal{D}}(c R d) \vee \bigvee_{\neg L \in\left(A_{0} \wedge B_{0}\right)^{-}} L \quad \vee a R b
$$

We know that $\mathcal{T}_{0}$ is convex with respect to Pred. Moreover, $\left(A_{0} \wedge B_{0}\right)^{+}$is a conjunction of positive literals. Therefore, either
(a) $\left(A_{0} \wedge B_{0}\right)^{+} \models a R b$, or
(b) $\left(A_{0} \wedge B_{0}\right)^{+} \models L$ for some $L \in\left(A_{0} \wedge B_{0}\right)^{-}$(then $A_{0} \wedge B_{0}$ is unsatisfiable and hence entails any atom $c_{i} R_{i} d_{i}$ ), or
(c) there exists $\left(c_{1} R_{1} d_{1}\right) \in \mathcal{D}$ such that $\left(A_{0} \wedge B_{0}\right)^{+} \models \mathcal{T}_{0} c_{1} R_{1} d_{1}$.

Case 1: $\left(A_{0} \wedge B_{0}\right)^{+} \models a R b$. Then we are done.
Case 2: $A_{0} \wedge B_{0}$ is unsatisfiable. In this case (i) and (ii) hold for $T=\emptyset$.
Case 3: $A_{0} \wedge B_{0}$ is satisfiable, $\left(A_{0} \wedge B_{0}\right)^{+} \not \vDash a R b$, and there exists $\left(c_{1} R_{1} d_{1}\right) \in \mathcal{D}$ such that $\left(A_{0} \wedge B_{0}\right)^{+} \models \mathcal{T}_{0} c_{1} R_{1} d_{1}$. Then $A_{0} \wedge B_{0}$ is logically equivalent in $\mathcal{T}_{0}$ with $A_{0} \wedge B_{0} \wedge c_{i} R_{i} d_{i}$. If it is not the case that by adding $c_{i} R_{i} d_{i}$ all premises of some rule in $\mathcal{H}$ become true we repeat the procedure for $\mathcal{D}_{1}=\mathcal{D} \backslash\left(c_{1} R_{1} d_{1}\right)$ : Again in this case $A_{0} \wedge B_{0} \wedge \bigwedge_{\left(c R^{\prime} d\right) \in \mathcal{D}_{1}} \neg\left(c R^{\prime} d\right) \wedge \neg(a R b) \models \mathcal{T}_{0} \perp$ (if it has a model then
$A_{0} \wedge B_{0} \wedge \mathcal{H} \wedge \neg(a R b)$ has one $)$, and as before, using convexity we infer that either $A_{0} \wedge B_{0} \models a R b$ (which cannot be the case) or $A_{0} \wedge B_{0}$ is unsatisfiable (which cannot be the case) or there exists $c_{2} R_{2} d_{2} \in \mathcal{D}_{1}$ with $A_{0} \wedge B_{0} \models \mathcal{T}_{0} c_{2} R_{2} d_{2}$. We can repeat the process until all the premises of some clause in $\mathcal{H}$ are proved to be entailed by $A_{0} \wedge B_{0}$. Let $C=\bigwedge_{i=1}^{n} c_{i} R_{i} d_{i} \rightarrow c R d$ be such a clause.
Case 3a. Assume that $C$ contains only constants occurring in $A$ or only constants occurring in $B$. Then $A_{0} \wedge B_{0} \wedge \mathcal{H}$ is equivalent with respect to $\mathcal{T}_{0}$ with $A_{0} \wedge B_{0} \wedge(\mathcal{H} \backslash C) \wedge c R d$. By the induction hypothesis for $A_{0}^{\prime} \wedge B_{0}^{\prime}=$ $A_{0} \wedge B_{0} \wedge c R d$ and $\mathcal{H}^{\prime}=\mathcal{H} \backslash\{C\}$, we know that there exists $T^{\prime}$ such that $A_{0}^{\prime} \wedge B_{0}^{\prime} \wedge\left(\mathcal{H}^{\prime} \backslash \mathcal{H}^{\prime}{ }_{\text {mix }}\right) \wedge \mathcal{H}^{\prime}{ }_{\text {sep }} \wedge \neg(a R b) \models \perp$, and (ii) holds too.
Then, for $T=T^{\prime}, A_{0}^{\prime} \wedge B_{0}^{\prime} \wedge\left(\mathcal{H}^{\prime} \backslash \mathcal{H}^{\prime}{ }_{\text {mix }}\right) \wedge \mathcal{H}^{\prime}$ sep is logically equivalent to $A_{0} \wedge$ $B_{0} \wedge\left(\mathcal{H} \backslash \mathcal{H}_{\text {mix }}\right) \wedge \mathcal{H}_{\text {sep }}$, so (i) holds.
In order to prove (ii), note that, by definition, $\mathcal{H}_{\text {mix }}^{\prime}=\mathcal{H}_{\text {mix }}$ and $\mathcal{H}_{\text {sep }}^{\prime}=\mathcal{H}_{\text {sep }}$. By the induction hypothesis, $A_{0}^{\prime} \wedge B_{0}^{\prime} \wedge\left(\mathcal{H}^{\prime} \backslash \mathcal{H}^{\prime}\right.$ mix $) \cup \mathcal{H}_{\text {sep }}^{\prime}$ is logically equivalent to a corresponding conjunction $\bar{A}_{0}^{\prime} \wedge \bar{B}_{0}^{\prime}$ containing as conjuncts all literals in $A_{0}^{\prime}$ and $B_{0}^{\prime}$ and all conclusions of rules in $\mathcal{H}^{\prime} \backslash \mathcal{H}_{\text {mix }}^{\prime}$ and $\mathcal{H}_{\text {sep }}^{\prime}$. On the other hand, $A_{0}^{\prime} \wedge B_{0}^{\prime}$ is logically equivalent to $A_{0} \wedge B_{0} \wedge(c R d)$, where $(c R d)$ is the conclusion of the rule $C \in \mathcal{H} \backslash \mathcal{H}_{\text {mix }}$. This proves (ii).

Case $\mathbf{3 b}$. Assume now that $C$ is mixed, for instance that $c_{1}, \ldots, c_{n}, c$ are constants in $A$ and $d_{1}, \ldots, d_{n}, d$ are constants in $B$. Assume that $C$ is obtained from an instance of a clause of the form $\bigwedge_{i=1}^{n} x_{i} R_{i} s_{i}(\bar{y}) \rightarrow f\left(x_{1}, \ldots, x_{n}\right) R g(\bar{y})$. (The case when $C$ corresponds to an instance of a monotonicity axiom is similar.) This means that there exist $c \approx f\left(c_{1}, \ldots, c_{n}\right) \in D_{A}$ and $d_{i} \approx s_{i}(\bar{e}), d \approx g(\bar{e}) \in D_{B}$. In particular, $f$ is a $A$-function symbol and $g$ a $B$-function symbol; since $f$ and $g$ occur together in an axiom in $\mathcal{K}$ they are considered to be shared. The clause $C$ was chosen such that for each premise $c_{i} R_{i} d_{i}$ of $C, A_{0} \wedge B_{0} \models \mathcal{T}_{0} c_{i} R_{i} d_{i}$, and $\mathcal{T}_{0}$ is $P$-interpolating. Thus, there exist terms $t_{1}, \ldots, t_{n}$ containing only constants common to $A_{0}$ and $B_{0}$ such that for all $i \in\{1, \ldots, n\}$

$$
\begin{equation*}
A_{0} \wedge B_{0} \models \mathcal{T}_{0} c_{i} R_{i} t_{i} \wedge t_{i} R_{i} d_{i} \tag{2}
\end{equation*}
$$

Let $c_{f\left(t_{1}, \ldots, t_{n}\right)}$ be a new constant, denoting the term $f\left(t_{1}, \ldots, t_{n}\right)$, and let

$$
C_{A}=\bigwedge_{i=1}^{n} c_{i} R_{i} t_{i} \rightarrow c R c_{f\left(t_{1}, \ldots, t_{n}\right)} \quad \text { and } \quad C_{B}=\bigwedge_{i=1}^{n} t_{i} R_{i} d_{i} \rightarrow c_{f\left(t_{1}, \ldots, t_{n}\right)} R d
$$

Thus, $C_{A}$ corresponds to the monotonicity axiom

$$
\bigwedge_{i=1}^{n} c_{i} R_{i} t_{i} \rightarrow f\left(c_{1}, \ldots, c_{n}\right) R f\left(t_{1}, \ldots, t_{n}\right)
$$

whereas $C_{B}$ corresponds to the rule

$$
\bigwedge_{i=1}^{n} t_{i} R_{i} s_{i}(\bar{e}) \rightarrow f\left(t_{1}, \ldots, t_{n}\right) R g(\bar{e})
$$

As $R$ is transitive, by (2) the following holds:

$$
\begin{array}{rl}
A_{0} \wedge B_{0} \wedge C_{A} \wedge C_{B} \wedge \neg a R b & H \mathcal{T}_{0} A_{0} \wedge B_{0} \wedge\left(\bigwedge_{i=1}^{n} c_{i} R_{i} t_{i} \wedge C_{A}\right) \wedge\left(\bigwedge_{i=1}^{n} t_{i} R_{i} d_{i} \wedge C_{B}\right) \\
& \wedge \neg a R b \\
& H \mathcal{T}_{0} A_{0} \wedge B_{0} \wedge c R c_{f\left(t_{1}, \ldots, t_{n}\right)} \wedge c_{f\left(t_{1}, \ldots, t_{n}\right)} R d \wedge \neg a R b \\
& \models \mathcal{T}_{0} A_{0} \wedge B_{0} \wedge c R d \wedge \neg a R b
\end{array}
$$

(where $\# \mathcal{T}_{0}$ stands for logical equivalence with respect to $\mathcal{T}_{0}$ ).
Hence, $A_{0} \wedge B_{0} \wedge C_{A} \wedge C_{B} \wedge(\mathcal{H} \backslash C) \wedge \neg a R b \models \mathcal{T}_{0} A_{0} \wedge B_{0} \wedge c R d \wedge(\mathcal{H} \backslash C) \wedge \neg a R b$.
On the other hand, as $A_{0} \wedge B_{0} \models \mathcal{T}_{0} \bigwedge_{i=1}^{n} c_{i} R_{i} d_{i}, A_{0} \wedge B_{0} \wedge \mathcal{H}$ is logically equivalent with $A_{0} \wedge B_{0} \wedge c R d \wedge(\mathcal{H} \backslash C)$, so $A_{0} \wedge B_{0} \wedge C_{A} \wedge C_{B} \wedge(\mathcal{H} \backslash C) \wedge \neg a R b \models \mathcal{T}_{0} \perp$.
By the induction hypothesis for $A_{0} \wedge B_{0} \wedge c R c_{f\left(t_{1}, \ldots, t_{n}\right)} \wedge c_{f\left(t_{1}, \ldots, t_{n}\right)} R d$ and $\mathcal{H}^{\prime}=$ $\mathcal{H} \backslash C$ we know that there exists a set $T^{\prime}$ of terms such that

$$
A_{0} \wedge B_{0} \wedge c R c_{f\left(t_{1}, \ldots, t_{n}\right)} \wedge c_{f\left(t_{1}, \ldots, t_{n}\right)} R d \wedge\left(\mathcal{H}^{\prime} \backslash \mathcal{H}_{\text {mix }}^{\prime}\right) \wedge \mathcal{H}_{\text {sep }}^{\prime} \wedge \neg a R b \models \perp
$$

and also (ii) holds. Then (i) holds for $T=T^{\prime} \cup\left\{t_{1}, \ldots, t_{n}\right\}$. (ii) can be proved similarly using the induction hypothesis.

