# Not a Swiss Army Knife: Academics' Perceptions of Trade-Offs Around Generative Artificial Intelligence Use

AFSANEH RAZI<sup>\*</sup>, Drexel University, U.S.A LAYLA BOUZOUBAA, Drexel University, U.S.A ARIA PESSIANZADEH, Drexel University, U.S.A JOHN S. SEBERGER, Drexel University, U.S.A REZVANEH REZAPOUR, Drexel University, U.S.A

In the rapidly evolving landscape of computing disciplines, substantial efforts are being dedicated to unraveling the sociotechnical implications of generative AI (Gen AI). While existing research has manifested in various forms, there remains a notable gap concerning the direct engagement of knowledge workers in academia with Gen AI. We interviewed 18 knowledge workers, including faculty and students, to investigate the social and technical dimensions of Gen AI from their perspective. Our participants raised concerns about the opacity of the data used to train Gen AI. This lack of transparency makes it difficult to identify and address inaccurate, biased, and potentially harmful, information generated by these models. Knowledge workers also expressed worries about Gen AI undermining trust in the relationship between instructor and student and discussed potential solutions, such as pedagogy readiness, to mitigate them. Additionally, participants recognized Gen AI's potential to democratize knowledge by accelerating the learning process and act as an accessible research assistant. However, there were also concerns about potential social and power imbalances stemming from unequal access to such technologies. Our study offers insights into the concerns and hopes of knowledge workers about the ethical use of Gen AI in educational settings and beyond, with implications for navigating this new landscape.

Additional Key Words and Phrases: Sociotechnical implications, Transparency, Ethical use, Generative AI

## **1 INTRODUCTION**

Remarkable effort spanning the computing domains (e.g., natural language processing [NLP], humancomputer interaction [HCI], AI, etc.) is currently being devoted to understanding the sociotechnical implications of generative AI (hereafter Gen AI) technologies (e.g., [5, 65]). The deployment of ChatGPT, in particular, has led to extensive research into the positive and negative implications in domains like education (e.g., [12, 76]).

There is relatively little research directly addressing Gen AI in the context of "knowledge work" (cf [43]) – or labor involving the creation, dissemination, and management of information [66]. Recent studies have identified the need for specific framework around academic integrity [67, 75, 76] to mitigate harmful content and negative social impact. Yet, a gap remains in understanding the

nuanced implications of these models within academic knowledge work itself. The ever-growing integration of Gen AI tools into knowledge-intensive professions, spanning writers, researchers, and students, warrants further exploration into the ethical trade-offs faced by people in academia.

This work addresses this gap by answering the following question **RQ**: *How do knowledge workers in academia perceive of trade-offs involved in the use of Generative AI*? To answer our RQ, we conducted semi-structured interviews with 18 knowledge workers professionally situated in academia (i.e., faculty, students, teachers, and librarians). Thematic analysis (TA) [11]was used to produce systematic and situated knowledge about our participants' perceptions of Gen AI in relation to their knowledge work roles. We found six prominent themes around general and knowledge workspecific challenges, including 1) challenges in training data reliability, accuracy, and data privacy and governance, 2) human-AI collaboration and writing, 3) trust and ethics in education, 4) adopting AI in education challenges and opportunities, 5) bridging knowledge and social class gaps, and 6) practical solutions including AI literacy and regulations.

We discuss these themes and highlight the ethical considerations arising from the opportunities and challenges presented by Gen AI in academia. Concerns about model training, the use of Gen AI as a writing assistant, growing distrust among students and educators, and the need for appropriate pedagogy are reported, illustrating participants' concerns and hopes regarding how Gen AI is reshaping workflows, demanding new skills, and redefining the nature of knowledge work. Findings revealed promise and uncertainty: while Gen AI may augment human capabilities and democratize information, it raises concerns about potential biases in AI outputs and the erosion of critical thinking skills.

Our work underscores the importance of fairness, accountability, ethics, and trust in developing and applying Gen AI tools in knowledge work. By addressing these key areas, we aim to foster AI systems that are not only technologically advanced but also ethically sound and socially responsible. Our research advocates for a balanced approach that equally prioritizes technological innovation and ethical considerations to ensure the equitable and transparent development and use of Gen AI tools. Our findings can help devise guidelines and frameworks that contribute to building and maintaining public trust in AI technologies, ensuring their use benefits society as a whole, respects human rights, and promotes social welfare.

#### 2 RELATED WORK

# 2.1 AI Accessibility, Governance, and Regulations

The emergence and widespread availability of advanced AI tools like Open AI's ChatGPT and Google's BARD have significantly highlighted the importance of equitable access to AI technologies. This development has started a renewed focus on challenges and opportunities related to AI accessibility. The issue of fairness in accessing AI tools, and democratization of AI models [52], along with the facilitation of access for people with less technical skills and knowledge [50] have become more prominent these days with no barrier to access [72]. The digital divide, initially described as the disparity in access to computers and the internet [41, 74], has evolved to include a second-level division concerning differences in internet skills and usage across various groups and cultures [60]. Gen AI technologies, while advancing, potentially exacerbate this divide. Factors like lack of device access, internet restrictions, and cultural barriers in AI understanding and utilization, particularly for marginalized groups and the elderly, highlight the need for more accessible AI and AI literacy training [10, 13, 20]. In addition, Gen AI poses risks of exacerbating income inequality and market monopolization [14, 78]. The over-reliance on the Gen AI tool suggests that low-skilled workers may be replaced in the near future, widening the income gap, and favoring large companies with the necessary resources and infrastructure, potentially leading to

ACM,,

industry monopolies [16, 23]. Kasneci et al. [39] highlights the significance of multilingualism and financial fairness as two important aspects of LLM accessibility, underlying the predominance of English in LLM research, which poses challenges for the speakers of other languages, and advocating for regulatory measures to bridge financial disparities and promote equitable access in diverse educational contexts.

