#### Abstract

We count tilings of the $n \times m$ rectangular grid, cylinder, and torus with arbitrary tile sets up to arbitrary symmetries of the square and rectangle, along with cyclic shifting of rows and columns. This provides a unifying framework for understanding a family of counting problems, expanding on the work by Ethier and Lee counting tilings of the torus by tiles of two colors.

Given some set of arbitrary patterns, we are interested in counting ways of tiling the $n \times m$ square grid, of tiling the infinite strip in a periodic way, and of tiling the Euclidean plane in a way that is periodic both left-to-right and top-to-bottom, up to various symmetries. These counting problems are of actual physical interest: if we are designing a square table that will be tiled with four tiles that are rotations of the tile pattern $\square$, then there are 43 ways of doing so up to rotation and reflection of the table, as illustrated in Figure 1

However we may be interested in counting the number of tile designs up to other symmetries: if the table is fixed, then there are $4^{4}=256$ tilings; if two tilings are considered the same if one is a rotation of another, then there are 70 such tilings. In the setting of the Euclidean plane we might imagine that we plan to tile the floor of a building with a repeating $2 \times 2$ pattern of these tiles, where we consider two tilings to be the same if one is a rotation, reflection, or translation of another; in this case, there are 17 such tilings.

Ultimately, we will construct a framework for counting the number of ways of tiling the grid up to various symmetries. This provides a unifying theory for a family of problems that appear to have only been analyzed in an ad hoc manner ${ }^{1}$ This has resulted in the addition of 49 new sequences to the On-Line Encyclopedia of Integer Sequences (OEIS) 5].

When we look at the grid up to symmetries of the square, we call this the $n \times m$ grid, an example of which is illustrated in Figure 1. When we additionally allow cyclic shifting of columns, we call this the $n \times m$ cylinder, which is illustrated in Figure 2. When we allow cyclic shifting of the rows in addition to the above symmetries, we call this the $n \times m$ torus, which is illustrated in Figure 3 ,

The number of such tilings depends on the size of the grid, the symmetries of the grid under consideration, the symmetries of the tile designs, and the number of tile designs with a given symmetry. We formalize each of these four notions below, and use them to give a formula that counts the number of corresponding tile designs.

[^0]

Figure 2: Part (a) shows a $3 \times 4$ cylinder repeated three times horizontally with two $3 \times 4$ regions selected. Part (b) is one of the grid representations of this cylinder. Part (c) is an equivalent grid representation if $180^{\circ}$ rotation is allowed.

Figure 3: Part (a) shows a $2 \times 2$ torus repeated three times horizontally and three times vertically, with three $2 \times 2$ regions selected. Part (b) shows three tilings of the $2 \times 2$ grid that are equivalent under the toroidal action $\mathbb{Z} / 2 \mathbb{Z} \times \mathbb{Z} / 2 \mathbb{Z}$. Part (c) shows a $2 \times 2$ torus that is equivalent to the other tori under the dihedral action $r^{3}$.

## 1 Notation and preliminaries

In this section, we will formalize the notation of a grid and its size, the symmetries of the grid that we count up to, the symmetries of the tile designs, and the number of tile designs with a given symmetry.

### 1.1 Tilings and the grid

In order to talk about tilings of the $n \times m$ grid, cylinder, and torus, it is important to first formalize what these are. All of these ideas start with the fundamental idea of the $n \times m$ grid, which we define as follows.
Definition 1.1.1. The $n \times m$ grid is the set $\mathbb{Z} / n \mathbb{Z} \times \mathbb{Z} / m \mathbb{Z}$, and the elements of this set are called cells.
When illustrating grids, we use the convention that the $n \times m$ grid has $n$ columns and $m$ rows, which are described using 0 -indexed Cartesian coordinates, where $(0,0)$ is the cell in the lower left corner and ( $n-1, m-1$ ) is the cell in the upper right corner.

### 1.2 Symmetries of the grid

We will count grids up to various symmetries, some of which may be specified by subgroups of the dihedral group of the square, $R \leq D_{8}=\left\langle r, f \mid r^{4}=f^{2}=(r f)^{2}=\mathrm{id}\right\rangle$. Because this is a group of rotations and reflections of the grid, we call this subgroup $R$. When considering the $n \times m$ grid for $n \neq m$, we will further specify that $R \leq D_{4}$, where $D_{4}=\left\langle r^{2}, f \mid\left(r^{2}\right)^{2}=f^{2}=\mathrm{id}\right\rangle$ is the dihedral group of the rectangle $\int^{2}$

In all cases, we will use the convention that our symmetry groups act on the grid via right actions, illustrated in Figure 4. We will also use the conventions that $r$ acts on the grid by $+90^{\circ}$ rotations and $f$ acts on the grid by horizontal reflection (i.e. over the vertical line). Because the group acts on the right, $r f$ reflects the square grid over the line $y=x$ and $r^{3} f$ corresponds to matrix transposition.

Figure 4: Illustrations of the eight group actions of the dihedral group of the square $D_{8}$, which we call "identity", " $90^{\circ}$ rotation", " $180^{\circ}$ rotation", " $-90^{\circ}$ rotation", "horizontal reflection", "diagonal reflection", "vertical reflection", and "antidiagonal reflection" respectively.

Formally, we describe the action on the cell by specifying how the generators of $D_{8}$ act.
Definition 1.2.1. The (right) action of an element of $D_{4}$ on a cell $(x, y) \in \mathbb{Z} / n \mathbb{Z} \times \mathbb{Z} / m \mathbb{Z}$ is given by

$$
\begin{aligned}
& (x, y) \cdot f=(n-1-x, y), \quad \text { and } \\
& (x, y) \cdot r^{2}=(n-1-x, m-1-y)
\end{aligned}
$$

In the case of an $n \times n$ grid, the action of $r \in D_{8}$ is given by

$$
\begin{equation*}
(x, y) \cdot r=(n-1-y, x) \tag{1}
\end{equation*}
$$

These actions can be extended to all of $D_{4}$ and $D_{8}$ via the binary operation of the group, since the group action is specified for the generators.

### 1.3 Symmetries of the cylinder and torus

Now that we know how the dihedral group acts on the $n \times n$ and $n \times m$ grids, we can also look at symmetries of the grid by cyclic shifting of rows and/or columns. When we shift just the columns ${ }^{3}$, we call this a

[^1]cylindrical action, which we describe with the group $\mathbb{Z} / n \mathbb{Z}$; when we shift the rows and columns, we call this a toroidal, which we describe with the group $\mathbb{Z} / n \mathbb{Z} \times \mathbb{Z} / m \mathbb{Z}$. Both of these are named in reference to the corresponding topological identification of the square.

Definition 1.3.1. The cylindrical action of $a \in \mathbb{Z} / n \mathbb{Z}$ on a cell $(x, y) \in \mathbb{Z} / n \mathbb{Z} \times \mathbb{Z} / m \mathbb{Z}$ corresponds to $a$ (rightward) cyclic shift of columns:

$$
(x, y) \cdot a=(x+a, y)
$$

Definition 1.3.2. The toroidal of $(a, b) \in \mathbb{Z} / n \mathbb{Z} \times \mathbb{Z} / m \mathbb{Z}$ on a cell $(x, y) \in \mathbb{Z} / n \mathbb{Z} \times \mathbb{Z} / m \mathbb{Z}$ corresponds to a (rightward) cyclic shift of columns and an (upward) cyclic shift of rows:

$$
(x, y) \cdot(a, b)=(x+a, y+b)
$$

Definition 1.3 .2 is illustrated in Figure 5 .

Figure 5 : The $(3,1) \in \mathbb{Z} / 4 \mathbb{Z} \times \mathbb{Z} / 3 \mathbb{Z}$ acts on the $4 \times 3$ grid identified as a torus by cyclically shifting columns to the right by 3 and cyclically shifting rows by 1 .

### 1.4 Compatibility of grid symmetries

Notice that we can act on the grid with both the dihedral actions and the cylindrical/toroidal actions. In order to make the group actions of the dihedral group compatible with the the cylindrical action $(\mathbb{Z} / n \mathbb{Z})$ or the toroidal action $(\mathbb{Z} / n \mathbb{Z} \times \mathbb{Z} / m \mathbb{Z})$, we define their (outer) semidirect product, $\mathbb{Z} / n \mathbb{Z} \rtimes R$ or $(\mathbb{Z} / n \mathbb{Z} \times \mathbb{Z} / m \mathbb{Z}) \rtimes R$ respectively. As in the examples above, we define this as a right action, thinking of this as first cyclically shifting the rows and columns and then rotating or reflecting according to the element $R$.

The outer semidirect products are defined with respect to the homomorphisms $\psi: D_{4} \rightarrow \operatorname{Aut}(\mathbb{Z} / n \mathbb{Z})$ and $\phi: D_{8} \rightarrow \operatorname{Aut}(\mathbb{Z} / n \mathbb{Z} \times \mathbb{Z} / m \mathbb{Z})$ respectively. (We use $D_{4}$ rather than $D_{8}$ in the case of the cylinder because a $90^{\circ}$ rotation is not an isometry of the infinite strip, which is the universal cover of the cylinder.)

Definition 1.4.1. Let $\psi: D_{4} \rightarrow \operatorname{Aut}(\mathbb{Z} / n \mathbb{Z})$ be given by

$$
\begin{aligned}
\psi_{f}(x) & =\psi_{r^{2}}(x) \\
\psi_{\mathrm{id}}(x) & =-x \text { and } \\
\psi_{r^{2} f}(x) & =x
\end{aligned}
$$

Then the product of two elements in $\mathbb{Z} / n \mathbb{Z} \rtimes D_{4}$ is given by

$$
\left(a_{1}, g_{1}\right)\left(a_{2}, g_{2}\right)=\left(a_{1}+\psi_{g_{1}}\left(a_{1}\right), g_{1} g_{2}\right)
$$

In the case of the torus, the definition of the semidirect product $(\mathbb{Z} / n \mathbb{Z} \times \mathbb{Z} / m \mathbb{Z}) \rtimes R$, where $R \leq D_{8}$, is essentially similar.

Definition 1.4.2. Let $\phi: D_{8} \rightarrow \operatorname{Aut}(\mathbb{Z} / n \mathbb{Z} \times \mathbb{Z} / m \mathbb{Z})$ be defined on the generators $r$ and $f$ by

$$
\begin{aligned}
\phi_{f}((x, y)) & =(-x, y) \text { and } \\
\phi_{r}((x, y)) & =(y,-x)
\end{aligned}
$$

and extended to the other elements of $D_{8}$. Then the binary operation of the semidirect product of $(\mathbb{Z} / n \mathbb{Z} \times$ $\mathbb{Z} / m \mathbb{Z}) \rtimes D_{8}$ is given by

$$
\left(\left(a_{1}, b_{1}\right), g_{1}\right)\left(\left(a_{2}, b_{2}\right), g_{2}\right)=\left(\left(a_{1}, a_{2}\right)+\phi_{g_{1}}\left(a_{1}, a_{2}\right), g_{1} g_{2}\right)
$$

Using the facts that $r$ and $f$ generate $D_{8}$ and $\phi$ is a homomorphism, together with function composition yields:
$\phi_{\mathrm{id}}((x, y))=(x, y), \quad \phi_{r}((x, y))=(y,-x), \quad \phi_{r^{2}}((x, y))=(-x,-y), \quad \phi_{r^{3}}((x, y))=(-y, x)$,
$\phi_{f}((x, y))=(-x, y), \quad \phi_{r f}((x, y))=(y, x), \quad \phi_{r^{2} f}((x, y))=(x,-y), \quad \phi_{r^{3} f}((x, y))=(-y,-x)$.
Example 1.4.3. We check our work on an individual cell. For every choice of tile and pair of symmetries, we should have

$$
\left((x, y) \cdot\left(\left(a_{1}, b_{1}\right), g_{1}\right)\right) \cdot\left(\left(a_{2}, b_{2}\right), g_{2}\right)=(x, y) \cdot\left(\left(\left(a_{1}, b_{1}\right), g_{1}\right)\left(\left(a_{2}, b_{2}\right), g_{2}\right)\right)
$$

In particular, we check in the case of the $4 \times 4$ torus with $(x, y)=(1,0),\left(\left(a_{1}, b_{1}\right), g_{1}\right)=((1,1), f)$ and $\left(\left(a_{2}, b_{2}\right), g_{2}\right)=((2,0), r)$.

$$
\begin{aligned}
((1,0) \cdot((1,1), f)) \cdot((2,0), r) & =((2,1) \cdot f) \cdot((2,0), r) \\
& =(1,1) \cdot((2,0), r) \\
& =(3,1) \cdot r \\
& =(2,3)
\end{aligned}
$$

Now using the semidirect product,

$$
\begin{aligned}
(1,0) \cdot(((1,1), f)((2,0), r)) & =(1,0) \cdot\left((1,1)+\phi_{f}(2,0), f r\right) \\
& =(1,0) \cdot\left((1,1)+(-2,0), r^{3} f\right) \\
& =(1,0) \cdot\left((3,1), r^{3} f\right) \\
& =(0,1) \cdot r^{3} f \\
& =(2,3) .
\end{aligned}
$$

This suggests that this semidirect product is the appropriate way to make the dihedral actions compatible with the toroidal action.

### 1.5 Symmetries of tile designs

We are now ready to start filling in our grid with tiles. Before defining what tiles are, we introduce the following definition for convenience.

Definition 1.5.1. If $X$ is a set and $G$ has a group action on $X$, then we call $X$ a $G$-set.
Definition 1.5.2. Given $R \leq D_{8}$, a set of tile designs is simply an $R$-set. A tile design is any element of such a set.

We will always illustrate our tile designs with squares that have designs in them, but any abstract $R$-set will work in place of these illustrations. When we specify one of these tile designs together with a cell, we get a tile.

Definition 1.5.3. A tile in the $n \times m$ grid with the set of tile designs $T$ is an element of $(\mathbb{Z} / n \mathbb{Z} \times \mathbb{Z} / m \mathbb{Z}) \times T$.
Now we are ready to define a tiling of the grid, which is a specification of a tile design for each cell.
Definition 1.5.4. A tiling of the $n \times m$ grid with the set of tile designs $T$ is a map $f:(\mathbb{Z} / n \mathbb{Z} \times \mathbb{Z} / m \mathbb{Z}) \rightarrow T$. The tiles associated with the tiling are elements of the graph of the map

$$
\{((x, y), f(x, y)) \mid(x, y) \in \mathbb{Z} / n \mathbb{Z} \times \mathbb{Z} / m \mathbb{Z}\}
$$

We next give an example to illustrate all of these definitions.
Example 1.5.5. Suppose that $R=D_{4}=\left\langle r^{2}, f\right\rangle$, the dihedral group of the rectangle. Then

$$
T=\{\square \| \Lambda\rfloor \nabla \nabla \Delta \Delta A \Delta \Delta V\}
$$

is a set of tile designs, because it is an $R$-set. The $3 \times 2$ tiling

consists of the six tiles

$$
\{((0,0), \boldsymbol{\square})((0,1), \boldsymbol{\square})((1,0), \vdots)((1,1), \square)((2,0), \vdots \text { ■ }
$$

Since we have now defined tiles, we are ready to talk about how the symmetries of our grid, cylinder, or torus act on tiles: dihedral actions can act on the tile design nontrivially, but cylindrical/toroidal actions always act on a tile design by the identity. We extend Definitions 1.2.1, 1.3.1, and 1.3 .2 to this setting in a direct way, and illustrate this in Figure 6 .
Definition 1.5.6. If $((x, y), d)$ is a tile in an $n \times m$ grid, then $g \in D_{4}$ acts on $((x, y), d)$ by

$$
\begin{aligned}
& ((x, y), d) \cdot \mathrm{id}=((x, y), d) \\
& ((x, y), d) \cdot r^{2}=\left((n-1-x, m-1-y), d \cdot r^{2}\right) \\
& ((x, y), d) \cdot f=((n-1-x, y), d \cdot f), \text { and } \\
& ((x, y), d) \cdot r^{2} f=\left((x, m-1-y), d \cdot r^{2} f\right)
\end{aligned}
$$

Furthermore, if $((x, y), d)$ is a tile in an $n \times n$ grid, then $g \in D_{8}$ acts on $((x, y), d)$ by the above actions together with

$$
\begin{aligned}
& ((x, y), d) \cdot r=((n-1-y, x), d \cdot r) \\
& ((x, y), d) \cdot r^{3}=\left((y, n-1-x), d \cdot r^{3}\right) \\
& ((x, y), d) \cdot r f=((y, x), d \cdot r f), \text { and } \\
& ((x, y), d) \cdot r^{3} f=\left((n-1-y, n-1-x), d \cdot r^{3} f\right)
\end{aligned}
$$

In order to understand what makes two tiles essentially different with respect to counting tilings, it is useful to define the notion of a stabilizer subgroup.
Definition 1.5.7. Let $X$ be a $G$-set. Then the stabilizer subgroup of an element $x \in X$ is the subgroup

$$
G_{x}=\{g \in G \mid x \cdot g=x\} \leq G
$$

Because our set of tile designs $T$ is an $R$-set, the relevant difference between different tile designs for the purpose of counting tilings is their stabilizer subgroups.

(a)

$$
((1,0), \quad \vdots) \cdot r^{2} f=((1,1), \cdots)
$$

(b)

Figure 6: An example of the action of $r^{2} f$ (a vertical reflection) on (a) a tiling of the $3 \times 2$ grid and on (b) a specific tile.

### 1.6 Classifying sets of tile designs

In order to describe the essential features of a set of tile designs, we partition it into orbits with respect to $R$. By counting up the number of orbits and classifying each orbit by the (conjugacy class of the) stabilizer subgroup of one of its representatives we can understand the combinatorics of the set of tile designs completely.

Definition 1.6.1. Let $R \subseteq D_{8}$ and let $T$ be a set of tile designs (with respect to $R$ ). Then for each (conjugacy class of) a subgroup $S \leq R$, let $\mathcal{O}_{S}^{R}$ denote the number of orbits that contain a tile whose stabilizer subgroup is conjugate to $S$.

Notice that we classify up to conjugacy class because if $d$ is stable under $S$, then $d \cdot g$ is stable under $g^{-1} S g$ since $(d \cdot g) \cdot g^{-1} S g=d \cdot S g=d \cdot g$.

Example 1.6.2. Suppose we are counting tilings of the grid, cylinder, or torus up to horizontal and vertical reflection with a set of tile designs given by

$$
T=\{\square \| \Sigma \pm \nabla \nabla \Delta \Delta V A \backslash \Delta V\}
$$

Since the symmetry group $D_{4}=\left\langle r^{2}, f \mid\left(r^{2}\right)^{2}=f^{2}=\mathrm{id}\right\rangle$ has 5 conjugacy classes of subgroups, there are five type of orbits:

$$
\begin{array}{ll}
\mathcal{O}_{\left\langle r^{2}, f\right\rangle}^{\left\langle r^{2}, f\right\rangle}=2 & \text { via }\left\{\begin{array}{l}
\text { and }\{
\end{array}\right. \\
\mathcal{O}_{\langle f\rangle}^{\left\langle r^{2}, f\right\rangle}=1 & \text { via }\left\{\begin{array}{l}
\text { and }
\end{array}\right. \\
\mathcal{O}_{\left\langle r^{2}\right\rangle}^{\left\langle r^{2}, f\right\rangle}=2 & \text { via }\left\{\begin{array}{l}
\text { and }
\end{array}\right. \\
\mathcal{O}_{\left\langle r^{2} f\right\rangle}^{\left\langle r^{2}, f\right\rangle}=0 \\
\mathcal{O}_{\mathbb{1}}^{\left\langle r^{2}, f\right\rangle}=1
\end{array}
$$

Lemma 1.6.3. The number of tilings for a given $R$-tiling $T$ only depends on the tuple

$$
\bigoplus_{S \in \operatorname{conj}(R)} \mathcal{O}_{S}^{R}
$$

where $\operatorname{conj}(R)$ is the set of equivalence classes of subgroups of $R$ up to conjugacy.