Theorem 8 Assume that $\mathcal{T}_{0}$ is convex and $P$-interpolating with respect to $P \subseteq$ Pred, and that the ground satisfiability w.r.t. $\mathcal{T}_{0}$ is decidable and the interpolating terms can be effectively computed. Assume that $\mathcal{T}=\mathcal{T}_{0} \cup \mathcal{K}$ is a $\Psi$-local extension of $\mathcal{T}_{0}$ with a set of clauses $\mathcal{K}$ which only contains combinations of clauses of type (1). Then $\mathcal{T}$ is also $P$-interpolating and the interpolating terms can be effectively computed.

Proof: We prove that if $A, B$ are conjunctions of literals and $A\left(\bar{c}, \bar{a}_{1}, a\right) \wedge$ $B\left(\bar{c}, \bar{b}_{1}, b\right) \models_{\mathcal{T}} a R b$ where $R \in P$, then there exists a term $t$ containing only the constants common to $A$ and $B$ and only function symbols which are shared by $A$ and $B$, such that $A\left(\bar{c}, \bar{a}_{1}, a\right) \wedge B\left(\bar{c}, \bar{b}_{1}, b\right) \models_{\mathcal{T}} a R t \wedge t R b$. We can restrict w.l.o.g. to a purified and flattened conjunction of unit clauses $A_{0} \wedge B_{0} \wedge \operatorname{Def} \wedge \neg(a R b)$. With the notation used on page [13, by Theorem 5 we have:
$A_{0} \wedge B_{0} \wedge \operatorname{Def} \wedge \neg(a R b) \models_{\mathcal{T}} \perp$ iff $\mathcal{K}_{0} \wedge A_{0} \wedge B_{0} \wedge \operatorname{Con}\left[D_{A} \wedge D_{B}\right]_{0} \wedge \neg(a R b) \models_{\mathcal{T}_{0}} \perp$. By Proposition 7 (ii), there exists a set $T$ of $\left(\Sigma_{0} \cup C\right)$-terms containing only constants common to $A_{0}$ and $B_{0}$ such that $\mathcal{H}=\mathcal{K}_{0} \wedge \operatorname{Con}\left[D_{A} \wedge D_{B}\right]_{0}$ can be separated as described in Proposition 7, $A_{0} \wedge B_{0} \wedge\left(\mathcal{H} \backslash \mathcal{H}_{\text {mix }}\right) \wedge \mathcal{H}_{\text {sep }} \wedge \neg a R b$ is logically equivalent w.r.t. $\mathcal{T}_{0}$ with a separated conjunction of ground literals $\bar{A}_{0} \wedge \bar{B}_{0} \wedge \neg a R b$, which is therefore unsatisfiable, so $\bar{A}_{0} \wedge \bar{B}_{0} \models a R b$. From the $P$-interpolation property in $\mathcal{T}_{0}$, there exists a term containing the shared constants such that $\bar{A}_{0} \wedge \bar{B}_{0} \models \mathcal{T}_{0} a R t \wedge t R b$. If we now replace all constants $c_{f\left(t_{1}, \ldots, t_{n}\right)}$ introduced in the purification process or in the separation process with the terms they denote, we obtain $A \wedge B \models_{\mathcal{T}} a R t \wedge t R b$. Since all intermediate terms $t_{i}$ contain only shared symbols and the function symbol $f$ is shared by $A$ and $B$, all terms $f\left(t_{1}, \ldots, t_{n}\right)$, hence also $t$ contain only symbols shared by $A$ and $B$.

We obtain the following procedure for $P$-interpolation if $A \wedge B \models \mathcal{T} a R b$ :
Step 1: Preprocess Using locality, flattening and purification we obtain a set $\mathcal{H} \wedge A_{0} \wedge B_{0}$ of formulae in the base theory, where $\mathcal{H}$ is as in Proposition 7 .
Step 2: $\Delta:=\mathrm{T}$. Repeat as long as $A_{0} \wedge B_{0} \wedge \Delta \not \vDash a R b$ : Let $C \in \mathcal{H}$ whose premise is entailed by $A_{0} \wedge B_{0} \wedge \Delta$.
If $C$ is not mixed, move $C$ to $\mathcal{H}_{\text {sep }}$ and add its conclusion to $\Delta$.
If $C$ is mixed, compute terms $t_{i}$ which separate the premises in $C$, and separate the clause into an instance $C_{1}$ of monotonicity and an instance $C_{2}$ of a clause in $\mathcal{K}$ as in the proof of Proposition 7 Remove $C$ from $\mathcal{H}$, and add $C_{1}, C_{2}$ to $\mathcal{H}_{\text {sep }}$ and their conclusions to $\Delta$.
Step 3: Compute separating term. Compute a separating term for $A_{0} \wedge$ $B_{0} \wedge \Delta \models a R b$ in $\mathcal{T}_{0}$, and construct an interpolant for the extension as explained in the proof of Theorem 8

## 5 Example: Semilattices with monotone operators

We will now analyze $\leq$-interpolation properties for theories of semilattices with monotone operators.

### 5.1 The theory SLat of semilattices

We define the theory SLat of semilattices and show that conditions A1 and A2 are satisfied for SLat.
A semilattice $(S, \sqcap)$ is set $S$ with a binary operation $\Pi$ which is associative, commutative and idempotent. One can equivalently regard semilattices as partially ordered sets ( $S, \leq$ ), in which infima $a_{1} \sqcap \ldots \sqcap a_{n}$ of finite non-empty subsets $\left\{a_{1}, \ldots, a_{n}\right\} \subseteq S$ exist; then $a \leq b$ iff $a \sqcap b=a$.
The theory SLat of semilattices can be axiomatized by equations (associativity, commutativity and idempotence of $\sqcap$ ), therefore it clearly is $\approx$-convex: Convexity w.r.t. $\leq$ follows from the fact that $x \leq y$ iff $(x \sqcap y) \approx x$.

Lemma 1. Ground satisfiability w.r.t. SLat is decidable.
Proof: This is a consequence of the fact that the theory of semilattices SLat is a local extension of the theory of pure equality - this follows from a result on the locality of lattices by Skolem [21], or by results in [10], since every partial semilattice weakly embeds into a total one. 1
The theory SLat is $\leq$-interpolating, therefore also $\approx$-interpolating (cf. [18]; we present the proof since it indicates how the intermediate terms can be computed):

[^0]Lemma 9 The theory SLat of semilattices is $\leq$-interpolating.
Proof: This is a constructive proof based on the fact that SLat $=\operatorname{ISP}\left(S_{2}\right)$, where $S_{2}$ is the 2-element semilattice, i.e. every semilattice is isomorphic to a sublattice of a power of $S_{2}$ - or, alternatively, that every semilattice is isomorphic to a semilattice of sets. We prove that the theory of semilattices is $\leq$-interpolating, i.e. that if $A$ and $B$ are two conjunctions of literals and $A \wedge B \models_{\text {SLat }} a \leq b$, where $a$ is a constant occurring in $A$ and $b$ a constant occurring in $B$, then there exists a term containing only common constants in $A$ and $B$ such that $A \models_{\text {SLat }} a \leq t$ and $A \wedge B \models$ SLat $t \leq b$. We can assume without loss of generality that $A$ and $B$ consist only of atoms: Indeed, assume that $A \wedge B=A_{1} \wedge \cdots \wedge A_{n} \wedge \neg A_{1}^{\prime} \wedge \cdots \wedge \neg A_{m}^{\prime}$, where $A_{1}, \ldots, A_{n}, A_{1}^{\prime}, \ldots, A_{m}^{\prime}$ are atoms. Then the following are equivalent:
$-A \wedge B \models_{\text {SLat }} a \leq b$
$-\models_{\mathrm{SLat}} A \wedge B \rightarrow a \leq b$
$-\models$ SLat $\neg A_{1} \vee \cdots \vee \neg A_{n} \vee A_{1}^{\prime} \vee \cdots \vee A_{m}^{\prime} \vee a \leq b$
$-\models_{\text {SLat }}\left(A_{1} \wedge \cdots \wedge A_{n}\right) \rightarrow A_{1}^{\prime} \vee \cdots \vee A_{m}^{\prime} \vee a \leq b$
$-A_{1} \wedge \cdots \wedge A_{n} \models_{\text {SLat }} A_{1}^{\prime} \vee \cdots \vee A_{m}^{\prime} \vee a \leq b$
Since the theory of semilattices is convex w.r.t. $\leq$ and $\approx$, it follows that if $A \wedge B \models_{\text {SLat }} a \leq b$ then either
(a) $A_{1} \wedge \cdots \wedge A_{n} \models$ SLat $A_{j}^{\prime}$ for some $j \in\{1, \ldots, m\}$ or
(b) $A_{1} \wedge \cdots \wedge A_{n} \models$ SLat $a \leq b$.

It is easy to see that in case (a), $A \wedge B \models \perp$. Then the conclusion follows immediately. We therefore consider the case when $A$ and $B$ consist only of atoms.

As SLat $=\operatorname{ISP}\left(S_{2}\right)$, in SLat the same Horn sentences are true as in the 2element semilattice $S_{2}$. Thus, $A \wedge B \models_{\text {SLat }} a \leq b$ iff $A \wedge B \models_{S_{2}} a \leq b$, so we can reduce such a test to entailment in propositional logic.

