

Essential norm of the extensions of Stević-Sharma operator on some spaces of analytic functions

Mostafa Hassanlou* and Hussain Gissy*

ABSTRACT. In this paper, we consider two extensions of Stević-Sharma operator and find estimations for the essential norm of them from $\mathcal{Q}_K(p, q)$ and H^∞ into weighted Bloch spaces.

1. Introduction

The essential norm of an operator is the distance of the operator from the space of compact operators. Let f belongs to the space of the analytic functions on the unit disc. Suppose that φ is an analytic self map of the unit disc. The composition operator induced by φ is denoted by C_φ , and is defined by $C_\varphi f = f \circ \varphi$. The weighted composition operator uC_φ , u is an analytic function on the unit disc, is defined by $uC_\varphi f = uf \circ \varphi$. Through the decades, there has been an interest on investigating the (weighted) composition operators on spaces of functions, which started somehow after the excellent book of Cowen and MacCluer, [3]. There are several operators related to these operators using derivative or integral such as $uC_\varphi D$, D is the differentiation operator, $uC_\varphi Df = uf' \circ \varphi$. In [15, 16], the Stević-Sharma operator was introduced and it can be viewed as sum of uC_φ and $uC_\varphi D$ which is of importance due to the relation with topological structure of the spaces of such operators.

Our aim in this paper is to estimating the essential norm of two extensions of Stević-Sharma operator on some well-known spaces of analytic functions, H^∞ and $\mathcal{Q}_K(p, q)$. As results we obtain compactness criteria for these operators which are proved before.

2. Background Material

Let \mathbb{D} be unit disk $\{z \in \mathbb{C} : |z| < 1\}$, $\mathcal{H}(\mathbb{D})$ be the space of all analytic functions on \mathbb{D} and $\mathcal{S}(\mathbb{D})$ be the set of all analytic self-maps of \mathbb{D} . Let H^∞ be the space of bounded analytic functions on \mathbb{D} with sup-norm, $\|f\|_\infty = \sup_{z \in \mathbb{D}} |f(z)|$.

A positive continuous function ϕ on $[0, 1)$ is called normal if there are two constants $b > a > 0$ and $\delta \in [0, 1)$ such that

- (i) $\frac{\phi(r)}{(1-r)^a}$ is decreasing on $[\delta, 1)$ and $\frac{\phi(r)}{(1-r)^a} \downarrow 0$
- (ii) $\frac{\phi(r)}{(1-r)^b}$ is increasing on $[\delta, 1)$ and $\frac{\phi(r)}{(1-r)^b} \uparrow \infty$

as $r \rightarrow 1$. An example of normal functions is $(1 - r^2)^\alpha$, $\alpha > 0$. Let μ be a positive function that is normal and radial, $\mu(z) = \mu(|z|)$. The weighted Bloch space \mathcal{B}_μ is the space of all analytic functions f for which

$$\sup_{z \in \mathbb{D}} \mu(z) |f'(z)| < \infty,$$

and it becomes a Banach space if we add $|f(0)|$ to the above statement. The α -Bloch space \mathcal{B}^α is obtained when $\mu(z) = (1 - |z|^2)^\alpha$ for $\alpha > 0$, see [23]. Also for $f \in \mathcal{B}^\alpha$,

$$\|f\|_{\mathcal{B}^\alpha} \approx |f'(0)| + \cdots + |f^{(n)}(0)| + \sup_{z \in \mathbb{D}} (1 - |z|^2)^{\alpha+n} |f^{(n+1)}(z)|, \quad n \in \mathbb{N}. \quad (1)$$