Proof. Suppose that we have two sets of tile designs $T$ and $T^{\prime}$ with the same number of orbits for each stabilizer conjugacy class. There exists a bijection $f: T \rightarrow T^{\prime}$ such that $f(d)=d^{\prime}$ whenever $d$ and $d^{\prime}$ have the same stabilizer subgroup in $R$, that is, $R_{d}=R_{d^{\prime}}$. Then the induced map of $f$ to the tilings is also bijection of tilings.

In Appendix A.5, we explicitly enumerate all of the $R$-sets of tile designs that consist of a single orbit for each subgroup $R \leq D_{4}$ or $R \leq D_{8}$.

### 1.7 Counting strategy

In order to count how many tilings exist up to various symmetries, we will use Burnside's lemma.
Theorem 1.7.1 (Burnside's lemma). Let $X$ be a $G$-set. Then the size of $X$ up to the action of $G$ is

$$
|X / G|=\frac{1}{|G|} \sum_{g \in G}\left|X^{g}\right|
$$

where $\left|X^{g}\right|$ is the number of elements of $X$ that are fixed under the action of $g \in G$.
We want to understand how many tilings are fixed under various symmetries. To do this it is necessary to categorize the symmetries of various tiles.

Definition 1.7.2. Let $T$ be a set of tile designs, where $R \leq D_{8}$. For each $g \in R$, the set of tiles that are fixed by $g$ is denoted

$$
T^{g}=\{d \in T \mid d \cdot g=d\}
$$

and the size of this set is denoted

$$
t_{g}=\left|T^{g}\right|
$$

Note that $T^{\text {id }}=T$, so $t_{\text {id }}$ is the total number of tiles designs.
The following theorem gives us a strategy for counting the number of tilings that are fixed under a given symmetry, which is illustrated in Figure 7.

Theorem 1.7.3. Suppose that $s=g \in R, s=(a, g) \in \mathbb{Z} / n \mathbb{Z} \rtimes R$, or $s=((a, b), g) \in(\mathbb{Z} / n \mathbb{Z} \times \mathbb{Z} / m \mathbb{Z}) \rtimes R$.
Since the set of cells $\mathbb{Z} / n \mathbb{Z} \times \mathbb{Z} / m \mathbb{Z}$ form an $\langle s\rangle$-set, we partition the cells into orbits with respect to the cyclic subgroup $\langle s\rangle$, which we call $\Theta_{s}$, so that $\bigsqcup_{\vartheta \in \Theta_{s}} \vartheta=\mathbb{Z} / n \mathbb{Z} \times \mathbb{Z} / m \mathbb{Z}$.

Then if $X^{s}$ is the set of tilings of the $n \times m$ grid that are stable under $s$,

$$
\left|X^{s}\right|=\prod_{\vartheta \in \Theta_{s}} t_{g^{|\vartheta|}} .
$$

Proof. Because $\Theta_{s}$ partitions the cells into orbits with respect to the cyclic subgroup $\langle s\rangle$, the number of tilings that are fixed under $s$ is equal to the product of the number of tilings of each orbit of cells under $\langle s\rangle$.

The tiling of an orbit of cells can be specified by a single tile $d$, which then determines the rest of the orbit by $((x, y), d) \cdot s^{k}$ for $0 \leq k<|\vartheta|$. The only requirement for a valid tiling of a orbit is that

$$
((x, y), d)=((x, y), d) \cdot s^{|\vartheta|}=\left((x, y), d \cdot g^{|\vartheta|}\right)
$$

thus $d$ must be fixed by $g^{|\vartheta|}$, and so $d \in T^{g^{|\vartheta|}}$. Therefore there are $t_{g^{|\vartheta|}}$ choices for $d$ and thus for the orbit of cells containing $(x, y)$.

Thus, this reduces the problem to a matter of counting the orbits of cells under each symmetry $s$ along with counting the sizes of each of these orbits.

We proceed with Sections 2, 3, and 4. which all implement the above strategy. Each section consists broadly of fixed point counting theorems, which count tilings of the grid that are fixed under the actions of $D_{4}$ or $D_{8}$ for arbitrary sets of tile designs.

Figure 7: An illustration showing a tiling of the $4 \times 4$ torus that is fixed under $((1,2), r)$, and the six orbits of its cells with respect to the subgroup generated by this symmetry. There are three orbits of size 4 (whose tiles are stable under $r^{4}=\mathrm{id}$ ), one orbit of size 2 (whose tiles are stable under $r^{2}$ ), and two orbits of size 1 (whose tiles are stable under $r$ ).

## 2 Grid

For counting tilings of the $n \times m$ rectangular grid or $n \times n$ square grid under subgroups $R \leq D_{4}$ and $R \leq D_{8}$ respectively, we count the number of tilings that are fixed under each element of $R$.

In the following two subsections, we denote the rectangular grid by RG and the square grid SG.

### 2.1 The $n \times m$ grid

We begin by specifying the number of tilings that are fixed under each symmetry.
Definition 2.1.1. For a given set of tile designs $T$, and an element $g \in R \leq D_{4}$, The number of tilings of the $n \times m$ grid by tile designs in $T$ that are fixed by $g$ is denoted $\operatorname{fxpt}_{g}^{R G}(n, m)$.

Theorem 2.1.2. For a given set of tile designs $T$ and an element $g \in R \leq D_{4}$, the number of tilings of the $n \times m$ grid by tile designs in $T$ that are fixed by $g$ is

$$
\begin{align*}
& \operatorname{fxpt}_{\mathrm{id}}^{R G}(n, m)=t_{\mathrm{id}}^{n m} .  \tag{2}\\
& \operatorname{fxpt}_{r^{2}}^{R G}(n, m)= \begin{cases}t_{\mathrm{id}}^{n m / 2} & n m \text { even } \\
t_{\mathrm{id}}^{(n m-1) / 2} t_{r^{2}} & n m \text { odd } .\end{cases}  \tag{3}\\
& \operatorname{fxpt}_{f}^{R G}(n, m)= \begin{cases}t_{\mathrm{id}}^{n m / 2} & n \text { even } \\
t_{\mathrm{id}}^{(m(n-1)) / 2} t_{f}^{m} & n \text { odd. }\end{cases}  \tag{4}\\
& \operatorname{fxpt}_{r^{2} f}^{R G}(n, m)
\end{align*}= \begin{cases}t_{\mathrm{id}}^{n m / 2} & m \text { even }  \tag{5}\\
t_{\mathrm{id}}^{(n(m-1)) / 2} t_{r^{2} f}^{n} & m \text { odd } .\end{cases}
$$

Then the number of distinct tilings of the $n \times m$ grid up to action of $R$ is given by

$$
\begin{equation*}
\frac{1}{|R|} \sum_{g \in R} \operatorname{fxpt}_{g}^{R G}(n, m) \tag{6}
\end{equation*}
$$

Proof. The proof will consist of three cases.
Equation (2). This follows from the fact that $t_{\mathrm{id}}$ is the number of distinct tiles, and every tiling is fixed under id $\in D_{4}$.

Equation (3). This follows from the fact that the (right) action of $r^{2}$ on the cell $(x, y)$ is

$$
(x, y) \cdot r^{2}=(n-x-1, m-y-1)
$$

Since $r^{2}$ has order 2 , each cell is in an orbit of size 1 or 2 . The cell $(x, y)$ is fixed under the action of $r^{2}$ if and only if $n$ and $m$ are both odd and $(x, y)=\left(\frac{n-1}{2}, \frac{m-1}{2}\right)$.
Therefore when $n m$ is even, the grid is partitioned into $n m / 2$ orbits of size 2 , so any fixed tiling can be specified by choosing any tile design in $T$ for each orbit. When $n m$ is even, the grid is partitioned into one orbit of size 1 together with $(n m-1) / 2$ orbits of size 2 , so any fixed tiling can be specified by choosing a tile design in $T^{r^{2}}$ for the fixed point and any tile design in $T$ for each orbit.

Equations (4) and (5). These two equations are essentially the same, so without loss of generality, we will prove the case of Equation (4). The right action of $f$ on $((x, y), d)$ is

$$
((x, y), d) \cdot f=((n-x-1, m), d \cdot f)
$$

Because $f$ is order 2, we can conclude that $(x, y)$ is either a fixed point or a 2 -cycle with respect to $f$. It follows that $(x, y)$ is a fixed point if and only if $n$ is odd and $x=(n-1) / 2$, therefore when $n$ is odd the tiling has $m$ fixed cells. The fixed cells can be specified by any tile design in $T^{f}$, and the cells in orbits of size 2 can be specified by any tile design in $T$.

Equation (6) Finally, this is a direct application of Burnside's lemma.

### 2.2 The $n \times n$ grid

There are more symmetries and some specializations in the case of the $n \times n$ grid, which we denote SG for "square grid".
Definition 2.2.1. For a given set of tile designs $T$, and an element $g \in R \leq D_{8}$, the number of tilings of the $n \times n$ grid by tile designs in $T$ that are fixed by $g$ is denoted $\operatorname{fxpt}_{g}^{S G}(n)$.
Theorem 2.2.2. For a given set of tile designs $T$ and an element $g \in R \leq D_{8}$, the number of tilings of the $n \times m$ grid by tile designs in $T$ that are fixed by $g$ is

$$
\begin{align*}
& \operatorname{fxpt}_{\mathrm{id}}^{S G}(n)=\operatorname{fxpt}_{\mathrm{id}}^{R G}(n, n)=t_{\mathrm{id}}^{n^{2}}  \tag{7}\\
& \operatorname{fxpt}_{r^{2}}^{S G}(n)=\operatorname{fxpt}_{r^{2}}^{R G}(n, n)= \begin{cases}t_{\mathrm{id}}^{n^{2} / 2} & n \text { even } \\
t_{\mathrm{id}}^{\left(n^{2}-1\right) / 2} t_{r^{2}} & n \text { odd }\end{cases}  \tag{8}\\
& \operatorname{fxpt}_{f}^{S G}(n)=\operatorname{fxpt}_{f}^{R G}(n, n)= \begin{cases}t_{\mathrm{id}}^{n^{2} / 2} & n \text { even } \\
t_{\mathrm{id}}^{\left(n^{2}-n\right) / 2} t_{f}^{n} & n \text { odd }\end{cases}  \tag{9}\\
& \operatorname{fxpt}_{r^{2} f}^{S G}(n)=\operatorname{fxpt}_{r^{2} f}^{R G}(n, n)= \begin{cases}t_{\mathrm{id}}^{n^{2} / 2} & n \text { even } \\
t_{\mathrm{id}}^{\left(n^{2}-n\right) / 2} t_{r^{2} f}^{n} & n \text { odd }\end{cases}  \tag{10}\\
& \operatorname{fxpt}_{r}^{S G}(n)=\operatorname{fxpt}_{r^{3}}^{S G}(n)= \begin{cases}t_{\mathrm{id}}^{n^{2} / 4} \\
t_{\mathrm{id}}^{\left(n^{2}-1\right) / 4} t_{r} & n \text { oven }\end{cases}  \tag{11}\\
& \operatorname{fxpt}_{r f}^{S G}(n)=t_{\mathrm{id}}^{\left(n^{2}-n\right) / 2} t_{r f}^{n} .  \tag{12}\\
& \operatorname{fxpt}_{r^{3} f}^{S G}(n)=t_{\mathrm{id}}^{\left(n^{2}-n\right) / 2} t_{r^{3} f .}^{n} . \tag{13}
\end{align*}
$$

Then the number of distinct tilings of the $n \times n$ grid up to the dihedral action of the square is given by

$$
\begin{equation*}
\frac{1}{|R|} \sum_{g \in R} \operatorname{fxpt}_{g}^{S G}(n) \tag{14}
\end{equation*}
$$

Proof. This proof proceeds with four cases.
Equations (7), (8), (9), and (10). These follow directly from Theorem 2.1.2, by specifying $m=n$.
Equation 11). Firstly, notice that the tilings that are fixed under $r$ are identically those that are fixed under $r^{-1}=r^{3}$. The (right) action of $r \in D_{8}$ on a cell $(x, y)$ is

$$
(x, y) \cdot r=(n-y-1, x)
$$

therefore $(a, b)$ is a fixed point if and only if it satisfies the system of equations

$$
\begin{align*}
a & =n-b-1  \tag{15}\\
b & =a \tag{16}
\end{align*}
$$

which has an integer solution only when $n$ is odd and when $(a, b)=\left(\frac{n-1}{2}, \frac{n-1}{2}\right)$. Also, there are no cells that occur in 2 -cycles. This can be seen by noticing that cells that occur in 2 -cycles are also fixed points under $r^{2}$, and by the proof of Theorem 2.1.2, we know that this occurs under the same conditions as the fixed points under $f$. Therefore all other cells occur in 4-cycles.
Therefore when $n$ is even, the grid is partitioned into $n^{2} / 4$ orbits of size 4 , each of which can be specified by any tile design in $T$; when $n$ is odd, the grid has one fixed point, which must be tiled with a tile design in $T^{r}$, and the remaining cells can be partitioned into $\left(n^{2}-1\right) / 4$ orbits of size 4 , each of which can be specified by any tile design in $T$.

Equations 12) and 13). Because $r f$ and $r^{3} f$ are conjugate, these are essentially similar, so without loss of generality, we will prove Equation 12 .
The (right) action of $r f \in D_{8}$ on a cell $(x, y)$ is

$$
(x, y) \cdot r f=(y, x)
$$

Thus, $(x, y)$ is a fixed point if and only if $x=y$, otherwise it is a part of a 2 -cycle. Therefore there are $n$ fixed points, which can be specified by a tile design in $T^{r f}$ and $\left(n^{2}-n\right) / 22$-cycles, which can be specified with any tile design in $T$.

Equation (14). The final equation follows by a direct application of Burnside's lemma.

## 3 Cylinder

Here we use the convention that the $n \times m$ cylinder is identified along its left and right sides, as illustrated in Figure 2 .

Even in the case of $n \times n$ grids, we only consider tilings of cylinders up to subgroups of the dihedral group of the rectangle, because other symmetries of the square would result in swapping the pair of identified sides (the right and left side) of the grid with the pair of non-identified sides (the top and bottom).

In both the case of the cylinder and the torus, we will repeatedly use the following observation.
Lemma 3.0.1. For fixed values of $n$ and $a$, the equation

$$
\begin{equation*}
x \equiv-1-x-a \quad(\bmod n) \tag{17}
\end{equation*}
$$

has solutions that depend on the parity of $n$ and a.
When $n$ is odd, there is one solution:

$$
\begin{equation*}
x \equiv \frac{n+1}{2}(-1-a) \quad(\bmod n) \tag{18}
\end{equation*}
$$

When $n$ is even and $a$ is odd, there are two solutions:

$$
\begin{align*}
& x \equiv \frac{-1-a}{2} \quad(\bmod n)  \tag{19}\\
& x \equiv \frac{n-1-a}{2} \quad(\bmod n) \tag{20}
\end{align*}
$$

When $n$ and a are both even, there are no solutions.
Proof. In both cases, we write equation (17) as

$$
2 x \equiv-1-a \quad(\bmod n)
$$

Odd $n$. When $n$ is odd, 2 has a multiplicative inverse of $(n+1) / 2$, so multiplying gives the unique solution described in equation 18 ).

Even $n$ and odd $a$. When $n$ is even and $a$ is odd, $-1-a$ is even. Dividing by 2 gives the solution given in equation $\sqrt{19}$, and adding $n$ and dividing by 2 gives the solution in equation 20 .

Even $n$ and $a$. When both $n$ and $a$ are even, $2 x$ is even and $-1-a$ is odd, so there are no solutions.

Similarly, we will repeatedly use the following lemma when counting fixed points for both the cylinder and the torus.

Lemma 3.0.2 ( $(4)$. Given some $a \in \mathbb{Z} / n \mathbb{Z}$, if $d$ is a minimal solution to the equation

$$
d a \equiv 0 \quad(\bmod n)
$$

then $d \mid n$. Moreover, when $d$ is a divisor of $n$, there are $\varphi(d)$ choices for a that result in $d$ being a minimal solution, where $\varphi$ is Euler's totient function.

Proof. First, we can see that the least value of $d a$ will occur when $d a=\operatorname{lcm}(a, n)$, and thus

$$
d=\operatorname{lcm}(a, n) / a=n / \operatorname{gcd}(a, n)
$$

Therefore $d$ must be a divisor of $n$. The $\varphi(d)$ choices for $a$ such that $d$ is a minimal solution to $d a \equiv 0(\bmod n)$ are $a \in\{k n / d \mid 1 \leq k \leq d$ and $\operatorname{gcd}(k, d)=1\}$.

### 3.1 The $n \times m$ cylinder

We denote the $n \times m$ cylinder by the superscript $C$.
Definition 3.1.1. For a given set of tile designs $T$, and an element $g \in R \leq D_{4}$ the sum over all cyclic shifts of the number of tilings of the $n \times m$ cylinder by tile designs in $T$ that are fixed by $(a, g) \in \mathbb{Z} / n \mathbb{Z} \rtimes R$ is denoted

$$
\operatorname{fxpt}_{g}^{C}(n, m)=\sum_{a \in \mathbb{Z} / n \mathbb{Z}} X^{(a, g)}
$$

where $X^{(a, g)}$ is the number of tilings fixed by $(a, g)$.
Theorem 3.1.2. The sum over all cyclic shifts of the number of tilings of the $n \times m$ cylinder by tile designs in $T$ that are fixed by $(a, \mathrm{id}) \in \mathbb{Z} / n \mathbb{Z} \rtimes R$ is given by

$$
\begin{equation*}
\operatorname{fxpt}_{\mathrm{id}}^{C}(n, m)=\sum_{d \mid n} \varphi(d) t_{\mathrm{id}}^{n m / d} \tag{21}
\end{equation*}
$$

Proof. For each element $(a, \mathrm{id}) \in \mathbb{Z} / n \mathbb{Z} \rtimes R$, the size of the orbits is the least $d$ such that $d a \equiv 0(\bmod n)$. By Lemma 3.0.2, when $d \mid n$ there are $\varphi(d)$ choices for $a$ that result in orbits of size $d$, and each choice partitions the $n \times m$ grid into $n m / d$ orbits.

