## **Abstract**

Obstructive sleep apnea (OSA) is a sleep respiratory disease characterized by sleep snoring accompanied by apnea and daytime sleeplessness. It is a complex disease, with the multifactorial etiology, and the pathology is incompletely understood. Genioglossus (GG), the largest dilator of upper airway, whose fatigue is strongly correlated to onset of OSA. This brief review was to investigate the pathogenesis of OSA targeting on GG from different risk factors as gender, obesity, and aging, and the molecular mechanism of GG injury in OSA pathogenesis. We hope to find the targeted molecular mechanism on GG in OSA treatment.

Obstructive sleep apnea (OSA) is a sleep disordered breathing disease characterized by recurrent collapse of the upper airway during sleep. Epidemiologic data show that the overall prevalence of self-reported OSA was 6.4% in females and 13.8% in males, increasing with the BMI (from  $<20$  to  $\geq 40$   $\text{kg}\cdot\text{m}^{-2}$ ) in both sexes<sup>1</sup>. The prevalence of middle-aged people is significantly increased, about 17% of men and 9% of women. OSA can cause systemic diseases, and is an independent pathogenic factor for various diseases such as cardiovascular, cerebrovascular, metabolic, neurological, and psychiatric systems<sup>2-3</sup>.

The major feature of OSA pathogenesis is a perturbation between upper airway obstruction and neuro-muscular responses during sleep<sup>4</sup>. Chronic intermittent hypoxia (CIH) result from recurrent upper airway collapse, as well as repeated high-level anti-resistance activity, would make the upper airway dilator more susceptible to develop fatigue<sup>5</sup>. A wide range of treatment options are applied for OSA, including continuous positive airway pressure (CPAP), weight loss, oral appliances (OA), and surgery<sup>6</sup>. However, the treatment of OSA targets the narrow anatomic structure of the upper airway, but lacks an effective therapy for upper airway muscle dysfunction.

Genioglossus (GG), the largest dilator of upper airway, whose fatigue is strongly correlated to onset of apnea<sup>7</sup>. GG originates from the medial superior mental spine of the mandible, with the inferior fibers attached to the hyoid bone, the middle and superior fibers distributed in the tongue body<sup>8</sup>. The molecular mechanism of OSA in terms of the main signaling pathways and epigenetics alterations are introduced, such as microRNA, long non-coding RNA, and DNA methylation, as well as small molecular compounds as potential targets for OSA<sup>9</sup>. However, the molecular mechanism GG in OSA/CIH models remains unclear. The research group is committed to studying the pathological mechanism of OSA targeting on GG.

## **1. Risk factors for adult OSA pathogenesis and therapy targeting on GG**

The main risk factors for adult OSA include not only anatomical stenosis, but also include gender, obesity, and aging<sup>10</sup>. Therefore, we now review the pathogenic mechanism of OSA regarding on these latter risk factors.

### **1.1 Estrogen related physiological process influence GG fatigue from gender**

## **difference**

There is strong evidence for an increased susceptibility of males (or decreased susceptibility of females) to OSA<sup>11</sup>. The research group observed that the electromyogram (EMG) activity of GG was affected by hormone levels in young female<sup>12</sup>. Then we performed ovariectomy in rats, and found reduced EMG activity of GG with decreased myosin heavy chain IIA (MyHCIIA) isoform distribution<sup>13</sup>. Estrogen (estradiol) could stimulate the expression of estrogen receptor  $\alpha$  (ER $\alpha$ ) and greatly improve activities of GG; While androgen (testosterone) inhibited the expression of androgen receptor (AR) and ER $\beta$ , and impaired GG fatigue resistance capacity<sup>14</sup>. Furthermore, testosterone treatment decreased the fatigue resistance in aged GG muscles by acting at sarcoplasmic reticulum Ca<sup>2+</sup>-ATPase (SERCA) activity and SERCA gene expression<sup>15</sup>. This implied that hormone levels may affect the function of GG by affecting ERs and SERCA.

