## Abstract

The LIGO–Virgo–KAGRA (LVK) Collaboration has made breakthrough discoveries in gravitational-wave astronomy, a new field of astronomy that provides a different means of observing our Universe. Gravitational-wave discoveries are possible thanks to the work of thousands of people from across the globe working together. In this article, we discuss the range of engagement activities used to communicate LVK gravitational-wave discoveries and the stories of the people behind the science using the activities surrounding the release of the third Gravitational Wave Transient Catalog as a case study.

## 1 Introduction: Context and Objectives

Gravitational waves (GWs) can be difficult to imagine. They are ripples in spacetime, created by the acceleration of massive objects, that propagate across the Universe at the speed of light. The strongest GW sources are massive and rapidly moving: the best sources for ground-based GW detectors are coalescing binaries of black holes or neutron stars. After travelling across the cosmos to Earth, GWs are almost imperceptibly small. The strongest signals correspond to a stretching and squeezing of space of 1 part in  $10^{21}$ . Observing GWs has therefore been a great experimental challenge, requiring an international community to design and build the complex, highly sensitive instruments needed to measure the waves, and to create and test the algorithms needed to analyse the data.

In 2015, one hundred years after Einstein first calculated the properties of GWs in his theory of general relativity, the first direct observation of GWs was made.<sup>1</sup> This discovery was confirmation for Einstein’s theory, an experimental triumph, and the beginning of a new era for astronomy. The signal GW150914 came from two black holes, each about 30 times the mass of our Sun, coalescing more than a billion light-years away. This was the first time such a binary black hole system was found, the first time black holes of this size were discovered, and the first time two black holes were observed to inspiral and merge. The discovery was a major news event around the world,<sup>2</sup> building on the public’s enduring fascination with Einstein and black holes.

Since 2015, the LIGO–Virgo–KAGRA (LVK) Collaboration, which operates the international network of GW observatories (the

two LIGO sites in the US, Virgo in Italy, KAGRA in Japan and GEO 600 in Germany) has made many further GW discoveries. The field has grown rapidly, with the third GW Transient Catalog (GWTC-3) increasing the number of probable detections to 90.<sup>3</sup> The latest observing run is ongoing. These observations have revealed a diverse range of black hole and neutron star binaries, and revolutionised our understanding of the astrophysics of these sources.

Surrounding each results release are numerous engagement and communication activities. These share the wonder of discovery, what we can learn with GWs, and the technological advances that enable these groundbreaking measurements. Engagement and communication activities are carried out through the effort and enthusiasm of individual scientists, collaboration-wide teams, and partnerships between scientists and non-scientists, all of which complements the work of professional science communicators at the observatories. Matching the global composition of the LVK, selected resources have been translated into over 20 languages.

Discoveries also provide an opportunity to focus on the people behind the science. The LVK includes around 2000 people from diverse backgrounds across the globe; from designing instrumentation to operating the kilometre-scale laser interferometers, from coding analysis algorithms to calculating GW emission. By making connections with the people within the LVK, we show the human side of how science works, and provide possible role models for young people interested in science and technology.

In this article, we detail communication methods used by the LVK. We review the range of engagement activities used to communicate LVK GW discoveries and the stories of the people behind the science, with specific examples for GWTC-3.

## 2 General communication methods

Discovery announcements from the LVK normally have three components: paper, data release, and educational and engagement resources. Here we describe some general and long-term education and engagement activities of the LVK.