Expanding on the theme of fairness in AI accessibility, other aspects are imperative to consider, including algorithmic bias and ethical considerations in AI development [21, 40], which can impact marginalized communities and reinforce existing inequalities [41]. Additionally, the need for regulations and clear guidelines and standards for AI governance is crucial to ensure responsible AI deployment and minimize potential harm [25, 72]. In response to the rapid growth of advanced AI technologies, there has been a growing body of research dedicated to examining ethical implications, regulatory requirements, transparency, and governance aspects of these tools [4, 5, 32, 40, 51, 53, 61, 79]. Hacker et al. [32] argue that regulation should prioritize transparency and risk management, and broaden content moderation guidelines to include governance in Gen AI models. Pistilli et al. [53] discuss the interconnectedness of ethics, law, and computer science in influencing the development and implementation of AI systems, highlighting the potential for improved and responsible development and governance through the integration of complementary theories and frameworks from these disciplines. Furthermore, the incorporation of a principled and human rights-based approach to AI in the use of chatbots, centered around promoting values of human dignity, autonomy, transparency, accountability, and non-discrimination, has been recognized as a crucial element in AI regulatory frameworks [4, 55]. Previous research underscores the critical importance of prioritizing transparency, explainability, and interpretability in the future development of Gen AI tools to mitigate potential harms, including the spread of misinformation, risk assessment, liability, fact-checking, regulatory requirements, and the enhancement of AI literacy [72, 79].

#### 2.2 Data Accuracy and Privacy

LLMs, characterized by their billions of parameters [52], require substantial training data. This data, frequently collected from online platforms, often without explicit consent from the users or creators of the content, includes sensitive and private user information and is subject to inherent biases [8]. When LLMs are trained on public online data, there is a risk of perpetuating these biases, which can result in a range of harms and challenges for users interacting with these models [79]. On one hand, the collection of more extensive data can lead to improvements in the model's performance, enhancing its accuracy and effectiveness [77] and on the other hand, there is a need to prioritize user privacy and ethical considerations [77]. This dilemma poses a significant challenge and necessitates careful research to better understand the trade-offs and balances required in ethical training and developing these models [5, 77]. As shown in previous research, privacy concerns were identified as one of the major societal implications of Gen AI tools [5]. In a qualitative study, Rad and Rad [55] conducted a focus group study with 10 psychology students who had interacted with chatbots and identified privacy risk as a user concern when interacting with ChatGPT. In addition, manifestations of false authorship and plagiarism, hallucinations, and accidental spread of misinformation are highlighted as other harmful aspects of ChatGPT [5, 35, 44]. Hallucination, defined as the generation of a piece of text by LLMs based on their internal synthesizing algorithms, rather than the true context or real evidence [35], can be especially problematic in sensitive areas such as healthcare or the legal field [44]. Zhou et al. [81] analyzed the nature and dangers of misinformation created by AI during the COVID-19 pandemic and identified linguistic variances between human and AI-generated content, such as formulating conclusions, and mimicking personal tones, demonstrating distinct patterns in how AI conveys misinformation.

Similarly, Gadiraju et al. [25] surveyed 56 participants with disabilities to explore the existence of harmful false information in AI-generated content and found misleading and hurtful misinformation in generated content, i.e., stating people who use a wheelchair can not play basketball [25], highlighting the existence of intrinsic bias and the need for governing Gen AI models.

#### 2.3 Trust, Ethics, and Adapting to AI in Education and Beyond

While Gen AI has the potential to transform communication, including written communication, it has led to much speculation and concern about what these developments may mean for different professions, in education and beyond, in the near and long-term future [34, 48, 49, 71]. One major concern linked with the emergence of Gen AI is the "death of the author" or "death of writing" concepts, which implies a major shift in how written works are created and viewed, casting doubt on issues of originality and authorship, and questioning the trustworthiness of an AI-influenced world. While some research highlighted ChatGPT's effectiveness in creative writing and its capability to revise outputs, proving beneficial for learners in generating new ideas, overcoming writer's block, or receiving feedback on their writing [49], other studies have raised concerns. For instance, Inie et al. [34] points out that professionals are worried about the widespread use of advanced technologies like ChatGPT, fearing they could lead to a decline in quality, harm the creative process, and pose copyright issues. Concerning the adoption of Gen AI in higher education, Yang [76] collected public opinion on Weibo, a Chinese social platform, to investigate the impacts of ChatGPT on education and found data security and potentials for student cheating as two major concerns raised by the community, highlighting the need for implementing policies that would prevent students from academic misconduct.