The next theorem concerns the action of $\left(a, r^{2}\right) \in \mathbb{Z} / n \mathbb{Z} \rtimes R$, which is illustrated in Figure 8 .
Theorem 3.1.3. The sum over all cyclic shifts of the number of tilings of the $n \times m$ cylinder by tile designs in $T$ that are fixed by $\left(a, r^{2}\right) \in \mathbb{Z} / n \mathbb{Z} \rtimes R$ is given by

$$
\operatorname{fxpt}_{r^{2}}^{C}(n, m)= \begin{cases}n t_{\mathrm{id}}^{n m / 2} & m \text { is even }  \tag{22a}\\ n\left(\frac{1}{2} t_{\mathrm{id}}^{n m / 2}+\frac{1}{2} t_{\mathrm{id}}^{(n m-2) / 2} t_{r^{2}}^{2}\right) & m \text { is odd, } n \text { is even } \\ n t_{\mathrm{id}}^{(n m-1) / 2} t_{r^{2}} & m \text { and } n \text { are odd }\end{cases}
$$

Proof. The right action of $\left(a, r^{2}\right)$ on $((x, y), d)$ is

$$
\begin{equation*}
((x, y), d) \cdot\left(a, r^{2}\right)=\left((n-1-x-a, m-1-y), d \cdot r^{2}\right) \tag{23}
\end{equation*}
$$

By applying this map twice, we see that $((x, y), d)^{2}=$ id, so each orbit is either size 1 or size 2 . Orbits are size 1 precisely when

$$
\begin{align*}
x & \equiv-1-x-a \quad(\bmod n)  \tag{24}\\
y & =m-y-1 \tag{25}
\end{align*}
$$

Equation 22a. When $m$ is even, $2 y \neq m-1$, so there are no solutions to this system of equations. Thus all orbits have size 2 totaling $n m / 2$ orbits. We can choose any tile design in $T$ to start this orbit. Then we sum this over all choices $n$ choices of $a \in \mathbb{Z} / n \mathbb{Z}$.

Equation 22 b$)$. When $m$ is odd, the second equation has the unique solution of $y=(m-1) / 2$, which represents the middle row. The solutions for the second equation follow directly from Lemma 3.0.1, which states that when $n$ is even, the equation has two solutions when $x$ is odd and none otherwise; when $n$ is odd the second equation has a single solution.
Therefore when $m$ is odd and $n$ is even, half of the choices of $a \in \mathbb{Z} / n \mathbb{Z}$ result in no orbits of size 1 , and the other half of choices of $x$ result in two orbits of size 1 . In the former case, the grid decomposes into $n m / 2$ orbits of size 2 , each of which can be filled with any tile design. In the latter case, there are two orbits of size 1 , which must be filled with a tile that is fixed under $r^{2}$, and the rest of the grid decomposes into $(n m-2) / 2$ orbits all of size 2 , which can be filled with any tile design.

Equation 22c). Lastly, when both $m$ and $n$ are odd, there is a single orbit of size 1 that must be filled with a tile that is fixed under $r^{2}$, the remaining $n m-1$ cells are partitioned into $(n m-1) / 2$ orbits of size 2 that can be filled with any tile design.

The next theorem concerns the action of $(a, f) \in \mathbb{Z} / n \mathbb{Z} \rtimes R$, which is illustrated in Figure 9 .
Theorem 3.1.4. The sum over all cyclic shifts of the number of tilings of the $n \times m$ cylinder by tile designs in $T$ that are fixed by $(a, f) \in \mathbb{Z} / n \mathbb{Z} \rtimes R$ is given by

$$
\operatorname{fxpt}_{f}^{C}(n, m)= \begin{cases}n\left(\frac{1}{2} t_{\mathrm{id}}^{n m / 2}+\frac{1}{2} t_{\mathrm{id}}^{(n m-2 m) / 2} t_{f}^{2 m}\right) & n \text { is even }  \tag{26a}\\ n t_{\mathrm{id}}^{(n m-m) / 2} t_{f}^{m} & n \text { is odd }\end{cases}
$$

Proof. Since $(a, f)^{2}=$ id, every tile is either a fixed point or appears in a 2 -cycle under $(a, f)$. The right action of $(a, f)$ on $((x, y), d)$ is

$$
((x, y), d) \cdot(a, f)=((-x-a-1, y), d \cdot f)
$$

so the tiles that appear as fixed points are those that satisfy

$$
x=-1-x-a \quad(\bmod n)
$$

Figure 8: The action of $\left(a, r^{2}\right) \in \mathbb{Z} / n \mathbb{Z} \rtimes R$ on a tiling is equivalent to a $180^{\circ}$ rotation of both the leftmost $n-a \times m$ sub-grid and the rightmost $a \times m$ sub-grid.

Equation 26a). When $n$ and $a$ are both even, there are no fixed points. When $n$ is even and $a$ is odd, there are two fixed points in each row:

$$
\begin{align*}
& x \equiv(n-a-1) / 2 \quad(\bmod n) \quad \text { and }  \tag{27}\\
& x \equiv(2 n-a-1) / 2 \quad(\bmod n) . \tag{28}
\end{align*}
$$

Equation (26b). When $n$ is odd, there is one fixed cell in each row, which occurs when $x \equiv(-a-1)(n+1) / 2$ $(\bmod n)$.

Figure 9: The action of $(a, f) \in \mathbb{Z} / n \mathbb{Z} \rtimes R$ on a tiling is equivalent to a horizontal flip of both the leftmost $n-a \times m$ sub-grid and the rightmost $a \times m$ sub-grid.

Theorem 3.1.5. The sum over all cyclic shifts of the number of tilings of the $n \times m$ cylinder by tile designs in $T$ that are fixed by $\left(a, r^{2} f\right) \in \mathbb{Z} / n \mathbb{Z} \rtimes R$ is given by

$$
\operatorname{fxpt}_{r^{2} f}^{C}(n, m)= \begin{cases}\sum_{d \mid n} \varphi(d) t_{\mathrm{id}}^{n m / \operatorname{lcm}(d, 2)} & m \text { is even }  \tag{29a}\\ \sum_{d \mid n} \varphi(d) t_{\mathrm{id}}^{(n m-n) / \operatorname{lcm}(d, 2)} t_{\left(r^{2} f\right)^{d}}^{n / d} & m \text { is odd }\end{cases}
$$

Proof. We can see that $\left(a, r^{2} f\right)$ acts on the coordinates of $(x, y)$ separately, that is,

$$
(x, y) \cdot\left(a, r^{2} f\right)^{k}= \begin{cases}(x+k a, m-1-y) & k \text { odd } \\ (x+k a, y) & k \text { even }\end{cases}
$$

Notice that the orbits of the $y$-coordinates have size 2, so it is enough to determine the size of the orbits of the $x$-coordinates. By Lemma 3.0 .2 for each divisor $d \mid n$, there are $\varphi(d)$ choices for $a$ such that the size of the orbits of the $x$-coordinate is $d$.

Equation 29a. When $m$ is even, we see that $y \neq m-y-1$ has no solutions, the orbit of every $y$-coordinate has size 2. For each $x$-orbit size $d \mid n$, each cell must be in an orbit of size $\operatorname{lcm}(d, 2)$, and there must $n m / \operatorname{lcm}(d, 2)$ of them. Each can be specified by any tile design, since all tile designs are stable under $\left(r^{2} f\right)^{\operatorname{lcm}(d, 2)}=\mathrm{id}$.

Equation 29b. When $m$ is odd, we see that $y=m-y-1$ has a solutions precisely when $y=(m-1) / 2$. For each $x$-orbit size $d \mid n$, if $y=(m-1) / 2$, then the orbit has size $d$, otherwise it has size lcm $(d, 2)$, as in the case above. Therefore there are $n$ cells that are in orbits of size $d$ resulting in $n / d$ orbits that can be specified by any tile design that is stable under $\left(r^{2} f\right)^{\operatorname{lcm}(d, 2)}$. The remaining $n^{2}-n$ cells are partitioned into $\left(n^{2}-n\right) / \operatorname{lcm}(d, 2)$ orbits of size $\operatorname{lcm}(d, 2)$ that can be specified by any tile design.

Theorem 3.1.6. For a given set of tile designs $T$, a symmetry group $R \leq D_{4}$, and an element $g \in R$, the number of distinct tilings of the $n \times m$ cylinder is

$$
\begin{equation*}
\frac{1}{n|R|} \sum_{g \in R} \operatorname{fxpt}_{g}^{C}(n, m) \tag{30}
\end{equation*}
$$

Proof. We will use the convention that when we index over $g$, implicitly $g \in R$; when we index over $a$, implicitly $a \in \mathbb{Z} / n \mathbb{Z}$; and when we index over $(a, g)$, implicitly $(a, g) \in \mathbb{Z} / n \mathbb{Z} \rtimes R$.

Since $\operatorname{fxpt}_{g}^{\mathrm{C}}(n, m)=\sum_{a} X^{(a, g)}$, we can see that

$$
\begin{aligned}
\frac{1}{n|R|} \sum_{g} \mathrm{fxpt}_{g}^{\mathrm{C}}(n, m) & =\frac{1}{n|R|} \sum_{g} \sum_{a} X^{(a, g)} \\
& =\frac{1}{|\mathbb{Z} / n \mathbb{Z} \rtimes R|} \sum_{(a, g)} X^{(a, g)}
\end{aligned}
$$

which counts the number of distinct tilings by a direct application of Burnside's lemma.

## 4 Torus

This section builds on the work of Ethier [1] and Ethier and Lee [2. By specializing to the set of tile designs $T=\{, \quad\}$, we recover their work. Irvine 3 generalized this in the specific context of a set of tile designs of size $n$ in the specific case that no rotation or reflection is allowed (only cyclic shifting of rows and columns), which we recover in Theorem 4.1.2.

We distinguish between the rectangular torus, which we denoted by RT, and the square torus, which we denote by ST.

### 4.1 The $n \times m$ torus

Definition 4.1.1. For a given set of tile designs $T$, and an element $g \in R \leq D_{4}$ the sum over all cyclic shifts of the number of tilings of the $n \times m$ cylinder by tile designs in $T$ that are fixed by $((a, b), g) \in$ $(\mathbb{Z} / n \mathbb{Z} \times \mathbb{Z} / m \mathbb{Z}) \rtimes R$ is denoted

$$
\operatorname{fxpt}_{g}^{R T}(n, m)=\sum_{(a, b) \in \mathbb{Z} / n \mathbb{Z} \times \mathbb{Z} / m \mathbb{Z}} X^{((a, b), g)}
$$

where $X^{((a, b), g)}$ is the number of tilings fixed by $((a, b), g)$.

Theorem 4.1.2. The sum over all cyclic shifts of the number of tilings of the $n \times m$ torus by tile designs in $T$ that are fixed by $(a, \mathrm{id}) \in(\mathbb{Z} / n \mathbb{Z} \times \mathbb{Z} / m \mathbb{Z}) \rtimes R$ is given by

$$
\begin{equation*}
\operatorname{fxpt}_{\mathrm{id}}^{R T}(n, m)=\sum_{c \mid m} \sum_{d \mid n} \varphi(c) \varphi(d) t_{\mathrm{id}}^{m n / \operatorname{lcm}(c, d)} \tag{31}
\end{equation*}
$$

Proof. The size of an orbit of a tile under $((a, b), g)^{k}$ is the set of solutions to

$$
\begin{aligned}
k a & \equiv 0 \\
k b & (\bmod n) \\
\equiv 0 & (\bmod m)
\end{aligned}
$$

For each individual equation, the minimal choice for $k$ must be a divisor of $n$. For a given divisor $d \mid n$, there are $\varphi(d)$ choices for $a \in \mathbb{Z} / n \mathbb{Z}$ so that $d a \equiv 0(\bmod n)$. Namely if $i$ is coprime to $d$, then $a=i(n / d)$ will be a minimal solution. An analogous argument holds for the second equation.

Therefore if $d \mid n$ and $c \mid m$, there are $\varphi(d) \varphi(c)$ pairs $(a, b) \in \mathbb{Z} / n \mathbb{Z} \times \mathbb{Z} / m \mathbb{Z}$ where $a$ has order $d$ and $b$ has order $c$, and thus $(a, b)$ has order $\operatorname{lcm}(d, c)$. Therefore, each orbit of cells has size $\operatorname{lcm}(d, c)$, and so the number of orbits of cells is $n m / \operatorname{lcm}(d, c)$.

Thus, the sum of the number of orbits over each pair $(a, b) \in \mathbb{Z} / n \mathbb{Z} \times \mathbb{Z} / m \mathbb{Z}$ gives equation (31), as desired.

The next theorem concerns the action of $\left((a, b), r^{2}\right) \in(\mathbb{Z} / n \mathbb{Z} \times \mathbb{Z} / m \mathbb{Z}) \rtimes R$, which is illustrated in Figure 10

Theorem 4.1.3. The sum over all cyclic shifts of the number of tilings of the $n \times m$ torus by tile designs in $T$ that are fixed by $\left(a, r^{2}\right) \in(\mathbb{Z} / n \mathbb{Z} \times \mathbb{Z} / m \mathbb{Z}) \rtimes R$ is given by

$$
\operatorname{fxpt}_{r^{2}}^{R T}(n, m)= \begin{cases}n m\left(\frac{3}{4} t_{\mathrm{id}}^{n m / 2}+\frac{1}{4} t_{\mathrm{id}}^{n m / 2-2} t_{r^{2}}^{4}\right) & n \text { and } m \text { even }  \tag{32a}\\ n m t_{\mathrm{id}}^{(n m-1) / 2} t_{r^{2}} & n \text { and } m \text { odd } \\ n m\left(\frac{1}{2} t_{\mathrm{id}}^{n m / 2}+\frac{1}{2} t_{\mathrm{id}}^{n m / 2-1} t_{r^{2}}^{2}\right) & \text { otherwise. }\end{cases}
$$

Proof of Theorem 4.1.3. The orbits of cells under the group generated by $\left((a, b), r^{2}\right)$ have size either 1 or 2 , because by how we defined the semidirect product, $\left((a, b), r^{2}\right)$ has order 2 :

$$
\begin{equation*}
\left((a, b), r^{2}\right)^{2}=\left((a, b), r^{2}\right)\left((a, b), r^{2}\right)=\left((a, b)+(-a,-b), r^{2} r^{2}\right)=((0,0), \mathrm{id}) \tag{33}
\end{equation*}
$$

Therefore, it is enough to count how many cells are stable under $\left((a, b), r^{2}\right)$, which depends on the parity of $n, m, a$, and $b$.

The element $\left((a, b), r^{2}\right)$ fixes a cell $(x, y)$ when

$$
(x, y) \cdot\left((a, b), r^{2}\right)=(n-1-(x+a), n-1-(y+b))
$$

This corresponds to the system of equations

$$
\begin{align*}
x \equiv-1-x-a & (\bmod n)  \tag{34}\\
y \equiv-1-y-b & (\bmod m) \tag{35}
\end{align*}
$$

whose solutions are given by Lemma 3.0.1.
Therefore we proceed by each case

Equation 32a. When $n$ and $m$ are even, there are fixed cells only when both $a$ and $b$ are odd, by Lemma 3.0.1 in this case, there are exactly 4 fixed cells, because each equation in the system of equations has two solutions. When this occurs, it partitions the cells into 4 orbits of size 1 , which can be filled with tile designs that are fixed under $r^{2}$, and $(n m-4) / 2$ orbits of size 2 , which can be filled with any tile design.
When either $a$ or $b$ is even, there are no fixed cells, which partitions the cells into $n m / 2$ orbits of size 2 , each of which can be filled with any choice of tile design.
Since the 4 fixed cells occur for exactly one quarter of the pairs $(a, b) \in \mathbb{Z} / n \mathbb{Z} \times \mathbb{Z} / m \mathbb{Z}$, this results in the desired equation.

Equation (32b). When $n$ and $m$ are both odd, Lemma 3.0.1 states that equations (34) and (35) have one solution.
When this occurs, it partitions the cells into 1 orbit of size 1 , which can be filled only with a tile design that is fixed by $r^{2}$, and $(n m-1) / 2$ orbits of size 2 , which can be specified with any tile design.

Equation (32c). Without loss of generality, we can assume that $n$ is even and $m$ is odd, because the proof is essentially similar in the opposite case. Lemma 3.0.1 states that equation (34) has no solutions when $a$ is even and 2 solutions when $a$ is odd; it also states that 35 has one solution.
Thus for half of the pairs $(a, b)$, there are no fixed cells, and so there are $n m / 2$ orbits, each of which can be specified by any tile design.
For the other half of the pairs, there are 2 fixed cells, which can be specified by any tile design that is fixed under $r^{2}$ and $(n m-2) / 2$ orbits of size 2 that can be specified by any tile design.

Figure 10: The action of $\left((a, b), r^{2}\right) \in(\mathbb{Z} / n \mathbb{Z} \times \mathbb{Z} / m \mathbb{Z}) \rtimes R$ on a tiling is equivalent to a $180^{\circ}$ rotations of the lower left $(n-a) \times(m-b)$ sub-grid, the lower right $a \times(m-b)$ sub-grid, the upper left $(n-a) \times b$ sub-grid, and the upper right $a \times b$ sub-grid.

Theorem 4.1.4. The sum over all cyclic shifts of the number of tilings of the $n \times m$ torus by tile designs in $T$ that are fixed by $(a, f) \in(\mathbb{Z} / n \mathbb{Z} \times \mathbb{Z} / m \mathbb{Z}) \rtimes R$ is given by

$$
\operatorname{fxpt}_{f}^{R T}(n, m)= \begin{cases}n \sum_{c \mid m} \varphi(c)\left(\frac{1}{2} t_{\mathrm{id}}^{n m / \operatorname{lcm}(2, c)}+\frac{1}{2} t_{\mathrm{id}}^{(n-2) m / \operatorname{lcm}(2, c)} t_{f^{c}}^{2 m / c}\right) & n \text { even }  \tag{36a}\\ n \sum_{c \mid m} \varphi(c) t_{\mathrm{id}}^{(n-1) m / \operatorname{lcm}(2, c)} t_{f^{c}}^{m / c} & n \text { odd }\end{cases}
$$

and

$$
\operatorname{fxpt}_{r^{2} f}^{R T}(n, m)= \begin{cases}m \sum_{d \mid n} \varphi(d)\left(\frac{1}{2} t_{\mathrm{id}}^{n m / \operatorname{lcm}(d, 2)}+\frac{1}{2} t_{\mathrm{id}}^{n(m-2) / \operatorname{lcm}(d, 2)} t_{\left(r^{2} f\right)^{d}}^{2 n / d}\right) & m \text { even } \\ m \sum_{d \mid n} \varphi(d) t_{\mathrm{id}}^{n(m-1) / \operatorname{lcm}(d, 2)} t_{\left(r^{2} f\right)^{d}}^{n / d} & m \text { odd }\end{cases}
$$

Proof. Since $f$ and $r^{2} f$ are conjugate as elements of $D_{8}$, these fixed point formulas have essentially the same proof, so we will prove equations (36a) and 36b specifically.

Since $(x, y) \cdot((a, b), f)=(n-1-(x+a), y+b)$, we can view $((a, b), f)$ as acting on each coordinate separately. Since $((a, b), f)^{2}=((0,2 b)$, id), we can see that the orbits of the first coordinate have either size 1 or 2 . Moreover, by Lemma 3.0.1, there are no fixed cells when $n$ is even and $a$ is even, there are 2 fixed cells when $n$ is even and $a$ is odd, and there is 1 fixed cell when $n$ is odd.

Since $((a, b), f)$ acts on the second coordinate by shifting by $b$, we see that Lemma 3.0.2 applies. Thus for each divisor $c \mid m$, there are $\varphi(c)$ choices of $b$ that produce orbits of the second coordinate with size $c$.

Equation (36a). When $n$ is even, then half of the values of $a \in \mathbb{Z} / n \mathbb{Z}$ are even, and each orbit has size $\operatorname{lcm}(2, c)$ and these can be specified by any tile design.

The other half of values of $a$ are odd, which results in 2 fixed points for the first coordinate, each of which results in an orbit of size $c$ that can be specified by any tile design that is fixed by $f^{c}$. The remaining $(n-2) m$ cells then are partitioned into orbits of size $\operatorname{lcm}(2, c)$, which can be specified by any tile design.

