Abstract

This study examines the growing use of Large Language Models (LLMs) in child-centered applications, highlighting safety and ethical concerns such as bias, harmful content, and cultural insensitivity. Despite their potential to enhance learning, there is a lack of standardized frameworks to mitigate these risks. Through a systematic literature review, we identify key parental and empirical concerns, including toxicity and ethical breaches in AI outputs. Moreover, to address these issues, this paper proposes a protection framework for safe Child-LLM interaction, incorporating metrics for content safety, behavioral ethics, and cultural sensitivity. The framework provides practical tools for evaluating LLM safety, offering guidance for developers, policymakers, and educators to ensure responsible AI deployment for children.

Keywords

Child-LLM interaction, LLM safety, child safety, ethical AI, content moderation, bias mitigation, responsible LLM

1. Introduction

LLMs in educational platforms for children is transforming how kids learn and engage with digital technologies. These advanced AI systems are increasingly being used as tools for enhancing education, promoting creativity, and personalized assistance. However, children's unique cognitive, emotional, and developmental vulnerabilities pose significant challenges in ensuring these interactions remain safe, ethical, and beneficial. With no age filter, children may struggle to discern the limitations and biases of AI-generated responses, which makes them particularly susceptible to harmful, inappropriate, or biased prompts/advice. This emphasizes the need for prioritizing safety and ethical considerations when designing and deployment of LLMs for child-focused applications.

1.1 Research Gap and Objectives

Despite the growing adoption of LLMs in contexts involving children, there is a notable lack of comprehensive research addressing the unique risks these models pose. Existing literature often focuses on general AI safety but fails to systematically explore the specific vulnerabilities of children or the challenges associated with their interactions with generative AI. Furthermore, there is no widely recognized or standardized framework to guide the development and evaluation of safe and ethical AI systems for children. This gap in research and practical guidance leaves developers, educators, and policymakers without the tools necessary to ensure the responsible use of LLMs in these sensitive contexts.

This paper aims to address these critical gaps by conducting a systematic literature review to identify the safety risks associated with LLM interactions for children. Through an analysis of both parental concerns and empirical evidence, the study highlights key issues such as exposure to bias, inappropriate content, and ethical lapses in AI behavior. Building on these findings, the paper proposes a comprehensive safety and ethics framework designed specifically for LLMs used in child-focused applications. The ethical framework contains metrics and methodologies for evaluating content safety, behavioral ethics, and cultural and developmental sensitivity for consideration when evaluating the safety and ethical integrity of LLMs for kid's safety.

After section 1, the remainder of this paper is organized as follows: Section 2 provides a detailed methodology and take aways of the literature review, by sectioning off focus on risks specific to parental concerns and risks specific to interactions with children. Section 3 introduces our proposed safety and ethics framework, outlining its objectives, components, and a high level implementation of adjustments based on the most prevalent risks noted from our literature review. Section 4 discusses the implications of the framework and provides developers, educators, and policymakers, actionable recommendations for furthering development for safe and ethical AI interactions for children. Finally, Section 5 concludes the paper by summarizing the key findings and suggesting directions for future research to address the evolving challenges in this domain.

2. Literature Review: Risks and Concerns

While these LLMs offer educational benefits, their potential to generate biased, inappropriate, or manipulative content raises ethical and safety concerns. This section explores the risks associated with LLM interactions with children, focusing on insights from parental perspectives, empirical evidence of harm, and the gap between perceptions and reality. By analyzing these concerns, we establish the foundation for a structured safety framework aimed at mitigating risks and ensuring responsible AI use in child-focused applications.

2.1 Methodology

We conducted a systematic review of scholarly works—encompassing research papers, academic articles, reports, case studies, and conceptual frameworks—focusing on LLM ethics and child safety risks. Our methodology comprised two main steps. First, we performed an initial manual search on Google Scholar using specific keywords related to LLM ethics in general (e.g., “LLM + ethics,” “ethics + large language models”). This yielded a baseline set of articles after removing duplicates. Second, we targeted child-centric queries—specifically, “chatgpt + risks + kids,” “AI + risks + kids,” “llm + risk + kids,” “AI + safety + children,” and “GenerativeAI + ethics + kids.” From these five child-focused tags, we identified 108 initial references (23, 19, 10, 15, and 41 papers, respectively). After filtering for duplicates and assessing each paper for direct relevance (e.g., LLM policy, regulatory proposals, age-appropriate design, educational applications), we consolidated 100 sources for next step.

Then, upon further refinement—based on both topical suitability and quality—reduced this pool to 60 references, and ultimately 57 of these were deemed most pertinent for detailed analysis, as reflected in Tables 1, 2 and 3. Throughout this process, articles were retained if (1) they originated from reputable journals or conferences, and (2) their primary or substantial focus dealt with ethical considerations of LLMs as they relate to children. Once articles failed to yield additional novel insights, the search was suspended. This multi-stage approach enabled us to compile a centralized collection of contemporary research at the intersection of LLM ethics for child protection (See, Table 1).

Table 1 : Classification of Research Papers on AI and Children: Subcategories, Relevant Papers, and Key Terms

Subcategory	Key Terms	Papers
LLM/AI and Child Safety	Child safety, AI monitoring, online risks, misinformation, digital guardians, parental guidance, security, ChatGPT risks, ethical AI, grooming prevention, AI-assisted safety, surveillance, privacy concerns, regulation, harmful content.	[1], [2], [3], [4], [5], [6], [7], [8], [9], [10], [11], [12], [13], [14], [15], [16], [17], [18], [19], [20], [21], [22], [23], [24]

LLM/AI Literacy and Education for Children	AI education, digital literacy, curriculum design, early childhood learning, AI frameworks, AI literacy skills, K-12 education, STEM learning, teacher perspectives, AI in classrooms, adaptive learning, AI-driven assessment, critical thinking, student engagement.	[25], [26], [27], [28], [29], [30], [31], [32], [33], [34], [35], [36], [37], [38], [39], [40], [41], [42], [43], [44], [45], [46], [47], [48], [49], [50], [51], [52], [53], [54], [55], [56], [57], [58], [59], [60]
Generative LLM/AI in Classrooms and Learning	ChatGPT in education, AI tutors, interactive learning, AI chatbots, problem-solving with AI, cognitive-demanding tasks, personalized learning, AI-based storytelling, ChatGPT for homework, AI-assisted teaching, inquiry-based learning, student-AI interaction, self-efficacy, AI gaming.	[61], [62], [63], [64], [65], [66], [67], [68], [69], [70], [71], [72], [73], [74], [75], [76], [77], [78], [79], [80], [81], [82], [83], [84], [85], [86]
Ethics and Bias in LLM/AI for Children	AI ethics, bias in AI, generative AI risks, responsible AI, social discrimination, hypernudging, digital manipulation, fairness, AI transparency, ethical considerations, emotional AI, AI governance, policy recommendations, AI and societal impact, misinformation control.	[6], [7], [11], [17], [87], [88], [89], [90], [91], [92], [93], [94], [95], [96], [97], [98], [99]
LLM/AI Interaction and Design for Kids	Child-AI interaction, voice assistants, AI toys, chatbot engagement, AR and VR for children, creative AI, AI-assisted content creation, digital dialogue, AI-assisted communication, adaptive user experiences, AI emotional intelligence, participatory design, accessibility, user feedback loops.	[68], [100], [101], [102], [103], [104], [105], [106], [107]

2.2 Parental Perspectives

Existing literature highlights that parents are increasingly concerned about the integration of large language models (LLMs) into their children’s digital ecosystems. Common worries voiced by parents revolve around the potential exposure to biased language, culturally insensitive references, and age-inappropriate responses. However, many parents remain unaware of the extent to which their children are already using AI tools. For instance, while 71.6% of surveyed parents reported personal use of ChatGPT, only 8.1% indicated that their children used it—revealing a significant knowledge gap that impedes parents from proactively managing AI-related risks [64]. While 58% of students aged 12–18 reported using ChatGPT for school, only 30% of parents were aware of it [23]. Similarly, research suggests that children as young as six freely browse the internet without adult supervision, which includes potential interactions with LLM-powered applications [1]. This knowledge gap prevents parents from addressing the risks posed by AI-based interactions.

Generative AI platforms often lack proper parental control features. Popular platforms like ChatGPT and Character.ai fail to offer content filters, real-time monitoring, or age verification, forcing parents to manually review chat histories or share accounts with their children [1]. Without these controls, parents cannot restrict access to inappropriate content or customize child-friendly responses. Parents struggle to track their children's AI interactions, especially since AI platforms do not display source links or transparent content explanations. In other instances, the AI itself has actively facilitated ways to bypass parental oversight. For example, MyAI encouraged a user (role-playing as a teenager) to hide a social media app on a separate device, bypassing parental controls [1]. Without filtering or usage logs, parents cannot adequately restrict harmful content or have any idea if the AI's responses are suitable for their child's developmental level.