Furthermore, the potential use of ChatGPT in teaching and learning has been explored in computer programming [9, 15], data science education [80], economic and finance [27, 28], and medical education [3, 42]. In a thematic analysis, Shoufan [64] identified 8 positive (helpfulness, ease of use, and human-like conversation) and 7 negative (inaccurate answers and potential malicious misuse) themes based on the perception of students about ChatGPT. Yang [76] found ChatGPT and similar technologies helpful for students in learning at their own pace, creating a more personalized and customized education process; and reducing the workload of educators by minimizing their repetitive tasks. Similar studies found LLMs useful for creating educational content, improving student engagement, personalizing learning experiences, and functioning as a tutoring chatbot [38, 58]. On the other hand, Mosaiyebzadeh et al. [49] argue that while ChatGPT can make research and education processes more efficient, it poses different challenges, such as the potential for cheating on exams and homework, risking academic integrity. Also, it creates human-looking text that is challenging to detect. Previous work [2, 49] identified some of the threats and ethical challenges posed by this technology that need to be addressed, including data privacy and security, transparency, and disclosure, lack of fact-checking, accidental plagiarism, and absence of emotions in teaching. Other work raised concern about ChatGPT's potential to hinder critical thinking and other essential skills in students [67, 75]. These studies emphasized the critical need for specific guidelines, increased classroom assessments, and mandatory reporting of AI-based technology usage. Additionally, they argue for the implementation of appropriate regulations and ethical frameworks to maximize the educational benefits of ChatGPT while minimizing plagiarism and other academic concerns [5, 57].

#### 3.1 Study Design, Rationale, and Data Collection

We designed a semi-structured interview protocol to understand how knowledge workers perceive the ethical trade-offs related to the use of Gen AI, focusing on their interactions with ChatGPT and similar tools. We chose to engage with knowledge workers situated in university settings (e.g., students and faculty). Our decision to focus on this group was twofold. First, they represent a key demographic directly using and impacted by Gen AI (e.g., for activities like writing or translating). Second, we believed individuals active in academia would have the technical background to offer nuanced perspectives on the ethical considerations and potential for human-AI collaboration with Gen AI in their fields.

The semi-structured interviews were divided into three sections. The first section focused on understanding participant familiarity with ChatGPT (e.g., "How did you become familiar with ChatGPT?"). Contextual information included in responses to questions from the first section situated responses to the second interview section: eight questions intended to elicit information about how participants perceive Gen AI in general (e.g., "How do you think ChatGPT can impact people's lives?"). The third section of the interview included seven specific questions about participants' use of ChatGPT in knowledge work specifically (e.g., "What are some scenarios in which ChatGPT can be used in academic research and teaching?"). Conducted via Zoom, interviews ranged from 40 to 70 minutes, with a mean of roughly 50 minutes. Participants received a \$15 Amazon gift card as compensation for their time and effort. Interviews were conducted between April and May of 2023, roughly five or six months following the public deployment of ChatGPT.

#### 3.2 Participant Recruitment & Demographics

We interviewed 18 participants recruited through purposive snowball sampling via social media. All participants were knowledge workers in academia, including six identified as faculty (P3, P5, P8, P13, P15, P17), nine as students (P1, P2, P4, P9, P10, P11, P12, P14, P18), and three as postdoctoral, librarian, and teacher (P6, P7, P16). Eleven participants (61%) self-identified as male (P1-5, P8, P9, P10, P12, P14, P16), six (33%) as female (P6-7, P11, P13, P15, P18), and one (5%) as non-binary (P17). While efforts were made to ensure a diverse sample, we acknowledge potential limitations in the gender distribution of our participants.

#### 3.3 Data Analysis

We deployed thematic analysis (TA) [11] to analyze our data. Two research assistants (RAs) conducted the initial open-coding of data to develop a broad range of potential codes. During the open coding phase, RAs regularly met with senior members of the research team to discuss and refine the evolving codebook. The two RAs independently coded 10% of the interviews using the finalized codebook. We used Cohen's Kappa to calculate agreement between the two coders [47] and reached a sufficient agreement ( $\kappa > 0.6$ ). The RAs then coded the remaining interview data. After the coding was complete, the research team met to group the code conceptually into themes. The final codebook, final themes, and the prevalence of such themes are displayed in Table 1. In the following section, we narrate our findings, dedicating one subsection to each of the six final themes presented in Table 1.

# 3.4 Ethical Considerations

We obtained an IRB's approval from our Institution which deemed this study as exempt. We had a Study Information sheet presented for participants to review before agreeing to participate in our study through an online survey. All our team members completed CITI training for working

with human subjects. In addition, we took the utmost care to protect the privacy of participants by anonymizing their interview transcripts before the data analysis. We ensured the anonymization of quotes presented in our manuscript as well.

# 3.5 Researchers Positionality

The authors of this paper used Generative AI models and conducted research in this area. They also have backgrounds in information and computer sciences. These background and experiences may have influenced or informed our work.

#### 4 FINDINGS

#### 4.1 Challenges in Data Reliability, Accuracy, and Governance

All eighteen participants (100%) expressed concerns about the training data used for ChatGPT (i.e., an instance of Gen AI). Such concerns included: bias baked into Gen AI by way of training data, breach of copyright law in the training of models through unauthorized use of copyright material, outdated information, and lack of fact-checking. When discussing such awareness, participants recommended thorough oversight of model training. Yet recommendations for oversight dissolve into the complexity of factors associated with participant perceptions about Gen AI. Participants questioned the credibility of ChatGPT's data sources and emphasized the importance of establishing mechanisms to improve reliability and accuracy of information generated by these models.

"Where is ChatGPT getting the information? But what exactly is the evaluation process for this information? How I will show that this information is valid and they are quality information. So if we are not sure about these things, and maybe by mistake or by some silly algorithmic function, it pulls out some inferior information, if I may use the word, and you just fly with that information, then we might be facing another pandemic of misinformation"- P2

Participants expressed concerns about biases arising from training data. Participants mentioned the following forms of bias: racial bias and gender bias. Participants also raised concerns about general cultural insensitivity. In short, participants expressed opinions summarized by the following quote from P14: "*the machine learning model is only going to perform as well as the data is based on.*" Such concerns are further complicated by the opacity of models. For example, P7 worried that developers of Gen AI systems do not clearly understand how models generate outputs. Such opacity makes it hard to verify the semantic content of language produced by ChatGPT:

"T'm very concerned about the potential for this kind of AI and the biases that could be in it because it is so opaque like where it's pulling information from how it's generating that information is completely opaque, that is, up to the developers to design. And my understanding is that in many cases they don't really understand how it's coming up with the results from the datasets they feed in. So that's really problematic in terms of try to cross check that information."-P7

Such concerns were entangled with questions about privacy concerns and the copyright of the generated content.

