Figure 1. Illustrating the multilingual visual text rendering results with our approach. We show the French, Spanish, Chinese, Japanese, and Korean visual text results in the 1st, 2nd, 3rd, 4th, and 5th rows, respectively.

Abstract

Recently, *Glyph-ByT5* has achieved highly accurate visual text rendering performance in graphic design images. However, it still focuses solely on English and performs relatively poorly in terms of visual appeal. In this work, we address these two fundamental limitations by presenting *Glyph-ByT5-v2* and *Glyph-SDXL-v2*, which not only support accurate visual text rendering for 10 different languages but also achieve much better aesthetic quality. To achieve this, we make the following contributions: (i) creating a high-quality multilingual glyph-text and graphic design dataset consisting of more than 1 million glyph-text pairs and 10 million graphic design image-text pairs covering nine other languages, (ii) building a multilingual visual paragraph benchmark consisting of 1,000 prompts, with 100 for each language, to assess multilingual visual spelling accuracy, and (iii) leveraging the latest step-aware preference learning approach to enhance the visual aesthetic quality. With the combination of these techniques, we deliver a powerful customized multilingual text encoder, *Glyph-ByT5-v2*, and a strong aesthetic graphic generation model, *Glyph-SDXL-v2*, that can support accurate spelling in ~ 10 different languages. We perceive our work as a significant advancement, considering that the latest *DALL-E3* and *Ideogram 1.0* still struggle with the multilingual visual text rendering task.

1. Introduction

Visual text rendering has attracted huge interest and become a critical evaluation aspect in various latest commercial-level text-to-image generation models like *DALL-E3*, *Midjourney-v6*, and *Ideogram 1.0*. The research community has also observed significant progress in the visual text generation task since the development of the more effective rectified flow approach in *Stable Diffusion 3* [4] or the customized text encoder *Glyph-ByT5* [9]. However, all these efforts still focus on a single language, i.e., English. Visual text rendering for other languages, especially Chinese, Japanese, and Korean are still very challenging for existing approaches due to the scarcity of high-quality data. Figure 5 illustrates the generated images with multilingual visual text based on *DALL-E3* and *Ideogram 1.0*, respectively. We can observe that most of their visual spelling accuracy is nearly zero, highlighting that the multilingual visual text rendering task poses a fundamental challenge for both leading commercial text-to-image generation models.

We address the multilingual visual text rendering task by building high-quality and scalable multilingual training datasets. The key challenge is that glyph images and graphic design images associated with other languages are much sparser and harder to collect while being more complex

Figure 2. *Glyph-SDXL-v2* vs. *Glyph-SDXL* in graphic design images in terms of multilingual visual text spelling accuracy, layout quality, and visual aesthetics win-rates evaluated by human evaluator preferences. The only difference between *Glyph-SDXL-v2* and *Glyph-SDXL* is that we replace *SDXL* with *Albedo SDXL + SPO*.

| Language | # unique chars | # font types | Precision (%) | | | |
|------------|----------------|--------------|---------------|--------------|---------------|-------------|
| | | | <20 chars | <20-50 chars | <50-100 chars | ≥ 100 chars |
| English | 52 | 512 | 95.87 | 95.55 | 93.94 | 96.76 |
| French | 52+28 | 495 | 93.1 | 90.67 | 93.69 | 88.05 |
| Spanish | 52+14 | 473 | 92.33 | 88.75 | 88.59 | 91.33 |
| German | 52+8 | 471 | 91.13 | 87.65 | 88.98 | 90.97 |
| Portuguese | 52+24 | 497 | 82.27 | 87.00 | 89.92 | 90.01 |
| Italian | 52+20 | 498 | 90.33 | 88.28 | 86.55 | 93.30 |
| Russian | 66 | 160 | 91.67 | 87.85 | 85.19 | 85.54 |
| Chinese | 5,000 | 143 | 97.56 | 97.51 | 91.84 | 83.94 |
| Japanese | 1,148 | 211 | 89.11 | 90.82 | 85.76 | 82.38 |
| Korean | 617 | 122 | 91.16 | 92.73 | 86.54 | 79.91 |