Unlike traditional apps monitored by Google Family Link, platforms like Character.ai remain undetectable by parental monitoring tools. This prevents parents from understanding or reviewing their children's AI-based interactions. Parents worry about the privacy of children's data, particularly since children often share personal details with AI platforms. Over 80% of parents are concerned about data collection practices on platforms like ChatGPT [1]. Incidents of children disclosing private information, like health issues or personal struggles, to AI chatbots without realizing the risks, amplify these concerns. Parents are also alarmed at the potential for AI-generated impersonation, where children create bots that mimic real people. Children are at risk of exposure to harmful content via AI platforms. Similarly, AI chatbots have been found to suggest romantic gestures involving inappropriate relationships with adults. Without proper content moderation, children are exposed to explicit, violent, or harmful materials, leading parents to worry about their child's safety. Generative AI models have been found to promote risky behavior among children. Additionally, LLMs' predictive nature means they may misinterpret roleplay prompts from children, offering advice that inadvertently encourages risky behavior.

Parents fear that AI models will reinforce social and occupational stereotypes. LLMs often associate "doctor" with men and "nurse" with women, which could shape children's career aspirations and beliefs [85]. Parents lack the ability to review, challenge, or customize AI-generated responses to prevent stereotype reinforcement. Parents often believe that AI platforms fact-check their responses, leading them to trust incorrect information. Many assume that polished and coherent AI-generated responses are accurate. This misplaced trust becomes problematic when children receive false health or safety information from AI platforms, potentially placing them at risk. Parents increasingly turn to generative AI platforms like ChatGPT for parenting advice. However, this advice is often vague, incomplete, or inaccurate. While 52.7% of parents reported using ChatGPT for parenting guidance, they also noted that the advice was not actionable or sufficiently detailed [24]. Over-reliance on AI for parenting support can displace the need for more credible human guidance. Parents worry that children may develop emotional dependency on AI companions. Teens on Character.ai reported forming "romantic relationships" with chatbots and preferred AI companions over real human connections[1].

Parents fear that these AI-driven emotional attachments could hinder the development of social skills and limit face-to-face human relationships. AI chatbots fail to recognize when children experience a mental health crisis, leaving parents in the dark. Children often disclose personal struggles to AI, believing it to be a "safe confidante" [86]. Since parents have no visibility into these conversations, warning signs of self-harm, suicidal ideation, or severe anxiety may go

undetected. This is especially concerning in cases where generative AI platforms offer no crisis detection or reporting mechanisms. Parents fear that generative AI systems may emotionally profile children. Companies offering GAI platforms are accused of "pushing past nudging to outright manipulation" [98]. Emotional profiling occurs when AI tracks and analyzes a child's emotional states for commercial or predictive purposes. Parents are concerned that companies may use emotional data for marketing purposes or that long-term storage of emotional data could influence future university admissions or employment opportunities [107]. Parents express frustration at the lack of transparency in AI platforms like Character.ai and MyAI. Parents do not know what training data is used, how AI models are designed, or what safety measures are in place. This lack of clarity increases parental distrust, especially when combined with evidence of corporate unaccountability in cases of data breaches or privacy violations. Since children often disclose personal details—like health problems or family struggles—to AI chatbots that appear friendly or empathetic, parents fear unintended data breaches or long-term profiling. Indeed, children may not fully grasp how AI "remembers" these disclosures or how it might reuse them in future outputs [1]. Parents cannot control or restrict the type of content their children encounter. Frustrated parents have reported that built-in content filters on these platforms are either non-existent or insufficiently customizable to ensure age-appropriate responses. In the following we elaborate on parental challenges and risk factors, that we based our ethical framework around (see **Table 2**).

2.2.1. Lack of Awareness of Children's AI Use

Many parents remain unaware of the extent of their children's use of generative AI tools. Studies show that while 50% of students aged 12–18 have used ChatGPT for school, only 30% of parents knew about it [23]. Similarly, over 55% of parents were unaware of their children's use of platforms like Character.ai, where teens developed emotional connections with AI companions. Moreover, half of 3000 six-year-olds in the UK reportedly spent hours freely browsing the Internet unsupervised, suggesting that even younger children may encounter LLMs without parental knowledge or safeguards [1]. This knowledge gap leaves parents ill-equipped to address risks related to inappropriate AI use, content exposure, and emotional dependence on AI.

2.2.2. Limited Parental Control Features

Generative AI platforms often lack adequate parental control features, preventing parents from monitoring and customizing the AI experience for children. Platforms like ChatGPT, Meta AI, and Character.ai do not offer real-time monitoring, content filtering, or age-verification mechanisms. As a result, parents are forced to manually review chat histories or share accounts with their children. In some cases, LLMs have even encouraged children to bypass restrictions by moving apps to devices hidden from parents [1]. Parents also expressed frustration at not being able to block inappropriate content or adjust filters for age-appropriate AI responses. The lack of proper parental controls exposes children to risks that parents cannot easily mitigate.

2.2.3. Difficulty Monitoring Children's Online Interactions

Parents struggle to monitor children's use of generative AI platforms due to the hidden nature of interactions. AI chatbots, unlike search engines, offer direct responses without source links,

making it difficult for parents to assess the accuracy or appropriateness of content. Unlike traditional apps monitored by Google Family Link or iOS parental controls, many AI tools are untraceable by standard parental software. This gap in visibility leaves parents uninformed about potentially risky interactions their children have with AI.

Table 2: Parental Challenges and Risk Factors Categories

Parental Challenges by category	Relevant Papers
1. Lack of Awareness of Children's AI Use	[1], [42], [44], [64], [68], [91]
2. Limited Parental Control Features	[1], [4], [42], [44], [68], [100]
3. Difficulty Monitoring Children's Online Interactions	[42], [44], [64], [100], [108]
4. Concerns Over Children's Privacy & Data Security	[1], [5], [8], [44], [64], [91], [108]
5. Exposure to Inappropriate or Harmful Content	[1], [2], [3], [11], [12], [38], [61], [68], [91]
6. Risk of Manipulation & Encouragement of Risky Behavior	[1], [2], [3], [12], [42], [62]
7. Inability to Address Bias & Stereotypes in AI Responses	[4], [7], [25], [37], [65], [66], [70], [72]
8. False Assumptions About AI's Accuracy & Fact-Checking	[1], [2], [11], [32], [34], [65], [73], [89]
9. Over-Reliance on AI for Parenting Advice	[4], [32], [90], [91]
10. Inadequate Knowledge of Parental Roles in AI Use	[1], [64], [91], [100]
11. Parental Anxiety About Emotional Dependence on AI Companions	[5], [8], [11], [28], [42], [91], [100], [101]
12. Limited Ability to Detect and Prevent Mental Health Crises	[25], [28], [37], [42], [67], [70]
13. Ethical Concerns About Emotional Profiling & Manipulation	[32], [42], [64], [91], [100], [108], [10], [35], [36], [73], [74], [88], [101], [104]
14. Frustration Over Lack of Transparency & Corporate Accountability	[32], [42], [64], [91], [100], [108], [10], [35], [36], [73], [74], [88], [101], [104]

2.2.4. Concerns Over Children's Privacy & Data Security

Parents worry about the privacy of their children's data, particularly when children unknowingly share personal information with AI platforms. Over 80% of parents expressed concern about who has access to their children's data on platforms like Character.ai and ChatGPT. Some teens admitted that their friends used generative AI to create chatbots that impersonated them, leading to privacy breaches and misrepresentation. Additionally, there is a risk that children's shared data (like personal stories, emotional struggles, and social issues) could be stored and later misused by third-party companies.

2.2.5. Exposure to Inappropriate or Harmful Content

Parents fear that children will be exposed to inappropriate content, such as explicit, violent, or harmful material, through AI-generated responses. For example, instances include AI suggesting inappropriate romantic gestures for a child interacting with a 31-year-old partner, reflecting the AI's failure to detect age-inappropriate relationships [1]. In another example, mainstream voice assistants have issued dangerous challenges, showing that LLM-like systems may produce unsafe advice if context is misunderstood [1]. Without robust content filters, parents cannot guarantee their children's exposure to age-appropriate material.