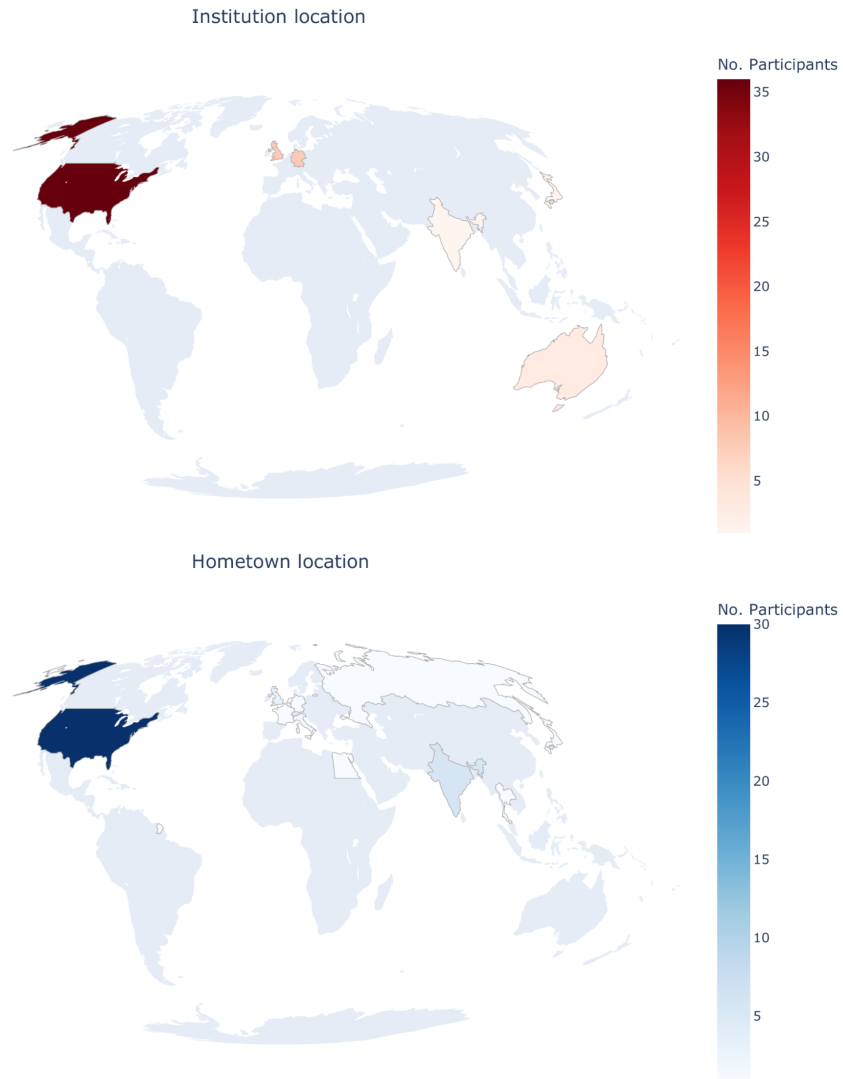

### 2.1 The people behind the science

Discovery science is not just about the results, it is also about the people behind them. Highlighting individuals within the LVK can provide STEM role models, challenge stereotypes, and help to foster a welcoming environment.

The LIGO Magazine ([www.ligo.org/magazine](http://www.ligo.org/magazine)) is published twice annually. Content is commissioned and edited by volunteers from the LIGO Scientific Collaboration and it has a professional, high-quality design for print and online PDF. Since the first edition

<sup>\*</sup>[hannah.middleton@ligo.org](mailto:hannah.middleton@ligo.org)

<sup>†</sup>[christopher.berry@ligo.org](mailto:christopher.berry@ligo.org)

**Figure 1:** Frequency of Humans of LIGO participants' institution (top) and hometown (bottom) county. Scientists come from more diverse locations than just the institutions of the LVK.

**Figure 2:** Antimatter comic showing LIGO scientists performing detector checks (credit: Nutsinee Kijbunchoo).

in 2012, the LIGO Magazine has featured 470 authors, representing 237 workplaces in 23 countries. Authors are from the GW community and beyond, and the target audience is both collaboration members and the interested public. Articles include perspectives of working on GW science, personal stories, opinion pieces, and advice columns.

Humans of LIGO ([humansofligo.blogspot.com](http://humansofligo.blogspot.com)) showcases the lives, backgrounds, and inspirations of LVK members and GW scientists through blog posts. Each post consists of an image of the participant, a direct quote about their experiences, and a short biography including job description and hobbies. Since its inception in 2018, the blog has featured 59 participants from 11 different countries, working at 42 institutions (Figure 1). The blog posts are shared on LIGO social media, and have reached over 53,000 views (as of May 2024).

Antimatter web comics ([antimatterwebcomics.com](http://antimatterwebcomics.com)) by Nutsinee Kijbunchoo features day-to-day experiences and current affairs from the GW community and beyond (Figure 2). Mental health and graduate-student life are focuses of many comics. Comics have been regularly featured in the LIGO Magazine.

The LIGO-India blog, Glorious Women<sup>4</sup> showcases STEM role models, highlighting women from across the LVK. Behind-the-scenes interviews feature the daily lives of students, their motivation, contributions and challenges.<sup>5</sup>

## 2.2 Academic audiences

Sharing our discoveries, and how to use them, is key to ensuring a wider impact on the scientific community.