Table 1. Illustrating the multilingual visual text rendering results achieved with our approach across a varying number of characters. Performance is demonstrated by evaluating word-level precision for the seven languages listed above and character-level precision for the three languages listed below. All results are based on a single model rather than multiple models tailored for each language.

than those in English. To overcome this challenge, we design a simple translation-based approach to transform English glyph images and graphic design images into ones with other languages. We show a representative case in Figure 8. To ensure coherent layout arrangement across different languages, we keep the total number of characters close to the number of characters in English. With this design, we first create a multilingual paired text-glyph dataset consisting of 1 million glyph images with black backgrounds to train a multilingual *Glyph-ByT5-v2* text encoder. This encoder bridges the gap between multilingual glyph images and multilingual text prompts. Then, we create a multilingual graphic design dataset consisting of 10 million images to train the multilingual *Glyph-SDXL-v2*.

In addition, we improve the visual aesthetics of the generated graphic design images by leveraging the latest step-aware preference optimization technique [6] and the albedo technique [1]. We empirically verified that *SDXL* fine-tuned with these post-training techniques can significantly enhance the visual aesthetics of the generated graphic design images.

To demonstrate the effectiveness of our approach, we not only construct a multilingual *VISUALPARAGRAPHY* benchmark to assess visual spelling accuracy but also conduct a thorough user study to compare the overall quality of the

Figure 3. Illustrating the multilingual visual text rendering results with our approach. We show the German, Portuguese, Italian, and Russian visual text results in the 1st, 2nd, 3rd, and 4th rows, respectively.

graphic design images generated with DALL·E3 and our Glyph-SDXL-v2. As shown in Figure 2, the graphic design images generated with Glyph-SDXL-v2 are preferred 63.7% of the time over those generated with the previous Glyph-SDXL in terms of visual aesthetics while ensuring closely accurate visual spelling performance. We also have reported the OCR precision of our approach on multilingual VISUALPARAGRAPHY benchmark in Table 1. In addition, we illustrate the generated multilingual visual text results in Figure 1 and Figure 3. we expect our approach to provide a strong aesthetic baseline for the accurate multilingual visual text rendering task and inspire more efforts to push progress along this path.

2. Related Work

Most existing efforts [2, 3, 8–10, 14] focus on accurate visual text rendering of English. AnyText [13] further shows very modest visual text rendering results for other languages like Chinese, Japanese, and Korean due to the difficulty of collecting high-quality data, training the models on only 10,000 images for five different languages. This is far from addressing the multilingual visual text rendering task, considering the number of characters for these non-English languages is much larger than the number of characters in English. In addition, we also empirically find that all the latest commercial image generation models like DALL·E3, Imagen3, Stable Diffusion 3 [4], and Ideogram 1.0¹ perform relatively poorly on multilingual visual text rendering tasks.

Figure 5. Visualization of multilingual generation results by DALL-E3 and Ideogram 1.0.

Our Contribution Our work mainly extends the previous Glyph-ByT5 [9] for accurate multilingual visual text rendering tasks. The primary contribution of our work lies in presenting a scalable high-quality dataset of 1 million multilingual glyph-text pairs and 10 million multilingual graphic design images, training a powerful multilingual Glyph-ByT5-v2 that aligns multilingual text into the glyph image space, and training a multilingual Glyph-SDXL-v2 that supports accurate visual text rendering in ten different languages.

3. Our Approach

We build the multilingual visual text rendering approach based on the previous Glyph-ByT5 and Glyph-SDXL [9] by making the following improvements. We keep the design of the glyph text encoder, glyph vision encoder, and box-level contrastive loss unchanged by default. We illustrate more details of the improvements as follows.