Let $p > 0$, $q > -2$ and $K : [0, \infty) \rightarrow [0, \infty)$ be a nondecreasing continuous function. The space $\mathcal{Q}_K(p, q)$ consists of all $f \in \mathcal{H}(\mathbb{D})$ such that

$$\|f\|_{\mathcal{Q}_K(p, q)}^p = |f(0)| + \sup_{\xi \in \mathbb{D}} \int_{\mathbb{D}} |f'(z)|^p (1 - |z|^2)^q K(g(z, \xi)) dA(z) < \infty,$$

where dA is the normalized Lebesgue area measure in \mathbb{D} , $g(z, \xi) = \log \frac{1}{|\varphi_\xi(z)|}$ is the Green function and $\varphi_\xi(z) = \frac{\xi - z}{1 - \bar{\xi}z}$. For $p \geq 1$, $\mathcal{Q}_K(p, q)$ with the norm $\|f\|_{\mathcal{Q}_K(p, q)}$ becomes a Banach space. For more information on these spaces and operators on them, see [8, 10–14]. Following [18], we assume that the following condition holds

$$\int_0^1 (1 - r^2)^q K(-\log r) r dr < \infty,$$

since otherwise $\mathcal{Q}_K(p, q)$ consists only of constant functions. For $f \in \mathcal{Q}_K(p, q)$ we have $f \in \mathcal{B}^{\frac{q+2}{p}}$ and

$$\|f\|_{\mathcal{B}^{\frac{q+2}{p}}} \leq \|f\|_{\mathcal{Q}_K(p, q)}. \quad (2)$$

A function h with derivative $|h'(z)|^p = |1 - z|^{-q-2}$ represents an extremal growth in $\mathcal{B}^{\frac{q+2}{p}}$ and by Lemma 2.7 [8], there exist parameters p, q and K such that $h \in \mathcal{Q}_K(p, q) \subsetneq \mathcal{B}^{\frac{q+2}{p}}$. Also taking $K(t) = t^s$, $0 < s < 1$ and $q > -s - 1$ imply that $\mathcal{Q}_K(p, q)$ coincides with the non-trivial $F(p, q, s)$ space which includes some other well-known spaces of analytic functions, see [22]. For some researches regarding $\mathcal{Q}_K(p, q)$ space, one can refer to [5, 10, 12, 14, 18, 19, 19].

For $\psi_1, \psi_2 \in \mathcal{H}(\mathbb{D})$ and $\varphi \in \mathcal{S}(\mathbb{D})$, the Stević-Sharma operator is defined by

$$(T_{\psi_1, \psi_2, \varphi} f)(z) = \psi_1(z)f(\varphi(z)) + \psi_2(z)f'(\varphi(z)), \quad z \in \mathbb{D}, f \in H(\mathbb{D}).$$

This operator includes composition, multiplication, weighted composition, differentiation, composition followed by differentiation operator and other operators like $DM_u, C_\varphi D, DC_\varphi, M_u C_\varphi D, M_u DC_\varphi, C_\varphi M_u D, DM_u C_\varphi, C_\varphi DM_u$ and $DC_\varphi M_u$. The extensions of this operator, called Stević-Sharma type operator, we use here are $T_{\psi_1, \psi_2, \varphi}^n$ and $T_{\psi_1, \psi_2, \varphi}^{m, n}$:

$$(T_{\psi_1, \psi_2, \varphi}^n f)(z) = \psi_1(z)f^{(n)}(\varphi(z)) + \psi_2(z)f^{(n+1)}(\varphi(z)), \quad n \in \mathbb{N}_0$$

$$(T_{\psi_1, \psi_2, \varphi}^{m, n} f)(z) = \psi_1(z)f^{(m)}(\varphi(z)) + \psi_2(z)f^{(n)}(\varphi(z)), \quad m \in \mathbb{N}_0, n \in \mathbb{N}.$$

The properties of generalized Stević-Sharma operator on spaces of fractional Cauchy transforms, Hardy spaces, derivative Hardy spaces and minimal Mobius invariant spaces have been investigated in [1, 2, 7, 21]. The boundedness and compactness of $T_{\psi_1, \psi_2, \varphi}^n$ from Hardy space into Zygmund-type space were studied in [6]. Guo and Mu characterized boundedness and essential norm of $T_{\psi_1, \psi_2, \varphi}^{m, n}$ from derivative Hardy spaces into Zygmund-type spaces in [4]. The authors of [5], investigated the boundedness and compactness of $T_{\psi_1, \psi_2, \varphi}^n$ from $\mathcal{Q}_K(p, q)$ and $\mathcal{Q}_{K,0}(p, q)$ spaces to Bloch-type spaces and little Bloch-type spaces. The same research has been done for the operator $T_{\psi_1, \psi_2, \varphi}^{m, n}$ between H^∞ and Bloch-type spaces (little Bloch-type spaces) in [20].