"Who owns the work that the AI produces? And then, whenever you feed it where it's like the questions of mine that I have, you know, fed it to see what it does. Will AI claim some kind of ownership of that? Where or what will happen with that writing in the future?"-P17

Participants further noted concern about models trained on data that is outdated:

"It can't get information from local communities and timely events. It doesn't understand references to things that have happened in someone's community. There's also work online, that it can't access that has to do with more with digging around in databases and archives and stuff. ChatGPT is actually terrible with databases, so what you've done is you combined the things it's good at and the things that humans are good at and put them together."-P8

Fifteen participants (83%) expressed concerns about AI "hallucinations" and potential inaccuracies and false information generated by AI and their lack of understanding regarding how generative AI chatbots generate content. "It's not a Swiss army knife where you can just use it in every situation. You need to be very precise with what you are using it for, and not knowing what its limitations are. [...] you cannot use it to verify facts, because it doesn't know what is, it doesn't have it doesn't give you references of any sort. People should be made aware of the hallucinations that it does, because it sounds very confident when it gives answers and if somebody doesn't know that, hey, it could be wrong, then they are going to suffer the consequences of that, and that is going to be the biggest negative impact in my opinion."- P12

Participants further expressed concerns about Gen AI sources of information and the lack of fact-checking mechanisms. The fear is that users might blindly trust the information provided without verifying it, leading to the spread of misinformation:

"I think a lot of people believe what it tells them, and if there are no safeguards, it could cause a lot of misinformation. And I think misinformation tends to snowball, so I don't know what guardrails exist on ChatGPT on where it's pulling its information from. [...] Fact-checking is also a big mountain to climb, so I don't know if the Internet can truly ever be fully fact-checked. But if it's not being fact-checked, I think a lot of people stand to lose from it, and I think that's when it becomes harmful. So I think it's harmful for people who believe anything that technology tells them without doing their own research. -P9

Twelve participants (67%) expressed concerns about data governance, data privacy, and use. They argued that the general public should have more insight and control over the data being used by ChatGPT. Even the participants who were not as worried about data privacy and governance compared with their social circles also conveyed concerns:

"I have a lot of friends who are worried about the lack of transparency in terms of what the company is doing with user data. [...] I don't want to speculate about what the company might do, but it's worrying that they won't tell us how long my queries are held. How identifiable are they who have access to what I have searched for? And when would that happen?"-P3

# 4.2 Human-AI Collaboration in Writing

Knowledge workers involved in research have recognized the value of Gen AI as a writing tool. They mentioned its potential to assist with proofreading for grammatical errors, formatting citations, and more (N=11, 61%). One participant even compared ChatGPT to asking their spouse for proofreading assistance, highlighting the convenience it offers. Additionally, participants acknowledged the potential of Gen AI as a research assistant (N=8, 44%) during the initial phases of research, particularly for ideation. They have mentioned its current use for ideation and the possibility of enhancing the research ideation process by providing real-time insights on the current state of the art and identifying research gaps - a feature not currently available in general tools like ChatGPT due to gaps in training data.

"I would say, I do think just in terms of the process of developing a research project. I mean, my experiences with it are that accepting the limitations that exist can be very useful, almost as a research partner, right? Because it does have access to this massive dataset that it can pull up instantly. And I think there are a lot of potentials to develop and refine ideas and projects and things like that and engagement"-P7

Users mentioned that generative AI can be a helpful tool for addressing "writer's block" (N=5, 28%) as well as assisting with grammatical errors, formatting citations, and general ideation. They claimed that ChatGPT makes it easier to write by providing guidance for their paper, preventing

them from spending excessive time staring at a blank page, and allowing them to write more efficiently.

Furthermore, participants (N=9, 50%) expressed dissatisfaction with ChatGPT's inability to capture personal voice and style, particularly in tasks like writing cover letters or essays. They noted that while ChatGPT produces acceptable content, it often lacks the unique personal touch that makes such communications authentic.

"...But I still think it does the job as in like it gives you a cover letter that's acceptable, but something that I did not like about it was, and it's pretty obvious, it doesn't feel like me and I think when we need something like a cover letter, or like you're writing an essay for a class, I think it's personally important for me to feel like this is my voice and I think it's difficult for ChatGPT to replicate that I know some people have uploaded their own writing samples, told it to analyze it. I haven't tried that yet..." -P9

The issue of potential overreliance (N=6, 33%) to ChatGPT was also raised. Participants (N=3, 17%) worry that excessive use of ChatGPT for assignments could hinder critical thinking and diminish the benefits of collaborative learning.

"Maybe some people might get so dependent on it. Yeah, I know some people don't do any of the assignments and only depend on ChatGPT... I remember we had this course, it was very tough, and we used to get together a few people in a group and then talk about it, discussing, Googling it, reading books. But when you use ChatGPT you're not doing any of this. You're just getting some prepared answers. So I think ChatGPT won't let them [people] think." -P18

Considering the potential consequences of overreliance on Gen AI participants acknowledged the tradeoff of speed vs. authenticity. Using Gen AI to create content may speed up efficiency; however, it could stifle human originality and expression, leading to homogenization of content. Additionally, assuming that the quality of content developed by Gen AI is suitable, the need for human innovation in those areas could decline, leading to a decline in human creative potential and problem-solving abilities.