Communication with academics is primarily through scholarly articles. Since GW astronomy is a new field, the LVK have written dedicated articles on introductory GW data analysis,<sup>6</sup> the structure of our data releases,<sup>7,8</sup> and the basic physics of a binary black hole coalescence (suitable for undergraduate teaching).<sup>9</sup>

Data releases are coordinated by the GW Open Science Center (GWOSC), which hosts raw data, links to LVK publications and further data products ([gwosc.org](http://gwosc.org)). GWOSC maintains lists of open-source analysis software and provides teaching on data analysis through annual Open Data Workshops. The workshops are delivered in a hybrid format; with 200–300 people participating in-person each year, and over 7700 people enrolling online over the last four years. Workshop materials are openly available online.

To accompany the release of key papers, the LVK organises webinars through Zoom, with attendees able to submit questions. Recordings are uploaded to YouTube.

The LVK also engages with the academic community to promote proper recognition of its three constituent collaborations. There is currently a bias in scholarly literature: an abbreviated narrative attributes credit to LIGO, excluding Virgo and KAGRA from LVK achievements, with consequences for scientific careers, accuracy of public media and interactions with funding agencies. A year-long project<sup>10</sup> studied this cognitive bias, and tried to educate the community.

## 2.3 Formal classroom education

LVK members have maintained long-term efforts to introduce GWs and related topics into formal classroom education. Examples include an Educator's Guide,<sup>11</sup> courses for community college teachers, high school resources, and undergraduate lab demonstrations.<sup>12</sup>

Einstein-First ([www.einsteinianphysics.com](http://www.einsteinianphysics.com)) has developed an eight-year science curriculum that introduces quantum concepts and general relativity at primary school, followed by GWs, black holes, cosmology and quantum measurement in middle school.<sup>13</sup> Efforts are underway to introduce Einstein-First in Australia, India, USA and Brazil.

## 2.4 Science Summaries and press releases

LVK Science Summaries are a long-standing effort to explain LVK publications at a technical level typically higher than in the popular press but still accessible for enthusiastic lay readers. They are published on [www.ligo.org](http://www.ligo.org), distributed as print copies at outreach events, and shared with journalists. Summaries are translated into a variety of languages by LVK volunteers, with discovery papers often receiving the most attention (e.g., the GW190521 summary was translated into 16 languages).<sup>14</sup>

Press releases to accompany discovery announcements are prepared centrally, including quotations from a selection of LVK members, and then adapted by member institutions (often including quotations from their scientists). These are frequently drawn upon for news articles.

## 2.5 In-person interactions: Science festivals, museums and visitor centers

In-person outreach to the general public reaches fewer people than other means, but it can yield impactful interactions, and may be perceived as having more value.<sup>15</sup>

LVK members participate in science festivals, classroom visits, the creation of science exhibits (such as interactive detector models,<sup>12,16</sup> visitor centers and tours of the GW observatories. The face-to-face format allows staff to customize the experience to the visitor.

LVK's visitor centers merge artifacts from the detectors with interactive exhibits that put the visitor in the role of a scientist or engineer. The exhibits explore the underlying science and engineering of GW detectors, from the importance of pendula to the concepts underpinning gravity. In-person and virtual tours of the detectors give a glimpse to the heart of operations. Over 330,000 visitors have interacted with the LVK visitor centers; 2024 attendance is projected to reach 30,000.

Science festivals and local outreach efforts around the world connect with classrooms and the general public. Outreach is performed by seasoned scientists, engineers, graduate students and undergraduates who have only recently learned about GWs. Such outreach efforts positively impact the undergraduates who perform the outreach.<sup>17–19</sup>

## 2.6 Graphics

Unlike electromagnetic observatories, GW data does not naturally lend itself to the stunning images that are commonplace throughout astronomy. Nevertheless, visualisations, infographics and cartoons<sup>20</sup> form key parts of our outreach activities, e.g., infographics displaying key facts are produced to accompany discoveries; simplified plots of results may be created for Science Summaries, and artistic representations of our sources may accompany press releases.

Videos and images are produced from numerical-relativity simulations of sources and the GWs they emit. Since new simulations are often produced to better understand the physics of novel

**Figure 3:** The detector data for GW150914, and an artistic representation of its binary black hole source (credit: LIGO/National Science Foundation/Aurore Simonnet/Somona State University). The source is shown at three stages, corresponding to the portions of the signal beneath.

sources, fresh visualisations have often accompanied discovery announcements.