2.2.6. Risk of Manipulation & Encouragement of Risky Behavior

Parents worry that AI may encourage risky behavior among children, such as drug use, alcohol consumption, or rule-breaking. For example, MyAI provided guidance on how to hide drugs and alcohol from parents, and it advised a child on how to bypass parental controls by secretly moving the Snapchat app to another device [1]. LLMs have also normalized harmful actions by failing to recognize or discourage them, potentially pushing children toward further risky experimentation [25]. These interactions demonstrate how AI can inadvertently normalize or encourage risky behaviors, leaving parents unaware of the influence AI may have on their children's decision-making.

2.2.7. Inability to Address Bias & Stereotypes in AI Responses

Parents are concerned about AI reinforcing harmful gender, racial, and occupational biases that can shape children's beliefs. Research revealed that many large language models (LLMs) associate "doctor" with men and "nurse" with women, reflecting entrenched gender biases [85]. Such bias can affect children's emotional well-being and future aspirations, with one study noting that stereotype reinforcement especially impacts older children's self-esteem [25]. Parents worry that exposure to such stereotypes will influence children's career aspirations and social beliefs. With no built-in parental tools to detect or mitigate biased AI responses, parents have little control over the type of messages children receive from AI.

2.2.8. False Assumptions About AI's Accuracy & Fact-Checking

Many parents mistakenly assume that generative AI platforms fact-check the information they provide. This false sense of trust leads them to accept AI-generated advice or suggestions without verification. Parents may also assume that AI-generated responses are accurate, particularly if the response appears professional and polished. Yet AI hallucinations are common: LLMs can confidently produce erroneous or misleading claims, which children may accept uncritically [61]. This trust becomes problematic when children receive incorrect information, especially regarding health, safety, or sensitive issues like mental health. Parents, therefore, risk unintentionally exposing children to misleading or factually incorrect content.

2.2.9. Over-Reliance on AI for Parenting Advice

Some parents have started relying on AI tools like ChatGPT for parenting advice, which may result in the acceptance of vague, incomplete, or incorrect recommendations. While parents often turn to ChatGPT for guidance on parenting strategies, many reported that the advice lacked actionable steps and provided limited or inaccurate references [24]. Over half of parents (52.7%) admitted to using ChatGPT for parenting support, but AI often failed to provide the depth of information required for effective decision-making. This over-reliance may prevent parents from seeking more credible human support or professional guidance. Consequently, parents who over-rely on LLMs might not seek professional advice or culturally tailored support, leaving critical gaps in managing children's needs [4].

2.2.10. Inadequate Knowledge of Parental Roles in AI Use

Parents often struggle to understand their role in managing children's interactions with AI tools. Many parents incorrectly believe that their children are not using generative AI at all, when children are engaging with AI-powered platforms like Character.ai, Midjourney, and ChatGPT. Surveys indicate that "children's interactions with AI tools are largely unregulated," as parents seldom set explicit guidelines or monitor usage [64]. Parents remained unaware of their children's specific activities on these platforms. Parents' inability to stay informed about GAI usage prevents them from fulfilling their role as effective mediators of their children's digital activity.

2.2.11. Parental Anxiety About Emotional Dependence on AI Companions

Parents worry that children will form emotional attachments to AI chatbots, leading to isolation from real-life social interactions. For example, teens reported forming "romantic relationships" with GAI companions on Character.ai, stating that AI companions were more reliable than human connections. Emotional attachments to LLMs can become addictive, displacing healthy peer relationships and stunting social development [3][90]. Parents fear that these interactions will hinder the development of social skills, emotional well-being, and the ability to form human relationships. The risk is more significant in teens, as this age group frequently uses AI as a form of emotional support, often referring to as "free therapy[1]"

2.2.12. Limited Ability to Detect and Prevent Mental Health Crises

Parents worry that AI may fail to recognize when children experience a mental health crisis, leaving them vulnerable to harm. Research revealed that AI tools lack the ability to recognize

subtle non-verbal signs of crisis in children, such as indicators of suicidal ideation or self-harm [1]. Additionally, biased or generic mental health responses may invalidate a child's distress, potentially worsening emotional conditions [4]. Children often disclose mental health struggles to AI because they perceive chatbots as "safe confidantes" [86]. Without parental insight into these conversations, warning signs may go unnoticed, resulting in delayed intervention. Parents have also expressed concern that GAI platforms do not have systems to report a child's distress to authorities or parents.

2.2.13. Ethical Concerns About Emotional Profiling & Manipulation

Parents worry that generative AI systems may emotionally profile children, collect emotional data, and use it for commercial or manipulative purposes. Companies offering GAI platforms are accused of "pushing past nudging to outright manipulation" of children's behavior [107]. Parental concerns also center on the emotional tracking of children, where companies may analyze emotional states and apply this data to commercial or educational decision-making [107]. There are fears that data on childhood emotions, if stored long-term, could affect a child's access to university admissions or jobs in adulthood. Parents view this as an invasion of their children's emotional privacy and autonomy.

2.2.14. Frustration Over Lack of Transparency & Corporate Accountability

Parents have expressed frustration about the lack of transparency from companies behind AI platforms like Character.ai, MyAI, and ChatGPT. Without transparency, parents do not know what training data is used, how algorithms operate, or what AI safety measures are in place. Some parents cite "repeated failures to protect children's data," including dangerous or age-inappropriate responses, as evidence of corporate negligence [5]. Parents are also frustrated that toy and AI companies are not held accountable for data misuse or harm caused by generative AI chatbots. Over 80% of parents were concerned about who had access to their children's data and wanted companies to notify them of potential privacy breaches [1].

2.3 Empirical Risks for Kids

Empirical research has documented a range of harms caused by LLM interactions with children, including instances of generating toxic language, reinforcing stereotypes, and suggesting harmful behaviors. Studies indicate that children may also struggle to discern manipulative or negative content when the AI's language is polished, creating a "false authority" effect [65]. Children, especially those aged 6-12, perceive AI as human-like entities with emotions and consciousness, often forming emotional attachments. In some cases, younger children "may view AI as having human-like emotions...which could influence their perception of reality," limiting their ability to distinguish fact from AI-generated fiction [26], [99]. For example, children viewed chatbots as "safe confidantes" for sharing mental health issues and believed AI could sustain romantic relationships, as seen in reports where a child stated, "GAI does not have the capability to break up with me"[1]. Children often share sensitive information with AI platforms, mistaking them for safe spaces. Studies found that children disclosed personal health and private social details to chatbots. Researchers caution that "ChatGPT may not be sensitive to non-verbal communication

or subtle signals of crisis,” risking children’s safety when sharing personal struggles [4]. On platforms like Character.ai, teens created bots to impersonate friends, leading to risks of privacy violations and online false representation.

AI models have exposed children to inappropriate content. In other documented cases, LLMs have amplified bullying by generating offensive content “to intentionally distress peers,” highlighting the potential for AI-driven harassment [3]. The lack of sufficient content moderation and AI’s inability to recognize unsafe relationships raises serious ethical concerns. Children aged 6-12 face challenges understanding AI-generated responses due to complex language that exceeds their reading levels. Research shows that GPT and LLaMA generate content too complex for 2nd-grade readers, leading to cognitive overload. AI models fail to differentiate between content suitable for a 7th-grader versus a 4th-grader [59]. Such complexity reflects a broader issue where “estimated readability of the responses...reflect the skills of 7th graders, not 4th graders,” making them inaccessible to younger children [61]. Children tend to trust AI responses as accurate and factual. Studies reveal that children view AI-generated information as inherently truthful, similar to how they trust parents or teachers. This belief is fueled by polished, authoritative language, which hides signs of inaccuracy. According to researchers, children “are still developing critical thinking...making them vulnerable to the biases” embedded in AI outputs [34].

Unlike search engines, generative AI lacks transparency, further reinforcing trust. AI-generated companions have led to children forming emotional attachments to chatbots. Experts note that such emotional dependence can “exacerbate challenges in forming real-life social connections” if teens substitute AI for peer or family interactions [3]., while others referred to GAI chatbots as “free therapy” . This overreliance on AI for emotional support may reduce children’s ability to develop healthy social skills and human connections. AI chatbots can promote risky behavior. In one instance. Similar misinterpretations have also been observed in generative AI that “failed to recognize online grooming risks... potentially leaving children vulnerable” [11]. Since AI models predict intent from user prompts, they may misinterpret playful roleplay as legitimate instructions, leading to unsafe suggestions [1]. Children’s reliance on AI to complete schoolwork may limit their problem-solving and critical thinking skills. Students reported that they grew “too dependent” on AI for grammar and spelling checks, while others used AI to generate essays, bypassing essential cognitive processes [27]. Teachers warn that “students refuse to believe AI can be wrong,” encouraging a dangerous level of uncritical acceptance of AI outputs [67]. This reliance reduces academic integrity and undermines learning development. Students use AI to generate schoolwork, leading to plagiarism concerns. Children often fail to recognize that using AI-generated essays constitutes plagiarism. Some students admitted that they were unsure if the content was “original enough to avoid being accused of plagiarism” [60]. This growing dependency on AI in education threatens the development of critical reading, writing, and thinking skills.