3.1. Multilingual Glyph-ByT5

Multilingual Glyph-Text Dataset The first key contribution of this work is to build a scalable and accurate multilingual (paragraph-)glyph-text dataset $\mathcal{D}_{\text{multilingual}}^{\text{glyph}}$ and the multilingual graphic design dataset $\mathcal{D}_{\text{multilingual}}^{\text{design}}$. We illustrate the statistics of the constructed glyph-text dataset in the first column Table 2.

Given that the number of glyph images and graphic designs corresponding to the other nine languages is much smaller compared to English, it is impractical to collect a large number of high-quality graphic design images for these languages. To address this challenging issue, we propose a simple yet effective translation-based approach to generate a large number of multilingual glyph-text and paragraph-glyph-text pairs. This is achieved by transforming the high-quality English glyph-text dataset, created using the graphic renderer based on [5], into datasets for other languages. We explain how we construct the multilingual dataset as follows. We construct a multilingual vocabulary set consisting of the 5,000 most frequently used words in each language. We also generate a large number of multilingual glyph-text pairs using a random strategy that transforms the original English characters into characters of other languages. Additionally, we need to consider the differences in font types across different languages. Figure 8 illustrates representative cases of transforming an English glyph image into glyph images of nine other languages.

Multilingual Glyph Augmentation Similar to Glyph-ByT5, we apply glyph augmentation during the glyph-alignment pre-training stage. For alphabetic languages, we use the same augmentation strategies as for English, namely *glyph replacement*, *glyph repeat*, *glyph drop*, and *glyph add* at both the character level and word level. For character-

| Language | Glyph-ByT5-v2 | Glyph-SDXL-v2 |
|------------|-----------------------|------------------------------|
| | # of glyph-text pairs | # of design-image-text pairs |
| English | 100K | 1M |
| Chinese | 300K | 3M |
| French | 20K | 200K |
| German | 20K | 200K |
| Spanish | 20K | 200K |
| Portuguese | 20K | 200K |
| Italian | 20K | 200K |
| Russian | 100K | 1M |
| Japanese | 100K | 1M |
| Korean | 100K | 1M |
| Mixed | 200K | 2M |

Table 2. Illustrating the details of multilingual training dataset of Glyph-ByT5-v2 and Glyph-SDXL-v2.

based languages like Chinese, Japanese, and Korean, we apply *glyph repeat* and *glyph drop* only at the character level, as it is difficult to define word-level combinations for these languages. In addition, to overcome the challenge of modeling the complex structures of various Chinese characters, we design a similarly-shaped character replacement strategy that replaces selected characters with the most similar ones based on their shape. To help users understand these designs, we provide a typical example of the similarly-shaped character replacement scheme in Figure 7, where we randomly select a character and replace it with a structurally similar character for each augmented case.

Other Settings We chose to build the multilingual Glyph-ByT5-v2 text encoder from the ByT5-Small text encoder (217M parameters), implemented the visual encoder based on DINOv2 with ViT-B/14 (86M parameters), and applied the original box-level contrastive loss directly. We treated all images of different languages equally without applying separate box-level contrastive loss for each language independently. In addition, we also apply the hard-negative contrastive loss based on glyph augmentation to further improve the visual spelling accuracy.

3.2. Multilingual Glyph-SDXL

We build the multilingual Glyph-SDXL-v2 by integrating the multilingual Glyph-ByT5-v2 with a improved SDXL [6] by following the region-wise multi-head cross-attention scheme proposed in [9].

Multilingual Design Dataset The second key challenge of this work is also at the lack of high-quality multilingual graphic design datasets for training a multilingual design-text generation model. We follow the similar translation based manner to transform the previous English graphic design images into the ones of other language and illustrate a representative example in Figure 9.