# 4.3 Trust & Ethics in Education

The most expressed concern in academic settings regarding Gen AI was the use of AI detection services, which may produce inaccurate or misleading results (N=13, 72%).

"There was a professor in Texas who heard about these tools [ChatGPT] and wanted to make sure students were not cheating on their final papers[...] I think those are wildly irresponsible to use right now. But what he did was actually paste their essays into ChatGPT and ask ChatGPT, "Was this written by you?" And of course it came back and said yes, for like 90% of his class, and then he failed them all because he did not understand what that system was actually doing." - P5

Another concern was cheating (N=11, 61%), especially in writing assignments. Participants were concerned that students, under stress from their coursework, may attempt to submit papers generated by AI to meet deadlines instead of asking for extensions or writing their own work:

"They run out of time [for assignments], and that's when they [cheat]. So, we just have to ask questions expecting them to use it [ChatGPT] so that they can't cheat, because that's the expectation." -P16

Although cheating was frequently expressed, there was also mention of the concern of creating a distrustful culture between students and teachers (N=8, 38.1%). We observed opposing forces around trust and Gen AI as a threat by faculty versus a tool by students. Students expressed that

they felt accused of using ChatGPT to bypass learning and not understanding concepts, such as the below quote by a student:

"Yesterday my friend told me that her English teacher wanted to fail her from the class because she used ChatGPT to write an assignment. Of course, one wouldn't want to complete an assignment, so they can just kind of ask ChatGPT to do it. But then that begs the question. What are you grading them on? Are you grading them on original thought and understanding of the concept? Or are you grading them on how many words they wrote, and whether it's grammatically correct? Instead of AI writing for you, if it writes with you and becomes this writing coach, you don't consider that as plagiarism, right? Because they're helping you develop that skill in whatever you're doing. So using AI to help you develop something versus just kind of answering for you. It's going to become like a writing course for you. So plagiarism would be there, but then we just have to rethink the way we test students." - P14

Whereas faculty felt that Gen AI needs to be used more responsibly by students:

"Since the pandemic started, there's been more and more programs that use cameras and technology to monitor your students sometimes. And I guess that's a kind of AI. Maybe as far as how it watches the students and flags students for doing a behavior that it deems suspicious. And so, I guess that's another area where I would have concerns about the AI and that technology. I guess my concern is kind of like a combination of the privacy of students and my ongoing philosophy for a long time has been to trust students. Lately that's been challenged; I'm seeing cases where I can't trust the work I'm getting. That I know is not theirs. So that's kind of a concern, you know privacy and trusting students, and then just wanting students to learn. And I mean, to enjoy learning for the sake of learning, that's something that I always try to really emphasize to my students." - P17

We had diverse perspectives on the matter of distrust, such as the fear that students will suffer the consequences or faculty accepting Gen AI from faculty and students.

Among the interviews, 39% (N=7) of the participants emphasized the importance of considering the appropriate scenarios for using generative AI. The mental model of proper usage encourages people to adapt to a changing learning environment where AI is increasingly present. Participants mentioned that when debating which tasks are ethically acceptable to delegate to AI, they explore issues such as accountability, transparency, and fairness:

"For example, if I need to know how to use a saw properly, I can just say what's the good way to use a saw [...] if you know for a fact that information won't affect your health or your livelihood. I think you can use ChatGPT there, because if it's going to affect your health, I wouldn't be asking ChatGPT here how to treat cancer...I might ask that: Hey? You know what, I have a minor cut, what's gonna be the best way to disinfect it so, depending on the severity of something, I think ChatGPT can be used in scenarios like that."-P12

# 4.4 Adapting to AI in Education: Challenges & Opportunities

Participants expressed that Gen AI could assist students in quickly identifying and presenting relevant sources of information for their assignments, saving them time compared to traditional internet or textbook searches. Instructors also recognized the potential of generative AI to modernize the classroom but acknowledged the importance of "pedagogy readiness" - the reflection on how to incorporate AI technology into teaching practices. 94 percent of participants (N=17) emphasized the significance of pedagogy readiness, suggesting that students should be encouraged to critique Gen AI responses instead of solely relying on them to solve problems. This approach would enable students to develop critical thinking skills typically reserved for research-based courses: "...this sort of paradigm of assignments where you get ChatGPT or similar to do something, and then critique it. Those are pretty useful. I don't think that's the only use case, where there's some educational value to be extracted from these systems other than like special topic in a machine learning course." - P5

Participants recommended modifying the education curriculum to address the potential negative impacts of generative AI on education. The suggested changes encompass a wide range of improvements, including crafting more engaging and relevant assignments, refining question formats to challenge critical thinking skills, selecting materials that enhance knowledge acquisition, and adopting fair and effective evaluation methods to accurately measure progress.

Among knowledge workers, participants in (N=8, 44%) academia expressed the potential benefits of using Gen AI as a tool to supplement student education. They believed that ChatGPT could facilitate easier questioning, topic discussion, and addressing writing issues, acting as an at-home tutor.

"... When a student is learning something in class, you can use AI to supplement that learning, and give everybody a really good tutor, right, like I mentioned before. If everybody is given a really good tutor, everybody's performance becomes really good. It's not just a below average student becomes an above average student, and an average student becomes an excellent student..." - P14

Participants discussed the potential for generative AI to accelerate the pace of education (N=7, 39%). They mentioned that AI could provide quick access to information, allowing students to learn at their own pace and enabling educators to cover more material in a shorter amount of time. However, concerns were also raised about the risk of sacrificing depth of understanding and critical thinking skills in favor of speed.