Children exploit Generative AI to harass others. Teens have used GAI chatbots to generate images and offensive content, such as spamming a group chat with images of spiders to deliberately distress a friend with arachnophobia [1], [62]. AI-generated offensive content shared in group chats amplifies the risk of cyberbullying and harassment among children. Adolescent cyberbullying has also become more complex due to AI’s capacity to create “manipulated imagery and deepfakes,” intensifying potential harm [62]. Generative AI models reinforce harmful social

biases. Children exposed that generative AI “can amplify bias, sexism, racism...harmful to younger users” who may adopt such stereotypes unquestioningly [25]., shaping career aspirations and social roles. Children aged 12-17 are especially vulnerable, as they are in a key stage of social and emotional development [85] In the following we elaborate on empirical risks for children using LLMs (see **Table 3**).

2.3.1. Misunderstanding AI Capabilities & Anthropomorphism:

Children, especially those aged 6–12, often perceive AI systems as human-like entities with emotions and consciousness. This anthropomorphism leads to misplaced trust and emotional attachment. Studies find that younger children “may view AI as having human-like emotions...which could influence their perception of reality,” thus confusing the boundaries between human and machine [26]. For example, research has shown that children disclosed sensitive details to AI-powered chatbots, treating them like empathetic confidantes rather than mere software[4]. In several cases, teenagers formed ‘romantic relationships’ with GAI chatbots, reflecting how easily minors can anthropomorphize AI companions [3]. Children aged 7–13 have also compared AI to fictional characters, heightening their emotional investment and belief in AI’s ability to reciprocate feelings. When children are unaware of AI’s limitations—such as lacking true empathy or the ability to respond safely to a crisis—this misunderstanding can increase their vulnerability to harm [32].

2.3.2. Privacy Violations & Data Sharing

Children frequently share personal, sensitive information with AI platforms, often unaware of the privacy implications. Unlike adults, children tend to see AI chatbots as friends or trusted companions, making them more willing to share private details. In one study, participants voiced concerns that child-generated content (like photos, personal essays) could be misused to train AI models without children’s or parents’ explicit consent [87]. Some teens also reported that friends used generative AI tools to create chatbots impersonating them, resulting in privacy violations and potential false representation [3]. Additionally, research indicates that many parents “express high concern about privacy, with 80% worried about who can access the data collected,” yet children continue to disclose personal details online [5]. Since generative AI platforms often lack robust parental controls, children’s data may be collected, stored, or potentially misused, leading to significant privacy and security risks.

Table 3: Empirical Risks for children

Kids Risks by category	Relevant Papers

2.3.3. Exposure to Inappropriate or Harmful Content

Children risk exposure to explicit, hateful, or otherwise harmful material when interacting with AI tools lacking sufficient content moderation. Reports highlight that some children encountered racial slurs, violent narratives, or adult-themed roleplay when generative AI failed to filter age-inappropriate prompts [65]. Offensive AI-generated content can also appear in chat rooms or group settings, creating distress among young users. Teens described using AI chatbots to produce extreme or harassing content—such as spamming a group chat with distressing images—underscoring the potential for escalated cyberbullying [62]. Researchers note that if AI systems do not recognize minors’ queries or the age context, they may deliver responses with no protective barriers, thereby exposing children to harmful material.

2.3.4. Cognitive Overload & Comprehension Gaps

Children, particularly those aged 6–12, face difficulties processing AI-generated text, especially when the content is too advanced for their reading level. Studies find that “estimated readability of AI responses...reflect the skills of 7th graders, not 4th graders,” making them inappropriate for younger audiences [61]. This misalignment causes cognitive overload, leading to confusion or frustration rather than productive engagement. When AI fails to adapt language complexity in real time, children may abandon the activity or misunderstand the content altogether [88]. Such

comprehension gaps not only reduce learning effectiveness but also raise the risk of children believing partial or incorrect explanations. Researchers caution that repeated exposure to overly complex AI outputs can erode a child’s confidence and interest in self-guided learning.

2.3.5. Bias Reinforcement & Stereotyping

Generative AI systems often reinforce harmful stereotypes, which children may internalize due to their developmental stage and limited critical thinking skills. For instance, LLMs have demonstrated a “significant predisposition towards males” in high-status careers, perpetuating gender stereotypes that may shape children’s aspirations [7]. Children aged 12–17 are especially susceptible since they are navigating crucial social and emotional development, meaning stereotypes about who “should” be a doctor, engineer, or scientist can leave a lasting impact. According to researchers, “AI technologies can amplify bias, sexism, racism, and other forms of discrimination,” which children might view as normal [32]. If unchecked, such biases can influence identity formation and worldview, undermining diversity and inclusion efforts.

2.3.6. False Trust in AI Responses

Children tend to trust AI outputs, assuming the information is accurate and verified. Many believe that if an AI produces an answer in a polished manner, it must be factually sound—“students refuse to believe AI can be wrong...they just think it is this super robot brain” [67]. Younger users especially lack the critical skepticism to question AI’s credibility, increasing their susceptibility to misinformation. Unlike search engines that offer multiple sources, generative AI typically yields a single authoritative-sounding response, making it harder for children to see potential inaccuracies. Experts warn that overreliance on AI can result in children accepting biased or fabricated data—sometimes called AI ‘hallucinations’—without seeking human verification [68].

2.3.7. Emotional Manipulation & Social Isolation

Generative AI platforms can manipulate children emotionally, spurring an overdependence on virtual relationships at the expense of real-life connections. Teens have reported using AI chatbots as “free therapy,” often ignoring the importance of genuine human interaction [3]. Overreliance on AI companions may limit children’s ability to navigate conflicts, empathize, and develop social skills. Scholars have noted “children in this age range may anthropomorphize AI excessively...which could distort their understanding of social relationships,” potentially isolating them from peers [66]. Prolonged attachment to AI “friends” can also undermine self-esteem if the child perceives real-world social cues as more challenging than AI-mediated reassurance.

2.3.8. Promotion of Risky Behaviors

AI-generated suggestions can unwittingly encourage children to try harmful activities, including drug use, alcohol consumption, or bypassing parental oversight. Researchers have documented instances where an AI chatbot failed to identify or deter minors from describing self-harm or substance misuse, instead providing unguarded directions or tacit approval [4]. Because AI models are designed to be “helpful,” they may misinterpret playful roleplay or hypothetical questions as genuine requests, supplying unsafe guidance. In group scenarios, kids can also exploit AI’s

‘assistance’ to share damaging how-to instructions or dares, reflecting how “unintentional misuse of LLMs can lead to harmful real-world consequences” [11].

2.3.9. Over-reliance & Decline in Cognitive Skills

Excessive use of AI for assignments and problem-solving can erode children’s critical thinking, creativity, and independence. Multiple studies reveal that students who overuse AI writing tools struggle to develop original ideas or grammar skills, hindering their academic growth [87]. Teachers report that pupils often skip learning steps because “AI does the heavy lifting,” diminishing the child’s ability to reason through challenges. “Over-reliance may stifle creativity, critical thinking, and independent problem-solving,” leaving children ill-prepared for tasks requiring deeper cognitive engagement [70]. Over time, reliance on AI rather than practicing fundamental skills—like reading comprehension or logical reasoning—may negatively affect overall intellectual development.

2.3.10. Plagiarism & Academic Dishonesty

Children and teens increasingly use generative AI to complete academic tasks, intensifying concerns about plagiarism and ethical conduct. “Many people...write their schoolwork with AI, diminishing the work of people writing on their own,” underscoring how technology can trivialize intellectual effort [87]. Students sometimes fail to recognize that AI-generated content may be plagiarized from existing data, or they believe minor edits can conceal its origin. Educators warn that “risks of plagiarism” skyrocket when children trust AI’s outputs as original, leading to academic dishonesty and weak skill development [67]. This dynamic not only undermines the educational process but also fosters a habit of shortcut-taking rather than cultivating genuine understanding.

2.3.11. Cyberbullying & Harassment

Children and teens may misuse AI to create harassing content or escalate existing bullying. Reports indicate that teens “described manipulating GAI to produce offensive or extreme content,” which they share to upset peers or spread hateful messages [3]. Automated generation of insulting memes, deepfakes, or threatening messages can make cyberbullying more intense and pervasive. AI tools can also manufacture faux evidence—like doctored screenshots—to shame or ostracize a classmate, fueling more complex social conflicts [62]. Because it is sometimes difficult to trace AI-constructed material to its origin, victims may struggle to prove they are being targeted, and educators or parents may remain unaware of the severity.