Guo and Zhao in [5] proved that $T_{\psi_1, \psi_2, \varphi}^n : \mathcal{Q}_K(p, q) \rightarrow \mathcal{B}_\mu$ is compact if and only if

$$A(\psi_1', \varphi, \gamma + n - 1) = A(\psi_1\varphi' + \psi_2', \varphi, \gamma + n) = A(\psi_2\varphi', \varphi, \gamma + n + 1) = 0,$$

where the notations are defined in (7). Also Zhang and Guo in [20] proved that $T_{\psi_1, \psi_2, \varphi}^{m, n} : H^\infty \rightarrow \mathcal{B}_\mu$, $m + 1 < n$, is compact if and only if

$$\sum_{i=1}^4 \lim_{|\varphi(z)| \rightarrow 1} \|T_{\psi_1, \psi_2, \varphi}^{m, n} f_{i, \varphi(z)}\|_{\mathcal{B}_\mu} = \sum_{i \in \{m, m+1, n, n+1\}} \lim_{|\varphi(z)| \rightarrow 1} \frac{\mu(z)|E_i(z)|}{(1 - |\varphi(z)|^2)^i} = 0,$$

where the notations are defined in Section 4. Motivated by the above results, we are going to extend them and compute approximately the essential norm of $T_{\psi_1, \psi_2, \varphi}^n : \mathcal{Q}_K(p, q) \rightarrow \mathcal{B}_\mu$ and $T_{\psi_1, \psi_2, \varphi}^{m, n} : H^\infty \rightarrow \mathcal{B}_\mu$. Recall that the compactness characterization is obtained from essential norm since the operator is compact if and only if the essential norm is zero.

All positive constants will be denoted by C which may vary from one occurrence to another. By $A \gtrsim B$ we mean there exists a constant C such that $A \geq CB$ and $A \approx B$ means that $A \gtrsim B \gtrsim A$.

3. Essential norm of $T_{\psi_1, \psi_2, \varphi}^n : \mathcal{Q}_K(p, q) \rightarrow \mathcal{B}_\mu$

Throughout this section, we assume that the following condition holds

$$\int_0^1 K(-\log r)(1-r)^{\min\{-1, q\}} \left(\log \frac{1}{1-r}\right)^{\chi_{-1}(q)} r dr < \infty, \quad (3)$$

where $\chi_O(x)$ is the characteristic function of the set O . One of the well-known criteria for studying compact operators is stated here, see [3].

Lemma 3.1. *Let $\psi_1, \psi_2 \in \mathcal{H}(\mathbb{D})$, $\varphi \in \mathcal{S}(\mathbb{D})$, $n \in \mathbb{N}_0$, $p > 0$, $q > -2$, $K : [0, \infty) \rightarrow [0, \infty)$ be a nondecreasing continuous function. Then $T_{\psi_1, \psi_2, \varphi}^n : \mathcal{Q}_K(p, q) \rightarrow \mathcal{B}_\mu$ is compact if and only if $T_{\psi_1, \psi_2, \varphi}^n : \mathcal{Q}_K(p, q) \rightarrow \mathcal{B}_\mu$ is bounded and for any bounded sequence $\{f_i\}_{i=1}^\infty$ in $\mathcal{Q}_K(p, q)$ which converges to zero uniformly on compact subsets of \mathbb{D} , as $i \rightarrow \infty$, we have $\|T_{\psi_1, \psi_2, \varphi}^n f_i\|_{\mathcal{B}_\mu} \rightarrow 0$ as $i \rightarrow \infty$.*