We use the same English background captions, generated with LLaVA [7] based on Llama 2-13B [12], and ap-

Table 4. Glyph-SDXL-v2 model training hyper-parameters.

ply different languages only for the prompts sent to the multilingual Glyph-ByT5-v2 text encoder. We also follow the region-wise multi-text-encoder fusion scheme to integrate the glyph-aware capabilities of our multilingual Glyph-ByT5-v2 text encoder with the strengths of the two original CLIP text encoders as described in [9]. Table 2 illustrates the statistics of the constructed multilingual design dataset on the second column.

4. Experiment

4.1. Training Settings

We illustrate the hyperparameters for training Glyph-ByT5-v2 and Glyph-SDXL-v2 in Table 3 and Table 4, respectively. We train Glyph-ByT5-v2 with $4\times$ A100 GPUs and Glyph-SDXL-v2 with $32\times$ A100 GPUs. To evaluate our method’s ability to generate accurate multilingual design text in graphic design images, we developed the multilingual VISUALPARAGRAPHY benchmark. We compared our method against the previous Glyph-SDXL and commercial products such as DALL-E3 in the design-text generation task. Our evaluation includes objective OCR metrics and a subjective user study to assess visual quality from multiple perspectives.

4.2. Evaluation Metrics

We categorize the ten different languages into two groups: (i) Alphabetic languages, consisting of English, French, German, Spanish, Italian, Portuguese, and Russian, use words as the basic unit of each sentence. These languages employ alphabets to form words, which can be easily identified using spaces. (ii) Character-based languages, consisting of Chinese, Japanese, and Korean, use characters as the basic unit of each sentence. Considering the differences between these languages, we adopt case-sensitive word-level precision for the alphabetic languages and character-level precision for the character-based languages. Additionally, we recruited 10 users with design backgrounds to evaluate and compare the quality of images generated by Glyph-SDXL-v2 vs. Glyph-SDXL, and Glyph-SDXL-v2 vs. DALL-E3.

Figure 10. Glyph-SDXL-v2 vs. DALL-E3 in graphic design images in terms of multilingual visual text spelling accuracy, layout quality, and visual aesthetics win-rates evaluated by human evaluator preferences.

4.3. Multilingual VISUALPARAGRAPHY Benchmark

We constructed a multilingual benchmark for the design-text generation task, named Multilingual VISUALPARAGRAPHY, amassing 100 prompts for each language. For each language, we collected prompts with varying numbers of characters and difficulty levels: rendering fewer than 20 characters, rendering 20 to 50 characters, rendering 50 to 100 characters, and rendering more than 100 characters.

4.4. Improving Aesthetics with SPO-SDXL

Unlike the original Glyph-SDXL, which uses the default SDXL [11], we opted to use the improved SDXL after post-training, specifically the SPO-SDXL fine-tuned with a step-aware preference learning scheme [6]. Figure 11 illustrates the improvements brought by applying the SPO post-training scheme. We can observe that Glyph-SDXL Albedo + SPO generates the images of the best quality, which significantly outperforms the ones generated with the original SDXL, as shown in Figure 2

4.5. Comparison with DALL-E3

Last, we compare our approach with the latest DALL-E3 on the multilingual visual text rendering task and illustrate the user study results in Figure 10. According to the comparison results, our method is preferred 91% of the time over DALL-E3 in terms of visual text quality. Notably, our approach also achieves comparable visual aesthetics to DALL-E3 by leveraging the benefits of the latest SPO post-training scheme.

5. Conclusion

In this paper, we present an improved customized multilingual text encoder for accurate multilingual visual text rendering. We have built scalable, high-quality multilingual glyph-text and graphic design datasets, enabling the training of our models, Glyph-ByT5-v2 and Glyph-SDXL-v2. We empirically show that replacing the original SDXL with post-trained versions optimized for human preferences significantly enhances visual aesthetics. The effectiveness of our approach is demonstrated through detailed comparisons and user studies.