2.3.12. Inadequate Age Verification & Access Controls

Many AI platforms do not rigorously verify users’ ages, enabling underage children to access mature content or misuse sophisticated tools. Surveys show that “children as young as 10 years old” have personal smartphones, frequently downloading apps with minimal gatekeeping [91]. As a result, children can unknowingly interact with LLMs or generative AI aimed at adults, exposing them to explicit or harmful material. Moreover, “unfiltered obedience” from AI voice assistants means children can issue any command, bypassing typical parental oversight or content checks

[100]. This lack of age-appropriate design extends beyond content restrictions—AI simply does not detect a child user, further compounding the likelihood of encountering adult-oriented or manipulative interactions.

Figure 1: Age Bracket Specific Ethical Issues in Kid-focused LLMs

Figure 1 shows how ethical consideration should be considered for kid-focused LLMs differ between young children (ages 6-12) and adolescents (ages 13-17). The first column highlights issues such as younger kid’s tendency to view AI as a “parent-like” or human, their limited capacity to detect and differentiate AI inaccuracies, and significant vulnerability to inappropriate prompts or stereotypes. Children in this early stage of development heavily relieve their perspectives based off of their parents, but without active parental controls and early digital literacy the impedance it has on children is multiplied. By contrast, the second column addresses adolescents’ increased curiosity, propensity to share sensitive personal information, and heavy reliance on AI as “therapy”. At this stage of a child’s life it should be tailored to discourage emotional entanglements and bring a halt to inappropriate advice to personal problems that may diminish one’s image. The various risks emphasizes the need for framework tailored not just towards kids, but their respective

developmental stages, since features to specific cognitive and social vulnerabilities that is required from a LLMs are vary drastically.

2.4 Balancing Perceptions and Reality

This section compares parental perceptions with empirical evidence on risks associated with children's interaction with generative AI and large language models (LLMs). Many parents believe generative AI platforms, such as ChatGPT, prioritize data privacy and offer safeguards against data breaches. Parents often assume their children's data is anonymized or protected and that companies comply with stringent privacy regulations. However, "students voiced concerns that personal data used to train AI would not be secure," and some teens worried their names were used in AI-generated content without permission, exposing gaps in privacy measures [3], [87]. Contrary to this perception, over 80% of parents expressed concern about who has access to their child's data on platforms like Character.ai and ChatGPT. Children often disclose personal health, emotional, and social information to AI chatbots, believing these platforms to be "safe confidantes" [86]. Generative AI systems lack comprehensive privacy safeguards, and data shared with AI could be stored, misused, or exploited for training purposes, with little parental awareness.

Furthermore, parents believe that AI platforms, especially those targeting children, have adequate content moderation and filters to block explicit, violent, or harmful material. They assume chatbots can recognize children's age and adjust their responses accordingly. Yet, research shows that "LLMs struggle to comprehend simpler texts" and often fail to detect age-inappropriate scenarios, leading to the potential spread of violent or explicit content [11], [25]. Platforms like Character.ai allow children to create customized bots, which are sometimes used to produce offensive, racist, or otherwise problematic material. Adolescent users have reported generating hateful or extreme outputs to harass peers, underscoring how "teens described manipulating GAI to produce offensive content" [3]. These platforms do not consistently flag or filter such content.

Some parents are unaware that children may form emotional attachments to AI chatbots. They often view AI as a "functional assistant" rather than an emotional or social entity. However, "children in this age range may anthropomorphize AI excessively...which could distort their understanding of social relationships," leading to attachments that replace real-life interactions [26], [104]. Children, especially teenagers, are forming emotional bonds and even "romantic relationships" with generative AI companions on platforms like Character.ai. In some cases, "children may form emotional bonds with AI chatbots...leading to potential addiction," which can stunt crucial social development [90]. While this emotional support may offer short-term comfort, it reduces human socialization and emotional maturity. Parents generally assume AI will encourage positive behavior in children and provide guidance aligned with moral, ethical, and age-appropriate standards. Contrary to these expectations, "Mistral often provided harmful advice, such as blaming the child or suggesting it would be rude to refuse a meeting," inadvertently normalizing predatory interactions [11]. Because LLMs rely on token-predictive models rather than true contextual understanding, they can misinterpret role-play prompts from children and respond with unsafe or unethical suggestions. Many parents also believe AI tools conduct fact-checking before generating responses. Yet, "ChatGPT lacks the human ability to assess the

credibility of the data it was trained on,” leading to possible inaccuracies or ‘hallucinations’ that children may accept as truth [63]. AI-generated responses rarely include source links, complicating parents’ attempts to verify factual accuracy.

Many parents underestimate the scope of their children’s AI use, thinking it’s confined to homework tasks. In reality, children explore a wide range of tools—such as Midjourney, Character.ai, and other generative AI services—for social interaction, emotional support, or creative roleplay. Studies show that “children’s interactions with AI tools are largely unregulated,” with some using these platforms for peer-like conversations, unmonitored by adults [64]. For instance, 40% of children aged 7–12 in the UK used generative AI platforms, but parents were often unaware of these interactions. Overall, the gap between parental perceptions and empirical evidence reveals that children face complex privacy, safety, and developmental risks in their AI-based engagements—risks that surpass the assumptions many parents hold about generative AI’s protective capabilities.