In the following lemma, we prove that $T_{\psi_1, \psi_2, \varphi}^n : \mathcal{Q}_K(p, q) \rightarrow \mathcal{B}_\mu$ is compact provided that it is bounded and $\rho = \|\varphi\|_\infty = \sup_{z \in \mathbb{D}} |\varphi(z)| < 1$. Note that regarding boundedness of the operator $T_{\psi_1, \psi_2, \varphi}^n : \mathcal{Q}_K(p, q) \rightarrow \mathcal{B}_\mu$ and applying it to the polynomials z^n , z^{n+1} and z^{n+2} , we have the following facts which we use in the proof of results of the paper:

$$\sup_{z \in \mathbb{D}} \mu(z) |\psi_1'(z)| < \infty, \quad (4)$$

$$\sup_{z \in \mathbb{D}} \mu(z) |\psi_1(z)\varphi'(z) + \psi_2'(z)| < \infty, \quad (5)$$

$$\sup_{z \in \mathbb{D}} \mu(z) |\psi_2(z)\varphi'(z)| < \infty. \quad (6)$$

Lemma 3.2. *Let $\psi_1, \psi_2 \in \mathcal{H}(\mathbb{D})$, $\varphi \in \mathcal{S}(\mathbb{D})$, $n \in \mathbb{N}_0$, $p > 0$, $q > -2$, $K : [0, \infty) \rightarrow [0, \infty)$ be a nondecreasing continuous function. If $\rho < 1$ and $T_{\psi_1, \psi_2, \varphi}^n : \mathcal{Q}_K(p, q) \rightarrow \mathcal{B}_\mu$ is bounded, then $T_{\psi_1, \psi_2, \varphi}^n : \mathcal{Q}_K(p, q) \rightarrow \mathcal{B}_\mu$ is compact.*

PROOF. Suppose that $\{f_i\}_i$ is a bounded sequence in $\mathcal{Q}_K(p, q)$ such that converges to 0 uniformly on compact subsets of \mathbb{D} as $i \rightarrow \infty$. According to Lemma 3.1, we prove that $\|T_{\psi_1, \psi_2, \varphi}^n f_i\|_{\mathcal{B}_\mu} \rightarrow 0$ as $i \rightarrow \infty$. The Cauchy's estimate implies that $\{f_i^{(n)}\}_i$, $\{f_i^{(n+1)}\}_i$ and $\{f_i^{(n+2)}\}_i$ converge uniformly to 0 on compact subsets of \mathbb{D} .

Computing the norm in weighted Bloch space we get

$$\begin{aligned}
 \|T_{\psi_1, \psi_2, \varphi}^n f_i\|_{\mathcal{B}_\mu} &= |(T_{\psi_1, \psi_2, \varphi}^n f_i)(0)| + \sup_{z \in \mathbb{D}} \mu(z) |(T_{\psi_1, \psi_2, \varphi}^n f_i)'(z)| \\
 &\leq |\psi_1(0) f_i^{(n)}(\varphi(0))| + |\psi_2(0) f_i^{(n+1)}(\varphi(0))| \\
 &\quad + \sup_{z \in \mathbb{D}} \mu(z) |\psi_1'(z) f_i^{(n)}(\varphi(z))| \\
 &\quad + \sup_{z \in \mathbb{D}} \mu(z) |(\psi_1(z) \varphi'(z) + \psi_2(z)) f_i^{(n+1)}(\varphi(z))| \\
 &\quad + \sup_{z \in \mathbb{D}} \mu(z) |\psi_2(z) \varphi'(z) f_i^{(n+2)}(\varphi(z))| \\
 &\leq |\psi_1(0) f_i^{(n)}(\varphi(0))| + |\psi_2(0) f_i^{(n+1)}(\varphi(0))| \\
 &\quad + \sup_{z \in \mathbb{D}} \mu(z) |\psi_1'(z)| \sup_{z \in D_\rho} |f_i^{(n)}(\varphi(z))| \\
 &\quad + \sup_{z \in \mathbb{D}} \mu(z) |\psi_1(z) \varphi'(z) + \psi_2(z)| \sup_{z \in D_\rho} |f_i^{(n+1)}(\varphi(z))| \\
 &\quad + \sup_{z \in \mathbb{D}} \mu(z) |\psi_2(z) \varphi'(z)| \sup_{z \in D_\rho} |f_i^{(n+2)}(\varphi(z))|,
 \end{aligned}$$

where $D_\rho = \{z \in \mathbb{D} : |\varphi| \leq \rho\}$ which is a compact subset of \mathbb{D} . Using (4) to (6), we obtain that if $i \rightarrow \infty$ then $\|T_{\psi_1, \psi_2, \varphi}^n f_i\|_{\mathcal{B}_\mu} \rightarrow 0$. \square