It follows that $A \wedge B \models_{\text {SLat }} a \leq b$ if and only if the following conjunction of literals in propositional logic is unsatisfiable:
$N_{A}:\left\{\begin{array}{c}P_{e_{1} \sqcap e_{2}} \leftrightarrow P_{e_{1}} \wedge P_{e_{2}} \\ P_{e_{1}} \leftrightarrow P_{e_{2}} \quad e_{1} \approx e_{2} \in A \\ P_{e_{1}} \rightarrow P_{e_{2}} \quad e_{1} \leq e_{2} \in A \\ \text { for all } e_{1}, e_{2} \text { subterms in } A \\ P_{a}\end{array} \quad N_{B}:\left\{\begin{array}{c}P_{g_{1} \sqcap g_{2}} \leftrightarrow P_{g_{1}} \wedge P_{g_{2}} \\ P_{g_{1}} \leftrightarrow P_{g_{2}} g_{1} \approx g_{2} \in B \\ P_{g_{1}} \rightarrow P_{g_{2}} g_{1} \leq g_{2} \in B \\ \text { for all } g_{1}, g_{2} \text { subterms in } B \\ \neg P_{b}\end{array}\right.\right.$
i.e. $A \wedge B \models_{\text {SLat }} a \leq b$ if and only if $\left(N_{A} \wedge P_{a}\right) \wedge\left(N_{B} \wedge \neg P_{b}\right) \models \perp$, where $N_{A}$ and $N_{B}$ are sets of Horn clauses in which each clause contains a positive literal. We show that if $A \wedge B \models_{\text {SLat }} a \leq b$ holds, then for the term

$$
t:=\bigcap\left\{e \mid A \models_{\mathrm{SLat}} a \leq e, e \text { common subterm of } A \text { and } B\right\}
$$

the following hold:
(i) $A \models \models_{\text {Lat }} a \leq t$, and
(ii) $A \wedge B \models \models_{\text {LLat }} t \leq b$.

This means that for the theory of semilattices we have a property stronger than $\leq$-interpolability.
Every $e \in T=\{e \mid A \models$ SLat $a \leq e, e$ common subterm of $A$ and $B\}$ corresponds to the positive unit clause $P_{e}$ (where $P_{e}$ is a propositional variable common to $N_{A}$ and $N_{B}$ ) which can be derived from $N_{A}$ using ordered resolution (with the ordering described above).
It is clearly the case that $A \models$ SLat $a \leq t$, because $N_{A} \wedge P_{a} \wedge \neg P_{t} \wedge\left(P_{t} \leftrightarrow \bigwedge_{e \in T} P_{e}\right)$ is unsatisfiable. Thus, (i) holds.
For proving (ii), observe that by saturating $N_{A} \wedge P_{a}$ under ordered resolution we obtain the following kinds of clauses which can possibly lead to $\perp$ after inferences with $N_{B} \wedge \neg P_{b}$ (and thus to the consequence $a \leq b$ together with $B$ ):
(a) $P_{e_{k}}$ positive unit clauses s.t. $e_{k}$ contains symbols common to $A$ and $B$, for $k \in\{1, \ldots, l\}$.
(b) $\bigwedge_{j=1}^{n_{i}} P_{c_{i j}} \rightarrow P_{d_{i}}$, where $c_{i j}$ and $d_{i}$ are common symbols, such that for all $i$, $j$ and $k$ we have $c_{i j} \neq e_{k}$ and $d_{i} \neq e_{k}$, for $i \in\{1, \ldots, p\}$.

Other types of clauses may appear too, but they can not be used to obtain $a \leq b$ :
To see that clauses where some $c_{i j}=e_{k}$ are not necessary to derive the consequence $a \leq b$, note that if $P_{e_{k}}$ is a positive unit literal and we have the clause $\left(P_{e_{k}} \wedge \bigwedge P_{c_{i j}}\right) \rightarrow P_{d_{i}}$, then by resolution we get as an inference $\bigwedge P_{c_{i j}} \rightarrow P_{d_{i}}$. It is easy to see that $\left(P_{e_{k}} \wedge \bigwedge P_{c_{i j}}\right) \rightarrow P_{d_{i}}$ is redundant in the presence of $\bigwedge P_{c_{i j}} \rightarrow P_{d_{i}}$. In the same way, clauses of the form $\bigwedge P_{c_{i j}} \rightarrow P_{e_{k}}$ (i.e. clauses of type (b) where $d_{i}=e_{k}$ ) are redundant in the presence of $P_{e_{1}}, \ldots, P_{e_{l}}$. For the proof of (ii) one needs to consider separately the case in which none of the $P_{d_{i}}$ is needed to derive $\perp$ together with $N_{B}$ (and thus the consequence $a \leq b$ ) and the case when some $P_{d_{i}}$ are needed.

Case 1: None of the $P_{d_{i}}$ is needed to derive $\perp$ together with $N_{B}$ (and thus the consequence $a \leq b)$. We know that $N_{A} \models P_{a} \rightarrow \bigwedge_{k=1}^{l} P_{e_{k}}$. From this it follows that $A \models a \leq\rceil_{k=1}^{l} e_{k}$.
For $A \wedge B \models a \leq b$ to be true, $\bigwedge_{k=1}^{l} P_{e_{k}} \wedge N_{B} \wedge \neg P_{b}$ must be unsatisfiable, so there has to be a subset $S \subseteq\{1, \ldots, l\}$ such that $\bigwedge_{k \in S} P_{e_{k}} \wedge N_{B} \wedge \neg P_{b}$. This means that $B \models \prod_{s \in S} e_{s} \leq b$. But then, since $\prod_{k=1}^{l} e_{k} \leq \prod_{s \in S} e_{s}$, it follows that $B \models\rceil_{k=1}^{l} e_{k} \leq b$, and therefore also $A \wedge B \models \prod_{k=1}^{l} e_{k} \leq b$.
Case 2: Some $P_{d_{i}}$ are needed to derive $\perp$ from $N_{B} \wedge \neg P_{b}$. Again, we know that $N_{A} \models P_{a} \rightarrow \bigwedge_{k=1}^{l} P_{e_{k}}$ (hence $\left.A \models a \leq\right\rceil_{k=1}^{l} e_{k}$ ).
For $A \wedge B \models a \leq b$ to be true, i.e. $\left(N_{A} \wedge P_{a}\right) \wedge\left(N_{B} \wedge \neg P_{b}\right)$ to be unsatisfiable, there have to be subsets $S_{1} \subseteq\{1, \ldots, l\}$ and $S_{2} \subseteq\{1, \ldots, p\}$ such that $N_{B} \wedge$ $\bigwedge_{k \in S_{1}} P_{e_{k}} \wedge \bigwedge_{i \in S_{2}}\left(\left(\bigwedge_{j} P_{c_{i j}}\right) \rightarrow P_{d_{i}}\right) \wedge \neg P_{b}$ is unsatisfiable.
Let $N_{A B}:=N_{B} \wedge \bigwedge_{k \in S_{1}} P_{e_{k}} \wedge \bigwedge_{i \in S_{2}}\left(\left(\bigwedge_{j} P_{c_{i j}}\right) \rightarrow P_{d_{i}}\right)$.
We know that $N_{B} \wedge \bigwedge_{k \in S_{1}} P_{e_{k}} \wedge \neg P_{b}$ is satisfiable. Assume that there is no $c_{i j}$ such that $N_{B} \wedge \bigwedge_{k \in S_{1}} P_{e_{k}} \wedge \neg P_{b} \models P_{c_{i j}}$. Then for every $c_{i j}, N_{B} \wedge \bigwedge_{k \in S_{1}} P_{e_{k}} \wedge \neg P_{b} \wedge \neg P_{c_{i j}}$ is satisfiable. Since all clauses in $N_{b} \wedge \bigwedge_{k \in S_{1}} P_{e_{k}} \wedge \neg P_{b}$ are Horn clauses, it follows that $N_{B} \wedge \bigwedge_{k \in S_{1}} P_{e_{k}} \wedge \neg P_{b} \wedge \bigwedge_{i, j} \neg P_{c_{i j}}$ is satisfiable. Every model of
$N_{B} \wedge \bigwedge_{k \in S_{1}} P_{e_{k}} \wedge \neg P_{b} \wedge \bigwedge_{i, j} \neg P_{c_{i j}}$ is a model of $N_{A B} \wedge \neg P_{b}$. It would therefore follow that $N_{A B} \wedge \neg P_{b}$ is satisfiable, which is a contradiction.
Thus, there exists at least one $c_{i j}$ such that $N_{B} \wedge \bigwedge_{k \in S_{1}} P_{e_{k}} \wedge \neg P_{b} \models P_{c_{i j}}$.
We can add $P_{c_{i j}}$ to this set of clauses and repeat the reasoning for the set of clauses obtained this way as long as we still have one clause of the form $\left(\left(\bigwedge_{j} P_{c_{i j}}\right) \rightarrow P_{d_{i}}\right)$ in $N_{A B}$ such that there exists at least one $c_{i j}$ such that $P_{c_{i j}}$ was not added to $N_{A B}$.
Then there has to be a sequence $\left(d_{i_{1} j}\right)_{j \in J_{1}},\left(d_{i_{2} j}\right)_{j \in J_{2}}, \ldots,\left(d_{i_{n} j}\right)_{j \in J_{n}}$ such that:

- $P_{d_{i_{1} j}}$ can be derived from $N_{A B} \wedge \wedge P_{e_{k}}$, for all $j \in J_{1}$,
$-P_{d_{i_{2} j}}$ can be derived from $N_{A B} \wedge \bigwedge P_{e_{k}} \wedge \bigwedge_{k \in J_{1}} P_{d_{i_{1} k}}$, for all $j \in J_{2}$,
$-P_{d_{i_{3} j}}$ can be derived from $N_{A B} \wedge \bigwedge P_{e_{k}} \wedge \bigwedge_{k \in J_{1}} P_{d_{i_{1} k}} \wedge \bigwedge_{k \in J_{2}} P_{d_{i_{2} k}}$, for all $j \in J_{3}$,
$-P_{d_{i_{n} j}}$ can be derived from $N_{A B} \wedge \bigwedge_{k} P_{e_{k}} \wedge \bigwedge_{k \in J_{1}} P_{d_{i_{1} k}} \wedge \cdots \bigwedge_{k \in J_{n-1}} P_{d_{i_{n-1} k}}$, for all $j \in J_{n}$,
- $P_{b}$ can be derived from $N_{A B} \wedge \wedge P_{e_{k}} \wedge \bigwedge_{k \in J_{1}} P_{d_{i_{1} k}} \wedge \ldots \wedge \bigwedge_{k \in J_{n}} P_{d_{i_{n} k}}$.