It is speculated that GG fatigue in OSA patients may be influenced by estrogen related physiological process. Then the research group established CIH rat models and found reduced contractile and duration properties of GG in CIH rats. CIH decreased the proportion of MyHCIIA, reduce the activity and expression of SERCA and mitochondrial cytochrome c oxidase in GG, then finally destroyed GG ultrastructures. Ovariectomy in rats exacerbated the above effect, while estrogen can partially reverse the effect of CIH in ovariectomized rats in part via regulation of the expression of ER $\alpha$ .<sup>16-20</sup>

Based on the preliminary understanding of estrogen's protective mechanism on GG function, the research group try to use estrogen substitutes to treat upper airway fatigue. Phytoestrogen genistein, coumestrol or resveratrol increased muscle fatigue resistance respectively, in part by up-regulation of ERs expression in ovariectomized rats<sup>21-22</sup>. Resveratrol dimer exhibited better protection than genistein and resveratrol, and expressed higher binding affinity for ER $\beta$  than for ER $\alpha$ <sup>23</sup>.

## **1.2 Obesity/Aging induced-GG injury aggravate OSA pathogenesis**

Obesity and aging are another two important risk factors for OSA<sup>24-25</sup>. The research group discovered that obesity induced-GG injury with mitochondrial

dysfunction and excessive oxidative stress, and activated the mitochondrial-related apoptotic pathway<sup>26</sup>. Hypoxia and aging interact to form a vicious circle with upregulation of p53 and p21, which worsened GG injury.<sup>27</sup>

## **2. Molecular mechanism of GG injury in OSA pathogenesis**

### **2.1 hypoxia inducible factors-1 $\alpha$ (HIF-1 $\alpha$ )**

HIF-1 $\alpha$  also plays an important role in GG fatigue in OSA pathogenesis. CIH induced the expression of HIF-1 $\alpha$  in the GG and altered the physical properties towards a more fatigable phenotype, whereas estrogen inhibited the over-expression of HIF-1 $\alpha$ <sup>28</sup>. The research group further revealed that increased HIF-1 $\alpha$  expression mediated muscle fatigue with mitochondrial ultrastructure damage via AMPK/PGC-1 $\beta$  signalling pathway<sup>29</sup>. The molecular regulation of myoblasts under hypoxia were described, in which HIF-1 $\alpha$  mediates Notch and Wnt signaling pathways<sup>30</sup>. Then the research group established skeletal muscle conditional HIF-1 $\alpha$  KO mice, and found there was a slight decrease in muscle fiber type I, IIa, IIx fiber types but an increase in type IIb<sup>31</sup>. A transcriptomic analysis of GG from conditional HIF-1 $\alpha$  KO mice showed multiple genes expression involved in the myogenesis, muscle development, and carbo hydrate metabolism<sup>32</sup>.

### **2.2 Reactive oxygen species (ROS)**

Reactive oxygen species (ROS) act as a medium in CIH-induced GG injury. ROS generation, MDA, and DNA damage were increased when GG myoblast was under hypoxic condition, lead to myoblast apoptosis<sup>33</sup>. The research group also found myoblast pyroptosis during OSA was results from excessive ROS via the NF- $\kappa$ B/HIF-1 $\alpha$  signaling pathway<sup>34</sup>. Nowadays, we conducted an RNA-Seq analysis of GG in CIH mice, and found a total of 637 differentially expressed genes (DEGs)<sup>35</sup>. Our previews study confirmed that CIH exposure could increase the expression of phosphofructokinase muscle-specific isoform and change metabolism in CIH rats<sup>36</sup>. Regarding the enriched biological processes terms, more than 40% of DEGs were associated with terms related to the responses to endogenous stimuli, cellular component organization and metabolic processes. It was verified in vivo and in vitro that CIH can induce excess ROS and reduce collagen synthesis, leading to the decline

in EMG<sup>GG</sup> function in CIH mice<sup>35</sup>.

### 3. Prospect

The research group have been dedicated to the pathological mechanism and treatment of adult OSA and pediatric OSA for decades. Recently, the possibility of stem cell therapy was tested, and it is found that dental pulp stem cells secretome alleviated hypoxia-induced GG myoblasts injury via Wnt/ $\beta$ -catenin and AMPK/PGC-1 $\alpha$  signaling pathway<sup>53-54</sup>. Our prospect is to targeted molecular mechanism on GG, so as to effectively improve GG fatigue resistance to upper airway muscle collapse.