For simplifying the calculations, we set $\gamma = \frac{q+2}{p}$ and

$$A(u, \varphi, \gamma) = \limsup_{|\varphi(z)| \rightarrow 1} \frac{\mu(z) |u(z)|}{(1 - |\varphi(z)|^2)^\gamma}. \quad (7)$$

Theorem 3.3. *Let $\psi_1, \psi_2 \in \mathcal{H}(\mathbb{D})$, $\varphi \in \mathcal{S}(\mathbb{D})$, $n \in \mathbb{N}_0$, $p > 0$, $q > -2$, $K : [0, \infty) \rightarrow [0, \infty)$ be a nondecreasing continuous function and μ be a normal and radial weight. If $T_{\psi_1, \psi_2, \varphi}^n : \mathcal{Q}_K(p, q) \rightarrow \mathcal{B}_\mu$ is bounded, then*

$$\begin{aligned}
 &\|T_{\psi_1, \psi_2, \varphi}^n\|_{e, \mathcal{Q}_K(p, q) \rightarrow \mathcal{B}_\mu} \approx \\
 &\max\{A(\psi_1', \varphi, \gamma + n - 1), A(\psi_1 \varphi' + \psi_2', \varphi, \gamma + n), A(\psi_2 \varphi', \varphi, \gamma + n + 1)\},
 \end{aligned} \quad (8)$$

PROOF. If $\rho < 1$, then employing Lemma 3.2, $T_{\psi_1, \psi_2, \varphi}^n : \mathcal{Q}_K(p, q) \rightarrow \mathcal{B}_\mu$ is compact and then $\|T_{\psi_1, \psi_2, \varphi}^n\|_{e, \mathcal{Q}_K(p, q) \rightarrow \mathcal{B}_\mu} = 0$. On the other hand, Theorem 2 of [5] implies that

$$A(\psi_1', \varphi, \gamma + n - 1) = 0, \quad A(\psi_1 \varphi' + \psi_2', \varphi, \gamma + n) = 0, \quad A(\psi_2 \varphi', \varphi, \gamma + n + 1) = 0.$$

So, both sides of (8) are equal. Let $\rho = 1$. The proof of the lower bound is based on the choosing suitable test functions. Let $\{z_k\}$ be a sequence in \mathbb{D} such that $\lim_{k \rightarrow \infty} |\varphi(z_k)| = 1$. Let

$$l_i(z) = \frac{(1 - |z_k|^2)^i}{(1 - \overline{z_k} z)^{\gamma+i-1}}, \quad a \in \mathbb{D}, \quad i = 1, 2, 3.$$

Consider the functions

$$\begin{aligned}
f_{z_k}(z) &= \frac{\gamma + n + 2}{\gamma + n} \prod_{j=0}^{n-1} (\gamma + j + 1)(\gamma + j + 2) l_1(z) \\
&\quad - 2 \frac{\gamma + n + 2}{\gamma + n + 1} \prod_{j=0}^{n-1} (\gamma + j)(\gamma + j + 2) l_2(z) + \prod_{j=0}^{n-1} (\gamma + j)(\gamma + j + 1) l_3(z), \\
g_{z_k}(z) &= \frac{\gamma + n + 2}{\gamma + n + 1} \prod_{j=0}^{n-1} (\gamma + j + 1)(\gamma + j + 2) l_1(z) \\
&\quad - \frac{2\gamma + 2n + 3}{\gamma + n + 1} \prod_{j=0}^{n-1} (\gamma + j)(\gamma + j + 2) l_2(z) + \prod_{j=0}^{n-1} (\gamma + j)(\gamma + j + 1) l_3(z), \\
h_{z_k}(z) &= \prod_{j=0}^{n-1} (\gamma + j + 1)(\gamma + j + 2) l_1(z) \\
&\quad - 2 \prod_{j=0}^{n-1} (\gamma + j)(\gamma + j + 2) l_2(z) + \prod_{j=0}^{n-1} (\gamma + j)(\gamma + j + 1) l_3(z).
\end{aligned}$$