But then $A \wedge B \models \Pi e_{k} \leq d_{i_{1} l}$, for all $l \in J_{1}$, hence $A \wedge B \models \Pi e_{k} \leq \prod_{l \in J_{1}} d_{i_{1} l}$, hence $A \wedge B \models\left(\prod e_{k} \sqcap \prod_{l \in J_{1}} d_{i_{1} l}\right) \approx \prod e_{k}$.
Therefore, as $A \wedge B \models\left(\Pi e_{k} \sqcap \prod_{l \in J_{1}} d_{i_{1} l}\right) \leq d_{i_{2} j}$, for all $j \in J_{2}$, we conclude that $A \wedge B \models \Pi e_{k} \leq \prod_{j} d_{i_{2} j}$.
Similarly it can be proved that $A \wedge B \models \prod_{k} \leq \prod_{j \in J_{n}} d_{i_{n} j}$, and finally that $A \wedge B \models \Pi e_{k} \leq b$.
We illustrate the computation of intermediate terms on an example.
Example 3. Let $A=\left\{a_{1} \leq c_{1}, c_{2} \leq a_{2}, a_{2} \leq c_{3}\right\}$ and $B=\left\{c_{1} \leq b_{1}, b_{1} \leq\right.$ $\left.c_{2}, c_{3} \leq b_{2}\right\}$. It is easy to see that $A \wedge B \models a_{1} \leq b_{2}$. We can find an intermediate term by using the methods described in the proof of Lemma 9 We saturate the set of clauses

$$
N_{A} \wedge P_{a_{1}}=\left(P_{a_{1}} \rightarrow P_{c_{1}}\right) \wedge\left(P_{c_{2}} \rightarrow P_{a_{2}}\right) \wedge\left(P_{a_{2}} \rightarrow P_{c_{3}}\right) \wedge P_{a_{1}}
$$

under ordered resolution, in which the propositional variables $P_{a_{1}}, P_{a_{2}}$ are larger than $P_{c_{1}}, P_{c_{2}}, P_{c_{3}}$. This yields the clauses $P_{c_{1}}$ and $P_{c_{2}} \rightarrow P_{c_{3}}$ containing shared propositional variables. $\left(N_{A} \wedge P_{a_{1}}\right) \wedge\left(N_{B} \wedge \neg P_{b_{2}}\right)$ is unsatisfiable iff $N_{B} \wedge \neg P_{b_{2}} \wedge$ $P_{c_{1}} \wedge\left(P_{c_{2}} \rightarrow P_{c_{3}}\right)$ is unsatisfiable. Indeed $t=c_{1}$ is an intermediate term, as $A \models a_{1} \leq c_{1}$ and $A \wedge B \models c_{1} \leq b_{2}$. Note that $N_{B} \wedge \neg P_{b_{2}} \wedge P_{c_{1}}$ is satisfiable, so $B \not \vDash c_{1} \leq b_{2}$. Moreover, we only need $P_{c_{2}} \rightarrow P_{c_{3}}$ in addition to $N_{B} \cup \neg P_{b_{2}}$ to derive $\perp$, thus $A \wedge B \models c_{1} \leq b_{2}$ and the clause $P_{c_{2}} \rightarrow P_{c_{3}}$ obtained from $N_{A}$ is really needed for this.

### 5.2 Semilattices with operators

We define the theory of semilattices with monotone operators in a set $\Sigma$ possibly satisfying additional properties and show that conditions A3 and A4 are satisfied for this theory.

Let $\Sigma$ be a set of unary ${ }^{2}$ function symbols. We consider the extension SLat $_{\Sigma}=$ SLat $\cup \operatorname{Mon}(\Sigma)$ of SLat with new function symbols in $\Sigma$ satisfying the monotonicity axioms $\operatorname{Mon}_{\Sigma}=\bigcup_{f \in \Sigma} \operatorname{Mon}(f)$, where:

$$
\operatorname{Mon}(f) \quad \forall x, y(x \leq y \rightarrow f(x) \leq f(y))
$$

and also extensions $\operatorname{SLat} \cup \operatorname{Mon}(\Sigma) \cup \mathcal{K}$, where $\mathcal{K}$ is a set of axioms of the form:

$$
\begin{array}{rr}
\forall x & f(x) \leq g(x) \\
\forall x, y & y \leq g(x) \rightarrow f(y) \leq h(x) \tag{4}
\end{array}
$$

where $f, g, h \in \Sigma$, not necessarily all different.
Clearly, condition A3 is satisfied for the theory of semilattices with operators defined above. We show that condition A4 holds as well.

Lemma 10 The following extensions satisfy a locality property:
(i) The theory of semilattices SLat is local.
(ii) SLat $\cup \mathrm{Mon}_{\Sigma}$ is a local extension of SLat.
(iii) SLat $\cup \operatorname{Mon}_{\Sigma} \cup \mathcal{K}$ is a $\Psi$-local extension of SLat, where $\Psi$ is the closure operator on ground terms defined as follows:

$$
\begin{aligned}
& \Psi(G)= \bigcup_{i \geq 0} \Psi^{i}(G), \text { with } \Psi^{0}(G)=\operatorname{est}(G) \text { (the set of ground terms in } G \\
& \text { starting with extension functions), and } \\
& \Psi^{i+1}(G)=\left\{h(c) \mid \forall x(g(x) \leq h(x)) \in \mathcal{K} \text { and } g(c) \in \Psi^{i}(G)\right\} \cup \\
&\left\{g(c) \mid \forall x(g(x) \leq h(x)) \in \mathcal{K} \text { and } h(c) \in \Psi^{i}(G)\right\} \cup \\
&\left\{h(c) \mid \forall x, y(y \leq g(x) \rightarrow f(y) \leq h(x)) \in \mathcal{K} \text { and } g(c) \in \Psi^{i}(G)\right\} \cup \\
&\left\{g(c) \mid \forall x, y(y \leq g(x) \rightarrow f(y) \leq h(x)) \in \mathcal{K} \text { and } h(c) \in \Psi^{i}(G)\right\} .
\end{aligned}
$$

Proof: (i) follows from a result on the locality of lattices by Skolem [21], or by results in [10, since every partial semilattice weakly embeds into a total one.
(ii) follows from results in [28/29]. (iii) Since the axioms in $\mathcal{K}$ are not always linear, we use the locality criterion for non-linear sets of clauses mentioned in Theorem[6] and the fact that every semilattice $P=\left(S, \sqcap,\{f\}_{f \in \Sigma}\right)$ with partially defined monotone operators satisfying the axioms $\mathcal{K}$, and with the property that if a variable occurs in two terms $g(x), h(x)$ in a clause in $\mathcal{K}$, then for every $s \in S$, $g(s)$ is defined iff $h(s)$ is defined, weakly embeds into a semilattice with totally defined operators satisfying $\mathcal{K}$, which was proved in Lemma 4.5 from [27].
Given two sets of conjunctions of ground literals $A$ and $B$ over the signature of semilattices with operators, we consider the lattice operation $\square$ to be interpreted and the function symbols in $\Sigma$ to be uninterpreted. Let $\Sigma_{A}$ be the function symbols in $\Sigma$ occurring in $A$ and $\Sigma_{B}$ those occurring in $B$. We consider the following variants for "shared uninterpreted function symbols":

[^1]- Intersection-sharing: The shared function symbols of $A$ and $B$ are the function symbols in $\Sigma_{A} \cap \Sigma_{B}$.
- $\Theta_{\mathcal{K}}$-sharing (as defined in Example 11): $\Theta_{\mathcal{K}}\left(\Sigma_{A}\right)=\bigcup_{f \in \Sigma_{A}}\left\{g \in \Sigma \mid f \sim_{\mathcal{K}}^{*} g\right\}$, where $\sim_{\mathcal{K}}^{*}$ is the equivalence relation induced by $\sim_{\mathcal{K}}$ (with $f \sim_{\mathcal{K}} g$ iff $f, g$ occur in the same clause in $\mathcal{K}) ; \Theta_{\mathcal{K}}\left(\Sigma_{B}\right)$ is defined analogously. The $\Theta_{\mathcal{K}^{-}}$ shared function symbols are the function symbols in $\Theta_{\mathcal{K}}\left(\Sigma_{A}\right) \cap \Theta_{\mathcal{K}}\left(\Sigma_{B}\right)$.

Theorem 11 For every set $\mathcal{K}$ containing clauses of the form (3) and (4) above, the theory SLat $\cup \operatorname{Mon}_{\Sigma} \cup \mathcal{K}$ of semilattices with monotone operators satisfying axioms $\mathcal{K}$ is $\leq$-interpolating with the notion of $\Theta_{\mathcal{K}}$-sharing for uninterpreted function symbols.

Proof. The clauses of type (3) and (4) satisfy the conditions in the statement of Proposition 7 and Theorem 8, The result is therefore a consequence of the fact that the theory extension SLat $\subseteq$ SLat $\cup$ Mon $_{\Sigma} \cup \mathcal{K}$ satisfies conditions A1, A2, A3, A4 and of Proposition 7 and Theorem 8 .
We illustrate the way Theorem [5 Proposition 7 and Theorem 8 and the algorithm in Section 4 can be used for computing intermediate terms below:

Example 4. Consider the extension SLO $=$ SLat $_{\cup} \operatorname{Mon}_{f} \cup$ Mon $_{g} \cup \mathcal{K}$ of SLat with two monotone functions $f, g$ satisfying: $\mathcal{K}=\{y \leq g(x) \rightarrow f(y) \leq g(x)\}$. Consider the following conjunctions of atoms: $A:=d \leq g(a) \wedge a \leq c \wedge g(c) \leq a$ and $B:=b \leq d \wedge b \leq f(b)$. It can be checked that $A \wedge B \models b \leq a$.

To obtain a separating term we proceed as follows: By the definition of SLO, $A \wedge B \models_{S L O} b \leq a$ iff SLat $\wedge \operatorname{Mon}_{f} \wedge \operatorname{Mon}_{g} \wedge \mathcal{K} \wedge A \wedge B \wedge \neg(b \leq a) \models \perp$. By Theorem [5] this is the case iff SLat $\wedge\left(\operatorname{Mon}_{f} \wedge \operatorname{Mon}_{g} \wedge \mathcal{K}\right)[\Psi(G)] \wedge G \models \perp$, where $G=A \wedge B \wedge \neg(b \leq a)$, est $(G)=\{g(a), g(c), f(b)\}$ and $\Psi(G)=\{g(a), g(c), f(b)\}$.
$-\operatorname{Mon}_{f}[\Psi(G)]=\{b \leq b \rightarrow f(b) \leq f(b)\}$ (redundant).
$-\operatorname{Mon}_{g}[\Psi(G)]=\left\{d_{1} \leq d_{2} \rightarrow g\left(d_{1}\right) \leq g\left(d_{2}\right) \mid d_{1}, d_{2} \in\{a, c\}\right\}$.
$-\mathcal{K}[\Psi(G)]=\{b \leq g(a) \rightarrow f(b) \leq g(a), b \leq g(c) \rightarrow f(b) \leq g(c)\}$.
Step 1: We purify $\left(\operatorname{Mon}_{f} \wedge \operatorname{Mon}_{g} \wedge \mathcal{K}\right)[\Psi(G)] \wedge G$, by introducing constants $a_{1}$ for $g(a), c_{1}$ for $g(c)$ and $b_{1}$ for $f(b)$ and obtain the formula $\operatorname{Def} \wedge A_{0} \wedge B_{0} \wedge \mathrm{Mon}_{0} \wedge \mathcal{K}_{0}$ :

| Def | $A_{0} \wedge B_{0}$ | Mon $_{0} \wedge \mathcal{K}_{0}$ |
| :--- | :--- | :--- |
| $D_{A}: a_{1} \approx g(a) \wedge c_{1} \approx g(c)$ | $A_{0}: d \leq a_{1} \wedge a \leq c \wedge c_{1} \leq a$ | $\operatorname{Mon}_{A}$ |
| $D_{B}: b_{1} \approx f(b)$ | $B_{0}: b \leq d \wedge a_{1} \triangleleft c_{1}$ |  |
|  | $\triangleleft \in\{\leq, \geq\}$ | $\mathcal{K}_{\text {mix }}$ |
|  | $b \leq a_{1} \rightarrow b_{1} \leq a_{1}$ |  |
|  |  | $b \leq c_{1} \rightarrow b_{1} \leq c_{1}$ |

The instances of the congruence axioms $\operatorname{Con}\left[D_{A} \wedge D_{B}\right]$ are redundant in the presence of the corresponding instances of the monotonicity axioms for $f$ and $g$ and can therefore be ignored.