Acknowledgements We express our gratitude to Lin Liang, Kevin Lin, and Lijuan Wang for their insightful discussions and invaluable assistance in conducting large-scale exploration experiments.

| Row 3, Col3 | Background: The image shows a simple, cartoon-style illustration. There are three characters depicted: a person sitting on a table, and two cats sitting on the table as well. The background is a soft, pastel pink color, which gives the image a calm and serene atmosphere. Text: Text "是哪位小可爱正在看我的朋友圈" in <color-7>, <en-font-56>. |

Table 5. Detailed prompts for the generated images shown in Figure 1. (1/2)

| Image | Prompt |
|-------------|--|
| Row 3, Col4 | Background: The image displays a digital representation of a tarot card. The card is set against a dark background with a subtle star pattern. The card itself is framed by a decorative border with a repeating pattern of stars and crescent moons. At the center of the card, there is a large, stylized depiction of a crescent moon with rays emanating from it, creating a sense of illumination. Below the moon, there is a banner with a decorative border that matches the overall design of the card. The banner contains a placeholder text commonly known as "lorem ipsum," which is used to demonstrate the visual form of a document or a typeface without relying on meaningful content. The overall style of the image is digital and graphic, with a focus on a clean, modern aesthetic with a touch of vintage charm. The use of a dark background with a subtle star pattern adds a sense of mystery and intrigue to the image. Text: Text "揭开你的面具" in <color-89>, <cn-font-58>. Text "十二星座的隐藏人格" in <color-89>, <cn-font-105>. |
| Row 3, Col5 | Background: The image depicts a traditional Chinese stage with vibrant colors and intricate designs. The stage is adorned with red and gold hues, which are commonly associated with good fortune and prosperity in Chinese culture. The stage is also decorated with various Chinese motifs and symbols, such as the Chinese dragon, which is often depicted as a symbol of strength, power, and good luck. The stage is framed by two large, ornate Chinese lanterns, which are typically used to illuminate streets and buildings during nighttime festivities and celebrations. The overall style of the image is reminiscent of traditional Chinese paper-cut art, which is a popular form of folk art in China that involves cutting out intricate designs and patterns using scissors. The image is likely intended to evoke a sense of cultural heritage, tradition, and artistic craftsmanship associated with Chinese culture and history. Text: Text "根据国家法定假期的规定, 现将有关放假事宜通知如下: 2021年元旦1月1日至1月3日放假, 共3天, 特此通知。" in <color-0>, <cn-font-134>. Text "预祝大家假期愉快!" in <color-0>, <cn-font-6>. Text "放假通知" in <color-0>, <cn-font-63>. |
| Row 4, Col1 | Background: The image shows a beautifully decorated cake placed on a dining table. The cake is adorned with fresh berries, cream, and chocolate. The table setting is simple, with the cake being the main focus. The image is likely used for culinary purposes, such as a recipe or a food blog. Text: Text "人生的转机二十歳幸せ!!!" in <color-33>, <jp-font-79>. |
| Row 4, Col2 | Background: The image shows a nighttime cityscape with a dark sky filled with stars. The city is illuminated with various lights, suggesting a bustling urban environment. The image is framed by a black border, and there is a watermark or logo in the bottom right corner, which appears to be a stylized letter 'C'. The overall style of the image is illustrative and colorful, with a focus on the contrast between the dark sky and the brightly lit city. Text: Text "旧曆的12月30日" in <color-0>, <jp-font-70>. Text "除夜を祝う" in <color-0>, <jp-font-159>. |
| Row 4, Col3 | Background: The image features a repeating pattern of floral motifs in a light blue color. The floral motifs are symmetrically placed around the image. The background of the image is a solid dark blue color. The overall style of the image is graphic and minimalistic. Text: Text "2019除夕おめでとうございます" in <color-0>, <jp-font-170>. |