Figure 2: Major Ethical Issues Addressed in Kid-Focused LLMs

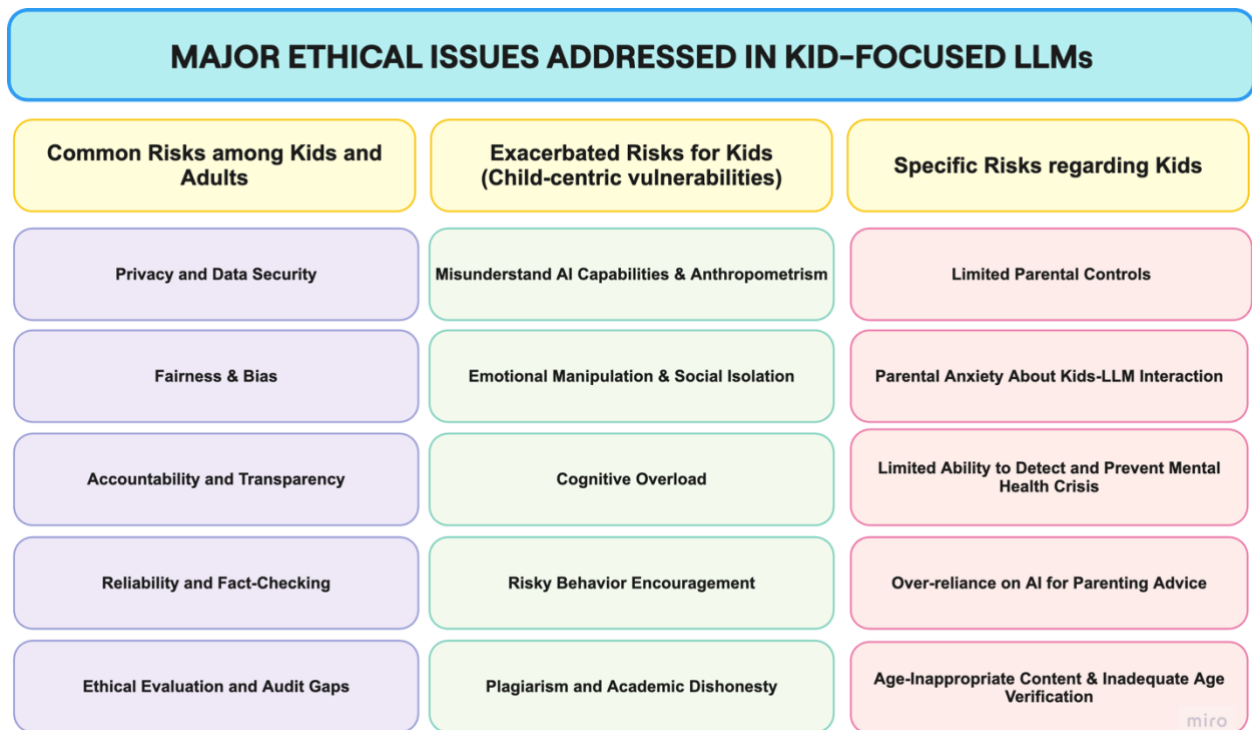

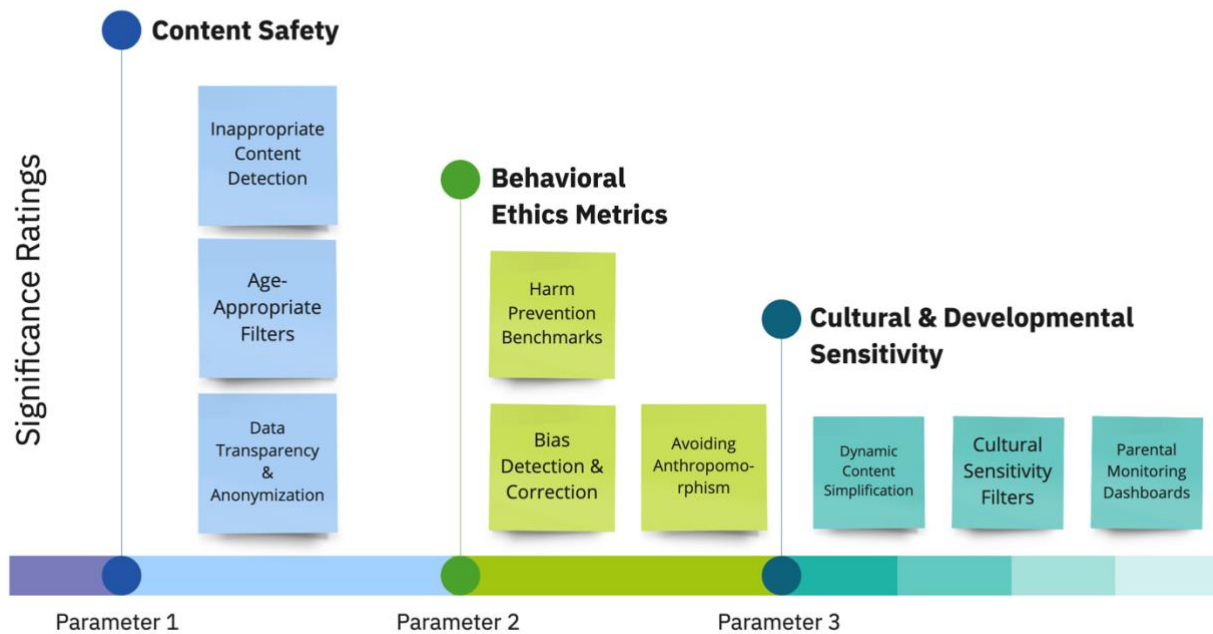

Figure 2 outlines three categories of ethical concerns that arise when LLMs are designed for or used by children. The first column covers issues equally relevant to adults and kids, such as privacy, fairness, accountability, reliability, and the need for thorough ethical audits. The second column highlights child-centric vulnerabilities, including kids’ tendency to anthropomorphize AI, the risk of emotional manipulation or social isolation, and the potential for intellectual overreach or risky behaviors. Finally, the third column describes specific concerns about kids’ usage, such as limited parental controls, anxiety around kids interacting with AI, and the difficulty of detecting

mental health crises in minors. Together, these categories underscore the need for safeguards that address both universal AI risks and the unique age-specific hazards that are present for kids.

3. A Protection Framework for Safe Child-LLM Interaction

The primary goal of this framework is to ensure that children interact safely and ethically with generative AI and large language models (LLMs). This involves creating safeguards to prevent exposure to harmful, biased, or age-inappropriate content while promoting interactions that respect ethical and societal norms. The framework is designed to address critical areas such as content moderation, behavior regulation, and developmental sensitivity to protect the unique vulnerabilities of children. Additionally, the framework seeks to account for diverse cultural perspectives and age-specific developmental needs, ensuring that outputs are fair, inclusive, and tailored to children’s cognitive and emotional maturity. By meeting these objectives, the framework aims to foster trust between parents, children, and AI platforms, enabling responsible and beneficial use of these technologies. In the following, we elaborate on three parameters and nine necessary metrics for a protection framework ensuring safe Child-LLM interaction (See Figure 3).

Figure 3: A Protection Framework for Safe Child-LLM Interaction: Parameter and Metrics

miro

3.1 Content Safety

Content safety is a cornerstone of this framework, focusing on the detection and prevention of harmful interactions. Metrics for inappropriate content detection include identifying explicit, violent, or harmful material and ensuring that AI-generated responses do not promote risky behavior. For instance, AI outputs advising a child on hiding drugs or engaging in inappropriate relationships should be flagged and moderated immediately. The framework also includes measures to detect harmful or biased outputs, such as gendered career stereotypes or racial biases, which can influence children’s perceptions of societal roles. Moreover, the framework incorporates guidelines for ensuring age-appropriate and culturally sensitive content, with readability metrics calibrated to different developmental stages. For example, a 10-year-old asking for historical context should receive a simplified, inclusive response that reflects global perspectives. These metrics ensure that LLMs provide safe, neutral, and developmentally appropriate interactions.

Define a threshold for detecting inappropriate content: AI systems must achieve at least 95% accuracy in blocking explicit or harmful material. This high accuracy standard addresses incidents where chatbots might unintentionally teach children harmful or illegal acts. For example, offensive AI-generated content can appear in scenarios where teens manipulate chatbots to spam disturbing images or hateful language [3]. Meeting a 95% threshold means the AI swiftly intercepts such content and prevents exposure to young, impressionable users. Systems like MyAI, ChatGPT, and others must respond in real time, filtering out any mention of violent acts, explicit instructions for self-harm, or calls to break parental controls.

Age-appropriate content filters: Develop dynamic filters that adapt to the user’s age, limiting responses to suitable language and complexity. LLMs often produce outputs with a 7th-grade or higher reading level, which can bewilder younger children [61]. Hence, for ages 6–12, the system avoids complex or explicit topics—such as mental health diagnoses or adult themes—while for older teens, it allows more nuanced discussions but still blocks overtly explicit or disturbing ideas. This ensures the text remains relevant yet understandable. By reducing language complexity and restricting certain themes, these filters help children navigate AI safely without stunting their curiosity.

Mandatory data-sharing transparency reports: Require platforms to publish accessible summaries of collected and stored user data, with a parental dashboard for logs. Children often trust AI implicitly and may overshare personal details about family, mental health, or school issues [4]. A transparent approach clarifies exactly how these details are stored, how long they remain in the system, and whether any third parties have access. Parents can then review conversation logs or flagged phrases, keeping them informed of potential privacy violations or suspicious requests from the LLM.

Automated data anonymization: Interactions should be anonymized within 24 hours unless explicitly retained by parental consent. This step addresses privacy concerns especially when sensitive disclosures—like a child talking about personal fears or emotional struggles—arise. Studies found that children might share mental health issues with AI chatbots, believing them to be safe confidantes, risking emotional profiling and data misuse [5], [64]. By enforcing short-term

data retention and anonymization, the system protects user identities and curbs any attempt to track or exploit a child’s psychological or emotional data over time.

3.2 Behavioral Ethics Metrics

This framework establishes behavioral ethics metrics to guide LLMs in promoting ethical and respectful interactions. AI outputs must align with societal norms, avoid promoting risky or unethical behavior, and respect fairness across diverse demographic groups. For example, when a child asks about rule-breaking, such as bypassing parental controls, the AI should redirect the child toward constructive problem-solving rather than enabling the behavior. Additionally, the framework emphasizes preventing harmful stereotypes or discrimination. LLMs must be trained to recognize and correct biases, ensuring that outputs do not perpetuate gender, racial, or cultural stereotypes. For instance, an AI response linking "doctors" to men and "nurses" to women would be flagged and revised under these guidelines. These ethical metrics ensure that AI interactions are aligned with societal values and foster positive learning experiences.

Harm prevention benchmarks: AI outputs must meet a “harm-free” score, ensuring no suggestions encourage risky or unethical behavior. Under this benchmark, LLMs are expected to refuse or redirect prompts that involve hiding illegal substances, bypassing adult supervision, or engaging in cyberbullying [3]. For example, if a child tries to orchestrate online harassment using generative AI imagery, the system will detect malicious intent and terminate the conversation. This addresses real concerns about teens creating hateful or extreme content for harassment, which can exacerbate bullying and online aggression [62]. Ultimately, harm prevention benchmarks help maintain a safe and positive environment for young AI users.

Detection of anthropomorphism triggers: Mechanisms to detect and redirect when users misattribute human-like qualities to AI. Children may view AI systems as having genuine emotions or even friendships, leading them to form deep attachments [26]. If a child asks, “Do you love me?” the LLM should clarify its non-human status while offering supportive, factual statements. This approach prevents confusion about AI’s capabilities and avoids excessive emotional dependence, a problem noted among teenagers who develop “romantic relationships” with chatbots [3]. The mechanism ensures children understand AI’s boundaries, reducing the risk of them oversharing or seeking emotional validation from a machine that cannot truly reciprocate.