Step 2. $\Delta:=\top$. Find clauses in $\operatorname{Mon}_{0} \wedge \mathcal{K}_{0}$ with premises entailed by $A_{0} \wedge B_{0} \wedge \Delta$.

$$
\begin{aligned}
& C=a \leq c \rightarrow a_{1} \leq c_{1}: C \text { is not mixed. Since } A_{0} \wedge B_{0} \models \text { SLat } a \leq c, A_{0} \wedge B_{0} \wedge(a \leq \\
&\left.c \rightarrow a_{1} \leq c_{1}\right) \text { is equivalent to } A_{0} \wedge B_{0} \wedge a_{1} \leq c_{1} . \text { Let } \Delta:=\left\{a_{1} \leq c_{1}\right\} .
\end{aligned}
$$

$C=b \leq a_{1} \rightarrow b_{1} \leq a_{1}: C$ is mixed. Since $A_{0} \wedge B_{0} \wedge a_{1} \leq c_{1} \models b \leq a_{1}$ we find a separating term. For this we use the method described in the proof of Lemma 9 . We consider the encoding $N_{B} \wedge P_{b}:=\left(P_{b} \rightarrow P_{d}\right) \wedge\left(P_{b} \rightarrow P_{b_{1}}\right) \wedge P_{b}$. Using ordered resolution with an ordering in which $P_{b}, P_{b_{1}} \succ P_{d}$ we derive the unit clauses $P_{d}$ and $P_{b_{1}}$. Since $d$ is the only shared constant, $t=d$ is the separating term. Thus, $A_{0} \wedge B_{0} \wedge a_{1} \leq c_{1} \models b \leq d \wedge d \leq a_{1}$. We now can separate the instance $b \leq a_{1} \rightarrow b_{1} \leq a_{1}$ of the clause in $\mathcal{K}$ by introducing a new shared constant $d_{1}$ as a name for $f(d)$ and replacing the clause, as described in the algorithm at the end of Section 4 with the conjunction of
(i) $b \leq d \rightarrow b_{1} \leq d_{1} \quad$ (corresponding to $b \leq d \rightarrow f(b) \leq f(b)$ )
(ii) $d \leq a_{1} \rightarrow d_{1} \leq a_{1} \quad$ (corresponding to $\left.d \leq g(a) \rightarrow f(d) \leq g(a)\right)$
((i) is an instance of a monotonicity axiom, (ii) is another instance of $\mathcal{K}$ ), and $A_{0} \wedge B_{0} \wedge a_{1} \leq c_{1} \wedge\left(b \leq d \rightarrow b_{1} \leq d_{1}\right) \wedge\left(d \leq a_{1} \rightarrow d_{1} \leq a_{1}\right)$ is equivalent to $A_{0} \wedge B_{0} \wedge a_{1} \leq c_{1} \wedge b_{1} \leq d_{1} \wedge d_{1} \leq a_{1}$. Let $\Delta:=\Delta \wedge b_{1} \leq d_{1} \wedge d_{1} \leq a_{1}$.

Step 3: The last conjunction entails $b \leq a$. To compute a separating term, we again use Lemma 9. We consider the encoding $N_{B}^{\prime} \wedge P_{b}:=\left(P_{b} \rightarrow P_{d}\right) \wedge\left(P_{b} \rightarrow\right.$ $\left.P_{b_{1}}\right) \wedge\left(P_{b_{1}} \rightarrow P_{d_{1}}\right) \wedge P_{b}$ of the $B$-part of the conjunction, $B_{0} \wedge b_{1} \leq d_{1}$. Using ordered resolution with an ordering in which $P_{b}, P_{b_{1}} \succ P_{d}, P_{d_{1}}$ we derive the unit clauses $P_{d}, P_{b_{1}}$ and $P_{d_{1}}$. Since $d, d_{1}$ are the shared constants, $t=d \sqcap d_{1}$ is the separating term w.r.t. SLat. Therefore, $d \sqcap f(d)$ is a separating term w.r.t. SLO. (it can in fact be seen that already $d$ is a separating term).

Theorem 12 If $\mathcal{K}$ contains axioms of type (4) then the theory of semilattices with operators is not $\leq$-interpolating when sharing is regarded as intersectionsharing.

Proof: Indeed, assume that for every $\mathcal{K}$ containing axioms of type (4), SLat ${ }_{\Sigma}(\mathcal{K})$ is $\leq$-interpolating w.r.t. intersection-sharing. Then it would also be $\approx$-interpolating w.r.t. intersection-sharing. This cannot be the case, as can be seen from Example 5 which is presented in what follows.

Example 5. Consider the theory $\operatorname{SLat}_{\Sigma}(\mathcal{K})$ of semilattices with monotone operators $f, g$ satisfying the axioms $\mathcal{K}=\{x \leq g(y) \rightarrow f(x) \leq g(y)\}$, and let $C$ be a set of constants containing constants $a, b, d, e$. We show that this theory does not have the $\Sigma_{S}$-Beth-definability property, where $\Sigma_{S}=\{g, e\}$.

Consider the conjunction of literals $A=(a \leq f(e)) \wedge(e \leq g(b)) \wedge(g(b) \leq a)$. One can prove that $a$ is implicitly definable w.r.t. $\{g, e\}$ by proving, using the hierarchical reduction for local theory extensions in Theorem 55 that:
$(a \leq f(e)) \wedge(e \leq g(b)) \wedge(g(b) \leq a) \wedge\left(a^{\prime} \leq f^{\prime}(e)\right) \wedge\left(e \leq g\left(b^{\prime}\right)\right) \wedge\left(g\left(b^{\prime}\right) \leq a^{\prime}\right) \models_{\text {Slat }_{\Sigma}\left(\mathcal{K} \cup \mathcal{K}^{\prime}\right)} a \approx a^{\prime}$.
We show that $a$ is not explicitly definable w.r.t. $\{g, e\}$. If there exists a term $t$ containing only $g$ and $e$ such that $(a \leq f(e)) \wedge(e \leq g(b)) \wedge(g(b) \leq a) \models_{\operatorname{Slat}_{\Sigma}(\mathcal{K})} a \approx t$, then the interpretations of $a$ and $t$ are equal in every model of $\operatorname{SLat}_{\Sigma}(\mathcal{K})$ which is a model of $A$. We show that this is not the case.
Let $S=\left(\left\{a_{S}, e_{S}, b_{S}, d_{S}\right\}, \sqcap, f_{S}, g_{S}\right)$ be the semilattice where:
$-d_{S} \leq e_{S} \leq a_{S}, d_{S} \leq b_{S}$ and $a_{S} \sqcap b_{S}=e_{S} \sqcap b_{S}=d_{S}$,

$$
\begin{aligned}
& -f_{S}\left(a_{S}\right)=f_{S}\left(e_{S}\right)=a_{S}, f_{S}\left(b_{S}\right)=f_{S}\left(d_{S}\right)=d_{S} \\
& -g_{S}\left(a_{S}\right)=g_{S}\left(e_{S}\right)=g_{S}\left(d_{S}\right)=d_{S} \text { and } g_{S}\left(b_{S}\right)=a_{S}
\end{aligned}
$$

Then $S$ satisfies $A, f_{S}$ and $g_{S}$ are monotone. We prove that $S$ is a model of $\mathcal{K}$ : Let $x, y \in S$. Assume that $x \leq g_{S}(y)$. We show that $f_{S}(x) \leq g_{S}(y)$.

- If $y \in\left\{a_{S}, e_{S}, d_{S}\right\}$ then $g_{S}(y)=d_{S}$ so $x=d_{S}$, and $f_{S}\left(d_{S}\right)=d_{S} \leq g_{S}(y)$.
- If $y=b_{S}$ then $g_{S}\left(b_{S}\right)=a_{S}$, so $x$ can be $a_{S}, e_{S}$ or $d_{S}$, and $f_{S}\left(a_{S}\right)=f_{S}\left(e_{S}\right)=$ $a_{S}, f_{S}\left(d_{S}\right)=d_{S}$, so $f_{S}(x) \leq g_{S}\left(b_{S}\right)=a_{S}$.

A term $t$ containing only $g$ and $e$ can be $e$ or can contain occurrences of $g$. If $t=e$ then the interpretation of $t$ in $S$ is $e_{S} \neq a_{S}$. If $t$ contains occurrences of $g$ it can be proven that the interpretation of $t$ in $S$ is $d_{S}$, i.e. is again different from $a_{S}$.

Thus $\mathcal{T}=\operatorname{SLat}_{\Sigma}(\mathcal{K})$ does not have the Beth definability property w.r.t. $\Sigma_{S}$, hence, by Theorem 4, $\mathcal{T} \cup \mathcal{T}^{\prime}=\operatorname{SLat}_{f, g}(\mathcal{K}) \cup \operatorname{SLat}_{f^{\prime}, g}\left(\mathcal{K}^{\prime}\right)=\operatorname{SLat}_{f, f^{\prime}, g}\left(\mathcal{K} \cup \mathcal{K}^{\prime}\right)$, where $\mathcal{K}^{\prime}=\left\{y \leq g(x) \rightarrow f^{\prime}(y) \leq g(x)\right\}$, does not have the $\approx$-interpolation property w.r.t. intersection-sharing, hence it does not have the $\leq$-interpolation property w.r.t. intersection-sharing.
Remark: By Theorem 11 and Theorem 4, $\mathcal{T}$ has the $\Theta_{\mathcal{K}}\left(\Sigma_{S}\right)$-Beth definability property, where $\Theta_{\mathcal{K}}\left(\Sigma_{S}\right)=\{f, g, e\}$. Indeed, then $A \models a \approx f(e)$.

