# Anti-Heroes: An Ethics-focused Method for Responsible Designer Intentions

SHIKHA MEHTA\* and SHRUTHI SAI CHIVUKULA\*, Pratt Institute, USA COLIN M. GRAY and RITIKA GAIROLA, Indiana University, USA

HCI and design researchers have designed, adopted, and customized a range of ethics-focused methods to inscribe values and support ethical decision making in a design process. In this work-in-progress, we add to this body of resources, constructing a method that surfaces the designer's intentions in an action-focused way, encouraging consideration of both manipulative and value-centered roles. *Anti-Heroes* is a card deck that allows a designer to playfully take on pairs of manipulative (Anti-Hero) and value-centered (Hero) roles during design ideation/conceptualization, evaluation, and ethical dialogue. The card deck includes twelve cards with Anti-Hero and Hero faces, along with three action cards that include reflective questions for different play modes. Alongside the creation of the Anti-Hero card deck, we describe the evaluation and iteration of the card deck through playtesting sessions with four groups of three design students. We propose implications of Anti-Heros for technology and design education and practice.

CCS Concepts: • Social and professional topics  $\rightarrow$  Codes of ethics; • Human-centered computing  $\rightarrow$  HCI theory, concepts and models; Interaction design process and methods.

Additional Key Words and Phrases: ethics-focused method, designer intentions, ethical reflection, ethics, values, manipulative intentions

#### **ACM Reference Format:**

## 1 INTRODUCTION

Numerous ethics-focused methods developed by HCI, STS, and design scholars and practitioners enable design decision making[2]. Most methods have been designed for support designers' ethical decision making, evaluate products based on values, and engage critically with consequences of their design decisions, with rare examples that focus on the designer's reflection on their own ethical awareness [1]. Though there have been a number methods and toolkits intended to encourage ethically-focused design practices, we identified an opportunity to design a method that is actor-focused, directing ethical decision making starting from a designer's intention towards a design artifact, and not just the other way around. In this work-in-progress, we present the conceptualization, core, and evaluation of a method titled "Anti-Hero." Anti-Hero is a card deck intended to expose manipulative and value-centered designer intentions and decision making as a designer strategizes, generates, and rationalizes solutions. Connecting the method with the existing landscape of ethics-focused methods, these variously manipulative and value-centered intentions were collated, refined, and filtered to form the 'Anti-Hero' card deck, which we describe in more detail in Section 2.

#### 2 CREATING THE ANTI-HERO METHOD

# 2.1 Conceptualization and Design of the Card Deck

We started our method creation process by studying various role-focused investigations of design behavior conducted by Chivukula, Gray, and colleagues, including the identification of "dark roles" in computing education [6] (e.g., the "trapsetter" and the "puppeteer") and identification of "asshole designer" properties [5] (e.g., being "two-faced"). These descriptions of negative roles that can be employed by designers helped us to construct a set of manipulative roles that focus on value-trade offs between supporting monetary business values and human values. Inspired by Taylor Swift's lyrics "It must be exhausting always rooting for the antihero," we wanted to design a card deck and name it "Anti-Hero" to indicate a playful attitude towards engagement with the cards. To integrate an expansive exploration of ethical considerations, we also created a set of related value-centered roles, indicated as "Hero" roles to counter each manipulative "Anti-Hero" tendency.

We then introduced a set of different prompts to induce engagement with the roles, identified by a set of supportive Action Cards that represented distinct play modes.

As method designers, our main intention with the Anti-Hero card deck was to expose and problematize a range of manipulative and value-centered behaviors designers might take during design decision making surfaced within the literature. The definitions and types include not just a focus on the final solution, but also the user paths, task flows, and user journeys. Though represented through a playful lens, the roles indicate designer behaviors that can surface during the framing, generation, and evaluation of design artifacts. The goal of the role cards was not for a designer to *choose* a particular Anti-Hero or Hero, but rather for them to *engage* with these roles using the Action Cards to better understand their own values and motivations that shape ultimate design outcomes. The playful framing of the method may also present an opportunity for designers to respectfully call out certain unethical or manipulative design decisions in team meetings by raising a Anti-Hero card, simulating a similar action to referees in a football match.