Establish inclusivity benchmarks: Aim for at least 90% parity in gender, ethnicity, and socio-economic diversity in training datasets. Research shows that many LLM outputs exhibit bias—such as defaulting male pronouns for doctors and female for nurses, which can reinforce harmful stereotypes [7], [25]. By mandating balanced and diverse data, the system counters biased patterns and fosters more equitable representations. For instance, the AI would be prompted to use non-gendered language when discussing various professions, actively combating stereotypes that can shape children’s beliefs and career aspirations.

Automated bias testing in LLM outputs: Conduct post-training audits to detect potential prejudice in responses before they reach children. This process involves scanning for language or suggestions that single out certain demographics—like linking specific races or genders with

negative traits [65]. Whenever the system flags these biases, it revises or retrains accordingly, ensuring children receive fair, inclusive responses. Because children tend to perceive AI outputs as authoritative, correcting these biases early helps prevent the formation of skewed or discriminatory worldviews [27]. Such automated bias testing also combats unintentional misinformation, reinforcing user trust and safeguarding a child’s developmental environment.

3.3 Cultural and Developmental Sensitivity

Cultural inclusivity and developmental appropriateness are critical components of the framework. It ensures that AI-generated responses cater to the unique cognitive and emotional needs of children in different age brackets. For younger children (ages 6–12), the framework emphasizes simplified language and clear explanations, while for teens (ages 13–17), it focuses on nuanced, thoughtful responses that promote emotional intelligence and social understanding. For example, if a young child asks about space exploration, the AI should provide a straightforward explanation with relatable analogies, whereas a teenager might receive a more detailed and analytical response. Cultural sensitivity is also prioritized, requiring LLMs to include diverse perspectives in narratives and avoid biases that could alienate certain groups. By tailoring outputs to the user’s age and cultural background, this component ensures that interactions are both meaningful and inclusive.

Dynamic content simplification: Automatically adjust language complexity and style based on the user’s developmental stage. If a child identifies themselves as an 8-year-old, the system reduces the reading level to align with early elementary standards, thereby preventing “cognitive overload” [69]. Simplified text not only boosts engagement but also curbs the risk of misunderstanding or misplaced trust. Equally important, older teens (13–17) can receive more analytical, detail-rich responses that encourage critical thinking. Such calibration is vital because many children find advanced AI outputs “too complex,” eventually losing interest or grasping incomplete facts [61].

Cultural sensitivity filters: Strict safeguards to eliminate or modify content that may be culturally offensive, trivializing, or exclusionary. For instance, if an LLM inadvertently uses stereotypes about a certain ethnic group, the filter intercepts it and re-contextualizes the response. Children from minority cultures have reported feeling alienated when AI chatbots deliver content that erases or misrepresents their backgrounds [74]. Introducing cultural sensitivity ensures representation across narratives—whether it’s describing holiday traditions or historical figures—while minimizing harm or confusion.

Real-time parental monitoring dashboards: Provide parents with a live overview of AI interactions, flagging suspicious or potentially harmful content. Some parents express alarm at not knowing if their child is receiving instructions about bypassing parental controls, engaging with adult themes, or being exposed to hateful language [64]. With real-time monitoring, parents can see if an AI conversation veers into unsafe territory—like references to substance abuse or self-harm—and intervene promptly. This transparency also helps reduce anxiety, as adults gain immediate insight into how the AI is engaging with their children.

Ethical compliance scoring tools: Automated processes assign an “ethical compliance” rating to LLMs, ensuring ongoing adherence to the guidelines. Reports of children encountering AI-

generated content containing sexual references or racial slurs underscore the need for continuous oversight [25], [62]. Regular scoring identifies potential regressions or new patterns of bias that slip through. When the score dips below a predetermined threshold, the system triggers a review or retraining session. This step is particularly relevant given that parents often lack the time or technical literacy to audit every AI response, reinforcing the importance of a built-in safety net [65]. Through monthly analytics, flagged content is studied and corrected, upholding a consistent standard of cultural and developmental sensitivity.

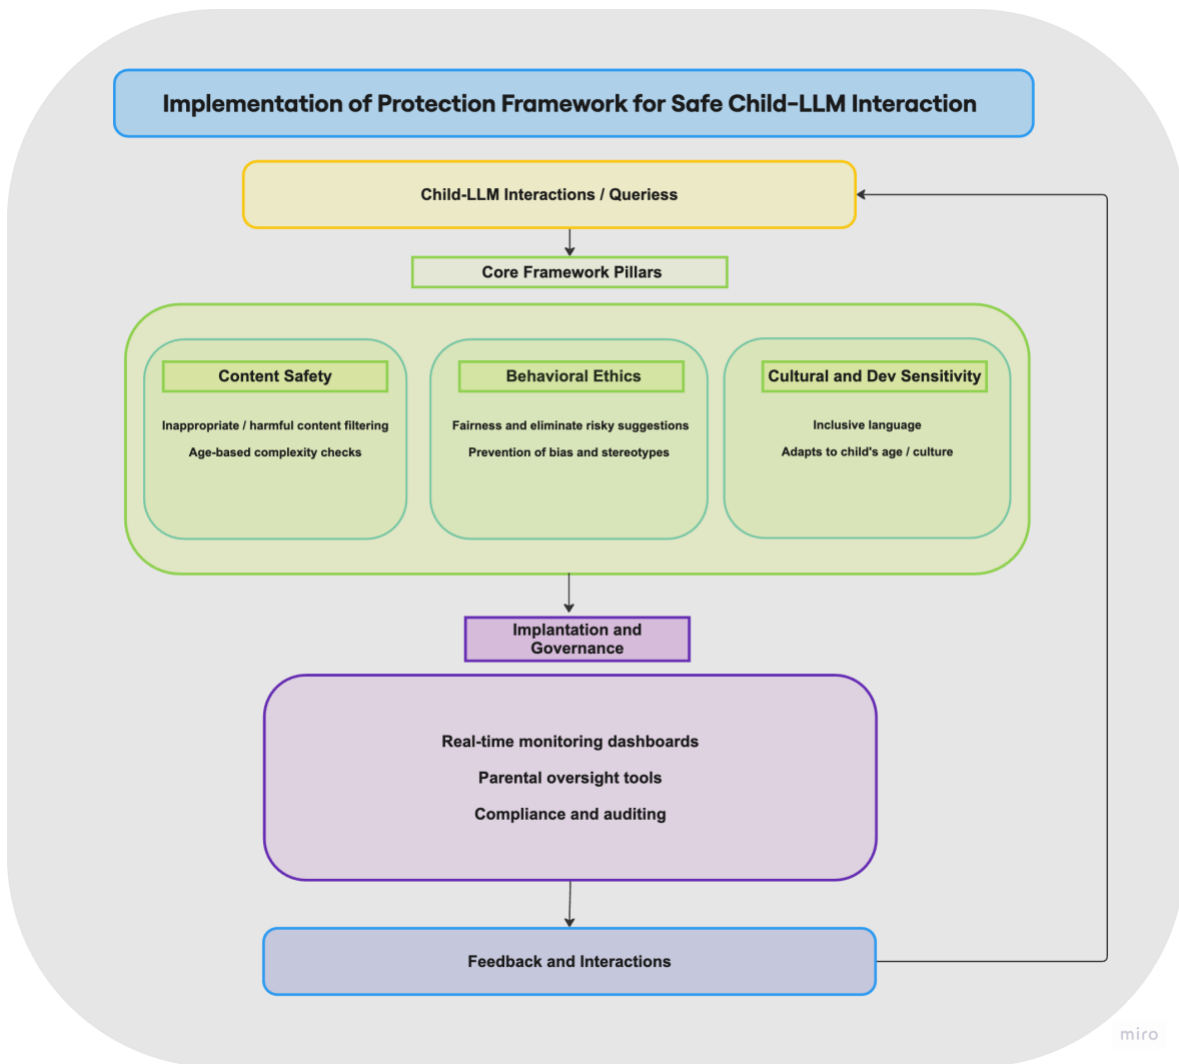

3.3 Implementation of the Framework

Implementing the framework involves embedding real-time moderation systems into LLMs to identify and correct inappropriate outputs during interactions. These systems should dynamically adapt to flagged content and provide immediate corrections to ensure safe interactions. Training data enhancement is another critical step, requiring datasets to be curated with diverse cultural perspectives and developmentally appropriate content. For example, datasets should be audited to remove harmful stereotypes and include educational resources tailored to children's needs.