Equation 36b. When $n$ is odd, then there is one fixed point for the first coordinate, resulting in $m$ cells where the first coordinate is fixed under the action of $((a, b), f)$. For each divisor $c \mid m$, there is a partition these $m$ cells into orbits of size $c$. The resulting $m / c$ orbits can be specified by any tile design that fixes $f^{c}$. The remaining $n(m-1)$ cells are partitioned into orbits of size $1 \mathrm{~cm}(2, c)$, resulting in $n(m-1) / \operatorname{lcm}(2, c)$ orbits which can be specified by any tile design.

Theorem 4.1.5. Then the number of distinct tilings of the $n \times m$ torus up to $R \subseteq D_{4}$ is given by

$$
\begin{equation*}
\frac{1}{n m|R|} \sum_{g \in R} \operatorname{fxpt}_{g}^{R T}(n, m) \tag{37}
\end{equation*}
$$

Proof. We will use the convention that when we index over $g$, implicitly $g \in R$; when we index over $(a, b)$, implicitly $(a, b) \in \mathbb{Z} / n \mathbb{Z} \times \mathbb{Z} / m \mathbb{Z}$; and when we index over $((a, b), g)$, implicitly $((a, b), g) \in(\mathbb{Z} / n \mathbb{Z} \times \mathbb{Z} / m \mathbb{Z}) \rtimes$ $R$.

Since $\operatorname{fxpt}_{g}^{\mathrm{RT}}(n, m)=\sum_{(a, b)} X^{((a, b), g)}$, we can see that

$$
\begin{aligned}
\frac{1}{n m|R|} \sum_{g} \mathrm{fxpt}_{g}^{\mathrm{RT}}(n, m) & =\frac{1}{n m|R|} \sum_{g} \sum_{(a, b)} X^{((a, b), g)} \\
& =\frac{1}{|(\mathbb{Z} / n \mathbb{Z} \times \mathbb{Z} / m \mathbb{Z}) \rtimes R|} \sum_{((a, b), g)} X^{((a, b), g)}
\end{aligned}
$$

which counts the number of distinct tilings by a direct application of Burnside's lemma.

### 4.2 The $n \times n$ torus

Theorem 4.2.1. The sum over all cyclic shifts of the number of tilings of the $n \times n$ square torus (denoted $S T)$ by tile designs in $T$ that are fixed by $((a, b), g) \in(\mathbb{Z} / n \mathbb{Z} \times \mathbb{Z} / m \mathbb{Z}) \rtimes R$ is given by $\operatorname{fxpt}_{g}^{S T}(n)$ where

$$
\begin{align*}
& \operatorname{fxpt}_{\mathrm{id}}^{S T}(n)=\operatorname{fxpt}_{\mathrm{id}}^{R T}(n, n)=\sum_{d_{1} \mid n} \sum_{d_{2} \mid n} \varphi\left(d_{1}\right) \varphi\left(d_{2}\right) t_{\mathrm{id}}^{n^{2} / \operatorname{lcm}\left(d_{1}, d_{2}\right)},  \tag{38}\\
& \operatorname{fxpt}_{r^{2}}^{S T}(n)=\operatorname{fxpt}_{r^{2}}^{R T}(n, n)= \begin{cases}n^{2} t_{\mathrm{id}}^{\left(n^{2}-1\right) / 2} t_{r^{2}} \\
n^{2}\left(\frac{3}{4} t_{\mathrm{id}}^{n^{2} / 2}+\frac{1}{4} t_{\mathrm{id}}^{n^{2} / 2-2} t_{r^{2}}^{4}\right) & n \text { even. }\end{cases}  \tag{39}\\
& \operatorname{fxpt}_{f}^{S T}(n)=\operatorname{fxpt}_{f}^{R T}(n, n)= \begin{cases}n \sum_{d \mid n} \varphi(d)\left(\frac{1}{2} t_{\mathrm{id}}^{n^{2} / \operatorname{lcm}(2, d)}+\frac{1}{2} t_{\mathrm{id}}^{\left(n^{2}-2 n\right) / \operatorname{lcm}(2, d)} t_{f^{d}}^{2 n / d}\right) & n \text { even } \\
n \sum_{d \mid n} \varphi(d) t_{\mathrm{id}}^{\left(n^{2}-n\right) / \operatorname{lcm}(2, d)} t_{f^{d}}^{n / d} & n \text { odd. }\end{cases}  \tag{40}\\
& \operatorname{fxpt}_{r^{2} f}^{S T}(n)=\operatorname{fxpt}_{r^{2} f}^{R T}(n, n)= \begin{cases}n \sum_{d \mid n} \varphi(d)\left(\frac{1}{2} t_{\mathrm{id}}^{n^{2} / \operatorname{lcm}(2, d)}+\frac{1}{2} t_{\mathrm{id}}^{\left(n^{2}-2 n\right) / \operatorname{lcm}(2, d)} t_{\left(r^{2} f\right)^{d}}^{2 n / d}\right) & n \text { even } \\
n \sum_{d \mid n} \varphi(d) t_{\mathrm{id}}^{\left(n^{2}-n\right) / \operatorname{lcm}(2, d)} t_{\left(r^{2} f\right)^{d}}^{n / d}\end{cases}  \tag{41}\\
& n \text { odd. }
\end{align*}
$$

Proof. These equations follow directly from Theorems 4.1.2, 4.1.3 and 4.1.4 by specifying $m=n$.
Theorem 4.2.2. The sum over all cyclic shifts of the number of tilings of the $n \times n$ torus by tile designs in $T$ that are fixed by $(a, r) \in(\mathbb{Z} / n \mathbb{Z} \times \mathbb{Z} / m \mathbb{Z}) \rtimes R$ is given by

$$
\operatorname{fxpt}_{r}^{S T}(n)=\operatorname{fxpt}_{r^{3}}^{S T}(n)= \begin{cases}n^{2} t_{\mathrm{id}}^{\left(n^{2}-1\right) / 4} t_{r} & n \text { odd }  \tag{42a}\\ n^{2}\left(\frac{1}{2} t_{\mathrm{id}}^{n^{2} / 4}+\frac{1}{2} t_{\mathrm{id}}^{\left(n^{2}-4\right) / 4} t_{r}^{2} t_{r^{2}}\right) & n \text { even }\end{cases}
$$

Proof. First, note that the first equality comes from the fact that tilings that are stable under $g$ are stable under $g^{-1}$.

Next, note that $((a, b), r)$ is an element of order 4, which follows from observing that $((a, b), r)=$ $\left(\left(a^{\prime}, b^{\prime}\right), r^{2}\right)$ together with equation (33). Therefore cells appear in orbits of size 1,2 , or 4 under $((a, b), r)$, and we will count how many cells appear in each.

We begin by counting cells $(x, y)$ that are fixed by $((a, b), r)$, that is they satisfy the system of equations

$$
\begin{array}{lr}
x \equiv-y-b-1 \quad(\bmod n) \\
y \equiv x+a & (\bmod n), \tag{44}
\end{array}
$$

where we can substitute $y$ with $x+a$ in the first equation to get

$$
\begin{equation*}
x \equiv-x-a-b-1 \quad(\bmod n) \tag{45}
\end{equation*}
$$

Next we count cells $(x, y)$ that are fixed by $((a, b), r)^{2}$, but are not solutions to the above system of equations. These cells satisfy the system of equations

$$
\begin{align*}
& x \equiv-1-x-a-b \quad(\bmod n)  \tag{46}\\
& y \equiv-1-y-b+a \quad(\bmod n) \tag{47}
\end{align*}
$$

Equation 42a). When $n$ is odd, we can solve equation 45 using Lemma 3.0.1. We can see that this has one solution when $n$ is odd, so in this case there is one fixed cell, which can be specified by any tile design that is stable under $r$.

We can add equations (46) and 47) and use Lemma 3.0.1 to see that this system has a single solution when $n$ is odd. However, this is identically the solution that specifies the fixed point, so this does not describe an orbit of size 2 .

Thus there are $n^{2}-1$ cells that are partitioned into $\left(n^{2}-1\right) / 4$ orbits of size 4 , which can be specified by any tile design.

Equation 42b When $n$ is even, we can see again by Lemma 3.0.1, that there are two fixed cells when $a+b$ is odd and none when $a+b$ is even.
When we check the number of orbits of size 2, Lemma 3.0.1 shows that we have 4 solutions when $a+b$ is odd and none when $a+b$ is even, 2 of which were the fixed cells, resulting in a single orbit of size 2 . Therefore, we can specify a fixed tiling by specifying tile designs that are fixed under $r$ for each of the two fixed cells, specifying a tile design that is fixed under $r^{2}$ for the orbit of size 2 , and specifying any tile designs for each of the $\left(n^{2}-4\right) / 4$ orbits of length 4 .

## Theorem 4.2.3.

$$
\operatorname{fxpt}_{r f}^{S T}(n)=n \sum_{d \mid n} \begin{cases}\varphi(d) t_{\mathrm{id}}^{\left(n^{2}-n\right) /(2 d)} t_{r f}^{n / d} & d \text { odd }  \tag{48a}\\ \varphi(d) t_{\mathrm{id}}^{n^{2} /(2 d)} & d \text { even } .\end{cases}
$$

and

$$
\operatorname{fxpt}_{r^{3} f}^{S T}(n)=n \sum_{d \mid n} \begin{cases}\varphi(d) t_{\mathrm{id}}^{\left(n^{2}-n\right) /(2 d)} t_{r^{3} f}^{n / d} & d \text { odd }  \tag{49}\\ \varphi(d) t_{\mathrm{id}}^{n^{2} /(2 d)} & d \text { even }\end{cases}
$$

Proof. These situations are essentially the same because $r f$ and $r^{3} f$ are conjugate in $D_{8}$, so we prove the case for $\mathrm{fxpt}_{r f}^{\mathrm{ST}}(n)$.

We can see that

$$
\begin{aligned}
& (x, y) \cdot((a, b), r f)^{2 k}=(x+k(a+b), y+k(a+b)) \\
& (x, y) \cdot((a, b), r f)^{2 k+1}=(y+k(a+b)+b, x+k(a+b)+a)
\end{aligned}
$$

and we can ask: what is the least $k$ such that either

$$
\begin{align*}
& x \equiv x+k(a+b) \quad(\bmod n)  \tag{50}\\
& y \equiv y+k(a+b) \quad(\bmod n) \tag{51}
\end{align*}
$$

or

$$
\begin{align*}
& x \equiv y+k(a+b)+b \quad(\bmod n)  \tag{52}\\
& y \equiv x+k(a+b)+a \quad(\bmod n) \tag{53}
\end{align*}
$$

In the first case, we want to know when $k(a+b) \equiv 0(\bmod n)$, which occurs first when $k=n / \operatorname{gcd}(a+b, n)$. We call this $d$ and note that $d \mid n$. In the second case, we can add equations (52) and (53) to get

$$
\begin{equation*}
(2 k+1)(a+b)=0 \quad(\bmod n) \tag{54}
\end{equation*}
$$

which occurs when $2 k+1=n / \operatorname{gcd}(a+b, n)$. Again, this is a divisor of $n$, so we say $2 k+1=d$ and note that this solution occurs only when $d$ is odd.

Equation 48a Thus, when $d$ is odd, we have the system of equations

$$
\begin{aligned}
& x \equiv y+\frac{d-1}{2}(a+b)+b \quad(\bmod n) \\
& y \equiv x+\frac{d-1}{2}(a+b)+a \quad(\bmod n)
\end{aligned}
$$

which has $n$ solutions: for each choice of $x$, there is a unique choice of $y$ that satisfies both equations. Each of these solutions correspond to a cell in one of the $n / d$ orbits of length $d$, each of which can be specified by any tile design that is stabilized by $(r f)^{d}=r f$, since $d$ is odd.
The other $n^{2}-n$ cells occur in one of the $\left(n^{2}-n\right) /(2 d)$ orbits of length $2 d$ that are solutions to the first system of equations. Each of these orbits can be specified by any tile design at all.
The $\varphi(d)$ comes from the fact that for any choice of $a$ there are precisely $\varphi(d)$ choices for $b$ such that $n / \operatorname{gcd}(a+b, n)=d$.

Equation 48 b When $d$ is even, there are no choices of $(x, y)$ that simultaneously satisfy equations 52 and 53), so all $n^{2}$ of the tiles $(x, y)$ occur in orbits of size $2 d$. Each of these $n^{2} /(2 d)$ orbits can be specified by any tile design.

Theorem 4.2.4. The number of distinct tilings of the $n \times n$ torus up to $R \leq D_{8}$ is given by

$$
\begin{equation*}
\frac{1}{n^{2}|R|} \sum_{g \in R} \mathrm{fxpt}_{g}^{S T}(n) \tag{55}
\end{equation*}
$$

Proof. The proof of this theorem is essentially identical to the proof of Theorem 4.1.5, which follows by definition together with Burnside's lemma.

Thus for any arbitrary $R \subseteq D_{8}$ and set of tile designs, we have a formula to count the number of tilings of the $n \times n$ torus up to $R$. A formula for each choice of $R$ together with each $R$-set generated by a single tile design can be found in Appendix A.5 the corresponding illustrations can be found in Appendix B. 5 .

## 5 Next steps

In this section, we propose several different settings for studying similar kinds of problems. Many of these may be subtle research problems, many may be good undergraduate research problems, and many may be good homework problems for a combinatorics class. Many of them would make for interesting additions to the On-Line Encyclopedia of Integer Sequences.

### 5.1 Rectangular tori under $90^{\circ}$ rotation

We have used the $n \times m$ torus as a model for a repeating tiling of the plane. However, in the case that $n \neq m$, we have only analyzed the case where we count tilings up to $D_{4}$, the dihedral group of the rectangle. However, for a given tile set, it is possible that a tiling of a $n \times m$ and a tiling of a $m \times n$ torus describe the same tiling of the plane; an example of this is given in Figure 11.

Conjecture 5.1.1. If a plane tiling described by an $n \times m$ torus is fixed under $((a, b), r),\left((a, b), r^{3}\right)$, $((a, b), r f)$, or $\left((a, b), r^{3} f\right)$, then it is equivalent to the tiling of $a \operatorname{gcd}(n, m) \times \operatorname{gcd}(n, m)$ torus.

Similarly, it might be interesting to count irreducible plane tilings: tilings of the plane corresponding to a tiling of the $n \times m$ torus that don't correspond to a smaller torus.

### 5.2 Other regions of the square grid.

We also are interested in counting the number of ways of tiling shapes like Aztec diamonds or centered square numbers, as shown in Figure 12.

Figure 11: A periodic tiling of the plane arising from a $6 \times 4$ torus tiling that is fixed under $90^{\circ}$ rotation. Notice that this tiling of the plane can also come from a $2 \times 2$ torus.

Figure 12: Order 1, 2, 3, and 4 centered square figures in the square tiling of the plane.

### 5.3 The Möbius strip and Klein bottle

Since we've looked at the orientable identifications of the grid, we are also interested in the non-orientable identifications. The Möbius strip has a universal cover that is $[0,1] \times \mathbb{R}$, and the Klein bottle has a universal cover of $\mathbb{R} \times \mathbb{R}$, so we can visualize them analogously to how we visualized the cylinder and torus respectively. An illustration of a tiling of the Möbius strip in Figure 13 . An illustration of a tiling of the Klein bottle in Figure 14.

We are also interested counting tilings of the real projective plane, but because the universal cover is not the Euclidean plane, it cannot be illustrated in the same manner as the Klein bottle and the torus.

Figure 13: (a) A $2 \times 2$ Möbius strip repeated four times horizontally. Parts (b), (c), and (d) show equivalent tilings under this symmetry.

### 5.4 Tilings of the triangular and hexagonal grids

While this paper explored tilings of the square grid and related settings, it is equally natural to ask about tilings of the triangular grid and hexagonal grid. In particular, it would be interesting to explore the number of tilings of (1) triangular regions of the triangular grid, (2) hexagonal regions of the triangular grid, (3) triangular regions of the hexagonal grid, or (4) hexagonal regions of the hexagonal grid, all of which are illustrated in Figure 15.

In the cases of tiling hexagons and triangles in the triangular grid, each can be extended to a tiling of the plane, as described in Figure 16.

Figure 14: Part (a) shows a $2 \times 2$ Klein bottle repeated three times horizontally and three times vertically, with three $2 \times 2$ regions selected. Part (b) shows three tilings of the $2 \times 2$ grid that are equivalent under the torus action $\mathbb{Z} / 2 \mathbb{Z} \times \mathbb{Z} / 2 \mathbb{Z}$. Part (c) shows a $2 \times 2$ Klein that is equivalent to the other Klein bottles under $180^{\circ}$ rotation.

Figure 15: An illustration of a triangle in a triangular grid, a hexagon in a triangular grid, a triangle in a hexagonal grid, and a hexagon in a hexagonal grid.

### 5.5 Other tilings of the Euclidean plane

Extending this idea even further, we might be interested in ways of placing multiple shapes of tiles on various tilings of the Euclidean plane by convex polygons, such as the truncated trihexagonal tiling, the snub square tiling, or the triakis triangular tiling.

Figure 17 shows an example of such a setup on a region of the truncated square grid.

### 5.6 Polyhedra

We are also interested in settings related to polyhedra. For instance, one could use various tile designs to count the number of distinct tilings of a $2 \times 2 \times 2$ Rubik's cube-like object, as illustrated in Figure 18 .

Similarly, one could do this analysis on other polyhedra, not limited to the Platonic solids, Archimedean solids, Johnson solids, prisms, antiprisms, and even polyhedra whose faces are not regular polygons, such as the rhombic dodecahedron.

Figure 16: (a) A triangular tiling of the plane tiled with repeating patterns of size 1 hexagons. (b) Three equivalent tilings of the triangular hexagon under this symmetry.

### 5.7 Hyperbolic plane

In addition to the settings with no curvature (the plane) and positive curvature (polyhedra) it is also interesting to look at this in the negative curvature setting of the hyperbolic plane, as illustrated in Figure 19.

### 5.8 Higher dimensional objects

We are also interested in computing higher-dimensional analogs, such as where the tile designs are spacefilling polyhedra.

### 5.9 Permuting tile colors

In some illustrations, one may observe that two tilings are equivalent up to swapping the colors of the tiles, as illustrated in Figure 20. In Appendix B.5. you may notice that for each tiling in Figures 72 and 74 , swapping the colors of the tiling is equivalent to a $180^{\circ}$ rotation, a property that we would like to understand better.

Figure 17: (a) A $4 \times 3$ section of the truncated square tiling, and (b) the square and octagonal tile designs.

Figure 18: Five illustrations of $2 \times 2 \times 2$ cubes tiled with Truchet tiles.

Figure 19: An illustration showing tilings of the size 2 and size 3 iterations of the order- 5 square tiling of the hyperbolic plane.

Figure 20: The following six tilings would be considered equivalent under permuting colors.

## A Sequences

This section of the appendix gives examples of all of the different sequences and tables of integers that count tilings of the $n \times m$ grid, cylinder, and torus for all valid choices of $R \leq D_{8}$ and all sets of tile designs consisting of a single orbit.