Images accompanying our discovery announcements have been selected as NASA Astronomy Pictures of the Day, e.g., to accompany our first detection, an artistic representation of a binary black hole coalescence (Figure 3) and a corresponding numerical-relativity simulation were featured (11 and 12 February 2016), and to accompany GW190521, an artistic representation of the GW emission from two spinning black holes was featured (8 September 2020).

## 2.7 Multisensory resources: sound and touch

Sound is a common analogy when describing GWs. While GWs are not sound, the GW frequencies observable by the LVK are similar to audio frequencies of human hearing. The signals lend themselves to audification ([www.soundsofspacetime.org](http://www.soundsofspacetime.org)): the technical name for the signal from a binary inspiral is a “chirp” in reference to its sweep up in frequency.

GWs can also be communicated through touch. The tidal spatial deformations of the first detected GW signal have been translated to a 3D-printable model, specifically tailored to the needs of visually impaired people. By running fingers along the edges of the shape, one can appreciate the features of a GW and perceive the details of the signal evolving in time. This design is freely available,<sup>21</sup> along with suggestions for classroom activities.

The Tactile Universe ([www.tactileuniverse.org](http://www.tactileuniverse.org))<sup>22</sup> has partnered with UK LVK groups to design tactile resource sets for use with blind and vision-impaired pupils in upper secondary education. A mix of 3D-printable (Figure 4) and more basic tactile resources, paired with existing sonifications, are tied to 20 minute workshops

that teach students about black holes and neutron stars, GW signals and detection, and core science topics like waves and gravity. The 3D-printable resources, example lesson scripts and guides are available on the website.

## 2.8 Art and music with science

Numerous art, music, and science collaborations explore novel approaches and interpretations of GWs. These collaborations showcase our science through a different and interesting point of view and often bring the topic of GWs to new audiences. Works have been created by both professional artists and musicians and members of the LVK.<sup>23</sup>

Just a few examples include music compositions,<sup>24,25</sup> open land art installations,<sup>26</sup> museum exhibits<sup>27</sup> and novel musical instruments ([gravitiesynth.tumblr.com](http://gravitiesynth.tumblr.com)). The LIGO-India blog has a virtual gallery GWSciArt that showcases GW-inspired artistic projects.<sup>28</sup>

## 2.9 Social media and non-traditional media

Non-traditional media provides an opportunity to present our science to broad audiences. Activities like social-media posts, blogs, and podcasts or interviews can help communicate science in an informal way, e.g., the Spanish podcasts “Oscilador armónico”,<sup>29</sup> “A ciencia cierta”<sup>30</sup> and “Coffee Break: Señal y Ruido”<sup>31</sup> which coined and popularized the term “gravitondas” (“gravit-waves”) for GWs.

The LVK has several social media accounts, for the collaborations and the observatory sites, on X, Facebook, Instagram, Mastodon (the Astrodon instance). Content includes educational

**Figure 4:** A Tactile Universe 3D printed surface of the inspiral of two black holes and the resulting GWs (credit: Coleman Krawczyk).

resources, news stories, and discovery announcements. Special posts are scheduled for events such as detection anniversaries or the International Day of Women and Girls in Science. Reddit has been used for Ask-me-anything posts about discoveries. Social media allows the LVK to interact directly with the public, and threads in response to questions have proved popular.

### 2.10 Computer games/apps, visualisations, and interactive technology

Interactive apps and games are engaging and fun ways to convey GW science. Physical interaction with virtual environments incorporates additional modes for audiences to engage with content. Activities range from computer games<sup>32</sup> ([www.laserlabs.org/](http://www.laserlabs.org/); [blackholehunter.org](http://blackholehunter.org)) to classroom and science festival teaching with virtual reality<sup>33,34</sup> ([www.scivr.com.au](http://www.scivr.com.au)).

## 3 Case Study: GWTC-3

GW discoveries from the LVK are published in catalogs: papers accompanied by data releases. GWTC-3<sup>3</sup> is the most recent of these, presenting results up to the end of our third observing run. Thanks to the continued improvements in detector sensitivity,<sup>35</sup> the rate of discoveries has increased with time, meaning that each catalog includes a significant number of new GW candidates. GWTC-3 represents the most sophisticated and comprehensive analysis published by the LVK to date.