Then, one can easily check that $f_{z_k}^{(n+1)}(z_k) = f_{z_k}^{(n+2)}(z_k) = 0$, $g_{z_k}^{(n)}(z_k) = g_{z_k}^{(n+2)}(z_k) = 0$, $h_{z_k}^{(n)}(z_k) = h_{z_k}^{(n+1)}(z_k) = 0$ and

$$\begin{aligned}
f_{z_k}^{(n)}(z_k) &= \frac{2 \prod_{j=0}^{n-1} (\gamma + j)(\gamma + j + 1)(\gamma + j + 2)}{(\gamma + n)(\gamma + n + 1)} \frac{\overline{z_k}^n}{(1 - |z_k|^2)^{\gamma+n-1}}, \\
g_{z_k}^{(n+1)}(z_k) &= - \frac{\prod_{j=0}^{n-1} (\gamma + j)(\gamma + j + 1)(\gamma + j + 2)}{\gamma + n + 1} \frac{\overline{z_k}^{n+1}}{(1 - |z_k|^2)^{\gamma+n}}, \\
h_{z_k}^{(n)}(z_k) &= 2 \prod_{j=0}^{n-1} (\gamma + j)(\gamma + j + 1)(\gamma + j + 2) \frac{\overline{z_k}^{n+2}}{(1 - |z_k|^2)^{\gamma+n+1}}.
\end{aligned}$$

Also the sequences $\{f_k\}$, $\{g_k\}$ and $\{h_k\}$ are bounded in $\mathcal{Q}_K(p, q)$ which converge to zero uniformly on compact subsets of \mathbb{D} , see [5]. For every compact operator

$K : \mathcal{Q}_K(p, q) \rightarrow \mathcal{B}_\mu$, using the norm in weighted Bloch space, we obtain

$$\begin{aligned}
 \|T_{\psi_1, \psi_2, \varphi}^n - K\|_{\mathcal{Q}_K(p, q) \rightarrow \mathcal{B}_\mu} &\succeq \limsup_{k \rightarrow \infty} \|(T_{\psi_1, \psi_2, \varphi}^n - K)f_{\varphi(z_k)}\|_{\mathcal{B}_\mu} \\
 &\geq \limsup_{k \rightarrow \infty} \|T_{\psi_1, \psi_2, \varphi}^n f_{\varphi(z_k)}\|_{\mathcal{B}_\mu} \\
 &\geq \limsup_{k \rightarrow \infty} \sup_{z \in \mathbb{D}} \mu(z) |(T_{\psi_1, \psi_2, \varphi}^n f_{\varphi(z_k)})'(z)| \\
 &\geq \limsup_{k \rightarrow \infty} \mu(z_k) |(T_{\psi_1, \psi_2, \varphi}^n f_{\varphi(z_k)})'(z_k)| \\
 &= \limsup_{k \rightarrow \infty} \mu(z_k) |\psi_1'(z_k) f_{\varphi(z_k)}^{(n)}(\varphi(z_k))| \\
 &\quad + \limsup_{k \rightarrow \infty} \mu(z_k) |(\psi_1(z_k) \varphi'(z_k) + \psi_2(z_k)) f_{\varphi(z_k)}^{(n+1)}(\varphi(z_k))| \\
 &\quad + \limsup_{k \rightarrow \infty} \mu(z_k) |\psi_2(z_k) \varphi'(z_k) f_{\varphi(z_k)}^{(n+1)}(\varphi(z_k))| \\
 &= \limsup_{k \rightarrow \infty} \frac{2 \prod_{j=0}^{n-1} (\gamma + j)(\gamma + j + 1)(\gamma + j + 2)}{(\gamma + n)(\gamma + n + 1)} \\
 &\quad \times \frac{\mu(z_k) |\psi_1'(z_k)| |\overline{\varphi(z_k)}|^n}{(1 - |\varphi(z_k)|^2)^{\gamma+n-1}}.
 \end{aligned}$$