## A. 1 The $n \times m$ grid

This section gives examples of every choice of symmetry of the $n \times m$ grid together with every essentially different set of tile designs that consists of a single orbit (or two orbits, in the case of a fully symmetric tile). Each sequence is annotated with its corresponding entry in the On-Line Encyclopedia of Integer Sequences. A table of all such sequences is given in Table 1.

|  | $\left\langle r^{2}, f\right\rangle$ | $\langle f\rangle \cong C_{2}$ | $\left\langle r^{2}\right\rangle \cong C_{2}$ |

## A.1.1 Under horizontal and vertical reflection

When counting tilings of the grid up to $\left\langle r^{2}, f\right\rangle$, we have that

$$
\begin{align*}
t_{\mathrm{id}} & =\mathcal{O}_{\left\langle r^{2}, f\right\rangle}^{\left\langle r^{2}, f\right\rangle}+2 \mathcal{O}_{\langle f\rangle}^{\left\langle r^{2}, f\right\rangle}+2 \mathcal{O}_{\left\langle r^{2} f\right\rangle}^{\left\langle r^{2}, f\right\rangle}+2 \mathcal{O}_{\left\langle r^{2}\right\rangle}^{\left\langle r^{2}, f\right\rangle}+4 \mathcal{O}_{\mathbb{1}}^{\left\langle r^{2}, f\right\rangle}  \tag{56}\\
t_{f} & =\mathcal{O}_{\left\langle r^{2}, f\right\rangle}^{\left\langle r^{2}, f\right\rangle}+2 \mathcal{O}_{\langle f\rangle}^{\left\langle r^{2}, f\right\rangle}  \tag{57}\\
t_{r^{2} f} & =\mathcal{O}_{\left\langle r^{2}, f\right\rangle}^{\left\langle r^{2}, f\right\rangle}+2 \mathcal{O}_{\left\langle r^{2} f\right\rangle}^{\left\langle r^{2}, f\right\rangle}  \tag{58}\\
t_{r^{2}} & =\mathcal{O}_{\left\langle r^{2}, f\right\rangle}^{\left\langle r^{2}, f\right\rangle}+2 \mathcal{O}_{\left\langle r^{2}\right\rangle}^{\left\langle r^{2}, f\right\rangle} \tag{59}
\end{align*}
$$

Proposition A.1.1.1. When $\mathcal{O}_{\left\langle r^{2}, f\right\rangle}^{\left\langle r^{2}, f\right\rangle}=2$, such as when

the number of tilings of the $n \times m$ grid up to horizontal/vertical reflection by tile designs that are fixed horizontal/vertical reflection is given by the following table:

| $n=1$ | 2 | 3 | 6 | 10 | 20 | 36 |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: |
| $n=2$ | 3 | 7 | 24 | 76 | 288 | 1072 |
| $n=3$ | 6 | 24 | 168 | 1120 | 8640 | 66816 |
| $n=4$ | 10 | 76 | 1120 | 16576 | 263680 | 4197376 |
| $n=5$ | 20 | 288 | 8640 | 263680 | 8407040 | 268517376 |
| $n=6$ | 36 | 1072 | 66816 | 4197376 | 268517376 | 17180065792 |

This is OEIS sequence A225910.

Proposition A.1.1.2. When $\mathcal{O}_{\langle f\rangle}^{\left\langle r^{2}, f\right\rangle}=1$, such as when

$$
T=\{\gg\}
$$

the number of tilings of the $n \times m$ grid up to horizontal and vertical reflection by tiles that are fixed under horizontal reflection but not vertical reflection is given by the following table:

| $n=1$ | 1 | 3 | 4 | 10 | 16 | 36 |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: |
| $n=2$ | 2 | 7 | 20 | 76 | 272 | 1072 |
| $n=3$ | 3 | 24 | 144 | 1120 | 8448 | 66816 |
| $n=4$ | 6 | 76 | 1056 | 16576 | 262656 | 4197376 |
| $n=5$ | 10 | 288 | 8320 | 263680 | 8396800 | 268517376 |
| $n=6$ | 20 | 1072 | 65792 | 4197376 | 268451840 | 17180065792 |

The transpose of this table is the number of tilings by tiles fixed under vertical reflection but not horizontal reflection.

This has been added to the OEIS as sequence A368218.
Proposition A.1.1.3. When $\mathcal{O}_{\left\langle r^{2}\right\rangle}^{\left\langle r^{2}, f\right\rangle}=1$, such as when

$$
T=\{\boldsymbol{\nabla}, \boldsymbol{\nabla}\},
$$

the number of tilings of the $n \times m$ grid up to horizontal and vertical reflection by tiles that are fixed under $180^{\circ}$ rotation, but not horizontal or vertical reflection is given by the following table:

| $n=1$ | 1 | 2 | 3 | 6 | 10 | 20 |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: |
| $n=2$ | 2 | 7 | 20 | 76 | 272 | 1072 |
| $n=3$ | 3 | 20 | 136 | 1056 | 8256 | 65792 |
| $n=4$ | 6 | 76 | 1056 | 16576 | 262656 | 4197376 |
| $n=5$ | 10 | 272 | 8256 | 262656 | 8390656 | 268451840 |
| $n=6$ | 20 | 1072 | 65792 | 4197376 | 268451840 | 17180065792 |

This table is symmetric across its main diagonal.
This has been added to the OEIS as sequence A368219.
Proposition A.1.1.4. When $\mathcal{O}_{\mathbb{1}}^{\left\langle{ }^{2}, f\right\rangle}=1$, such as when

$$
T=\{\square, \square,
$$

the number of tilings of the $n \times m$ grid up to horizontal and vertical reflection by tiles that are fixed only under id $\in D_{4}$ is given by the following table:

| $n=1$ | 1 | 6 | 16 | 72 | 256 |
| :--- | ---: | ---: | ---: | ---: | ---: |
| $n=2$ | 6 | 76 | 1056 | 16576 | 262656 |
| $n=3$ | 16 | 1056 | 65536 | 4196352 | 268435456 |
| $n=4$ | 72 | 16576 | 4196352 | 1073790976 | 274878431232 |
| $n=5$ | 256 | 262656 | 268435456 | 274878431232 | 281474976710656 |
| $n=6$ | 1056 | 4197376 | 17180000256 | 70368756760576 | 288230376688582656 |

This has been added to the OEIS as sequence A368220.

## A.1.2 Under horizontal (equivalently vertical) reflection

When counting tilings of the grid up to $\langle f\rangle$ (equivalently $\left\langle r^{2} f\right\rangle$ ), we have that

$$
\begin{align*}
t_{\mathrm{id}} & =\mathcal{O}_{\langle f\rangle}^{\langle f\rangle}+2 \mathcal{O}_{\mathbb{1}}^{\langle f\rangle}  \tag{60}\\
t_{f} & =\mathcal{O}_{\langle f\rangle}^{\langle f\rangle} \tag{61}
\end{align*}
$$

Proposition A.1.2.1. When $\mathcal{O}_{\langle f\rangle}^{\langle f\rangle}=2$, such as when

$$
T=\left\{\begin{array}{c}
\mathrm{Z}
\end{array}\right\},
$$

the number of tilings of the $n \times m$ grid up to horizontal reflection by two tiles that are fixed under horizontal reflection is given by the following table:

| $n=1$ | 2 | 3 | 6 | 10 | 20 | 36 |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: |
| $n=2$ | 4 | 10 | 40 | 136 | 544 | 2080 |
| $n=3$ | 8 | 36 | 288 | 2080 | 16640 | 131328 |
| $n=4$ | 16 | 136 | 2176 | 32896 | 526336 | 8390656 |
| $n=5$ | 32 | 528 | 16896 | 524800 | 16793600 | 536887296 |
| $n=6$ | 64 | 2080 | 133120 | 8390656 | 537001984 | 34359869440 |

This has been added to the OEIS as sequence A368221.
Proposition A.1.2.2. When $\mathcal{O}_{\mathbb{1}}^{\langle f\rangle}=1$, such as when

the number of tilings of the $n \times m$ grid up to horizontal reflection by tiles that are fixed only under id $\in\langle f\rangle$ is given by the following table:

| $n=1$ | 1 | 2 | 4 | 8 | 16 | 32 |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: |
| $n=2$ | 3 | 10 | 36 | 136 | 528 | 2080 |
| $n=3$ | 4 | 32 | 256 | 2048 | 16384 | 131072 |
| $n=4$ | 10 | 136 | 2080 | 32896 | 524800 | 8390656 |
| $n=5$ | 16 | 512 | 16384 | 524288 | 16777216 | 536870912 |
| $n=6$ | 36 | 2080 | 131328 | 8390656 | 536887296 | 34359869440 |

This has been added to the OEIS as sequence A368222.

## A.1.3 Under $180^{\circ}$ rotation

When counting tilings of the grid up to $180^{\circ}$ rotation $\left(S=\left\langle r^{2}\right\rangle\right)$,

$$
\begin{align*}
t_{\mathrm{id}} & =\mathcal{O}_{\left\langle r^{2}\right\rangle}^{\left\langle r^{2}\right\rangle}+2 \mathcal{O}_{\mathbb{1}}^{\left\langle r^{2}\right\rangle}  \tag{62}\\
t_{r^{2}} & =\mathcal{O}_{\left\langle r^{2}\right\rangle}^{\left\langle r^{2}\right\rangle} \tag{63}
\end{align*}
$$

Proposition A.1.3.1. When $\mathcal{O}_{\left\langle r^{2}\right\rangle}^{\left\langle r^{2}\right\rangle}=2$ such as when

$$
T=\left\{\begin{array}{llll} 
& \vdots
\end{array}\right\}
$$

the number of tilings of the $n \times m$ grid up to $180^{\circ}$ rotation by tiles that are fixed under $180^{\circ}$ rotation is given by the following table:

| $n=1$ | 2 | 3 | 6 | 10 | 20 | 36 |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: |
| $n=2$ | 3 | 10 | 36 | 136 | 528 | 2080 |
| $n=3$ | 6 | 36 | 272 | 2080 | 16512 | 131328 |
| $n=4$ | 10 | 136 | 2080 | 32896 | 524800 | 8390656 |
| $n=5$ | 20 | 528 | 16512 | 524800 | 16781312 | 536887296 |
| $n=6$ | 36 | 2080 | 131328 | 8390656 | 536887296 | 34359869440 |

This has been added to the OEIS as sequence A368223.
Proposition A.1.3.2. When $\mathcal{O}_{\mathbb{1}}^{\left\langle r^{2}\right\rangle}=1$, such as when

the number of tilings of the $n \times m$ grid up to $180^{\circ}$ rotation by tiles that are fixed only under id $\in\left\langle r^{2}\right\rangle$.

| $n=1$ | 1 | 3 | 4 | 10 | 16 | 36 |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: |
| $n=2$ | 3 | 10 | 36 | 136 | 528 | 2080 |
| $n=3$ | 4 | 36 | 256 | 2080 | 16384 | 131328 |
| $n=4$ | 10 | 136 | 2080 | 32896 | 524800 | 8390656 |
| $n=5$ | 16 | 528 | 16384 | 524800 | 16777216 | 536887296 |
| $n=6$ | 36 | 2080 | 131328 | 8390656 | 536887296 | 34359869440 |

This has been added to the OEIS as sequence A368224.

## A. 2 The $n \times n$ grid

This section gives examples of every choice of symmetry of the $n \times n$ grid together with every essentially different set of tile designs that consists of a single orbit (or two orbits, in the case of a fully symmetric tile). Each sequence is annotated with its corresponding entry in the On-Line Encyclopedia of Integer Sequences. A table of all such sequences is given in Table 2 ,

## A.2.1 Under symmetries of the square

When counting tilings of the grid up to $\langle r, f\rangle$, we have that

$$
\begin{align*}
t_{\mathrm{id}} & =\mathcal{O}_{\langle r, f\rangle}^{\langle r, f\rangle}+2 \mathcal{O}_{\left\langle r^{2}, f\right\rangle}^{\langle r, f\rangle}+2 \mathcal{O}_{\left\langle r^{2}, r f\right\rangle}^{\langle r, f\rangle}+2 \mathcal{O}_{\langle r\rangle}^{\langle r, f\rangle}+4 \mathcal{O}_{\langle f\rangle}^{\langle r, f\rangle}+4 \mathcal{O}_{\langle r f\rangle}^{\langle r, f\rangle}+4 \mathcal{O}_{\left\langle r^{2}\right\rangle}^{\langle r, f\rangle}+8 \mathcal{O}_{\mathbb{1}}^{\langle r, f\rangle}  \tag{64}\\
t_{f}=t_{r^{2} f} & =\mathcal{O}_{\langle r, f\rangle}^{\langle r, f\rangle}+2 \mathcal{O}_{\left\langle r^{2}, f\right\rangle}^{\langle r, f\rangle}+4 \mathcal{O}_{\langle f\rangle}^{\langle r, f\rangle}  \tag{65}\\
t_{r^{2}} & =\mathcal{O}_{\langle r, f\rangle}^{\langle r, f\rangle}+2 \mathcal{O}_{\left\langle r^{2}, f\right\rangle}^{\langle r, f\rangle}+2 \mathcal{O}_{\left\langle r^{2}, r f\right\rangle}^{\langle r, f\rangle}+2 \mathcal{O}_{\langle r\rangle}^{\langle r, f\rangle}+4 \mathcal{O}_{\left\langle r^{2}\right\rangle}^{\langle r, f\rangle} . \tag{66}
\end{align*}
$$

Proposition A.2.1.1. When $\mathcal{O}_{\langle r, f\rangle}^{\langle r, f\rangle}=2$, such as when

the number of tilings of the $n \times n$ grid up to $D_{8}$ action by two distinct tile designs which are fixed under all elements of $D_{8}$ is given by

$$
2,6,102,8548,4211744,8590557312,70368882591744,2305843028004192256, \ldots
$$

This is OEIS sequence A054247.

|  | $\langle r, f\rangle$ | $\left\langle r^{2}, r f\right\rangle$ | $\langle r\rangle$ | $\langle r f\rangle$ |

T=\{\mathbf{\Delta} / \boldsymbol{\square}, \square\}
$$

the number of tilings of the $n \times n$ grid up to $D_{8}$ action by tiles that are stable under $180^{\circ}$ rotation is given by

$$
1,39,32896,536895552,140737496743936,590295810384475521024, \ldots
$$

Note that the above sequence agrees with sequence in Proposition A.2.1.5. which has been added to the OEIS as sequence A367524.
Proposition A.2.1.8. When $\mathcal{O}_{\mathbb{1}}^{\langle r, f\rangle}=1$, such as when

$$
T=\{\sim \boldsymbol{Q} \boldsymbol{\square}, \boldsymbol{Q}\}
$$

the number of tilings of the $n \times n$ grid up to $D_{8}$ action by tiles that are stable under $180^{\circ}$ rotation is given by

$$
1,538,16777216,35184378381312,4722366482869645213696, \ldots
$$

This has been added to the OEIS as sequence A367525.

## A.2.2 Under diagonal and antidiagonal reflection

When counting tilings of the grid up to $\left\langle r^{2}, f\right\rangle$, we have that

$$
\begin{align*}
t_{\mathrm{id}} & =\mathcal{O}_{\left\langle r^{2}, f\right\rangle}^{\left\langle r^{2}, f\right\rangle}+2 \mathcal{O}_{\langle f\rangle}^{\left\langle r^{2}, f\right\rangle}+2 \mathcal{O}_{\left\langle r^{2} f\right\rangle}^{\left\langle r^{2}, f\right\rangle}+2 \mathcal{O}_{\left\langle r^{2}\right\rangle}^{\left\langle r^{2}, f\right\rangle}  \tag{67}\\
t_{f} & =\mathcal{O}_{\left\langle r^{2}, f\right\rangle}^{\left\langle r^{2}, f\right\rangle}+2 \mathcal{O}_{\langle f\rangle}^{\left\langle r^{2}, f\right\rangle}  \tag{68}\\
t_{r^{2} f} & =\mathcal{O}_{\left\langle r^{2}, f\right\rangle}^{\left\langle r^{2}, f\right\rangle}+2 \mathcal{O}_{\left\langle r^{2}, f\right\rangle}^{\left\langle r^{2}\right.}  \tag{69}\\
t_{r^{2}} & =\mathcal{O}_{\left\langle r^{2}, f\right\rangle}^{\left\langle r^{2}, f\right\rangle}+2 \mathcal{O}_{\left\langle r^{2}\right\rangle}^{\left\langle r^{2}, f\right\rangle} \tag{70}
\end{align*}
$$

Proposition A.2.2.1. When $\mathcal{O}_{\left\langle r^{2}, r f\right\rangle}^{\left\langle r^{2}, r f\right\rangle}=2$, such as when

$$
T=\left\{\begin{array}{l}
\boldsymbol{j}, \ldots
\end{array}\right\}
$$

the number of tilings of the $n \times n$ grid up to diagonal and antidiagonal flipping by two colors of tiles that are stable under this symmetry is given by

$$
2,9,168,16960,8407040,17180983296,140737630961664,4611686053860868096, \ldots
$$

This has been added to the OEIS as sequence A367526.
Proposition A.2.2.2. When $\mathcal{O}_{\langle r f\rangle}^{\left\langle r^{2}, r f\right\rangle}=1$, (resp $\left.\mathcal{O}_{\left\langle r^{3} f\right\rangle}^{\left\langle r^{2}, r f\right\rangle}=1\right)$ such as when

$$
T=\{\vec{\square} ; \boldsymbol{Z}\},
$$

the number of tilings of the $n \times n$ grid up to diagonal and antidiagonal flipping by the orbit of a tile that is stable under antidiagonal (resp. diagonal) flipping is given by

$$
1,7,144,16704,8396800,17180459008,140737555464192,4611686036680998912, \ldots
$$

This has been added to the OEIS as sequence A367527.
Proposition A.2.2.3. When $\mathcal{O}_{\left\langle r^{2}\right\rangle}^{\left\langle r^{2}, r f\right\rangle}=1$, such as when

$$
T=\{\square, \square\}
$$

the number of tilings of the $n \times n$ grid up to diagonal and antidiagonal flipping by the orbit of a tile that is stable under $180^{\circ}$ rotation is given by

$$
1,5,136,16448,8390656,17179934720,140737496743936,4611686019501129728, \ldots
$$

This has been added to the OEIS as sequence A367528.
Proposition A.2.2.4. When $\mathcal{O}_{\mathbb{1}}^{\left\langle r^{2}, r f\right\rangle}=1$, such as when

$$
T=\{\mathbf{\Delta}, \boldsymbol{\square}\}
$$

the number of tilings of the $n \times n$ grid up to diagonal and antidiagonal flipping by the orbit of a tile that is not stable under any of these symmetries is given by

$$
1,68,65536,1073758208,281474976710656,1180591620734591172608, \ldots
$$

This has been added to the OEIS as sequence A367529.

## A.2.3 Under $90^{\circ}$ rotation

Proposition A.2.3.1. When $\mathcal{O}_{\langle r\rangle}^{\langle r\rangle}=2$, such as when

$$
T=\{\square, \quad\}
$$

the number of tilings of the $n \times n$ grid up to $90^{\circ}$ rotation by two colors of tiles that are fixed under this symmetry are

$$
2,6,140,16456,8390720,17179934976,140737496748032,4611686019501162496, \ldots
$$

This is in the OEIS as A047937, which is column 2 of A343095.