Manuscript submitted to ACM

2.1.1 Anti-Heroes Cards. Once we decided on the two sets of cards—role-based and action-based—in the card deck, we started to formulate the Anti-Heroes and Heroes. We listed all the findings from the "dark roles" [6] which included trapsetter, puppeteer, nagger, camouflager, empathy manipulator, cynic, stakeholder's pet, contingency planner, capitalist, business analyst, and by-the-book. Similarly, we listed "asshole designer" properties [5] including nickling-and diming, two-faced, entrapping, misrepresenting, automating-the-user away, and controlling. We filtered and combined similar manipulative roles to construct 12 Anti-Heroes (full definitions and outcomes are included as Supplemental Material). We primarily adopted the "dark roles" and then converted the asshole designers properties into roles-focused vocabulary. We identified clear definitions for all these roles to describe the intentions these Anti-Heroes would be likely to leverage or actions they would be likely to perform. We then identified *Hero* roles as a value-centered counterpart to each Anti-Hero role, specifically seeking to activate a tension between the Hero and Anti-Hero. We crafted action-oriented names for the Hero roles and further honed the researched set of Anti-Hero roles by adding descriptive intended actions to enhance user comprehension. Finally, we iterated upon the 12 Anti-Hero and 12 corresponding Hero cards to amplify their ethical contrasts. We designed each card to be double-sided so that the corresponding and contrasting roles could be read as a unified entity. Given the physical nature of a card, the cards could be interacted in an engaging manner by moving them around and flipping them over to discover opposing roles. Across the 12 Anti-Hero cards (Figure ??), we identified a range of persuasive techniques potentially employed by designers engaging with design concerns related to privacy (e.g., Trap-Setter), payment systems (e.g., Nickling-and-Diming), user empathy (e.g., Empathy Manipulator or FOMO-Dealer), and user flows or information architecture (e.g., Puppeteer). Since the framing of the cards spans a range of topics and business goals, we anticipate the card-deck will foster a cohesive discussion of design goals and artifacts across different design stages.

Visual Design. Once the fundamental names and definitions were iterated and finalized, the visual design of the cards was furthered by placing key illustrations at the card's core, effectively displaying the intended action visually (Figure 1, left). A clear, centrally positioned Anti-Hero or Hero name was paired with supplementary descriptive text positioned below the illustration. Each card side featured a distinct tag of 'Anti-Hero' and 'Hero' in the bottom right corner, facilitating easy identification of the sides and their relation to each other. Furthermore, the decision of a solid colored backdrop for the Anti-Hero side and a white backdrop for its flip Hero side served as a subtle cue to emphasize the Anti-Hero's significance in its eponymous toolkit.

2.1.2 Action Cards. The Action Cards were developed as supplements to the role-focused cards (Anti-Hero and Hero cards) to serve as different play modes, prompting discussion and fostering critical thinking among designers. To accommodate the different play modes, we created the following Action Cards: 'Evaluation,' 'Reverse Brainstorming,' and 'Ethical Dialogue' (detailed in Table 1.) The Action Cards encourage a playful versatility that allows for application of the card deck across diverse scenarios and purposes, encouraging and inciting varied perspectives and considerations. Designers are empowered to explore moral considerations and make decisions based on their intentions and objectives through the reflective questions (listed in Table 1) on these cards for Anti-Hero or Hero perspectives (as illustrated in Figure 1, right). The Action cards hence serve as catalysts for thought-provoking discussions, laying the foundation for ethical argumentation. By enabling designers to delve into complex issues, these cards foster meaningful dialogue and deepen understanding of ethical principles.

Design Action: Definition	Questions
Reverse Brainstorming: Generating ideas that are	<b>Anti-Hero:</b> How can we create the worst user experience?;
contrary to the desired outcome	<b>Hero:</b> How can we iterate for user values??
Ethical Dialogue: Having a conversation related to	Anti-Hero: What values are inscribed in this solution? What
ethical and manipulative intentions or outcomes	have we still not talked about?; Hero: How much are we
	not giving considering ethical considerations?
Evaluation: Assessing a digital artifact for iteration	<b>Anti-Hero:</b> How much are we shutting down user's choice?;
and user-values	Hero: How much are we valuing user's agency?

Table 1. Action Cards, Definition, and Reflective Questions

#### 2.2 Evaluation Study

We conducted an evaluation study employing principles from playtesting [3] and lab protocols [4]. The goal of this evaluation study was to observe and analyze how designers engaged with the card deck in a design process, including better understanding initial reactions, behaviors, outcomes, overall experience, and usability.