Further, some participants (N=4, 22%) proposed returning to a more traditional style of education for curriculum and assignments. They suggested having oral exams without tools like PowerPoint to ensure students cannot rely on AI.

"T'm going back to oral exams. I can't do an AI with an oral exam. Well, I'm actually not opposed to doing more oral exams but I think that's a sign that the person isn't even ready to engage in the conversation. All they know how to do is to pull back from it. Given that there are some people who know very well what to do, and am also pulling back from it."-P3

Moreover, some participants (N=2, 11%) expressed concerns about students relying too heavily on Gen AI in the classroom. They believed this reliance could lead to a lack of foundational knowledge in a topic, making students unprepared for advanced courses and ultimately resulting in failure.

# 4.5 Bridging Knowledge Gaps, Enabling Accessibility, and Social Dynamics Impacts

Our participants raised several benefits and concerns about the potential impacts of using generative AI, highlighting a range of issues from societal impacts to personal experiences. A significant concern, expressed by half of our participants (N=11, 61%), was the potential of ChatGPT to either widen or bridge social class divides. The fear was that access to, and the use of advanced technologies like ChatGPT might create or exacerbate inequalities, either by providing advantages to those who can access it or by leaving behind those who cannot.

On the contrary, ChatGPT was particularly appreciated by participants (N=5, 28%) for its role in democratizing access to knowledge, enabling a broader range of individuals to engage with information and learning resources.

"Whether it be academic or non-academic, the gap between the Western society and developing could be like India, has virtually closed because of the Internet. So I think ChatGPT can only take that further [...]I think there are a lot of opportunities in it being like an equalizer tool where people from different parts of the world are coming up with the same by-product because they had access to the same tools." -P9

Furthermore, participants (N=2, 11%) highlighted ChatGPT's role in aiding people with disabilities. One individual with a visual impairment recounted how ChatGPT acted as a reading assistant, interpreting and verbalizing written content that they otherwise found challenging to access.

"... This could also be beneficial for people who are visually impaired, allowing them to understand specific parts of an article or content. Additionally, I think it would be useful to take pictures of artifacts and have ChatGPT describe what they are. Overall, I see a lot of potential in these applications of ChatGPT..." -P6

# 4.6 Practical Solutions from AI Literacy to Regulations

Participants came up with several practical solutions when asked about overcoming the challenges with generative AI. Many participants (N=12, 67%) mentioned that there needs to be a better understanding of the technology in people's lives to use generative AI effectively and ethically. A solution to these issues is to educate people on the capabilities of generative AI and provide awareness of its limitations. For example, P2 stated that people always find a way to use new technologies even if it is banned with punishments, so the solution is to teach them to use them responsibly:

"T'm mentioning information literacy so much because this is what I know about, and it's something I've been reading. You need to let student know that there is no problem in using it. But you have to use this responsibly. It is more about awareness and creating awareness, Train people to know how to use it, and know where to use it and where not to use it."-P2

Faculty initiated talks and workshops to educate other colleagues and instructors on generative AI:

"So rather than you know, kind of jump to the idea of banning it, my colleagues and I were more interested in well, are there ways we can harness this for good? Can we make our classes better rather than worse by using this technology in the classroom? So we've held a series of conferences and webinars on the topic." - P8

Further, many participants (N=11, 61%) called for the need for regulations and policies to control some aspects of the use of generative AI. They provided examples of cases of how those regulations would be helpful in different sectors. They called these policies and regulations to ensure the ethical use of generative AI and to limit the power that it has.

"For the government, you should create laws, because if the roots or the source of this data is checked, I think it'll help a lot. I mean, they just need to create laws and policies, we'll make sure that the contents of this data are well-sourced, and it might reduce the chances of giving very bad results at the end of the day."- P1

Participants (N=8, 44%) expressed the lack of ethics built in for generative AI. They expressed concerns regarding the potential for harmful application of artificial intelligence when ethical considerations are not embedded within its design. However, integrating ethical principles into AI is also a subject of debate. Participants described different scenarios that malicious users could use generative AI to commit crimes and harm others, from stealing from banks (P1, P4) to building bombs (P12):

"Just imagine, like terrorist organization getting their hands on this thing because you also don't even know what the training data set is. So it might have some darknet resources as well on there so what if you did write a prompt that gives you access to building any sort of an explosive over there which is not going to be. You can say that I don't have access to Ingredient X, can you suggest some common ingredients and it might be able to give you. "-P12

They mentioned many of the safeguards implemented to avoid receiving harmful information could be bypassed by role-playing and jailbreaking techniques.

"Yesterday in class for the first time, students reported that ChatGPT was breaking rules, being asked to roleplay and the reason is that you can get it to do things that are outside of the safety protocols by asking it to take on a role that is somehow like imagining that it's some creature that isn't bound by the rules that it's normally bound by."-P8

P8 elaborated further that companies such as OpenAI constantly try to safeguard their models against these attacks, and it is hard to cover all the possible ways that these models could be exploited.

Only a couple of participants (N=2, 11%) noted the call for the developmental pause of the generative AI. In those cases, it was to say it is important to regulate and enforce those regulations. However, it is hard since the powerful companies would still try to take advantage of the situation:

"I think it's very unclear how you could regulate this stuff. The solutions that have been proposed include a pause but without a sort of you know government mandate, or some way of enforcing that is hard to do [...] some of the tech companies have actually asked for a pause. You know the head of Google is like, hey, let's have a pause, because then they could be more assured that they can roll out their tool safely, as opposed to another company, galloping forward and just putting the tool out without thinking about how what the bad effects it could have. So sometimes companies actually ask for regulation as a way to make sure they don't get caught blindsided by other companies that are less ethical."- P8

Overall, participants provided various solutions in order to adopt the responsible use of Gen AI since they mostly believed that it is inevitable to pause the development and use of it.