Proposition A.2.3.2. When $\mathcal{O}_{\left\langle r^{2}\right\rangle}^{\langle r\rangle}=1$, such as when
the number of tilings of the $n \times n$ grid up to $90^{\circ}$ rotation by tiles that are fixed under $180^{\circ}$ rotations is given by

$$
1,6,136,16456,8390656,17179934976,140737496743936,4611686019501162496, \ldots
$$

This has been added to the OEIS as sequence A367531.
Proposition A.2.3.3. When $\mathcal{O}_{\mathbb{1}}^{\langle r\rangle}=1$, such as when

$$
T=\{\mathbf{N}, \boldsymbol{\lambda}\}
$$

the number of tilings of the $n \times n$ grid up to $90^{\circ}$ rotation by an asymmetric tile

$$
1,70,65536,1073758336,281474976710656,1180591620734591303680, \ldots
$$

This has been added to the OEIS as sequence A367532.

## A.2.4 Under diagonal (equivalently antidiagonal) reflection

Proposition A.2.4.1. When $\mathcal{O}_{\langle r f\rangle}^{\langle r f\rangle}=2$, such as when

the number of tilings of the $n \times n$ grid up to flipping over the antidiagonal by tiles that are fixed under that symmetry is given by

$$
2,12,288,33280,16793600,34360786944,281475110928384,9223372071214514176, \ldots
$$

This is OEIS sequence A200564.
Proposition A.2.4.2. When $\mathcal{O}_{\mathbb{1}}^{\langle r f\rangle}=1$, such as when

$$
T=\left\{\begin{array}{lll} 
& & \\
\hdashline \mathbf{n} &
\end{array}\right\},
$$

the number of tilings of the $n \times n$ grid up to flipping over the antidiagonal by asymmetric tiles is given by

$$
1,8,256,32768,16777216,34359738368,281474976710656,9223372036854775808, \ldots
$$

This is OEIS sequence A103488.

## A. 3 The $n \times m$ cylinder

This section gives examples of every choice of symmetry of the $n \times m$ cylinder together with every essentially different set of tile designs that consists of a single orbit (or two orbits, in the case of a fully symmetric tile). Each sequence is annotated with its corresponding entry in the On-Line Encyclopedia of Integer Sequences. A table of all such sequences is given in Table 3 .

|  | $\left\langle r^{2}, f\right\rangle$ | $\langle f\rangle$ | $\left\langle r^{2} f\right\rangle$ | $\left\langle r^{2}\right\rangle$ | 1 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathcal{O}_{V}$ | Table A.3.1.1 OEIS: A368253 | - | - | - | - |
| $\mathcal{O}_{\langle f\rangle}$ | $\begin{aligned} & \text { Table A.3.1.2 } \\ & \text { OEIS: A368254 } \end{aligned}$ | $\begin{aligned} & \text { Table A.3.2.1 } \\ & \text { OEIS: A368258 } \end{aligned}$ | - | - | - |
| $\mathcal{O}_{\left\langle r^{2} f\right\rangle}$ | $\begin{aligned} & \text { Table A.3.1.3 } \\ & \text { OEIS: A368255 } \end{aligned}$ | - | Table A.3.3.1 OEIS: A368260 | - | - |
| $\mathcal{O}_{\left\langle r^{2}\right\rangle}$ | $\begin{aligned} & \text { Table A.3.1.4 } \\ & \text { OEIS: A368256 } \end{aligned}$ | - | - | $\begin{aligned} & \text { Table A.3.4.1 } \\ & \text { OEIS: A368262 } \end{aligned}$ | - |

Table 3: An index of tables that describe the number of tilings of the $n \times m$ cylinder.

## A.3.1 Under horizontal and vertical reflection

Proposition A.3.1.1. When $\mathcal{O}_{\left\langle r^{2}, f\right\rangle}^{\left\langle r^{2}, f\right\rangle}=2$, such as when

$$
T=\{\text {, or } \quad T=\{\text {, }\}
$$

the number of tilings of the $n \times m$ cylinder up to horizontal and vertical reflection by tiles that are fixed under those actions is given by

| $n=1$ | 2 | 3 | 6 | 10 | 20 | 36 | 72 |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| $n=2$ | 3 | 7 | 24 | 76 | 288 | 1072 | 4224 |
| $n=3$ | 4 | 13 | 74 | 430 | 3100 | 23052 | 179736 |
| $n=4$ | 6 | 34 | 378 | 4756 | 70536 | 1083664 | 17053728 |
| $n=5$ | 8 | 78 | 1884 | 53764 | 1689608 | 53762472 | 1718629200 |
| $n=6$ | 13 | 237 | 11912 | 709316 | 44900448 | 2865540112 | 183287416192 |
| $n=7$ | 18 | 687 | 77022 | 9608050 | 1227536100 | 157077883188 | 20105440563816 |

This has been added to the OEIS as sequence A368253.
Proposition A.3.1.2. When $\mathcal{O}_{\langle f\rangle}^{\left\langle r^{2}, f\right\rangle}=1$, such as when

$$
T=\{\nabla \square\}
$$

the number of tilings of the $n \times m$ cylinder up to horizontal and vertical reflection by tiles that are fixed under horizontal reflection is given by

| $n=1$ | 1 | 3 | 4 | 10 | 16 | 36 | 64 |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| $n=2$ | 2 | 7 | 20 | 76 | 272 | 1072 | 4160 |
| $n=3$ | 2 | 13 | 60 | 430 | 2992 | 23052 | 178880 |
| $n=4$ | 4 | 34 | 346 | 4756 | 70024 | 1083664 | 17045536 |
| $n=5$ | 4 | 78 | 1768 | 53764 | 1685920 | 53762472 | 1718511232 |
| $n=6$ | 8 | 237 | 11612 | 709316 | 44881328 | 2865540112 | 183286192832 |
| $n=7$ | 9 | 687 | 75924 | 9608050 | 1227395664 | 157077883188 | 20105422588224 |

This has been added to the OEIS as sequence A368254.

Proposition A.3.1.3. When $\mathcal{O}_{\left\langle r^{2} f\right\rangle}^{\left\langle r^{2}, f\right\rangle}=1$, such as when

the number of tilings of the $n \times m$ cylinder up to horizontal and vertical reflection by tiles that are fixed under vertical reflection is given by

| $n=1$ | 1 | 2 | 3 | 6 | 10 | 20 | 36 |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| $n=2$ | 2 | 5 | 14 | 44 | 152 | 560 | 2144 |
| $n=3$ | 2 | 9 | 50 | 366 | 2780 | 22028 | 175128 |
| $n=4$ | 4 | 26 | 298 | 4244 | 66184 | 1050896 | 16787488 |
| $n=5$ | 4 | 62 | 1692 | 52740 | 1679368 | 53696936 | 1718039376 |
| $n=6$ | 9 | 205 | 11272 | 701124 | 44761184 | 2863442960 | 183253337472 |
| $n=7$ | 10 | 623 | 75486 | 9591666 | 1227208420 | 157073688884 | 20105365066344 |

This has been added to the OEIS as sequence A368255.
Proposition A.3.1.4. When $\mathcal{O}_{\left\langle r^{2}\right\rangle}^{\left\langle r^{2}, f\right\rangle}=1$, such as when

$$
T=\{\boldsymbol{\nabla}, \boldsymbol{\nabla}\}
$$

the number of tilings of the $n \times m$ cylinder up to horizontal and vertical reflection by tiles that are fixed under $180^{\circ}$ rotation is given by

| $n=1$ | 1 | 2 | 3 | 6 | 10 | 20 | 36 |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| $n=2$ | 2 | 5 | 14 | 44 | 152 | 560 | 2144 |
| $n=3$ | 2 | 9 | 52 | 366 | 2800 | 22028 | 175296 |
| $n=4$ | 4 | 26 | 298 | 4244 | 66184 | 1050896 | 16787488 |
| $n=5$ | 4 | 62 | 1704 | 52740 | 1679776 | 53696936 | 1718052480 |
| $n=6$ | 8 | 205 | 11228 | 701124 | 44758448 | 2863442960 | 183253162688 |
| $n=7$ | 9 | 623 | 75412 | 9591666 | 1227199056 | 157073688884 | 20105363867968 |

This has been added to the OEIS as sequence A368256.
Proposition A.3.1.5. When $\mathcal{O}_{\mathbb{1}}^{\left\langle r^{2}, f\right\rangle}=1$, such as when

the number of tilings of the $n \times m$ cylinder up to horizontal and vertical reflection by asymmetric tiles is given by

| $n=1$ | 1 | 6 | 16 | 72 | 256 | 1056 |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: |
| $n=2$ | 4 | 44 | 544 | 8384 | 131584 | 2100224 |
| $n=3$ | 6 | 366 | 21856 | 1399512 | 89478656 | 5726711136 |
| $n=4$ | 23 | 4244 | 1050128 | 268472384 | 68719870208 | 17592195482624 |
| $n=5$ | 52 | 52740 | 53687104 | 54975896016 | 56294995342336 | 57646075552465728 |
| $n=6$ | 194 | 701124 | 2863399264 | 11728132423744 | 48038396383286784 | 196765270153929688064 |

This has been added to the OEIS as sequence A368257.

## A.3.2 Under horizontal reflection

Proposition A.3.2.1. When $\mathcal{O}_{\langle f\rangle}^{\langle f\rangle}=2$, such as when

the number of tilings of the $n \times m$ cylinder up to horizontal reflection two distinct tiles that are stable under horizontal reflection is given by

| $n=1$ | 2 | 4 | 8 | 16 | 32 | 64 | 128 |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| $n=2$ | 3 | 10 | 36 | 136 | 528 | 2080 | 8256 |
| $n=3$ | 4 | 20 | 120 | 816 | 5984 | 45760 | 357760 |
| $n=4$ | 6 | 55 | 666 | 9316 | 139656 | 2164240 | 34084896 |
| $n=5$ | 8 | 136 | 3536 | 106912 | 3371840 | 107505280 | 3437022464 |
| $n=6$ | 13 | 430 | 23052 | 1415896 | 89751728 | 5730905440 | 366571686592 |
| $n=7$ | 18 | 1300 | 151848 | 19206736 | 2454791328 | 314154568000 | 40210845176448 |

This has been added to the OEIS as sequence A368258.
Proposition A.3.2.2. When $\mathcal{O}_{\mathbb{1}}^{\langle f\rangle}=1$, such as when

the number of tilings of the $n \times m$ cylinder up to horizontal reflection by a tile that is not stable under horizontal reflection is given by

| $n=1$ | 1 | 2 | 4 | 8 | 16 | 32 | 64 |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| $n=2$ | 2 | 6 | 20 | 72 | 272 | 1056 | 4160 |
| $n=3$ | 2 | 12 | 88 | 688 | 5472 | 43712 | 349568 |
| $n=4$ | 4 | 39 | 538 | 8292 | 131464 | 2098704 | 33560608 |
| $n=5$ | 4 | 104 | 3280 | 104864 | 3355456 | 107374208 | 3435973888 |
| $n=6$ | 9 | 366 | 22028 | 1399512 | 89489584 | 5726711136 | 366504577728 |
| $n=7$ | 10 | 1172 | 149800 | 19173968 | 2454267040 | 314146179392 | 40210710958720 |

This has been added to the OEIS as sequence A368259.

## A.3.3 Under vertical reflection

Proposition A.3.3.1. When $\mathcal{O}_{\left\langle r^{2} f\right\rangle}^{\left\langle r^{2} f\right\rangle}=2$, such as when

the number of tilings of the $n \times m$ cylinder up to vertical reflection by two distinct tiles that are stable under vertical reflection is given by

| $n=1$ | 2 | 3 | 6 | 10 | 20 | 36 | 72 |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| $n=2$ | 3 | 7 | 24 | 76 | 288 | 1072 | 4224 |
| $n=3$ | 4 | 14 | 100 | 700 | 5560 | 43800 | 350256 |
| $n=4$ | 6 | 40 | 564 | 8296 | 131856 | 2098720 | 33566784 |
| $n=5$ | 8 | 108 | 3384 | 104968 | 3358736 | 107377488 | 3436078752 |
| $n=6$ | 14 | 362 | 22288 | 1399176 | 89505984 | 5726689312 | 366505626368 |
| $n=7$ | 20 | 1182 | 150972 | 19175140 | 2454416840 | 314146329192 | 40210730132688 |

This has been added to the OEIS as sequence A368260.
Proposition A.3.3.2. When $\mathcal{O}_{\mathbb{1}}^{\left\langle r^{2} f\right\rangle}=1$, such as when

the number of tilings of the $n \times m$ cylinder up to vertical reflection by a tile that is not stable under vertical reflection is given by

| $n=1$ | 1 | 3 | 4 | 10 | 16 | 36 | 64 |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| $n=2$ | 2 | 7 | 20 | 76 | 272 | 1072 | 4160 |
| $n=3$ | 2 | 14 | 88 | 700 | 5472 | 43800 | 349568 |
| $n=4$ | 4 | 40 | 532 | 8296 | 131344 | 2098720 | 33558592 |
| $n=5$ | 4 | 108 | 3280 | 104968 | 3355456 | 107377488 | 3435973888 |
| $n=6$ | 8 | 362 | 21944 | 1399176 | 89484128 | 5726689312 | 366504228224 |
| $n=7$ | 10 | 1182 | 149800 | 19175140 | 2454267040 | 314146329192 | 40210710958720 |

This has been added to the OEIS as sequence A368261.

## A.3.4 Under $180^{\circ}$ rotation

Proposition A.3.4.1. When $\mathcal{O}_{\left\langle r^{2}\right\rangle}^{\left\langle r^{2}\right\rangle}=2$, such as when

the number of tilings of the $n \times m$ cylinder up to $180^{\circ}$ rotation by two distinct tiles that are stable under $180^{\circ}$ rotation is given by

| $n=1$ | 2 | 3 | 6 | 10 | 20 | 36 | 72 |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| $n=2$ | 3 | 7 | 24 | 76 | 288 | 1072 | 4224 |
| $n=3$ | 4 | 16 | 104 | 720 | 5600 | 43968 | 350592 |
| $n=4$ | 6 | 43 | 570 | 8356 | 131976 | 2099728 | 33568800 |
| $n=5$ | 8 | 120 | 3408 | 105376 | 3359552 | 107390592 | 3436104960 |
| $n=6$ | 13 | 382 | 22284 | 1400536 | 89505968 | 5726776672 | 366505626304 |
| $n=7$ | 18 | 1236 | 150824 | 19182160 | 2454398112 | 314147227968 | 40210727735936 |

This has been added to the OEIS as sequence A368262.
Proposition A.3.4.2. When $\mathcal{O}_{\mathbb{1}}^{\left\langle r^{2}\right\rangle}=1$, such as when

the number of tilings of the $n \times m$ cylinder up to $180^{\circ}$ rotation by a tiles that is not stable under $180^{\circ}$ rotation is given by

| $n=1$ | 1 | 3 | 4 | 10 | 16 | 36 | 64 |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| $n=2$ | 2 | 7 | 20 | 76 | 272 | 1072 | 4160 |
| $n=3$ | 2 | 16 | 88 | 720 | 5472 | 43968 | 349568 |
| $n=4$ | 4 | 43 | 538 | 8356 | 131464 | 2099728 | 33560608 |
| $n=5$ | 4 | 120 | 3280 | 105376 | 3355456 | 107390592 | 3435973888 |
| $n=6$ | 9 | 382 | 22028 | 1400536 | 89489584 | 5726776672 | 366504577728 |

This has been added to the OEIS as sequence A368263.

## A.3.5 Under cylindrical action only

Proposition A.3.5.1. When $\mathcal{O}_{\mathbb{1}}^{\mathbb{1}}=2$, such as when

the number of tilings of the $n \times m$ cylinder by two distinct tiles is given by

| $n=1$ | 2 | 4 | 8 | 16 | 32 | 64 | 128 |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| $n=2$ | 3 | 10 | 36 | 136 | 528 | 2080 | 8256 |
| $n=3$ | 4 | 24 | 176 | 1376 | 10944 | 87424 | 699136 |
| $n=4$ | 6 | 70 | 1044 | 16456 | 262416 | 4195360 | 67113024 |
| $n=5$ | 8 | 208 | 6560 | 209728 | 6710912 | 214748416 | 6871947776 |
| $n=6$ | 14 | 700 | 43800 | 2796976 | 178962784 | 11453291200 | 733008106880 |
| $n=7$ | 20 | 2344 | 299600 | 38347936 | 4908534080 | 628292358784 | 80421421917440 |

This has been added to the OEIS as sequence A368264.

## A. 4 The $n \times m$ torus

This section gives examples of every choice of symmetry of the $n \times m$ torus together with every essentially different set of tile designs that consists of a single orbit (or two orbits, in the case of a fully symmetric tile). Each sequence is annotated with its corresponding entry in the On-Line Encyclopedia of Integer Sequences. A table of all such sequences is given in Table 4

|  | $\left\langle r^{2}, f\right\rangle$ | $\langle f\rangle$ | $\left\langle r^{2}\right\rangle$ | $\mathbb{1}$ |
| :---: | :---: | :---: | :---: | :---: |
| $\mathcal{O}_{V}$ | Table A.4.1.1 OEIS: A222188 | - | - - | - |
| $\mathcal{O}_{\langle f\rangle}$ | Table A.4.1.2 OEIS: A368302 | $\begin{aligned} & \text { Table A.4.2.1 } \\ & \text { OEIS: A368305 } \end{aligned}$ | - | - |
| $\mathcal{O}_{\left\langle r^{2}\right\rangle}$ | Table A.4.1.3 OEIS: A368303 | - | Table A.4.3.1 <br> OEIS: A368307 | - |
| $\mathcal{O}_{\mathbb{1}}$ | Table A.4.1.4 OEIS: A368304 | Table A.4.2.2 OEIS: A368306 | Table A.4.3.2 <br> OEIS: A368308 | Table A.4.4.1 OEIS: A184271 |

Table 4: An index of tables that describe the number of tilings of the $n \times m$ torus.