- 2.2.1 Protocol. Each session was 60 minutes in duration, divided into three parts. For the first 5-10 mins, we introduced the participants to the structure of the session and the purpose of the playtesting. We used three different protocols that aligned with the different Action cards (Section 2.1.2). Sessions 1 and 3 completed the Reverse Brainstorming play mode, which asked them to "use the cards to identify new solutions that would negatively impact the user"; Session 2 completed the Ethical Dialogue mode where they "use the cards to engage in a conversation about problematic or positive aspects of your design solutions"; and Session 4 completed the Evaluation mode where they "use the cards to evaluate your existing design solution." Participants were each asked to bring an in-progress or completed design project to the session. For the next 45 minutes, participants were asked to generate one or more appropriate solutions through discussion (e.g., screen layout/wireframe, user task flow), utilizing resources such as the whiteboard, sketching tools, and paper. Interaction with the card deck was encouraged in whatever manner the participants saw fit, with minimal opportunities for clarifications from the researchers. In the final 10-15 minutes of the session, participants were asked reflective questions about their interaction with the card set. Questions focused on aspects such as the design of the toolkit, its effectiveness in supporting design ideation, dialogue, and/or evaluation, advantages observed during its use, and suggestions for potential design iterations. Participants were also asked to reflect on their realizations about their actions as designers while engaging with the toolkit.
- 2.2.2 Participants. The evaluation study included 12 participants, all of whom were graduate students in Human-Computer Interaction, Product Design, and User Experience Design. To be eligible to participate, students needed to have experience in design, evaluation, and iteration, including the creation of design outcomes they could leverage during the session. We conducted four playtesting sessions, identified with codes AHP01,02,03, and 04. Each session included three students who were assigned with identifiers as P0nA, B, and C (n=1,2,3,4 for the number of sessions).
- 2.2.3 Data Collection and Analysis. With the permission from the participants, we video and audio recorded the sessions to capture the interactions with the cards, design discussions, assessment, feedback, design outcomes, and overall impression of the card deck. Within the transcripts, we focused our analysis on the final reflection and de-brief with the participants to summarize the evaluation results of the Anti-Hero card deck. We identified that participants primarily reflected on the impact of the card deck as designers and their responsibilities, as well as provided specific Manuscript submitted to ACM

evaluation feedback on the design of the cards. For instances where we had to build context around a participant's responses, we referred back to the 45 minute playtesting portion of the protocol to triangulate and validate the contexts of their reflection. We conducted an affinity mapping to present the evaluation results in the following section.

#### 2.3 Evaluation Results

In this section, we present the evaluation results from the playtesting sessions, focusing on: 1) *Reflective Engagements* where participants discussed how they envision the practical use of the Anti-Hero card deck in their everyday decision-making, conceptual expansion of the new method, and reflexive awareness of their designerly action and responsibility; and 2) *Design Evaluation and Iteration* where participants provided feedback on the design of the card deck.