Production and publication of a catalog is a multi-year project directly involving hundreds of experts. Given the significance of the results and the importance of easy-to-use data releases, effective communication is a priority. However, communication of catalog results faces: catalog results consist of comprehensive analyses of many signals (making them overwhelming), and the majority of

detections have properties similar to those observed in the past (lacking the excitement of a novel discovery). For GWTC-3, the project team included a member responsible for coordinating communication and outreach activities from the beginning. This embedding allowed for these activities to be planned as the project progressed, developed in tandem with the data releases, and coordinated with those compiling the results.

The variety of activities designed to communicate the discoveries from GWTC-3 span the diverse range of audiences targeted and platforms used by the LVK.

### 3.1 Academic

A series of LVK webinars were organised to coincide with the release of GWTC-3. The first on GWTC-2.1,<sup>36</sup> a reanalysis of the previous data using updated methods consistent with GWTC-3. Subsequent webinars in the series presented the GWTC-3 results and implications for cosmology, astrophysics and tests of general relativity. Presenters were drawn from those who made key contributions to the work, with preference given to early-career scientists, and ensuring a balance in geographic location and demographics.

The data release was a key component of the GWTC-3 results. It included Jupyter notebooks and Python scripts to demonstrate use and how to reproduce plots from the paper. Additionally, a Streamlit app was created to interactively make plots of source parameters: this enabled users to customise paper plots without needing to download data ([gwtc3-contours.streamlit.app/](http://gwtc3-contours.streamlit.app/)).

### 3.2 Written resources

Like the paper itself, the GWTC-3 Science Summary<sup>37</sup> had a broad scope to cover. It was written in close collaboration between outreach experts and the analysis and paper-writing teams. It includes

background information needed to understand the catalog, and a subset of highlight discoveries. The summary has been translated into 9 languages.

### 3.3 Magazine article

LIGO Magazine issue 20 featured an 8 page article on the story behind the catalog.<sup>38</sup> Short snippets from 23 members of the analyses, paper writing, and engagement teams wrote about their experiences and stories of working on the catalog and associated results. Although many individuals contributed to this feature, they represent only a fraction of those providing input to GWTC-3. Articles like this give readers a behind-the-scenes insight of working on big LVK results.

### 3.4 Graphics and visualisations

GWTC-3 updates to some of our long-standing visualisations were made. The new results were added to the Masses in the Stellar Graveyard plot 5), showing the masses of black holes and neutron stars observed by the LVK alongside those observed via traditional electromagnetic astronomy. An online version allows for customisable images.<sup>39</sup> The LVK Orrery was also updated, which shows a stylised animation of the GWTC-3 binaries.

New visualisations were also created. One was a poster reminiscent of a periodic table showing the catalog after each observing period. The poster was used in a variety of articles, a double-page LIGO Magazine spread,<sup>40</sup> and in the GWTC-3 webinar. An artistic representation of the detections in a box accompanied the publication in *Physical Review X*. An image showing spectrograms for the 90 GWTC-3 signals was featured as NASA Astronomy Picture of the Day (7 December 2021).

### 3.5 Audification

Low Mass Beats is a audification of the catalog, converting masses into pitch for each black hole or neutron star: the greater the mass, the lower the pitch. This lighthearted project provides an entertaining perspective on the catalog (SoundCloud: [soundcloud.com/user-889003031](https://soundcloud.com/user-889003031)).

### 3.6 Social media

GWTC-3 material was shared via a social media campaign in two bursts using the hashtag #GWCT3. The first burst coincided with the release of the preprint and associated data. Special attention was given to advertising the webinars and data releases. The second burst coincided with the publication of the journal article and priority was given to any resources developed since the initial release, such as the Streamlit plotter and Low Mass Beats.

For both bursts, posts were spaced over multiple days to catch the attention of people in different timezones. Material was translated into regional languages.<sup>41</sup> The pacing also made it natural to integrate popular-science articles written immediately after the release.

Resources were subsequently reshared, e.g., Low Mass Beats was shared on Halloween because of its spooky sound, and the Orrery was shared during NASA's Black Hole Week.

The impact of the social media campaign can be partially assessed via the Altmetric score. As of June 2024, the GWTC-3 paper has a score of 713 (including 56 news outlets and 5 Wikipedia pages). This score is in the 99th percentile of all tracked outputs.