## 6 Applications to $\mathcal{E L}$ and $\mathcal{E} \mathcal{L}^{+}$-Subsumption

We now explain how these results can be used in the study of the description $\operatorname{logics} \mathcal{E} \mathcal{L}$ and $\mathcal{E} \mathcal{L}^{+}$. In any description logic a set $N_{C}$ of concept names and a set $N_{R}$ of roles is assumed to be given. Concept descriptions can be defined with the help of a set of concept constructors. The available constructors determine the expressive power of a description logic. If we only allow intersection and existential restriction as concept constructors, we obtain the description logic $\mathcal{E L}$ [1], a logic used in terminological reasoning in medicine [3130. The table below shows the constructor names used in $\mathcal{E L}$ and their semantics.

| Constructor name | Syntax | Semantics |
| :--- | :--- | :--- |
| conjunction | $C_{1} \sqcap C_{2}$ | $C_{1}^{I} \cap C_{2}^{I}$ |
| existential restriction | $\exists r . C$ | $\left\{x \mid \exists y\left((x, y) \in r^{\mathcal{I}}\right.\right.$ and $\left.\left.y \in C^{\mathcal{I}}\right)\right\}$ |

The semantics is given by interpretations $\mathcal{I}=\left(\Delta, \cdot^{\mathcal{I}}\right)$, where $C^{\mathcal{I}} \subseteq \Delta$ and $r^{\mathcal{I}} \subseteq \Delta^{2}$ for every $C \in N_{C}, r \in N_{R}$. The extension of ${ }^{\mathcal{I}}$ to concept descriptions is inductively defined using the semantics of the constructors. In [32], the extension $\mathcal{E} \mathcal{L}^{+}$of $\mathcal{E} \mathcal{L}$ with role inclusion axioms is studied.

Definition 12. A TBox (or terminology) is a finite set consisting of general concept inclusions (GCI) of the form $C \sqsubseteq D$, where $C$ and $D$ are concept descriptions. A CBox consists of a TBox and a set of role inclusions of the form $r_{1} \circ \cdots \circ r_{n} \sqsubseteq s$, so we view CBoxes as unions $G C I \cup \mathcal{R}$ of a set GCI of general
concept inclusions and a set $\mathcal{R}$ of role inclusions of the form $r_{1} \circ \cdots \circ r_{n} \sqsubseteq s$, with $n \geq 1.3$

Definition 13. An interpretation $\mathcal{I}$ is a model of the $\operatorname{CBox} \mathcal{C}=G C I \cup \mathcal{R}$ if it is a model of $G C I$, i.e., $C^{\mathcal{I}} \subseteq D^{\mathcal{I}}$ for every $C \sqsubseteq D \in G C I$, and satisfies all role inclusions in $\mathcal{C}$, i.e., $r_{1}^{\mathcal{I}} \circ \cdots \circ r_{n}^{\mathcal{I}} \subseteq s^{\mathcal{I}}$ for all $r_{1} \circ \cdots \circ r_{n} \subseteq s \in \mathcal{R}$. If $\mathcal{C}$ is a CBox and $C_{1}, C_{2}$ are concept descriptions, then $\mathcal{C} \models C_{1} \sqsubseteq C_{2}$ if and only if $C_{1}^{\mathcal{I}} \subseteq C_{2}^{\mathcal{I}}$ for every model $\mathcal{I}$ of $\mathcal{C}$.

### 6.1 Algebraic semantics for $\mathcal{E} \mathcal{L}, \mathcal{E} \mathcal{L}^{+}$and $\sqsubseteq$-interpolation

In [24] we studied the link between TBox subsumption in $\mathcal{E L}$ and uniform word problems in the corresponding classes of semilattices with monotone functions. In [26], we showed that these results naturally extend to CBoxes and to the description logic $\mathcal{E} \mathcal{L}^{+}$. When defining the semantics of $\mathcal{E} \mathcal{L}$ or $\mathcal{E} \mathcal{L}^{+}$with role names $N_{R}$ we use a class of $\sqcap$-semilattices with monotone operators of the form SLat ${ }_{\Sigma}$, where $\Sigma=\left\{f_{r} \mid r \in N_{R}\right\}$. Every concept description $C$ can be represented as a term $\bar{C}$; the encoding is inductively defined:

- Every concept name $C \in N_{C}$ is regarded as a constant $\bar{C}=C$.
$-\overline{C_{1} \sqcap C_{2}}:=\bar{C}_{1} \sqcap \bar{C}_{2}$, and
$-\overline{\exists r C}=f_{r}(\bar{C})$.
If $\mathcal{R}$ is a set of role inclusions of the form $r \sqsubseteq s$ and $r_{1} \circ r_{2} \sqsubseteq s$, let $\mathcal{K}$ be the set of all axioms of the form:

$$
\begin{array}{ll}
\forall x\left(f_{r}(x) \leq f_{s}(x)\right) & \text { for all } r \sqsubseteq s \in \mathcal{R} \\
\forall x\left(f_{r_{1}}\left(f_{r_{2}}(x)\right) \leq f_{s}(x)\right) & \text { for all } r_{1} \circ r_{2} \sqsubseteq s \in \mathcal{R}
\end{array}
$$

Theorem 13 ([26]) Assume that the only concept constructors are intersection and existential restriction. Then for all concept descriptions $D_{1}, D_{2}$ and every $\mathcal{E} \mathcal{L}^{+} \operatorname{CBox} \mathcal{C}=G C I \cup \mathcal{R}-$ where $\mathcal{R}$ consists of role inclusions of the form $r \sqsubseteq s$ and $r_{1} \circ r_{2} \sqsubseteq s$-with concept names $N_{C}=\left\{C_{1}, \ldots, C_{n}\right\}$ and set of roles $N_{R}$ :

$$
\mathcal{C} \models D_{1} \sqsubseteq D_{2} \quad \text { iff } \quad\left(\bigwedge_{C \sqsubseteq D \in G C I} \bar{C} \leq \bar{D}\right) \models_{\operatorname{SLat}_{\Sigma}(\mathcal{K})} \overline{D_{1}} \leq \overline{D_{2}},
$$

where $\Sigma$ is associated with $N_{R}$ and $\mathcal{K}$ with $\mathcal{R}$ as described above.
In 339 the following notion of interpolation, which we call $\sqsubseteq$-interpolation, is defined: A description logic has the $\sqsubseteq$-interpolation property if for any CBoxes $\mathcal{C}_{A}=G C I_{A} \cup \mathcal{R}_{A}, \mathcal{C}_{B}=G C I_{B} \cup \mathcal{R}_{B}$ and any concept descriptions $C, D$ such that $\mathcal{C}_{A} \cup \mathcal{C}_{B} \models C \sqsubseteq D$ there exists a concept description $T$ containing only concept and role symbols "shared" by $\left\{\mathcal{C}_{A}, C\right\}$ and $\left\{\mathcal{C}_{B}, D\right\}$ such that

[^2]$\mathcal{C}_{A} \cup \mathcal{C}_{B} \models C \sqsubseteq T$ and $\mathcal{C}_{A} \cup \mathcal{C}_{B} \models T \sqsubseteq D$. By Theorem $13, \mathcal{C}_{A} \cup \mathcal{C}_{B} \models C \sqsubseteq D$ if and only if $A \wedge B \models_{\operatorname{SLat}_{\Sigma}(\mathcal{K})} \bar{C} \leq \bar{D}$, where $A=\bigwedge_{C_{1} \sqsubseteq C_{2} \in G C I_{A}} \overline{C_{1}} \leq \overline{C_{2}}$ and $B=\bigwedge_{C_{1} \sqsubseteq C_{2} \in G C I_{B}} \overline{C_{1}} \leq \overline{C_{2}}$, and $\mathcal{K}=\mathcal{K}_{A} \cup \mathcal{K}_{B}$, the union of the axioms associated with the set inclusions $\mathcal{R}_{A}$ resp. $\mathcal{R}_{B}$. By Theorem [11, there exists a term containing only constants and function symbols $\Theta_{\mathcal{K}_{A} \cup \mathcal{K}_{B}}$-shared by $A$ and $B$ such that $A \wedge B \models_{\operatorname{SLat}_{\Sigma}\left(\mathcal{K}_{A} \cup \mathcal{K}_{B}\right)} \bar{C} \leq t \wedge t \leq \bar{D}$. From $t$ we can construct a concept description $T$ containing only concept names and roles shared by $\mathcal{C}_{A}$ and $\mathcal{C}_{B}$, and by Theorem $13 C_{A} \wedge C_{B} \models C \sqsubseteq T \wedge T \sqsubseteq D$. Therefore, the $\sqsubseteq$-interpolation problem studied for description logics in [33|9] can be expressed in the case of $\mathcal{E} \mathcal{L}$ and $\mathcal{E} \mathcal{L}^{+}$as a $\leq$-interpolation problem in the class of semilattices with operators, and the hierarchical method for $\leq$-interpolation can be used in this case. We distinguish between intersection-sharing and $\Theta_{\mathcal{R}}$-sharing, where $\Theta_{\mathcal{R}}$ is the analogon of $\Theta_{\mathcal{K}}$ where $\mathcal{K}$ is the translation of $\mathcal{R}$.

Corollary $14 \mathcal{E} \mathcal{L}$ and $\mathcal{E} \mathcal{L}^{+}$have the $\sqsubseteq$-interpolation property w.r.t. $\Theta_{\mathcal{R}}$-sharing.
Corollary $15 \mathcal{E L}^{+}$with role inclusions of the form $r_{1} \circ r_{2} \sqsubseteq s$ does not have $\sqsubseteq$-interpolation w.r.t. intersection-sharing.

### 6.2 Example: $\sqsubseteq$-Interpolation for $\mathcal{E} \mathcal{L}^{+}$

We now explain our method in detail and illustrate each step of the method for $\leq$-interpolation described in Section 4 on an example.
Example 6. Consider the ontology $\mathcal{O}_{M e d}$ in Figure 1 It is based on an example from [32], which we modified in some points. We changed the CBox in order to ensure that it only contains general concept inclusions and that conjunction only appears on the left hand side of an axiom. Furthermore we left out some axioms and concepts, but also added new concepts (LeftVentricle, RightVentricle, Ventricle) and changed some axioms accordingly.