| Row 4, Col4 | Background: The image features a Shiba Inu dog with a human-like expression. The dog is wearing a plaid jacket and a scarf. The background is a solid yellow color. There is a speech bubble with a white background and a black border. The speech bubble is empty, suggesting that the dog is speaking or about to speak. Text: Text "独身のワンちゃん" in <color-6>, <jp-font-147>. Text "私の名前は" in <color-6>, <jp-font-84>. |
| Row 4, Col5 | Background: The image features two iced coffee drinks, each with a layer of cream on top. The drinks are placed on a white surface, and there is a small, white cloud-like shape above the drinks. The image has a playful and whimsical feel to it. Text: Text "早起は困難な人々目を覚ますために助けが必要です" in <color-1>, <jp-font-95>. Text "毎日は二度目のチャンスです一日一日を大切にするために" in <color-1>, <jp-font-205>. Text "人生は良すぎず、コーヒーは悪すぎません" in <color-1>, <jp-font-78>. | Row 5, Col1 | Background: The image is a vibrant and colorful graphic design. It features a group of people, possibly a band, depicted in a dynamic and energetic pose. The people are surrounded by a variety of colorful elements, such as musical notes, sound waves, and other abstract shapes. The overall style of the image is reminiscent of a retro or vintage aesthetic, with its bold colors and playful design elements. Text: Text ". 그릴 수 있는 대학 베스트 가수 대회." in <color-72>, <kr-font-79>. Text "SuperSingers 캠퍼스 특급 음색불안정하지 않고 청춘적이지 않아" in <color-14>, <kr-font-55>. Text "12/31 가수 대회2022년 12월 31일 19:00그릴 대학 학생 활동 센터 A103" in <color-0>, <kr-font-105>. |
| Row 5, Col2 | Background: The image shows a digital illustration of a laptop with a blank screen. On the right side of the laptop, there is a cartoon of a person with a speech bubble that says "Hello!" The person appears to be waving at the viewer. The background of the image is a light yellow color with a grid pattern. The overall style of the image is a combination of digital illustration and cartoon elements. Text: Text "창의력 부여 대회 창의력이 미래에 부여됩니다 창의성" in <color-2>, <kr-font-32>. Text "2024" in <color-24>, <en-font-116>. |
| Row 5, Col3 | Background: The image displays a vibrant and appetizing meal. The meal consists of a variety of ingredients, including what appears to be beef, peppers, and possibly onions. The ingredients are arranged in a circular pattern, suggesting a communal or family-style dining experience. The colors of the ingredients are vivid and contrast well with the darker background, making the meal look even more appetizing. The overall presentation of the meal is visually appealing and inviting, likely to stimulate the viewer's appetite and interest in the meal. Text: Text "커피와화구점" in <color-57>, <kr-font-92>. | Row 5, Col4 | Background: The image is a vibrant and colorful illustration. It features a variety of objects and elements that are arranged in a way that suggests a creative or artistic theme. The objects include what appears to be a piece of paper or a card, which is blank and centrally located. Surrounding the paper or card are various decorative elements such as what looks like a checked pattern, a floral pattern, and some geometric shapes. The colors used in the illustration are bright and varied, with a focus on warm tones. The overall style of the image is whimsical and playful, with a sense of creativity and imagination. | Row 5, Col5 | Background: The image is a digital illustration featuring a character that appears to be a young woman with a serene expression. She is depicted with long, flowing hair and is wearing a traditional East Asian-style dress with a floral pattern. The dress is predominantly in shades of blue and green, with a hint of pink. The character is seated on a bed of cherry blossoms, which are scattered around her. The blossoms are in full bloom, with their delicate pink petals and white stamens. The background of the image is a pale, soft blue sky with a few wispy clouds. The overall atmosphere of the image is one of tranquility and serenity. Text: Text "QR 코드를 스캔하여 즉시 등록하세요" in <color-6>, <kr-font-49>. Text "전문 메이크업 아티스트 아름다운 한복무료 촬영" in <color-6>, <kr-font-96>. Text "【행사 기간】5월 6일-5월 8일【행사 장소】상사호 고전 마을" in <color-1>, <kr-font-45>.