Hence

$$\|T_{\psi_1, \psi_2, \varphi}^n - K\|_{\mathcal{Q}_K(p, q) \rightarrow \mathcal{B}_\mu} \succeq \limsup_{|\varphi(z)| \rightarrow 1} \frac{\mu(z) |\psi_1'(z)|}{(1 - |\varphi(z)|^2)^{\gamma+n-1}} = A(\psi_1', \varphi, \gamma + n - 1).$$

Therefore

$$\|T_{\psi_1, \psi_2, \varphi}^n\|_{e, \mathcal{Q}_K(p, q) \rightarrow \mathcal{B}_\mu} = \inf_K \|T_{\psi_1, \psi_2, \varphi}^n - K\|_{\mathcal{Q}_K(p, q) \rightarrow \mathcal{B}_\mu} \succeq A(\psi_1', \varphi, \gamma + n - 1). \quad (9)$$

An analogous discussion using the sequence $\{g_k\}$ and $\{h_k\}$, the followings can be achieved:

$$\|T_{\psi_1, \psi_2, \varphi}^n\|_{e, \mathcal{Q}_K(p, q) \rightarrow \mathcal{B}_\mu} \succeq A(\psi_1 \varphi' + \psi_2', \varphi, \gamma + n),$$

$$\|T_{\psi_1, \psi_2, \varphi}^n\|_{e, \mathcal{Q}_K(p, q) \rightarrow \mathcal{B}_\mu} \succeq A(\psi_2 \varphi', \varphi, \gamma + n + 1),$$

which along with (9) imply the lower estimate of (8).

Let $\{r_k\} \subset (0, 1)$ be a sequence such that $r_k \rightarrow 1$ as $k \rightarrow \infty$. For any k , the operator $T_{\psi_1, \psi_2, r_k \varphi}^n : \mathcal{Q}_K(p, q) \rightarrow \mathcal{B}_\mu$ is bounded, [5]. Now from Lemma 3.2 we get that $T_{\psi_1, \psi_2, r_k \varphi}^n : \mathcal{Q}_K(p, q) \rightarrow \mathcal{B}_\mu$ is compact. So, definition of the essential norm implies that

$$\|T_{\psi_1, \psi_2, \varphi}^n\|_{e, \mathcal{Q}_K(p, q) \rightarrow \mathcal{B}_\mu} \leq \|T_{\psi_1, \psi_2, \varphi}^n - T_{\psi_1, \psi_2, r_k \varphi}^n\|_{\mathcal{Q}_K(p, q) \rightarrow \mathcal{B}_\mu}. \quad (10)$$

We have

$$\begin{aligned}
\|T_{\psi_1, \psi_2, \varphi}^n - T_{\psi_1, \psi_2, r_k \varphi}^n\|_{\mathcal{Q}_K(p, q) \rightarrow \mathcal{B}_\mu} &= \sup_{\|f\|_{\mathcal{Q}_K(p, q)} \leq 1} \|(T_{\psi_1, \psi_2, \varphi}^n - T_{\psi_1, \psi_2, r_k \varphi}^n)f\|_{\mathcal{B}_\mu} \\
&\leq \sup_{\|f\|_{\mathcal{Q}_K(p, q)} \leq 1} (|\psi_1(0)| |f^{(n)}(\varphi(0)) - f^{(n)}(r_k \varphi(0))| \\
&\quad + |\psi_2(0)| |f^{(n+1)}(\varphi(0)) - r_k f^{(n+1)}(r_k \varphi(0))| \\
&\quad + \sup_{z \in \mathbb{D}} \mu(z) |\psi_1'(z)| |f^{(n)}(\varphi(z)) - f^{(n)}(r_k \varphi(z))| \\
&\quad + \sup_{z \in \mathbb{D}} \mu(z) |(\psi_1(z)\varphi'(z) + \psi_2(z))| \\
&\quad \times |f^{(n+1)}(\varphi(z)) - r_k f^{(n+1)}(r_k \varphi(z))| \\
&\quad + \sup_{z \in \mathbb{D}} \mu(z) |\psi_2(z)\varphi'(z)| |f^{(n+2)}(\varphi(z)) - r_k^2 f^{(n+2)}(\varphi(z))|.
\end{aligned}$$