We divided the CBox into three parts: The $A$-part is our main TBox, $\mathcal{T}_{A}$, which is supposed to be consistent. The $B$-part, TBox $\mathcal{T}_{B}$, is an extension of the main CBox and may introduce some new (and in the worst case even unwanted) consequences. The $R$-part contains only role axioms $\mathcal{R}$.

We have the following sets of symbols (we indicate also the abbreviations used in what follows):

$$
\begin{aligned}
N_{C}^{A}= & \text { \{年docardium (Em), Tissue (T), HeartWall (HW), } \\
& \text { LeftVentricle (LV), RightVentricle (RV), Ventricle (V), } \\
& \text { Disease (D), Inflammation (I), Endocarditis (Es) }\} \\
N_{C}^{B}=\quad & \text { \{Heart (H), HeartDisease (HD), Disease (D), Ventricle (V) \} } \\
N_{C}^{A B}=\quad & \{\text { Disease (D), Ventricle (V) }\}
\end{aligned}
$$

Consider the subsumption Endocarditis $\sqsubseteq$ HeartDisease. We have Endocarditis $\in$ $N_{C}^{A}$ and HeartDisease $\in N_{C}^{B}$ and additionally the following hold:

$$
\mathcal{T}_{A} \cup \mathcal{T}_{B} \cup \mathcal{R} \models \text { Endocarditis } \sqsubseteq \text { HeartDisease }
$$

| $A_{1}:$ | Endocardium | $\sqsubseteq$ Tissue |  |
| ---: | ---: | :--- | :--- |
| $A_{2}:$ | Endocardium | $\sqsubseteq$ ヨpart－of．HeartWall |  |
| $A_{3}:$ | HeartWall | $\sqsubseteq$ BodyWall |  |
| $A_{4}:$ | HeartWall | $\sqsubseteq$ ヨpart－of．LeftVentricle |  |
| $A_{5}:$ | HeartWall | $\sqsubseteq$ ヨpart－of．RightVentricle |  |
| $A_{6}:$ | LeftVentricle | $\sqsubseteq$ Ventricle |  |
| $A_{7}:$ | RightVentricle | $\sqsubseteq$ Ventricle |  |
| $A_{8}:$ | Endocarditis | $\sqsubseteq$ Inflammation |  |
| $A_{9}:$ | Endocarditis | $\sqsubseteq$ ヨhas－location．Endocardium |  |
| $A_{10}:$ | Inflammation $\sqcap \exists$ has－location．Endocardium | $\sqsubseteq$ Endocarditis |  |
| $A_{11}:$ | Inflammation | $\sqsubseteq$ Disease |  |
| $A_{12}:$ | Inflammation | $\sqsubseteq$ ヨacts－on．Tissue |  |
|  |  |  |  |
| $B_{1}:$ | Ventricle | $\sqsubseteq$ ヨpart－of．Heart |  |
| $B_{2}:$ | HeartDisease | $\sqsubseteq$ Disease |  |
| $B_{3}:$ | HeartDisease | $\sqsubseteq$ ヨhas－location．Heart |  |
| $B_{4}:$ | Disease $\sqcap \exists$ has－location．Heart | $\sqsubseteq$ HeartDisease |  |
|  |  |  |  |
| $R_{1}:$ | part－ofo part－of | $\sqsubseteq$ part－of |  |
| $R_{2}:$ | has－location opart－of | $\sqsubseteq$ has－location |  |
|  |  |  |  |

Fig．1：Ontology $\mathcal{O}_{M e d}$
and，in addition：

$$
\mathcal{T}_{A} \cup \mathcal{R} \not \models \text { Endocarditis } \sqsubseteq \text { HeartDisease } \mathcal{T}_{B} \cup \mathcal{R} \not \models \text { Endocarditis } \sqsubseteq \text { HeartDisease }
$$

Therefore，we can use the method described in Section 4 （based on Proposition7． Theorem 8 and Lemma（9）to compute an intermediate term containing only shared symbols for the subsumption Endocarditis $\sqsubseteq$ HeartDisease，which serves as an explanation for the subsumption．

Step 1：We translate the original ontology to the theory of semilattices with operators．We now state the monotonicity axioms for each role explicitly．Figure 2 shows the ontology after the translation to the theory of semilattices with operators．Note that from here on we use the abbreviations for concept names indicated in the sets $N_{C}^{A}, N_{C}^{B}$ and $N_{C}^{A B}$ above and also abbreviations for role names，i．e．po for part－of，hl for has－location and ao for acts－on．

Step 2：Using unsat core computation we get the following minimal axiom set：

$$
\min _{A}=\left\{A_{2}, A_{4}, A_{6}, A_{8}, A_{9}, A_{11}, B_{1}, B_{4}, R_{2}\right\}
$$

Fig. 2: $\mathcal{O}_{\text {Med }}$ after translation to SLat with monotone operators

This means that for the following instantiation step we only have to consider the role axiom $R_{2}$ and none of the monotonicity axioms is needed.

Step 3: Let $\mathcal{T}_{0}=$ SLat and $T_{1}=\operatorname{SLat} \cup R_{2}$ be the extension of $T_{0}$ with axiom $R_{2}$. We know that it is a local theory extension, so we can use hierarchical reasoning. We first flatten the role axiom $R_{2}$ in the following way:

$$
R_{2}^{\text {flat }}: \quad \forall \mathrm{X}, \mathrm{Y}: \quad \mathrm{X} \leq \mathrm{po}(\mathrm{Y}) \quad \rightarrow \quad \mathrm{hl}(\mathrm{X}) \leq \mathrm{hl}(\mathrm{Y})
$$

We have the following set of ground terms:

$$
G=\operatorname{est}\left(\mathcal{T}_{A} \cup \mathcal{T}_{B} \cup \mathcal{R}\right)=\{\operatorname{po}(\mathrm{HW}), \mathrm{po}(\mathrm{LV}), \mathrm{po}(\mathrm{H}), \mathrm{hl}(\mathrm{Em}), \mathrm{hl}(\mathrm{H})\}
$$

We use the closure operator $\Psi$ described in Lemma 10 to extend our set of ground terms: For every term $\mathrm{po}(\mathrm{X})$ in $G$ we have to add the term $\mathrm{hl}(\mathrm{X})$ and vice versa. This leads to the following extended set $G^{\prime}$ of ground terms:

$$
G^{\prime}=\{\mathrm{po}(\mathrm{Em}), \mathrm{po}(\mathrm{HW}), \mathrm{po}(\mathrm{LV}), \mathrm{po}(\mathrm{H}), \mathrm{hl}(\mathrm{Em}), \mathrm{hl}(\mathrm{HW}), \mathrm{hl}(\mathrm{LV}), \mathrm{hl}(\mathrm{H})\}
$$

From $G^{\prime}$ we get the following instances of the axiom $R_{2}^{\text {flat }}$ :

$$
\begin{array}{ccll}
I_{1}: & \mathrm{Em} \leq \mathrm{po}(\mathrm{HW}) & \rightarrow & \mathrm{hl}(\mathrm{Em}) \leq \mathrm{hl}(\mathrm{HW}) \\
I_{2}: & \mathrm{Em} \leq \mathrm{po}(\mathrm{LV}) & \rightarrow & \mathrm{hl}(\mathrm{Em}) \leq \mathrm{hl}(\mathrm{LV}) \\
I_{3}: & \mathrm{Em} \leq \mathrm{po}(\mathrm{H}) & \rightarrow & \mathrm{hl}(\mathrm{Em}) \leq \mathrm{hl}(\mathrm{H}) \\
I_{4}: & \mathrm{HW} \leq \mathrm{po}(\mathrm{Em}) & \rightarrow & \mathrm{hl}(\mathrm{HW}) \leq \mathrm{hl}(\mathrm{Em}) \\
I_{5}: & \mathrm{HW} \leq \mathrm{po}(\mathrm{LV}) & \rightarrow & \mathrm{hl}(\mathrm{HW}) \leq \mathrm{hl}(\mathrm{LV}) \\
I_{6}: & \mathrm{HW} \leq \mathrm{po}(\mathrm{H}) & \rightarrow & \mathrm{hl}(\mathrm{HW}) \leq \mathrm{hl}(\mathrm{H}) \\
I_{7}: & \mathrm{LV} \leq \mathrm{po}(\mathrm{Em}) & \rightarrow & \mathrm{hl}(\mathrm{LV}) \leq \mathrm{hl}(\mathrm{Em}) \\
I_{8}: & \mathrm{LV} \leq \mathrm{po}(\mathrm{HW}) & \rightarrow & \mathrm{hl}(\mathrm{LV}) \leq \mathrm{hl}(\mathrm{HW}) \\
I_{9}: & \mathrm{LV} \leq \mathrm{po}(\mathrm{H}) & \rightarrow & \mathrm{hl}(\mathrm{LV}) \leq \mathrm{hl}(\mathrm{H}) \\
I_{10}: & \mathrm{H} \leq \mathrm{po}(\mathrm{Em}) & \rightarrow & \mathrm{hl}(\mathrm{H}) \leq \mathrm{hl}(\mathrm{Em}) \\
I_{11}: & \mathrm{H} \leq \mathrm{po}(\mathrm{HW}) & \rightarrow & \mathrm{hl}(\mathrm{H}) \leq \mathrm{hl}(\mathrm{HW}) \\
I_{12}: & \mathrm{H} \leq \mathrm{po}(\mathrm{LV}) & \rightarrow & \mathrm{hl}(\mathrm{H}) \leq \mathrm{hl}(\mathrm{LV})
\end{array}
$$

We purify all formulae by introducing new constants for the terms starting with a function symbol, i.e. role names. We save the definitions in the following set:

$$
\begin{gathered}
\text { Def }=\left\{\mathrm{po}_{\mathrm{HW}}=\mathrm{po}(\mathrm{HW}), \mathrm{po}_{\mathrm{LV}}=\mathrm{po}(\mathrm{LV}), \mathrm{po}_{\mathrm{H}}=\mathrm{po}(\mathrm{H}), \mathrm{h} \mathrm{l}_{\mathrm{EM}}=\mathrm{hl}(\mathrm{EM}),\right. \\
\\
\mathrm{hl} \\
\left.\mathrm{HW}=\mathrm{hl}(\mathrm{HW}), h \mathrm{l}_{\mathrm{LV}}=\mathrm{hl}(\mathrm{LV}), \mathrm{h} \mathrm{l}_{\mathrm{HC}}=\mathrm{hl}(\mathrm{HC}), \mathrm{h} \mathrm{l}_{\mathrm{H}}=\mathrm{hl}(\mathrm{H})\right\}
\end{gathered}
$$

We then have the set $A_{0} \wedge B_{0} \wedge I_{0}$, where $A_{0}, B_{0}$ and $I_{0}$ are the purified versions of $A=\left\{A_{2}, A_{4}, A_{6}, A_{8}, A_{9}, A_{11}\right\}, B=\left\{B_{1}, B_{4}\right\}$ and $I=\left\{I_{1}, \ldots, I_{10}\right\}$, respectively.