- 2.3.1 Reflective Engagements. Participants presented their reflexive awareness of value tensions and ethical concerns through the use of the Anti-Hero card deck in many different ways: 1) Engaging in ethical sense-making by drawing connections and recognizing "in the wild" manipulative designs or design decisions "Facebook is probably doing like 50 of these [Anti-Hero moves]" (P01B) they have seen in the past; and self-reflecting on how they have personally "been doing like many of the things that I mentioned as Anti-Hero up here for some time now ... I'm having this realization. Am I actually doing something wrong?" (P02A). 2) Engaging in ethical dialogue by finding design spaces that they might not often engage with such as "gray space" reflected by P04A: "we found a gray space, like they're (holding up a card) not doing it totally, but they're not being an antihero, but they're not even being the hero.... And I don't know how to evaluate that part."; and recognizing moments of practical application of the card deck in their everyday practice such as to solve ethical tensions in team meetings or "a PM [who] is coming to me being like, I want more clicks and more conversions of this payment screen" (P01C). 3) Engaging in ethical directionality for recovering from engaging with the Anti-Hero moves "since it's a bad user experience, we would not want to include in our potential solutions" (P03C) and easily access Hero moves by "just flipping the card" (P01B); and counteracting to Anti-Heroes for "good" as "Trap Setter [Anti-Hero] seems like the sort of thing that, you know, a lot of these educational content platforms do and it works for them. Like you can't go to the next video unless you've completed this video that I think it's pretty positive in that context" (P03C). 4) Engaging in failed or successful reification of ethical considerations by identifying design frames that might not be relevant to engage with Anti-Hero card deck such as developing a design system (P01B) which has no manipulative goals and clarifying goals and contextualizing ethical problems in different design stages.
- 2.3.2 Design Evaluation and Iteration. Participants also provided us feedback pertaining to the design and interactivity of the card deck. Visual design-wise, participants commented that the Anti-Hero and Hero tags on the cards (left bottom as in Figure 1) were too small, making it difficult for them to notice and understand the distinction between the two sides. Once they understood distinction between the two sides- color-side being Anti-hero and non-color-side being Hero, the tags no longer posed an issue. Participants discussed how the Anti-Hero side was made prominent through visual design by using bright colors, which is drawing attention towards the Anti-Hero side more. As P01B shared when considering finding any Anti-Hero "issues" in her own design work, she wondered: " 'how am I supposed to design that world? How am I supposed to design in this context?' And having the availability of, 'no [while flipping the card], there is a good way to design for this.' I think is really helpful. So I think the flipping for me personally, the flipping of Anti-Hero is like, really useful." In contrast, other participants mentioned the same design was not allowing them to view the entire palette of roles at once; instead, they had to switch sides to see the full card deck. However, P01A noted that this adds an engaging action element to the interaction. Additionally, participants also expressed that an "instruction" manual or "ways of using" the card deck would be helpful alongside the card deck (P02A, P02B, P01A, P01B). We intend

Manuscript submitted to ACM

to design a single card to present purpose of the Anti-Hero card deck and a few ways designers can interact with the card in the updated version of the card deck. These evaluation results will be further used to iterate the visual design of the card deck.

## 3 IMPLICATIONS AND FUTURE IMPLEMENTATION

Anti-Hero card deck, as an ethics-focused design method, is intended to explicitly surface manipulative intentions that can often arise in a design process leveraging monetary business values. Importantly, users of the method must have certain skills or abilities to fully engage and moments of counter-factual implications of the Anti-Hero card deck. For example, designers engaging with the method need to be aware of the socio-technical systems, its values, and impacts on the society. Designers also need external scaffolds to align, position, and evaluate their impacts in the bigger ecosystem of organizational values, applied ethics, and professional due-diligence. When these scaffolds are not in place, the card deck can become an awareness-based tool rather than delegating decision making for the designer. Through our evaluation, we also observed how the card deck could work in a counter-effective manner. Participants in our sessions often mentioned how Anti-Heroes looked "shiny" and more attractive, not only based on the visual design but also in how they tend to suggest business-friendly design solutions. Anti-Heroes present a range of opportunities for designers to often support the value trade-offs, which then have to be turned towards value-centered decision activated by Heroes only through the designer's intent. Further research should be conducted to see the impact of Heroes in generating value-centered solutions, and to better understand its impact when in the hands of a range of stakeholders involved in a design process such as Business Shareholders, Product Managers, and Users.

Based on the outcomes of our method creation and playtesting process, we identify multiple opportunities for this method to be implemented in design education and practice. **Education.** Design educators can utilize the card deck to expose students to the complexities and tensions inherent in design practice. Students' engagement with the method provides an avenue to bridge education and practice by exposing them to the values implicit in design problem-solving or solution-generating. Educators can use the card deck to allow students to explore their own design intentions and design responsibility. Educators can also use the card deck as a critique tool during student presentations or evaluation of design outcomes. **Practice.** Design practitioners can use the card deck to evaluate effectively value trade-offs and align their efforts with overarching goals and objectives towards user values. The card deck can also be used to foster open communication and transparency for teams as it facilitates a respectful acknowledgment and allocation of roles within the team. Moreover, the card deck provides a shared vocabulary for different stakeholders across the organization, enabling them to align their perspectives and priorities during product-focused discussions. This alignment not only streamlines the design process but also ensures that the final product meets the diverse needs and expectations of all stakeholders involved.

# **ACKNOWLEDGMENTS**

We acknowledge the efforts of Thomas Carlock and Ja-Nae Dunae who have engaged in reviewing the definitions work of the Anti-Heroes and Heroes; and Nayah Boucaud and Susmita Jamdade who have supported in conducting playtesting sessions. We credit Storyset for the visual illustration used as a part of our designs.