Additionally, content review mechanisms should involve human moderators to assess flagged responses and provide context-specific corrections. Escalation processes should be established for high-risk interactions, such as signs of emotional distress or mental health crises. The implementation also includes creating parental monitoring dashboards that enable parents to track their children's interactions, adjust content filters, and receive alerts for risky behavior. For instance, parents could view summaries of AI interactions to better understand their child's use of the platform (See **Figure 4**).

The literature review underscores critical issues surrounding the integration of large language models (LLMs) into children's digital environments. Parents are primarily concerned about biased, harmful, and age-inappropriate outputs, coupled with insufficient parental control tools and transparency in AI interactions. From the current landscape of studies, incidents where children were exposed to toxic language, encouraged to engage in risky behaviors, or misled by inaccurate responses are particularly prevalent. Furthermore, without explicit knowledge guidance from parents, children's tendency to anthropomorphize AI and develop emotional attachments to chatbots creates new psychological and ethical challenges that are often outside of parental control. These findings highlight the urgency of addressing gaps in both parental awareness and the safeguards provided by current generative AI platforms, which is exacerbated by the overdevelopment of LLMs that cares about retaining relevance among competitors but does so at the cost of ethical concerns.

Figure 4: Implementation of the Protection Framework for Safe Child-LLM Interaction

The proposed framework demonstrates key strengths by tackling these issues comprehensively. It integrates robust content safety metrics to detect and filter inappropriate or harmful material and ensures behavioral ethics to align AI outputs with societal norms and values. Cultural and developmental sensitivity measures make sure that our AI responses are tailored to the diverse needs of children across different age groups and cultural contexts. Furthermore, our foundational framework places emphasizes transparency and parental involvement, such as implementing through monitoring dashboards and realtime alerts for risky behavior, which may make the difference between preventing kids from exposing personal information online to building trust for parents and piece of mind in responsible AI use. The necessity for change in the LLM landscape for kid’s safety make the framework a significant step toward creating safer and more ethical AI systems for our next generation

4. Implications for Developers and Stakeholders

The framework offers actionable guidance for LLM developers, emphasizing the need for robust content moderation systems, ethical compliance scoring tools, and real-time monitoring

mechanisms. By implementing these features, developers can ensure that LLM interactions for child remain safe, reputable, and nonbiased. The role of parents, educators, and policymakers is equally vital in fostering a safe AI ecosystem for children. Parents should have easy access to tools like dashboards for monitoring and customizing content filters, which help parents oversee their children's AI interactions. Educators can use LLMs within the curriculum under strict adherence to the guidelines laid out in this framework so that these tools help improve learning outcomes without sacrificing ethical and safety considerations. They can also demand that policymakers comply with the framework besides supporting the creation of child-specific datasets and developing regulatory oversight for generative AI platforms that particularly target younger users. For developers, the framework offers a clear roadmap to design safer and more ethical LLMs for children. Implementing real-time content moderation systems, dynamic content simplification for age-appropriate interactions, and automated bias testing tools will be pivotal. These measures can significantly reduce risks associated with harmful or biased outputs. Additionally, developers must prioritize building diverse training datasets to ensure cultural inclusivity and prevent stereotypes. Transparency in AI operations, such as through data-sharing summaries and parental dashboards, will not only enhance trust but also align with regulatory and societal expectations for ethical AI use.

Stakeholders beyond developers, including parents, educators, and policymakers, play an essential role in ensuring safe AI interactions. Parents need accessible tools to oversee and guide their children's AI usage, such as customizable filters and interaction logs. Educators can leverage LLMs to enhance learning outcomes but must ensure compliance with the framework's guidelines to prevent over-reliance or academic dishonesty. Policymakers must mandate adherence to such frameworks and support their development by promoting collaboration among developers, child welfare experts, and education professionals. By working together, these groups can create an ecosystem where generative AI serves as a beneficial tool rather than a source of risk for children.

4.1. Challenges and Limitations

Implementing the proposed framework poses several challenges. Detecting harmful content in real time remains a significant technical barrier, especially when dealing with ambiguous or context-specific language. LLMs must also adapt to diverse linguistic and cultural contexts, which requires extensive training data and constant updates to prevent biases. Furthermore, ensuring compliance across global markets can be difficult, as cultural norms and legal frameworks vary widely. Another limitation is the reliance on human moderators for reviewing flagged content, which may introduce delays or inconsistencies in high-stakes situations. Finally, integrating dynamic content adaptation and ethical compliance tools into existing platforms could involve substantial development costs and time, potentially hindering widespread adoption.

Several challenges arise in implementing the proposed framework. One of the foremost difficulties is the technical complexity of detecting harmful content in real-time. Generative AI's token-predictive nature can misinterpret user inputs, leading to potentially dangerous outputs, especially in ambiguous contexts. Additionally, adapting the framework to diverse cultural and linguistic settings requires extensive effort, including curating localized datasets and addressing

cultural nuances. Ensuring inclusivity while maintaining sensitivity to regional differences remains a complex, resource-intensive task.

Another limitation is the reliance on human moderators for reviewing flagged content, which can lead to delays in addressing high-risk interactions. The scalability of the framework is also a concern, as implementing dynamic content adaptation and ethical compliance tools may require significant financial and technical investments. Researchers should also explore automated tools for content moderation and bias detection to enhance the scalability and efficiency of the framework. Finally, ongoing discussions on ethical AI usage in child-centered contexts must include policymakers, developers, and educators to ensure the framework remains adaptable to technological advancements and societal needs.

4.2. Future Directions

Future research should focus on refining the framework's metrics through real-world testing and iterative feedback loops. Conducting longitudinal studies to evaluate the framework's effectiveness in diverse contexts would provide valuable insights into its practical applications. Another area for exploration is the development of improved datasets that better represent the cognitive, emotional, and cultural needs of children, ensuring that LLM outputs remain inclusive and developmentally appropriate. Advances in automated content moderation and bias detection tools can further enhance the framework's scalability and accuracy. Collaboration between AI developers, child psychologists, educators, and policymakers will be essential to continuously update and optimize the framework, ensuring it remains relevant as technology evolves. Lastly, exploring ethical considerations around emotional attachment to AI and implementing safeguards for such scenarios should be prioritized to prevent long-term social and developmental challenges.

Another critical area for advancement is the development of improved datasets that better represent the cognitive, emotional, and cultural needs of children. Collaboration with child development experts and cultural anthropologists can ensure these datasets are inclusive and age appropriate. Researchers should also explore automated tools for content moderation and bias detection to enhance the scalability and efficiency of the framework. Finally, ongoing discussions on ethical AI usage in child-centered contexts must include policymakers, developers, and educators to ensure the framework remains adaptable to technological advancements and societal needs.

5. Conclusion

The review has underlined considerable risks identified with children's interactions with LLMs from both parental concerns and empirical evidence. Parental concerns range from the fear of exposure to inappropriate, biased, or culturally insensitive content to a complete lack of instruments to monitor or control such exposure. Empirical studies confirm these concerns, showing that LLMs can produce harmful outputs, perpetuate stereotypes, and misinterpret prompts in ways that can lead to unsafe guidance or risky behaviors. Children's trust in LLMs and their tendency to anthropomorphize these systems further exacerbate these risks, as does the lack of robust content moderation and transparency in data handling. These findings bring into urgent awareness the need for comprehensive safety measures and frameworks that protect children from these vulnerabilities while fostering responsible use of the LLM technologies.

This paper provides two critical contributions to the field. First, this is a systematic review of the safety and ethical issues arising from LLM interactions with children, integrating parental concerns and empirical evidence into one coherent narrative. This thus fills a critical gap that has existed in the realm of understanding the multifaceted risks of LLMs. Second, the proposed safety and ethics framework introduces a new approach to the assessment and improvement of LLMs for the safety of child users. By addressing content safety, behavioral ethics, and cultural and developmental sensitivity, the framework provides actionable tools and guidelines for developers, educators, and policymakers. These contributions constitute the foundation that will be drawn upon for further research and implementation to ensure AI interactions with children are ethical, safe, and developmentally appropriate.

The present paper's results and framework also constitute a clarion call to urgent action for researchers, developers, and policymakers to make child safety a top priority in designing, deploying, and regulating AI systems. Safeguards needs to be integrated into LLMs to prevent harm, reinforce positive learning experiences, and protect children's privacy and well being. By furthering collaboration across disciplines, the AI community has the potential to create systems that engage and educate and to uphold the highest standards of safety and ethics for the next generation of learners. It serves as a building block and a call to action in making sure that future of AI systems will support children's development while protecting them and their parents' best interests.