Step 4: To reduce the number of instances we compute an unsatisfiable core and obtain the following set of axioms:

$$
\min _{A}^{\prime}=\left\{A_{2}, A_{4}, A_{6}, A_{8}, A_{9}, A_{11}, B_{1}, B_{4}, I_{1}, I_{5}, I_{9}\right\}
$$

So we have $\mathcal{H}=\left\{I_{1}, I_{5}, I_{9}\right\}$. Out of these instances the first two are pure $A$ (meaning the premise contains only symbols in $N_{C}^{A}$ ), but $I_{9}$ is a mixed instance, since LV $\in N_{C}^{A} \backslash N_{C}^{B}$ and $\mathrm{H} \in N_{C}^{B} \backslash N_{C}^{A}$, so $\mathcal{H}_{\text {mix }}=\left\{I_{9}\right\}$.

Step 5: To separate the mixed instance LV $\leq \mathrm{po}_{\mathrm{H}} \rightarrow \mathrm{h} \mathrm{LV}_{\mathrm{LV}} \leq \mathrm{h} \mathrm{H}_{\mathrm{H}}$ we use the construction in Proposition 7 to compute an intermediate term $t$ in the common signature such that $\mathrm{LV} \leq t$ and $t \leq \mathrm{po}_{\mathrm{H}}$. We obtain $t=\mathrm{V}$. We get $\mathcal{H}_{\text {sep }}=$ $\left\{I_{9}^{A}, I_{9}^{B}\right\}$ where:

$$
\begin{array}{llll}
I_{9}^{A}: & \mathrm{LV} \leq \mathrm{V} & \rightarrow & \mathrm{~h} \mathrm{LV} \leq \mathrm{hl}_{\mathrm{V}} \\
I_{9}^{B}: & \mathrm{V} \leq \mathrm{po}_{\mathrm{H}} & \rightarrow \quad \mathrm{hl} \mathrm{~V} \leq \mathrm{hl}_{\mathrm{H}}
\end{array}
$$

Note that $I_{9}^{A}$ is an instance of the monotonicity axiom for the has-location role and $I_{9}^{B}$ is an instance of axiom $R_{2}^{\text {flat }}$.
Step 6: Since for all the instances that are necessary to derive the consequence it must be true that $\mathcal{T}_{A} \cup \mathcal{T}_{B}$ entails its premise, it is sufficient to consider only the corresponding conclusions. Note that w.r.t. SLat the formula $A_{0} \wedge I_{1} \wedge I_{5} \wedge I_{9}^{A}$ is equivalent to the following formula:

$$
\begin{aligned}
\bar{A}_{0} & =\mathrm{Em} \leq \mathrm{po}_{\mathrm{HW}} \wedge \mathrm{HW} \leq \mathrm{po}_{\mathrm{LV}} \wedge \mathrm{LV} \leq \mathrm{V} \wedge \mathrm{Es} \leq \mathrm{I} \wedge \mathrm{Es} \leq \mathrm{hl}_{\mathrm{Em}} \wedge \mathrm{I} \leq \mathrm{D} \\
& \wedge \mathrm{hl}_{\mathrm{EM}} \leq \mathrm{h} \mathrm{l}_{\mathrm{HW}} \wedge \mathrm{~h} \mathrm{l}_{\mathrm{HW}} \leq \mathrm{h} \mathrm{l}_{\mathrm{LV}} \wedge \mathrm{hl}_{\mathrm{LV}} \leq \mathrm{hl}_{\mathrm{V}}
\end{aligned}
$$

This formula can be seen as a set of Horn clauses $\bar{A}_{0}^{h}$ :
$\bar{A}_{0}^{h}=\left\{\left(\neg \mathrm{Em}_{\mathrm{Em}}^{\mathrm{po}} \mathrm{HW}\right),\left(\neg \mathrm{HW} \vee \mathrm{po}_{\mathrm{LV}}\right),(\neg \mathrm{LV} \vee \mathrm{V}),(\neg \mathrm{Es} \vee \mathrm{I}),(\neg \mathrm{Es} \vee \mathrm{hl} \mathrm{Em}),(\neg \mathrm{l} \vee \mathrm{D})\right.$,

$$
\left.\left(\neg h l_{\text {EM }} \vee h l_{\text {Hw }}\right),\left(\neg h l_{\text {Hw }} \vee h l_{L V}\right),\left(\neg h l_{\text {LV }} \vee h l_{V}\right)\right\}
$$

To obtain an explanation for $\mathcal{T}_{A} \cup \mathcal{T}_{B} \cup \mathcal{R} \models$ Endocarditis $\sqsubseteq$ HeartDisease we saturate the set $\bar{A}_{0}^{h} \cup\{$ Es $\}$ under ordered resolution as described in the proof of Theorem 9 where symbols occurring in $A$ but not in $B$ are larger than common symbols:

- Resolution of Es and $\neg E s \vee I$ yields $I$.
- Resolution of I and $\neg I \vee D$ yields $D$.
- Resolution of Es and $\left.\neg E s \vee h\right|_{E m}$ yields $\mathrm{hl}_{\mathrm{Em}}$.
- Resolution of $\mathrm{hl}_{\mathrm{Em}}$ and $\neg \mathrm{hl}_{\mathrm{EM}} \vee \mathrm{hl}_{\text {нw }}$ yields $\mathrm{h} \mathrm{l}_{\mathrm{Hw}}$.
- Resolution of $\mathrm{hl}_{\mathrm{HW}}$ and $\neg \mathrm{hl}_{\mathrm{HW}} \vee \mathrm{hl}_{\mathrm{LV}}$ yields $\mathrm{h} \mathrm{l}_{\mathrm{LV}}$.
- Resolution of $\mathrm{hl}_{\mathrm{LV}}$ and $\neg \mathrm{h}_{\mathrm{LV}} \vee \mathrm{hl}_{\mathrm{V}}$ yields $\mathrm{h} \mathrm{l}_{\mathrm{V}}$.

We obtained two resolvents containing only common symbols: D and hlv. Taking the conjunction of these terms and translating the formula back to description logic yields the following formula:

$$
J=\text { Disease } \sqcap \exists \text { has-location.Ventricle. }
$$

Indeed, the following properties hold:

$$
\begin{aligned}
\mathcal{T}_{A} \cup \mathcal{R} & \models \text { Endocarditis } \sqsubseteq J \\
\mathcal{T}_{A} \cup \mathcal{T}_{B} \cup \mathcal{R} & \models \quad J \sqsubseteq \text { HeartDisease }
\end{aligned}
$$

So $J$ is the intermediate term we were looking for.

### 6.3 Prototype implementation

The ideas were implemented in a prototype implementation ${ }^{4}$ for the theory of semilattices with operators satisfying axioms of type (1) considered in this paper. The program is written in Python and uses Z3 8 and SPASS [35] as external provers. The program implements Steps 1-3 in the algorithm presented at the end of Section 4 with the following optimization: In Step 1 after instantiation and purification, in order to reduce the size of the set of instances of axioms to be considered, an unsatisfiable core is computed with Z3. The program separates the mixed instances by computing intermediate terms for their premises using Theorem 9 and Proposition 7 for applying ordered resolution the prover SPASS is used. In Step 3, the intermediate term $T$ for $C \leq D$ is computed using the method described in Theorem 9 again using SPASS.

For the use for interpolation in $\mathcal{E L}$ and $\mathcal{E} \mathcal{L}^{+}$, the CBoxes $\mathcal{C}_{A}$ and $\mathcal{C}_{B}$ and the subsumption $C \sqsubseteq D$ are given as an input. A minimal subset of $\mathcal{C}_{A} \cup \mathcal{C}_{B}$ is computed from which $C \sqsubseteq D$ can be derived. (The user can choose between a precise translation to SPASS or a propositional translation to Z 3 which is not always precise, but turned out to be a good approximation. Standard implementations available for computing justifications of entailments from description logic ontologies could be used as well.) The problem is then translated into a problem for $\leq$-interpolation in semilattices with operators. After computing the interpolating term, the result is expressed in the syntax of description logics.

## 7 Conclusions and future work

In this paper we gave a hierarchical method for $P$-interpolation in certain classes of local theory extensions $\mathcal{T}_{0} \subseteq \mathcal{T}_{0} \cup \mathcal{K}$. We used these results for proving $\leq$ interpolation in classes of semilattices with monotone operators satisfying additional clauses $\mathcal{K}$ with a suitable notion of $\Theta_{\mathcal{K}}$-sharing we defined. We defined a form of Beth definability w.r.t. a subsignature $\Sigma_{S}$ and used it to show that

[^3]the class of semilattices with operators under consideration does not have the s-interpolation property if only the common function symbols and constants are considered to be "shared". We discussed how these results can be used for the study of interpolation in $\mathcal{E} \mathcal{L}$ and $\mathcal{E} \mathcal{L}^{+}$.
In future work we will explore other application areas of these results, both to classes of non-classical logics and to theories relevant in the verification. We will extend the implementation with possibilities of choosing the base theory and the methods for $P$-interpolation in the base theory. We will further investigate the links with Beth definability and possibilities of using Beth definability for computing explicit definitions for implicitly definable terms - and analyze the applicability of such results in description logics but also in verification.
Acknowledgments. We thank the reviewers for their helpful comments. The research reported here was funded by the Deutsche Forschungsgemeinschaft (DFG, German Research Foundation) - Projektnummer 465447331.

[^0]:    ${ }^{1}$ There are also other justifications for the decidability of ground satisfiability w.r.t. SLat, leading to different types of decision procedures: SLat $=\operatorname{ISP}\left(S_{2}\right)$, where $S_{2}$ is the 2 -element semilattice, i.e. every semilattice is isomorphic to a sublattice of a power of $S_{2}$ - or, alternatively, that every semilattice is isomorphic to a semilattice of sets. Thus, checking satisfiability w.r.t. SLat can be reduced to checking satisfiability w.r.t. $S_{2}$ and ultimately to propositional reasoning.

[^1]:    ${ }^{2}$ We assume that the function symbols are unary to simplify the presentation, and because in the applications to description logics we need only unary function symbols. All the results can be extended to function symbols of higher arity.

[^2]:    ${ }^{3}$ It can be shown that it is sufficient to consider role inclusions of the form $r \sqsubseteq s$ or $r_{1} \circ r_{2} \sqsubseteq s$, where $r, s, r_{1}, r_{2}$ are role names [3].

[^3]:    ${ }^{4}$ The implementation and some tests can be found here:
    https://userpages.uni-koblenz.de/~sofronie/p-interpolation-and-el/