# 5 DISCUSSION

# 5.1 Utility vs. Transparency Trade-offs

Our findings highlight the tension between the potential benefits of Gen AI and the ethical concerns raised by knowledge workers. While recognizing its potential to improve the efficiency of academic pursuits, participants also expressed concerns about the trade-offs associated with this technology. These include the risk of introducing learned biases, the potential loss of individualism in voice, and over-reliance on Gen AI, which could impact learners' understanding of foundational concepts in the long term. These issues have recently become the focus of various studies conducted in different contexts. In this section, we will delve into these considerations and their implications among knowledge workers.

One concern raised by the participants was the potential misuse of Gen AI as a writing assistant. They expressed worries about academic integrity and trust breaches, whether by educators, students, or research faculty. Already, there has been growing concern about student cheating even prior to the widespread use of Gen AI [7, 46, 69]. Now, students face false accusations from AI plagiarism detectors, leading to a loss of trust in student work by their educators. The limitations of AI detection tools further compound these concerns, as highlighted by Gorichanaz [30]. Our

finding that faculty see ChatGPT as a threat, whereas students see it as a tool, implies fundamental, but implicit, misunderstandings about how the educational context (i.e., the social purpose of education) may degrade trust in academic settings.

Another concern raised by participants related to the biases present within the training data used for Gen AI. These models learn from diverse public datasets over the internet, which often reflect societal biases, including racial, gender [12], and disability biases [25]. As a result, generated content may inadvertently perpetuate and amplify these biases, raising ethical questions about the responsible use of such technologies. The human biases inherent in training data would be magnified in Gen AI systems[8], as they will be adopted vastly in different fields across the globe. It is worth noting that one of the major players in this field, OpenAI, has reported that a large portion of their training data came from Reddit, a pseudo-anonymous social media platform that is known for its diversity in topics, plethora of communities, and levels of engagement [17]. Such data are mostly in English and produced by WEIRD (Western, Educated, Industrialized, Rich, Democratic) community [33]. Also, while this content may be considered more 'high-quality' due to the selection criteria of data (at least 3 karma) [68], it often provokes intense reactions from users and tends to be more controversial. This concept, known as digital emotion contagion [29], suggests that the bias from emotionally intense training data could impact the Gen AI model's output. Therefore, this warrants more research, especially with communities impacted most by those biases, to help co-design guidelines and ways to address and mitigate biases in training data, which are essential to ensure fair and unbiased outcomes. Best practices on transparent dataset documentation such as Data Card [26, 54] could be used to create more understanding for various stakeholders of the dataset origins and evolutions for more responsible AI development and deployment. More specific guidelines are needed for Gen AI dataset transparency as they require a larger scale for training the datasets, which are mostly publicly available and need explanations of copyright documentation. Meanwhile, companies care about having the first release of the newest technology and maximizing their profits; therefore, policies and regulations should be put in place to provide those explanations.

# 5.2 Pedagogical Impact

While the use of technology in education has a rich history [1], Gen AI presents unique opportunities to further enhance and personalize learning experiences. Unlike traditional educational technologies that provide static resources (e.g., pre-recorded lectures) or one-size-fits-all solutions (e.g., uniform grading delivery), Gen AI has the potential for dynamic feedback, tailored content, and individualized support. Our study shed light on this unique potential, as participants primarily identified "pedagogical readiness," "educational supplement," and "writing assistant" functions as key opportunities for Gen AI in academic settings. These findings are in line with current literature that explored the use of AI in the classroom [18, 62]. With the advent of Gen AI, educators are introduced to the opportunity to enhance their pedagogy through tackling specific tasks like automated lesson planning, adaptive assessments, and personalized feedback generation. Gen AI assistance in these cases are advertised to free up more time for teachers to dedicate to human-centered tasks, like mentoring. Within the curriculum development processes, Gen AI has the potential to assist educators in developing more personalized learning pathways that cater to student's individualistic needs. For example, an AI tool can recommend personalized reading materials and subsequently practice problems aligned with their learning gaps. Additionally, these tools can offer real-time feedback to students to increase their learning efficiency and the grading of teachers. With the advantage of having just-in-time, personalized support for large-scale settings, and improving the feeling of connection [62], Gen AI ultimately could enhances collaboration between humans and machines, with the goal of improving educational outcomes set forth by entities like

educational oversight committees, teachers, and parents. For non-native speakers, traditional language learning often proved challenging due to limited opportunities for real-time practice and feedback. Gen AI can bridge this gap by providing personalized and interactive dialogue prompts, adapting to individual errors and preferences, and offering context-sensitive suggestions for improvement [36]. This level of engagement can significantly enhance language acquisition, boost confidence in classroom communication, and bridge communication gaps between learners and educators, offering better collaboration and knowledge sharing. Each of these cases allows for Gen AI to act as a virtual, learning scaffold. In times of targeted support, these technologies can provide guided problem-solving and step-by-step explanations but should gradually fade away as students gain confidence in the topic to prevent an overreliance on the tool and, ultimately, a lack of foundational understanding. All these potentials being said, it doesn't mean that incorporating AI would be without difficulties. There has been a body of research [37, 70] on technology adoption in the workplace, which also suggests that automation creates more labor, as workers must learn how to use, incorporate, troubleshoot, and maintain the new technology.