## 4 Conclusions

GW astronomy is a new branch of astronomy. After decades of research, the first observation was made in 2015, and the field has grown rapidly since. These discoveries have been led by the LVK, an international collaboration of thousands of scientists. Sharing these discoveries has been a priority for the LVK. As a new field, communication has been essential to both publicise and explain results.

LVK activities span a range of audiences and media. Many resources are used in multiple contexts, such that utility can be amplified beyond the original target, e.g., paper plots used on social media, infographics in talks, and data audifications in musical performances.

Communicating LVK discoveries has a unique set of challenges, but each provides an opportunity:

- GWs are an unfamiliar means of performing astronomy. Unlike traditional astronomy, we do not directly image our sources. However, GW data is suitable for audification, and a variety of tactile resources have been made. These make GW astronomy accessible to people with vision impairments, who are often excluded from accessible astronomy communication.<sup>42</sup>
- LVK results are produced by large teams. This makes it difficult for those outside to understand how discoveries are made, or to construct human-interest stories. However, this enables us to emphasise the importance of teamwork and international cooperation to science. The LVK's breakthroughs are a direct contrast to the popular perception that scientific breakthroughs come from lone geniuses.<sup>43,44</sup> The diversity of the LVK's membership allows us to draw upon many different lived experiences, and demonstrate that scientists may come from any background.
- After the initial first observations, many detections were similar to those discovered previously. The increase in the LVK's detection rate is an experimental triumph—what was once extraordinary is now everyday. However, many detections are now not novel. It is therefore necessary to concentrate on the science enabled by a large set of detections. This has a benefit of reflecting that most scientific progress comes from careful study rather than a dramatic breakthrough.

While the LVK has benefitted from an existing interest in black holes and space, it has also faced hurdles, such as a tendency to misattribute discoveries to LIGO alone. As the field continues to mature, we expect that communication strategies will need to continue to evolve to reflect both the state of the field, and the interest and awareness of our audiences.

## Author Bios

**Hannah Middleton** is a research scientist at the Institute for Gravitational Wave Astronomy at the University of Birmingham, UK. She works on gravitational wave data analysis and is also a member of the LISA ground segment team (a future space-based gravitational wave observatory). She is enthusiastic about public engagement. She has worked on exhibits, art+science collaborations, and is the current Editor-in-Chief of the LIGO Magazine ([www.ligo.org/magazine](http://www.ligo.org/magazine)).  
<https://orcid.org/0000-0001-5532-3622>

**Christopher Berry** is a Senior Lecturer with the Institute of Gravitational Research, University of Glasgow, and a Visiting Scholar with the Center for Interdisciplinary Exploration & Research in Astrophysics, Northwestern University. He primarily works on gravitational-wave data analysis and understanding the astrophysics of black holes. Christopher has created a variety of public-engagement resources (from graphics to blog posts), helps to coordinate LIGO social media, and is part of the team behind the Gravity Spy community-science project.  
<https://orcid.org/0000-0003-3870-7215>

**Nicolas Arnaud** is a CNRS/IN2P3 researcher in France. He is a member of the Virgo Collaboration, working at the interface between instrument science and data analysis. Nicolas has been involved in outreach and education activities for several years, both in France and for the experiments he has worked on. He was the Virgo outreach coordinator at the time of the first detections of gravitational waves and is the French representative to the IPPOG Collaboration.  
<https://orcid.org/0000-0001-6589-8673>

**David Blair** is leader of the Einstein-First schools science education project that has created a comprehensive school Einsteinian science curriculum called Eight Steps to Einstein's Universe, for students from ages 7–15. Starting with toys and songs it coherently builds an intuitive understanding of modern science from atoms and photons, to topics including quantum measurement, cosmology, black holes, gravitational waves and climate science.  
<https://orcid.org/0000-0002-1501-2405>

**Jacqueline Bondell** is the Senior Education and Outreach Manager for both the ARC Centre of Excellence (CoE) for Dark Matter Particle Physics and the ARC CoE for Gravitational Wave Discovery (OzGrav). She develops educational content for outreach programs and school incursions, focusing on incorporating innovative technology and science content into curriculum-aligned educational opportunities for students and teachers.