## A.4.1 Under horizontal and vertical reflection

Proposition A.4.1.1. When $\mathcal{O}_{\left\langle r^{2}, f\right\rangle}^{\left\langle r^{2}, f\right\rangle}=2$, such as when

the number of tilings of the $n \times m$ torus up to horizontal and vertical reflection by two distinct tiles with both horizontal and vertical reflectional symmetry is given by the following table:

| $n=1$ | 2 | 3 | 4 | 6 | 8 | 13 | 18 |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| $n=2$ | 3 | 7 | 13 | 34 | 78 | 237 | 687 |
| $n=3$ | 4 | 13 | 36 | 158 | 708 | 4236 | 26412 |
| $n=4$ | 6 | 34 | 158 | 1459 | 14676 | 184854 | 2445918 |
| $n=5$ | 8 | 78 | 708 | 14676 | 340880 | 8999762 | 245619576 |
| $n=6$ | 13 | 237 | 4236 | 184854 | 8999762 | 478070832 | 26185264801 |
|  | 18 | 687 | 26412 | 2445918 | 245619576 | 26185264801 | 2872221202512 |

This is given by OEIS sequence A222188.
Proposition A.4.1.2. When $\mathcal{O}_{\langle f\rangle}^{\left\langle r^{2}, f\right\rangle}=1$, such as when

$$
T=\{\boldsymbol{\square}\}
$$

the number of tilings of the $n \times m$ torus up to horizontal and vertical reflection by a tile horizontal (but not vertical) reflectional symmetry is given by the following table:

| $n=1$ | 1 | 2 | 2 | 4 | 4 | 9 | 10 |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| $n=2$ | 2 | 5 | 9 | 26 | 62 | 205 | 623 |
| $n=3$ | 2 | 8 | 22 | 120 | 600 | 3936 | 25556 |
| $n=4$ | 4 | 22 | 126 | 1267 | 14164 | 181782 | 2437726 |
| $n=5$ | 4 | 44 | 592 | 13600 | 337192 | 8965354 | 245501608 |
| $n=6$ | 8 | 135 | 3936 | 178366 | 8980642 | 477655760 | 26184041441 |
| $n=7$ | 9 | 362 | 25314 | 2404372 | 245479140 | 26179947021 | 2872203226920 |

This has been added to the OEIS as sequence A368302.
Proposition A.4.1.3. When $\mathcal{O}_{\left\langle r^{2}\right\rangle}^{\left\langle r^{2}, f\right\rangle}=1$, such as when

$$
T=\left\{\begin{array}{ll}
\boldsymbol{F} & \boldsymbol{y}
\end{array}\right\}
$$

the number of tilings of the $n \times m$ torus up to horizontal and vertical reflection by a tile with $180^{\circ}$ rotational symmetry is given by the following table:

| $n=1$ | 1 | 2 | 2 | 4 | 4 | 8 | 9 |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| $n=2$ | 2 | 5 | 8 | 22 | 44 | 135 | 362 |
| $n=3$ | 2 | 8 | 24 | 120 | 612 | 3892 | 25482 |
| $n=4$ | 4 | 22 | 120 | 1203 | 13600 | 177342 | 2404372 |
| $n=5$ | 4 | 44 | 612 | 13600 | 337600 | 8962618 | 245492244 |
| $n=6$ | 8 | 135 | 3892 | 177342 | 8962618 | 477371760 | 26179772237 |
| $n=7$ | 9 | 362 | 25482 | 2404372 | 245492244 | 26179772237 | 2872202028544 |

This has been added to the OEIS as sequence A368303.
Proposition A.4.1.4. When $\mathcal{O}_{\mathbb{1}}^{\left\langle r^{2}, f\right\rangle}=1$, such as when

the number of tilings of the $n \times m$ torus up to horizontal and vertical reflection by a tile with no symmetry is given by the following table:

| $n=1$ | 1 | 4 | 6 | 23 | 52 | 194 |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: |
| $n=2$ | 4 | 28 | 194 | 2196 | 26524 | 351588 |
| $n=3$ | 6 | 194 | 7296 | 350573 | 17895736 | 954495904 |
| $n=4$ | 23 | 2196 | 350573 | 67136624 | 13744131446 | 2932037300956 |
| $n=5$ | 52 | 26524 | 17895736 | 13744131446 | 11258999068672 | 9607679419823148 |
| $n=6$ | 194 | 351588 | 954495904 | 2932037300956 | 9607679419823148 | 32794211709502184448 |

This has been added to the OEIS as sequence A368304.

## A.4.2 Under horizontal (equivalently vertical) reflection

Proposition A.4.2.1. When $\mathcal{O}_{\langle f\rangle}^{\langle f\rangle}=2$, such as when

the number of tilings of the $n \times m$ torus up to horizontal reflection by two distinct tiles with horizontal reflectional symmetry is given by the following table:

| $n=1$ | 2 | 3 | 4 | 6 | 8 | 14 | 20 |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| $n=2$ | 3 | 7 | 14 | 40 | 108 | 362 | 1182 |
| $n=3$ | 4 | 13 | 44 | 218 | 1200 | 7700 | 51112 |
| $n=4$ | 6 | 34 | 226 | 2386 | 27936 | 361244 | 4869276 |
| $n=5$ | 8 | 78 | 1184 | 26892 | 674384 | 17920876 | 491003216 |
| $n=6$ | 13 | 237 | 7700 | 354680 | 17950356 | 955180432 | 52367383810 |
| $n=7$ | 18 | 687 | 50628 | 4804062 | 490958280 | 52359294854 | 5744406453840 |

This has been added to the OEIS as sequence A368305.
Proposition A.4.2.2. When $\mathcal{O}_{\mathbb{1}}^{\langle f\rangle}=1$, such as when

the number of tilings of the $n \times m$ torus up to horizontal reflection by a tile that does not have horizontal reflectional symmetry is given by the following table:

| $n=1$ | 1 | 2 | 2 | 4 | 4 | 8 | 10 |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| $n=2$ | 2 | 5 | 8 | 24 | 56 | 190 | 596 |
| $n=3$ | 2 | 9 | 32 | 186 | 1096 | 7356 | 49940 |
| $n=4$ | 4 | 26 | 182 | 2130 | 26296 | 350316 | 4794376 |
| $n=5$ | 4 | 62 | 1096 | 26380 | 671104 | 17899020 | 490853416 |
| $n=6$ | 9 | 205 | 7356 | 350584 | 17897924 | 954481360 | 52357796826 |
| $n=7$ | 10 | 623 | 49940 | 4795870 | 490853416 | 52357896710 | 5744387279872 |

This has been added to the OEIS as sequence A368306.

## A.4.3 Under $180^{\circ}$ rotation

Proposition A.4.3.1. When $\mathcal{O}_{\left\langle r^{2}\right\rangle}^{\left\langle r^{2}\right\rangle}=2$, such as when

the number of tilings of the $n \times m$ torus up to $180^{\circ}$ rotation by two distinct tiles with $180^{\circ}$ rotational symmetry is given by the following table:

| $n=1$ | 2 | 3 | 4 | 6 | 8 | 13 | 18 |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| $n=2$ | 3 | 7 | 13 | 34 | 78 | 237 | 687 |
| $n=3$ | 4 | 13 | 48 | 224 | 1224 | 7696 | 50964 |
| $n=4$ | 6 | 34 | 224 | 2302 | 27012 | 353384 | 4806078 |
| $n=5$ | 8 | 78 | 1224 | 27012 | 675200 | 17920860 | 490984488 |
| $n=6$ | 13 | 237 | 7696 | 353384 | 17920860 | 954677952 | 52359294790 |
| $n=7$ | 18 | 687 | 50964 | 4806078 | 490984488 | 52359294790 | 5744404057088 |

This has been added to the OEIS as sequence A368307.
Proposition A.4.3.2. When $\mathcal{O}_{\mathbb{1}}^{\left\langle r^{2}\right\rangle}=1$, such as when

$$
T=\{\text { or } \quad T=\{\mathbf{N}, \quad \text {, }
$$

the number of tilings of the $n \times m$ torus up to $180^{\circ}$ rotation by a tile without $180^{\circ}$ rotational symmetry is given by the following table:

| $n=1$ | 1 | 2 | 2 | 4 | 4 | 9 | 10 |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| $n=2$ | 2 | 5 | 9 | 26 | 62 | 205 | 623 |
| $n=3$ | 2 | 9 | 32 | 192 | 1096 | 7440 | 49940 |
| $n=4$ | 4 | 26 | 192 | 2174 | 26500 | 351336 | 4797886 |
| $n=5$ | 4 | 62 | 1096 | 26500 | 671104 | 17904476 | 490853416 |
| $n=6$ | 9 | 205 | 7440 | 351336 | 17904476 | 954546880 | 52358246214 |
| $n=7$ | 10 | 623 | 49940 | 4797886 | 490853416 | 52358246214 | 5744387279872 |

This has been added to the OEIS as sequence A368308.

## A.4.4 Under toroidal action only

Proposition A.4.4.1. When $\mathcal{O}_{\mathbb{1}}^{\mathbb{1}}=2$, such as when

the number of tilings of the $n \times m$ grid up to cyclic shifting of rows and columns by any two distinct tile designs is given by the following table:

| $n=1$ | 2 | 3 | 4 | 6 | 8 | 14 | 20 |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| $n=2$ | 3 | 7 | 14 | 40 | 108 | 362 | 1182 |
| $n=3$ | 4 | 14 | 64 | 352 | 2192 | 14624 | 99880 |
| $n=4$ | 6 | 40 | 352 | 4156 | 52488 | 699600 | 9587580 |
| $n=5$ | 8 | 108 | 2192 | 52488 | 1342208 | 35792568 | 981706832 |
| $n=6$ | 14 | 362 | 14624 | 699600 | 35792568 | 1908897152 | 104715443852 |
| $n=7$ | 20 | 1182 | 99880 | 9587580 | 981706832 | 104715443852 | 11488774559744 |

This is OEIS sequence A184271.

## A. 5 The $n \times n$ torus

This section gives examples of every choice of symmetry of the $n \times n$ torus together with every essentially different set of tile designs that consists of a single orbit (or two orbits, in the case of a fully symmetric tile). Each sequence is annotated with its corresponding entry in the On-Line Encyclopedia of Integer Sequences. A table of all such sequences is given in Table 5 .

## A.5.1 Under the symmetries of the square

Proposition A.5.1.1. When $\mathcal{O}_{\langle r, f\rangle}^{\langle r, f\rangle}=2$, such as when

the number of tilings of the $n \times n$ torus up to symmetries of the square by two distinct tiles are fixed under all symmetries of the square is given by

$$
2,6,26,805,172112,239123150,1436120190288,36028817512382026, \ldots
$$

|  | $\langle r, f\rangle$ | $\left\langle r^{2}, r f\right\rangle$ | $\langle r\rangle$ | $\langle r f\rangle$ |
| :---: | :---: | :---: | :---: | :---: |
| $\mathcal{O}_{\langle r, f\rangle}$ | $\begin{aligned} & \text { Sequence A.5.1.1 } \\ & \text { OEIS: A255016 } \end{aligned}$ | (r, f) | (r) | (r) |
| $\mathcal{O}_{\left\langle r^{2}, f\right\rangle}$ | $\begin{aligned} & \text { Sequence A.5.1.2 } \\ & \text { OEIS: A367533 } \end{aligned}$ | - | - | - |
| $\mathcal{O}_{\left\langle r^{2}, r f\right\rangle}$ | $\begin{aligned} & \text { Sequence A.5.1.3 } \\ & \text { OEIS: A295223 } \end{aligned}$ | $\begin{aligned} & \text { Sequence A.5.2.1 } \\ & \text { OEIS: A368139 } \end{aligned}$ | - | - |

Table 5: An index of tables that describe the number of tilings of the $n \times n$ torus.

This is OEIS sequence A255016.
Proposition A.5.1.2. When $\mathcal{O}_{\left\langle r^{2}, f\right\rangle}^{\langle r, f\rangle}=1$, such as when

$$
T=\{\square, \square\},
$$

the number of tilings of the $n \times n$ torus up to symmetries of the square by a tile that is fixed under horizontal and vertical reflections is given by

$$
1,4,18,733,170440,239035502,1436110601256,36028815364865610, \ldots
$$

This has been added to the OEIS as sequence A367533.
Proposition A.5.1.3. When $\mathcal{O}_{\left\langle r^{2}, r f\right\rangle}^{\langle r, f\rangle}=1$, such as when

$$
T=\left\{\begin{array}{lll}
\boldsymbol{\eta} & \boldsymbol{y}
\end{array}\right\},
$$

the number of tilings of the $n \times n$ torus up to symmetries of the square by a tile that is fixed under diagonal and antidiagonal reflections is given by

$$
1,4,18,669,170440,238773358,1436110601256,36028800332480074, \ldots
$$

This is OEIS sequence A295223.
Proposition A.5.1.4. When $\mathcal{O}_{\langle r\rangle}^{\langle r, f\rangle}=1$, such as when

$$
T=\{\square,
$$

the number of tilings of the $n \times n$ torus up to symmetries of the square by a tile that is fixed under $90^{\circ}$ rotations is given by

$$
1,4,14,613,168832,238686222,1436101016320,36028798185029194, \ldots
$$

This has been added to the OEIS as sequence A367534.
Proposition A.5.1.5. When $\mathcal{O}_{\langle f\rangle}^{\langle r, f\rangle}=1$, such as when

$$
T=\{\boldsymbol{>}, \geq,
$$

the number of tilings of the $n \times n$ torus up to symmetries of the square by a tile that is fixed under horizontal (respectively vertical) reflections is given by

$$
1,16,3692,33570410,5629501212064,16397105856182791856, \ldots
$$

This has been added to the OEIS as sequence A367535.
Proposition A.5.1.6. When $\mathcal{O}_{\langle r f\rangle}^{\langle r, f\rangle}=1$, such as when

$$
T=\{\text {, N: }
$$

the number of tilings of the $n \times n$ torus up to symmetries of the square by a tile that is fixed under antidiagonal (respectively diagonal) reflections is given by

$$
1,17,3692,33572458,5629501212064,16397105857614447792, \ldots
$$

This has been added to the OEIS as sequence A367536.
Proposition A.5.1.7. When $\mathcal{O}_{\left\langle r^{2}\right\rangle}^{\langle r, f\rangle}=1$, such as when

$$
T=\{\mathbf{\Delta} / \boldsymbol{\square}, \square\}
$$

the number of tilings of the $n \times n$ torus up to symmetries of the square by a tile that is fixed under $180^{\circ}$ rotations is given by

$$
1,23,3776,33601130,5629507922944,16397105889110874288, \ldots
$$

This has been added to the OEIS as sequence A368137.
Proposition A.5.1.8. When $\mathcal{O}_{\mathbb{1}}^{\langle r, f\rangle}=1$, such as when

the number of tilings of the $n \times n$ torus up to symmetries of the square by a tile that is fixed under only the identity is given by

$$
1,154,1864192,2199026796168,188894659314785812480, \ldots
$$

This has been added to the OEIS as sequence A368138.

## A.5.2 Under diagonal and antidiagonal reflection

Proposition A.5.2.1. When $\mathcal{O}_{\left\langle r^{2}, r f\right\rangle}^{\left\langle r^{2}, r f\right\rangle}=2$, such as when

the number of tilings of the $n \times n$ torus up to diagonal and antidiagonal rotations by two distinct tiles that are symmetric under both reflections is given by

$$
2,6,36,1282,340880,477513804,2872221202512,72057600262282324, \ldots
$$

This has been added to the OEIS as sequence A368139.
Proposition A.5.2.2. When $\mathcal{O}_{\langle r f\rangle}^{\left\langle r^{2}, r f\right\rangle}=1$, such as when

$$
T=\{\mathbf{D}\}
$$

the number of tilings of the $n \times n$ torus up to diagonal and antidiagonal rotations by tile that is symmetric only under antidiagonal reflections is given by

$$
1,4,22,1154,337192,477360876,2872203226920,72057597041056852, \ldots
$$

This has been added to the OEIS as sequence A368140.
Proposition A.5.2.3. When $\mathcal{O}_{\left\langle r^{2}\right\rangle}^{\left\langle r^{2}, r f\right\rangle}=1$, such as when

$$
T=\{\infty, \square
$$

the number of tilings of the $n \times n$ torus up to diagonal and antidiagonal rotations by tile that is symmetric only under $180^{\circ}$ rotations is given by

$$
1,4,24,1154,337600,477339020,2872202028544,72057595967315028, \ldots
$$

This has been added to the OEIS as sequence A368141.
Proposition A.5.2.4. When $\mathcal{O}_{\mathbb{1}}^{\left\langle r^{2}, r f\right\rangle}=1$, such as when

$$
T=\{<\wedge, \gg\rangle
$$

the number of tilings of the $n \times n$ torus up to diagonal and antidiagonal rotations by a tile that is asymmetric is given by

$$
1,23,7296,67124308,11258999068672,32794211700912270688, \ldots
$$

This has been added to the OEIS as sequence A368142.

## A.5.3 Under $90^{\circ}$ rotation

Proposition A.5.3.1. When $\mathcal{O}_{\langle r\rangle}^{\langle r\rangle}=2$, such as when

the number of tilings of the $n \times n$ torus up to $90^{\circ}$ rotations by two distinct tiles that are symmetric under $90^{\circ}$ rotations is given by

$$
2,6,28,1171,337664,477339616,2872202032640,72057595967392816, \ldots
$$

This has been added to the OEIS as sequence A368143.
Proposition A.5.3.2. When $\mathcal{O}_{\left\langle r^{2}\right\rangle}^{\langle r\rangle}=1$, such as when

$$
T=\{\Delta /]
$$

the number of tilings of the $n \times n$ torus up to $90^{\circ}$ rotations by a tile that is symmetric under $180^{\circ}$ rotations is given by

$$
1,4,24,1155,337600,477339104,2872202028544,72057595967327280, \ldots
$$

This has been added to the OEIS as sequence A368144.
Proposition A.5.3.3. When $\mathcal{O}_{\mathbb{1}}^{\langle r\rangle}=1$, such as when

$$
T=\{\text {, }
$$

the number of tilings of the $n \times n$ torus up to $90^{\circ}$ rotations by a tile asymmetric with respect to rotations is given by

$$
1,23,7296,67124336,11258999068672,32794211700912314368, \ldots
$$

This has been added to the OEIS as sequence A368145.

## A.5.4 Under diagonal (equivalently antidiagonal) reflection

Proposition A.5.4.1. When $\mathcal{O}_{\langle r f\rangle}^{\langle r f\rangle}=2$, such as when

$$
T=\{Q,
$$

the number of tilings of the $n \times n$ torus up to transposition by two distinct tiles that are fixed under is given by

$$
2,6,44,2209,674384,954623404,5744406453840,144115192471496836, \ldots
$$

This is OEIS sequence A255015.
Proposition A.5.4.2. When $\mathcal{O}_{\mathbb{1}}^{\langle r f\rangle}=1$, such as when

the number of tilings of the $n \times n$ torus up to transposition by tiles that are asymmetric with respect to this transposition is given by

$$
1,4,32,2081,671104,954448620,5744387279872,144115188176529540, \ldots
$$

This has been added to the OEIS as sequence A367530.

## B Illustrations

This section of the appendix gives illustrations corresponding to all of the sequences and tables described in Appendix A, which shows an example of the tilings arising from all valid choices of $R \leq D_{8}$ and all sets of tile designs consisting of a single orbit.

## B. 1 The $n \times m$ grid

## B.1.1 Under horizontal and vertical reflection

Illustration B.1.1.1. [This is shown in Table A.1.1.1.]

Figure 21: The 24 ways of tiling the $2 \times 3$ grid up to $D_{4}=\left\langle r^{2}, f\right\rangle$ from a set of tile designs that consists of two orbits both of which contain an element with stabilizer subgroup $D_{4}$.
Illustration B.1.1.2. [This is shown in Table A.1.1.2]]

Figure 22: The 24 ways of tiling the $3 \times 2$ grid up to $D_{4}=\left\langle r^{2}, f\right\rangle$ from a set of tile designs that consists of one orbit containing an element whose stabilizer subgroup is $\langle f\rangle \leq D_{4}$.

Illustration B.1.1.3. [This is shown in Table A.1.1.3.]

Figure 23: The 20 ways of tiling the $3 \times 2$ grid up to $D_{4}=\left\langle r^{2}, f\right\rangle$ from a set of tile designs that consists of one orbit containing an element whose stabilizer subgroup is $\left\langle r^{2}\right\rangle \leq D_{4}$.

Figure 24: The 76 ways of tiling the $2 \times 2$ grid up to $D_{4}=\left\langle r^{2}, f\right\rangle$ from a set of tile designs that consists of one orbit containing an element whose stabilizer subgroup is $\mathbb{1} \leq D_{4}$.
B.1.2 Under horizontal (equivalently vertical) reflection

Illustration B.1.2.1. [This is shown in Table A.1.2.1.]

Figure 25: The 40 ways of tiling the $3 \times 2$ grid up to $\langle f\rangle$ from a set of tile designs that consists of two orbits both of which contain an element with stabilizer subgroup $\langle f\rangle$.

Illustration B.1.2.2. [This is shown in Table A.1.2.2]

Figure 26: The 32 ways of tiling the $3 \times 2$ grid up to $\langle f\rangle$ from a set of tile designs that consists of one orbit containing an element whose stabilizer subgroup is $\mathbb{1} \leq\langle f\rangle$.