Based on Rogers et al.'s Innovation Diffusion Theory [59], there are factors that affect people's decisions about technological innovations adoption. The two processes of adaption and diffusion are separated in this theory. in which the innovation adoption decision process includes five stages: 1) awareness of an innovation (influence by socioeconomic factors), 2) persuasion (gaining knowledge about the innovation), 3) decision, 4) implementations (acting on the decision), 5) conformation (reflecting and re-evaluation of the decision and implementation). This theory connects with our finding in a sense with stage two of how socioeconomic factors and access to change agents such as mass media influence awareness of an innovation [6]. While participants mentioned that Gen AI has the potential to bridge the educational gap and provide equal access to knowledge, there they were worried about the risk of widening the gap due to unequal access to technology. This widening of the "digital divide" depends on various factors such as access to computers and highspeed internet, as well as a lack of comprehensive understanding of Gen AI, particularly among students of color and the schools that serve them. To ensure that Gen AI is fair and equitable as an educational aid, we need to consider providing necessary technology support to low-resource school districts. Additionally, it is important to develop culturally inclusive Gen AI models to avoid exacerbating existing inequities. This requires frameworks for more ethical data collection. Lastly, to ensure the effective implementation of Gen AI tools, we must provide adequate training and support for educators on how to appropriately utilize Gen AI and manage student interactions with it.

# 5.3 Data and Algorithmic Governance Requires Careful Power Dynamic Considerations

The rapidly evolving capabilities of Gen AI raise urgent questions about responsible development and use. Such concerns primarily involve privacy, ethical considerations, and governance. That Gen AI creates realistic content often blurs the lines between original content and replication. This raised copyright and privacy concerns among our participants. The use of copyrighted material without proper attribution or permission posed possible copyright infringement risks. Moreover, the possibility of generating identifiable information through creative outputs posed a threat to individual privacy. Therefore, rigorous safeguards, like differential privacy and data anonymization [82], are critical alongside stricter regulations and guidelines for handling sensitive data.

While participants suggested AI regulations, questions regarding who should regulate AI presented a dilemma, including the potential for repression [22]. Several countries have already begun to develop executive orders and guidelines to regulate AI [45, 73]. While regulations are necessary to curb potential misuse, centralized control, especially in the hands of powerful entities like corporations and governments, raises concerns about censorship and manipulation. For example, the governments of more authoritative regimes may exploit their power to censor the technology and the internet for surveillance purposes, infringing upon the rights and freedom of speech of their citizens [24]. Even in democratic countries, lobbying may skew policies towards private interests, driven by profits and social control [56], at the expense of individual rights. A potential solution could lie in establishing an independent, global entity to oversee responsible AI practices, accounting for the size and needs of different models and companies.

Although the participants suggested having regulations and policies to mitigate the negative impacts of Generative AI, despite our best intentions, any action to implement applications, policies, or interventions may have unintended consequences that may lead to harm. For instance, a well-intentioned policy designed to reduce bias in AI may have the unintended effect of unfairly targeting a particular group of people. Therefore, we must exercise caution and thoughtfulness in our approach to ensure that we do not inadvertently cause harm while striving to make progress. It is essential to analyze every action's potential risks and benefits and consider alternative approaches to mitigate any unintended consequences [31].

The successful integration of Gen AI into academic settings and beyond necessitates more than just technological adaptation. Substantial adjustments on social, cultural, organizational, and institutional levels are necessary for knowledge workers to ethically and productively utilize this powerful tool. Recognizing the "productivity paradox" associated with computer adoption [19], which took nearly two decades for people to eventually understand and utilize, emphasized the importance of proactive preparation.

# 6 LIMITATIONS AND FUTURE RESEARCH

Our study was focused on knowledge workers in academia. Findings are limited to our participants; findings are not generalizable to everyone in knowledge work. Additionally, our research was US-centric and in English. Future research should investigate the perceptions and experiences of knowledge workers across diverse industries, cultures, languages, and backgrounds to gain a more comprehensive understanding of the ethical challenges of using Gen AI as also recommended by scholars [63]. We acknowledge that the interview methodology is susceptible to self-report biases such as recall and social desirability. Future work should consider gathering observational data, especially in the wild, to understand the trust relationship practices between students and teachers. Finally, our study provides opportunities for future research employing participatory design methods and real-time assessment to directly address the challenges identified, while actively involving stakeholders in designing solutions. This would significantly contribute to the development of human-centric Gen AI tools that meet the needs of knowledge workers across various sectors.

# 7 CONCLUSION

We conducted interviews with 18 knowledge workers from various fields to understand Gen AI's opportunities, ethical challenges, and solutions from their perspective. Our findings highlighted tensions of knowledge workers using Gen AI as a writing and research assistant while wondering about challenges around transparency, reliability, and inaccuracy of generated content. They also expressed concerns about the impact of addiction to using Gen AI causing lacking of personal voice and creativity. Moreover, knowledge workers are apprehensive about the impact of Gen AI on instructors and students. They mentioned pedagogy readiness and giving back to traditional teaching methods as ways to address academic integrity issues. Additionally, they believe that Gen AI could democratize knowledge by making research assistants accessible to more people,

ACM,,

while worried about the social and power dynamics in low socioeconomic people who do not have access to such technologies. Our research contributes to the ethical and fair use of Gen AI in the knowledge work context. It also highlights the need for greater transparency and accountability in Gen AI models, as well as the importance of considering sociotechnical factors in the development and deployment of these systems.