**Nicolas Bonne** is a blind astronomer and Public Engagement and Outreach Fellow based at the University of Portsmouth. He leads the Tactile Universe public engagement project which is developing free multi-sensory resources to give blind and vision impaired people more accessible ways to engage with current topics in astronomy.  
<https://orcid.org/0000-0001-9569-8808>

**Debarati Chatterjee** is Associate Professor at the Inter-University Centre for Astronomy and Astrophysics in Pune, India and the current chair of Education and Public Outreach for the LIGO-India project. Her expertise is in developing theoretical models of neutron stars and searching for signatures of its interior composition in

gravitational waves. She is also passionate about communicating science in different languages.

**Sylvain Chaty**, professor, vice-president of culture, science and society at Paris Cité University, is an astrophysicist in the AstroParticle and Cosmology (APC) laboratory. His research focuses on stellar evolution of binary systems, hosting neutron stars and black holes, from formation up to merging, leading to gravitational wave emission. Member of the international collaborations LIGO-Virgo-KAGRA and CTA (high energy astronomical observatory), and passionate about transmission and dissemination of knowledge, he currently is the outreach responsible for the Virgo group of APC.

**Storm Colloms** is a PhD student at the University of Glasgow researching the astrophysical origins of binary black holes detected with gravitational waves. They are also an editor and illustrator for the LIGO magazine, curator of the Humans of LIGO blog, and author and editor for Astrobites.  
<https://orcid.org/0009-0009-9828-3646>

**Lynn Cominsky** is an award-winning Professor in the Physics and Astronomy Department at Sonoma State University, and the director of EdEon STEM Learning which develops educational materials for NASA, NSF and the US Department of Education. She also co-chairs the Formal Education Working group for the LIGO Scientific Collaboration, and has led the creation of two online courses for community college instructors, an educator guide for secondary instructors and a video explaining how LIGO operates.  
<https://orcid.org/000-0003-2073-1065>

**Livia Conti** is senior researcher at Istituto Nazionale di Fisica Nucleare in Padova, Italy. As an experimental physicist, she has focused mainly at developing gravitational wave detectors, from the old style resonant bars to modern interferometers. Presently her major topic is mitigating noise due to scattered light. She is active in science dissemination, with special care for inclusion and accessibility.  
<https://orcid.org/0000-0003-2731-2656>

**Isabel Cordero-Carrión** is Associate Professor in the Faculty of Mathematics of the University of Valencia, Spain. She has been a member of the Virgo Collaboration since 2016 and is the current Virgo outreach coordinator. Her research lines focus on applied mathematics and astrophysics, with special interest in the development of numerical methods for partial differential equations, numerical relativity and gravitational waves.  
<https://orcid.org/0000-0002-1985-1361>

**Robert Coyne** is an associate teaching professor of physics at the University of Rhode Island, and the current chair of the Communications and Education division of the LIGO Scientific Collaboration. His research interests include multi-messenger studies of gamma-ray bursts. He is passionate about education and public outreach, having been involved in both science communication as well as physics education for over a decade.  
<https://orcid.org/0000-0002-5243-5917>

**Zoheyr Doctor** studies black holes and neutron stars through detections of gravitational waves. He studies how these dead stars are formed and under what circumstances they may collide with each other, releasing a powerful burst of gravitational waves. To explore these topics, Zoheyr makes frequent use of statistical and

machine-learning techniques, and enjoys bringing together astrophysics and data science.

**Andreas Freise** is a Professor of Gravitational Wave Physics at the Vrije Universiteit Amsterdam and Nikhef. His work focuses on instrument science and interferometer design, from GEO 600 to Virgo, LIGO and the Einstein Telescope. He founded the LIGO Magazine and started Laser Labs Games CIC to make and publish mobile apps for LVK outreach.  
<https://orcid.org/0000-0001-6586-9901>

**Aaron Geller** studies how stars and planets are born and how they change with time, both through observations and numerical simulations. In addition, he develops visualizations of his and others' work for both research and outreach purposes, and for use at Northwestern, the Adler Planetarium, within classroom lessons, and for the general astronomy enthusiast.

**Jen Gupta** is an Associate Professor in Public Engagement and Outreach at the Institute of Cosmology and Gravitation, University of Portsmouth, and a founding member of the Tactile Universe project.  
<https://orcid.org/0000-0001-9799-4459>

**Daniel Holz** is a Professor at the University of Chicago, working on gravitational-wave astrophysics and cosmology. He is Chair of the Science and Security Board of the Bulletin of the Atomic Scientists, and in this role helps set the time of the Doomsday Clock. Holz is also founding director of the UChicago Existential Risk Laboratory (XLab), an interdisciplinary effort focused on understanding and mitigating existential risks, including nuclear war, climate change, and AI-fueled disinformation.  
<http://orcid.org/0000-0002-0175-5064>

**William Katzman** leads the LIGO Science Education Center team as a LIGO Laboratory staff member and Caltech employee. William has been an LSC member since 2009, specializing in education and public outreach.