## B.1.3 Under $180^{\circ}$ rotation

Illustration B.1.3.1. [This is shown in Table A.1.3.1.]

Figure 27: The $363 \times 2$ grids up to $\left\langle r^{2}\right\rangle$ from a set of tile designs that consists of two orbits both of which contain an element with stabilizer subgroup $\left\langle r^{2}\right\rangle$.

Illustration B.1.3.2. [This is shown in Table A.1.3.2.]

Figure 28: The $102 \times 2$ grids up to $\left\langle r^{2}\right\rangle$ from a set of tile designs that consists of one orbit containing an element whose stabilizer subgroup is $\mathbb{1} \leq\left\langle r^{2}\right\rangle$.

## B. 2 The $n \times n$ grid

## B.2.1 Under symmetries of the square

Illustration B.2.1.1. [This is shown in Sequence A.2.1.1.]

Figure 29: The 6 distinct ways of tiling the $2 \times 2$ grid up to $D_{8}=\langle r, f\rangle$ from a set of tile designs that consists of two orbits both of which contain an element with stabilizer subgroup $D_{8}$.

Illustration B.2.1.2. [This is shown in Sequence A.2.1.2.]

Figure 30: The 4 distinct ways of tiling the $2 \times 2$ grid up to $D_{8}=\langle r, f\rangle$ from a set of tile designs that consists of one orbit containing an element whose stabilizer subgroup is $\left\langle r^{2}, f\right\rangle \leq D_{8}$.

Illustration B.2.1.3. [This is shown in Sequence A.2.1.3.]

Figure 31: The 6 distinct ways of tiling the $2 \times 2$ grid up to $D_{8}=\langle r, f\rangle$ from a set of tile designs that consists of one orbit containing an element whose stabilizer subgroup is $\left\langle r^{2}, r f\right\rangle \leq D_{8}$.

Illustration B.2.1.4. [This is shown in Sequence A.2.1.4.]

Figure 32: The 70 distinct ways of tiling the $3 \times 3$ grid up to $D_{8}=\langle r, f\rangle$ from a set of tile designs that consists of one orbit containing an element whose stabilizer subgroup is $\langle r\rangle \leq D_{8}$.
Illustration B.2.1.5. [This is shown in Sequence A.2.1.5.]

#   

Figure 33: The 39 distinct ways of tiling the $2 \times 2$ grid up to $D_{8}=\langle r, f\rangle$ from a set of tile designs that consists of one orbit containing an element whose stabilizer subgroup is $\langle f\rangle \leq D_{8}$.

Illustration B.2.1.6. [This is shown in Sequence A.2.1.6]]

Figure 34: The 43 distinct ways of tiling the $2 \times 2$ grid up to $D_{8}=\langle r, f\rangle$ from a set of tile designs that consists of one orbit containing an element whose stabilizer subgroup is $\langle r f\rangle \leq D_{8}$.
Illustration B.2.1.7. [This is shown in Sequence A.2.1.7.]

Figure 35: The 39 distinct ways of tiling the $2 \times 2$ grid up to $D_{8}=\langle r, f\rangle$ from a set of tile designs that consists of one orbit containing an element whose stabilizer subgroup is $\left\langle r^{2}\right\rangle \leq D_{8}$.
Illustration B.2.1.8. [This is shown in Sequence A.2.1.8.]

Figure 36: 50 of the 538 distinct ways of tiling the $2 \times 2$ grid up to $D_{8}=\langle r, f\rangle$ from a set of tile designs that consists of one orbit containing an element whose stabilizer subgroup is $\mathbb{1} \leq D_{8}$.
B.2.2 Under diagonal and antidiagonal reflection

Figure 37: The 168 tilings of the $3 \times 3$ grid up to $\left\langle r^{2}, r f\right\rangle$ from a set of tile designs that consists of two orbits both of which contain an element with stabilizer subgroup $\left\langle r^{2}, r f\right\rangle$.

Figure 38: The 144 tilings of the $3 \times 3$ grid up to $\left\langle r^{2}, r f\right\rangle$ from a set of tile designs that consists of one orbit containing an element whose stabilizer subgroup is $\langle r f\rangle \leq\left\langle r^{2}, r f\right\rangle$.

Illustration B.2.2.3. [This is shown in Sequence A.2.2.3.]

Figure 39: The 5 tilings of the $2 \times 2$ grid up to $\left\langle r^{2}, r f\right\rangle$ from a set of tile designs that consists of one orbit containing an element whose stabilizer subgroup is $\left\langle r^{2}\right\rangle \leq\left\langle r^{2}, r f\right\rangle$.

# Illustration B.2.2.4. [This is shown in Sequence A.2.2.4.] <br>     

Figure 40: The 68 tilings of the $2 \times 2$ grid up to $\left\langle r^{2}, r f\right\rangle$ from a set of tile designs that consists of one orbit containing an element whose stabilizer subgroup is $\mathbb{1} \leq\left\langle r^{2}, r f\right\rangle$.

## B.2.3 Under $90^{\circ}$ rotation

Illustration B.2.3.1. [This is shown in Sequence A.2.3.1.]

Figure 41: The 140 tilings of the $3 \times 3$ grid up to $\langle r\rangle$ from a set of tile designs that consists of two orbits both of which contain an element with stabilizer subgroup $\langle r\rangle$.

Illustration B.2.3.2. [This is shown in Sequence A.2.3.2.]

|  |
| :---: |
|  |  |
|  |  |
|  |  |
|  |  |
|  |  |
|  |  |
|  |  |

Figure 42: The 136 tilings of the $3 \times 3$ grid up to $\langle r\rangle$ from a set of tile designs that consists of one orbit containing an element whose stabilizer subgroup is $\left\langle r^{2}\right\rangle \leq\langle r\rangle$.

Illustration B.2.3.3. [This is shown in Sequence A.2.3.3.]

Figure 43: The 70 tilings of the $2 \times 2$ grid up to $\langle r\rangle$ from a set of tile designs that consists of one orbit containing an element whose stabilizer subgroup is $\mathbb{1} \leq\langle r\rangle$.
B.2.4 Under diagonal (equivalently antidiagonal) reflection

Illustration B.2.4.1. [This is shown in Sequence A.2.4.1.]

Figure 44: The 12 tilings of the $2 \times 2$ grid up to $\langle r f\rangle$ from a set of tile designs that consists of two orbits both of which contain an element with stabilizer subgroup $\langle r f\rangle$.

Illustration B.2.4.2. [This is shown in Sequence A.2.4.2.]

Figure 45: The 8 tilings of the $2 \times 2$ grid up to $\langle r f\rangle$ from a set of tile designs that consists of one orbit containing an element whose stabilizer subgroup is $\mathbb{1} \leq\langle r f\rangle$.

## B. 3 The $n \times m$ cylinder

B.3.1 Under horizontal and vertical reflection

Illustration B.3.1.1. [This is shown in Table A.3.1.1.]

Figure 46: The 24 distinct ways of tiling the $2 \times 3$ cylinder up to $D_{4}=\left\langle r^{2}, f\right\rangle$ from a set of tile designs that consists of two orbits both of which contain an element with stabilizer subgroup $D_{4}$.

Figure 47: The 20 distinct ways of tiling the $2 \times 3$ cylinder up to $D_{4}=\left\langle r^{2}, f\right\rangle$ from a set of tile designs that consists of one orbit containing an element whose stabilizer subgroup is $\langle f\rangle \leq D_{4}$.

Illustration B.3.1.3. [This is shown in Table A.3.1.3.]

Figure 48: The 26 distinct ways of tiling the $4 \times 2$ cylinder up to $D_{4}=\left\langle r^{2}, f\right\rangle$ from a set of tile designs that consists of one orbit containing an element whose stabilizer subgroup is $\left\langle r^{2} f\right\rangle \leq D_{4}$.

Illustration B.3.1.4. [This is shown in Table A.3.1.4.]

Figure 49: The 9 distinct ways of tiling the $3 \times 2$ cylinder up to $D_{4}=\left\langle r^{2}, f\right\rangle$ from a set of tile designs that consists of one orbit containing an element whose stabilizer subgroup is $\left\langle r^{2}\right\rangle \leq D_{4}$.

## Illustration B.3.1.5. [This is shown in Table A.3.1.5.]

Figure 50: The 20 distinct ways of tiling the $2 \times 2$ cylinder up to $D_{4}=\left\langle r^{2}, f\right\rangle$ from a set of tile designs that consists of one orbit containing an element whose stabilizer subgroup is $\mathbb{1} \leq D_{4}$.

## B.3.2 Under horizontal reflection

Illustration B.3.2.1. [This is shown in Table A.3.2.1.]

Figure 51: The 20 distinct ways of tiling the $3 \times 2$ cylinder up to $\langle f\rangle$ from a set of tile designs that consists of two orbits both of which contain an element with stabilizer subgroup $\langle f\rangle$.

Figure 52: The 20 distinct ways of tiling the $2 \times 3$ cylinder up to $\langle f\rangle$ from a set of tile designs that consists of one orbit containing an element whose stabilizer subgroup is $\mathbb{1} \leq D_{4}$.
B.3.3 Under vertical reflection

Figure 53: The 24 distinct ways of tiling the $2 \times 3$ cylinder up to $\left\langle r^{2} f\right\rangle$ from a set of tile designs that consists of two orbits both of which contain an element with stabilizer subgroup $\left\langle r^{2} f\right\rangle$.

Illustration B.3.3.2. [This is shown in Table A.3.3.2.]

Figure 54: The 20 distinct ways of tiling the $2 \times 3$ cylinder up to $\left\langle r^{2} f\right\rangle$ from a set of tile designs that consists of one orbit containing an element whose stabilizer subgroup is $\mathbb{1} \leq D_{4}$.

## B.3.4 Under $180^{\circ}$ rotation

Illustration B.3.4.1. [This is shown in Table A.3.4.1.]

Figure 55: The 16 distinct ways of tiling the $3 \times 2$ cylinder up to $\left\langle r^{2}\right\rangle$ from a set of tile designs that consists of two orbits both of which contain an element with stabilizer subgroup $\left\langle r^{2}\right\rangle$.

Illustration B.3.4.2. [This is shown in Table A.3.4.2.]

Figure 56: The 20 distinct ways of tiling the $2 \times 3$ cylinder up to $\left\langle r^{2}\right\rangle$ from a set of tile designs that consists of one orbit containing an element whose stabilizer subgroup is $\mathbb{1} \leq\left\langle r^{2}\right\rangle$.

## B.3.5 Under cylindrical action only

Illustration B.3.5.1. [This is shown in Table A.3.5.1.]

Figure 57: The 10 distinct ways of tiling the $2 \times 2$ cylinder from a set of tile designs that consists of two orbits, each containing a single tile design.

## B. 4 The $n \times m$ torus

B.4.1 Under horizontal and vertical reflection

Illustration B.4.1.1. [This is shown in Table A.4.1.1.]

Figure 58: The 13 distinct ways of tiling the $3 \times 2$ torus up to $\left\langle r^{2}, f\right\rangle$ from a set of tile designs that consists of two orbits both of which contain an element with stabilizer subgroup $D_{4}$.

Illustration B.4.1.2. [This is shown in Table A.4.1.2.]

Figure 59: The 8 distinct ways of tiling the $3 \times 2$ torus up to $\left\langle r^{2}, f\right\rangle$ from a set of tile designs that consists of one orbit containing an element whose stabilizer subgroup is $\langle f\rangle \leq D_{4}$.

Figure 60: The 8 distinct ways of tiling the $3 \times 2$ torus up to $\left\langle r^{2}, f\right\rangle$ from a set of tile designs that consists of one orbit containing an element whose stabilizer subgroup is $\left\langle r^{2}\right\rangle \leq D_{4}$.

Illustration B.4.1.4. [This is shown in Table A.4.1.4.]

Figure 61: The 28 distinct ways of tiling the $2 \times 2$ torus up to $\left\langle r^{2}, f\right\rangle$ from a set of tile designs that consists of one orbit containing an element whose stabilizer subgroup is $\mathbb{1} \leq D_{4}$.
B.4.2 Under horizontal (equivalently vertical) reflection

Figure 62: The 7 distinct ways of tiling the $2 \times 2$ torus up to $\langle f\rangle$ from a set of tile designs that consists of two orbits both of which contain an element with stabilizer subgroup $\langle f\rangle$.
Illustration B.4.2.2. [This is shown in Table A.4.2.2.]

Figure 63: The 9 distinct ways of tiling the $3 \times 2$ torus up to $\langle f\rangle$ from a set of tile designs that consists of one orbit containing an element whose stabilizer subgroup is $\mathbb{1} \leq\langle f\rangle$.
B.4.3 Under $180^{\circ}$ rotation

Illustration B.4.3.1. [This is shown in Table A.4.3.1.]

Figure 64: The 13 distinct ways of tiling the $3 \times 2$ torus up to $\langle f\rangle$ from a set of tile designs that consists of two orbits both of which contain an element with stabilizer subgroup $\langle f\rangle$.

Illustration B.4.3.2. [This is shown in Table A.4.3.2.]

Figure 65: The 9 distinct ways of tiling the $3 \times 2$ torus $\left\langle r^{2}\right\rangle$ from a set of tile designs that consists of one orbit containing an element whose stabilizer subgroup is $\mathbb{1} \leq\left\langle r^{2}\right\rangle$.
B.4.4 Under toroidal action only

Illustration B.4.4.1. [This is shown in Table A.4.4.1.]

Figure 66: The 15 distinct ways of tiling the $3 \times 2$ torus from a set of tile designs that consists of two orbits, each containing a single tile design.

## B. 5 The $n \times n$ torus

B.5.1 Under the symmetries of the square

Illustration B.5.1.1. [This is shown in Sequence A.5.1.1.]

Figure 67: The 26 ways of tiling the $3 \times 3$ torus up to $D_{8}=\langle r, f\rangle$ from a set of tile designs that consists of two orbits both of which contain an element with stabilizer subgroup $D_{8}$.

Illustration B.5.1.2. [This is shown in Sequence A.5.1.2.]

Figure 68: The 18 ways of tiling the $3 \times 3$ torus up to $D_{8}=\langle r, f\rangle$ from a set of tile designs that consists of one orbit containing an element whose stabilizer subgroup is $\left\langle r^{2}, f\right\rangle \leq D_{8}$.

Figure 69: The 18 ways of tiling the $3 \times 3$ torus up to $D_{8}=\langle r, f\rangle$ from a set of tile designs that consists of one orbit containing an element whose stabilizer subgroup is $\left\langle r^{2}, r f\right\rangle \leq D_{8}$.
Illustration B.5.1.4. [This is shown in Sequence A.5.1.4]

Figure 70: The 4 ways of tiling the $2 \times 2$ torus up to $D_{8}=\langle r, f\rangle$ from a set of tile designs that consists of one orbit containing an element whose stabilizer subgroup is $\langle r\rangle \leq D_{8}$.

Figure 71: The 16 ways of tiling the $2 \times 2$ torus up to $D_{8}=\langle r, f\rangle$ from a set of tile designs that consists of one orbit containing an element whose stabilizer subgroup is $\langle f\rangle \leq D_{8}$.

Illustration B.5.1.6. [This is shown in Sequence A.5.1.6.]

Figure 72: The 17 ways of tiling the $2 \times 2$ torus up to $D_{8}=\langle r, f\rangle$ from a set of tile designs that consists of one orbit containing an element whose stabilizer subgroup is $\langle r f\rangle \leq D_{8}$.

Illustration B.5.1.7. [This is shown in Sequence A.5.1.7.]

Figure 73: The 23 ways of tiling the $2 \times 2$ torus up to $D_{8}=\langle r, f\rangle$ from a set of tile designs that consists of one orbit containing an element whose stabilizer subgroup is $\left\langle r^{2}\right\rangle \leq D_{8}$.
Illustration B.5.1.8. [This is shown in Sequence A.5.1.8.]

Figure 74: The 154 ways of tiling the $2 \times 2$ torus up to $D_{8}=\langle r, f\rangle$ from a set of tile designs that consists of one orbit containing an element whose stabilizer subgroup is $\mathbb{1} \leq D_{8}$.

## B.5.2 Under diagonal and antidiagonal reflection

Figure 75: The 36 ways of tiling the $3 \times 3$ torus up to $\left\langle r^{2}, r f\right\rangle$ from a set of tile designs that consists of two orbits both of which contain an element with stabilizer subgroup $\left\langle r^{2}, r f\right\rangle$.

Figure 76: The 22 ways of tiling the $3 \times 3$ torus up to $\left\langle r^{2}, r f\right\rangle$ from a set of tile designs that consists of one orbit containing an element whose stabilizer subgroup is $\langle r f\rangle \leq\left\langle r^{2}, r f\right\rangle$.
Illustration B.5.2.3. [This is shown in Sequence A.5.2.3.]

Figure 77: The 24 ways of tiling the $3 \times 3$ torus up to $\left\langle r^{2}, r f\right\rangle$ from a set of tile designs that consists of one orbit containing an element whose stabilizer subgroup is $\left\langle r^{2}\right\rangle \leq\left\langle r^{2}, r f\right\rangle$.

Illustration B.5.2.4. [This is shown in Sequence A.5.2.4.]

Figure 78: The 23 ways of tiling the $2 \times 2$ torus up to $\left\langle r^{2}, r f\right\rangle$ from a set of tile designs that consists of one orbit containing an element whose stabilizer subgroup is $\mathbb{1} \leq\left\langle r^{2}, r f\right\rangle$.
B.5.3 Under $90^{\circ}$ rotation

Illustration B.5.3.1. [This is shown in Sequence A.5.3.1.]

Figure 79: The 28 ways of tiling the $3 \times 3$ torus up to $\langle r\rangle$ from a set of tile designs that consists of two orbits both of which contain an element with stabilizer subgroup $\langle r\rangle$.

Figure 80: The 24 ways of tiling the $3 \times 3$ torus up to $\langle r\rangle$ from a set of tile designs that consists of one orbit containing an element whose stabilizer subgroup is $\left\langle r^{2}\right\rangle \leq\langle r\rangle$.

Figure 81: The 23 ways of tiling the $2 \times 2$ torus up to $\langle r\rangle$ from a set of tile designs that consists of one orbit containing an element whose stabilizer subgroup is $\mathbb{1} \leq\langle r\rangle$.
B.5.4 Under diagonal (equivalently antidiagonal) reflection

Figure 82: The 44 ways of tiling the $3 \times 3$ torus up to $\langle r f\rangle$ from a set of tile designs that consists of two orbits both of which contain an element with stabilizer subgroup $\langle r f\rangle$.

Illustration B.5.4.2. [This is shown in Sequence A.5.4.2.]

Figure 83: The 32 ways of tiling the $3 \times 3$ torus up to $\langle r f\rangle$ from a set of tile designs that consists of one orbit containing an element whose stabilizer subgroup is $\mathbb{1} \leq\langle r f\rangle$.

[^0]:    ${ }^{1}$ This will give a unifying framework for over a dozen OEIS sequences including but not limited to A054247, A225910, A086675, A179043, A184271, A184284, A184277, A222187, A222188, A255015, A255016, A295223, A302484, A295229, A047937, A343095, A343096, and A200564.

[^1]:    ${ }^{2}$ We will later see that we use $D_{4}$ in the case of the $n \times n$ cylinder as well.
    ${ }^{3}$ Shifting just the rows is equivalent to shifting just the columns. Here we will always use the convention of shifting just the columns.