**David Keitel** works in the LSC since 2011 on gravitational-wave data analysis for a variety of sources. He is a faculty member at the University of the Balearic Islands in Spain. He is currently co-chair of the LVK continuous waves working group, which searches for long-duration gravitational-wave signals from spinning neutron stars, and has managed the LVK science summaries for several years.  
<https://orcid.org/0000-0002-2824-626X>

**Joey Shapiro Key** is an Associate Professor of Physics at the University of Washington Bothell contributing to data analysis development for gravitational wave observatories. She served as the chair of the Education and Public Outreach committee for the LIGO Scientific Collaboration during the exciting time of the detection and announcement of the first gravitational wave signals.  
<https://orcid.org/0000-0003-0123-7600>

**Nutsinee Kijbunchoo** is a postdoc at the University of Adelaide. Her current work focuses on investigating the crystal degradations inside of LIGO squeezers. In her spare time Nutsinee likes to play games, drink, and draw things. She is also the author of the Antimatterwebcomics.com. The comic features anything from space cats to students' mental health. Sometimes the comic illustrates collaboration's hot topics in a very politically incorrect way.

**Carl Knox** joined OzGrav, the Australian Centre of Excellence for Gravitational Wave Discovery, in 2017. He currently holds the title of Creative Technologist and Scientific Visualization Specialist. Carl specialises in data visualisation and artistic representations of astronomical phenomena, including gravitational waves. He uses various mediums, such as 3D animation, graphic design, and real-time generative techniques, to create artworks for media releases, public outreach, and experimental immersive and interactive experiences.

**Coleman Krawczyk** is a Senior Research Software Engineer and technical lead for the Tactile Universe project at the University of Portsmouth. He has designed the project's signature 3D printable models alongside software to make it easier for researchers, educators and communicators to make their own models.  
<https://orcid.org/0000-0001-9233-2341>

**Ryan Lang** is a Lecturer in the Concourse Program at the Massachusetts Institute of Technology. He has worked on LIGO outreach since the first gravitational-wave detection announcement in February 2016, focusing most recently on social media and the [questions@ligo.org](mailto:questions@ligo.org) service for answering scientific questions from the general public.

**Shane Larson** is a research professor of physics at Northwestern University, where he is Associate Director of CIERA (Center for Interdisciplinary Exploration and Research in Astrophysics). He works across the gravitational wave spectrum, specializing in compact binaries and the galaxy for both LIGO, and the forth-coming space-based observatory LISA. He teaches a broad range of introductory physics and astronomy, and also teaches for Northwestern's Prison Education Program. He is an active public science speaker and blogger.  
<https://orcid.org/0000-0001-7559-3902>

**Chris North** is a Reader and Head of Public Engagement at the School of Physics and Astronomy at Cardiff University. His activities include data visualisation and educational workshops across a range of areas, but particularly astronomy and gravitational waves. He has developed a number of schools workshops and interactive website.

**Sascha Rieger** is a science communicator affiliated with the Max Planck Institute for Gravitational Physics Albert Einstein Institute, in the gravitational wave research field for almost 25 years. He has worked on any number of movies, animations, graphics, exhibitions, and even more publications - reports, grant applications, brochures, flyers, posters among others. These days he is busy with the LIGO Magazine, one of the public outreach leads in the LISA Consortium, and doing Einstein Telescope communication whenever he finds the time.

**Aurore Simonnet** is the scientific illustrator for the EdEon STEM Learning team at Sonoma State University. She adds a creative and imaginative flare to physical science and technical illustrations used for various education and public outreach programs (LIGO among others!). From diagrams to astronomical illustrations, her skills in graphic design and technical drawing contribute a diverse blending of scientific and artistic perspective.

**Andrew Spencer** is a Lecturer at the Institute for Gravitational Research at the University of Glasgow, his research focus is laser interferometry and technology development for future gravitational

wave detectors. He has a special interest in outreach resource development, making education and communication resources for classrooms, science centres and festival events in addition to working on crossover projects that span science and creative arts.  
<https://orcid.org/0000-0003-4418-3366>