Since the singleton $\{\varphi(0)\}$ is compact, then as $k \rightarrow \infty$ we get

$$|\psi_1(0)| |f^{(n)}(\varphi(0)) - f^{(n)}(r_k \varphi(0))| \rightarrow 0, \quad |\psi_2(0)| |f^{(n+1)}(\varphi(0)) - r_k f^{(n+1)}(r_k \varphi(0))| \rightarrow 0.$$

We divide rest of the above equation into two parts, one is taken on the set $\{z : |\varphi(z)| \leq \delta\}$, which is compact, and the other is on the set $\{z : |\varphi(z)| > \delta\}$. From compactness of the set and using the equations (4)-(6), the first part tends to zero as $k \rightarrow \infty$. For the other part we have

$$\begin{aligned}
&\|T_{\psi_1, \psi_2, \varphi}^n - T_{\psi_1, \psi_2, r_k \varphi}^n\|_{\mathcal{Q}_K(p, q) \rightarrow \mathcal{B}_\mu} \\
&\leq \sup_{\{z: |\varphi(z)| > \delta\}} \mu(z) |\psi_1'(z)| |f^{(n)}(\varphi(z)) - f^{(n)}(r_k \varphi(z))| \\
&\quad + \sup_{\{z: |\varphi(z)| > \delta\}} \mu(z) |(\psi_1(z)\varphi'(z) + \psi_2(z))| |f^{(n+1)}(\varphi(z)) - r_k f^{(n+1)}(r_k \varphi(z))| \\
&\quad + \sup_{\{z: |\varphi(z)| > \delta\}} \mu(z) |\psi_2(z)\varphi'(z)| |f^{(n+2)}(\varphi(z)) - r_k^2 f^{(n+2)}(\varphi(z))| \\
&\leq \sup_{\{z: |\varphi(z)| > \delta\}} \left(\frac{\mu(z) |\psi_1'(z)|}{(1 - |\varphi(z)|^2)^{\gamma+n-1}} + \frac{\mu(z) |\psi_1'(z)|}{(1 - |r_k \varphi(z)|^2)^{\gamma+n-1}} \right) \\
&\quad + \sup_{\{z: |\varphi(z)| > \delta\}} \left(\frac{\mu(z) |(\psi_1(z)\varphi'(z) + \psi_2(z))|}{(1 - |\varphi(z)|^2)^{\gamma+n}} + \frac{\mu(z) |(\psi_1(z)\varphi'(z) + \psi_2(z))|}{(1 - |r_k \varphi(z)|^2)^{\gamma+n}} \right) \\
&\quad + \sup_{\{z: |\varphi(z)| > \delta\}} \left(\frac{\mu(z) |\psi_2(z)\varphi'(z)|}{(1 - |\varphi(z)|^2)^{\gamma+n+1}} + \frac{\mu(z) |\psi_2(z)\varphi'(z)|}{(1 - |r_k \varphi(z)|^2)^{\gamma+n+1}} \right).
\end{aligned}$$

Therefore

$$\begin{aligned} \|T_{\psi_1, \psi_2, \varphi}^n - T_{\psi_1, \psi_2, r_k \varphi}^n\|_{\mathcal{Q}_K(p, q) \rightarrow \mathcal{B}_\mu} &\leq \sup_{\{z: |\varphi(z)| > \delta\}} 2 \frac{\mu(z) |\psi_1'(z)|}{(1 - |\varphi(z)|^2)^{\gamma+n-1}} \\ &+ \sup_{\{z: |\varphi(z)| > \delta\}} 2 \frac{\mu(z) |(\psi_1(z)\varphi'(z) + \psi_2(z))|}{(1 - |\varphi(z)|^2)^{\gamma+n}} \\ &+ \sup_{\{z: |\varphi(z)| > \delta\}} 2 \frac{\mu(z) |\psi_2(z)\varphi'(z)|}{(1 - |\varphi(z)|^2)^{\gamma+n+1}}. \end{aligned}$$

As $\delta \rightarrow 1$, we obtain

$$\begin{aligned} \|T_{\psi_1, \psi_2, \varphi}^n - T_{\psi_1, \psi_2, r_k \varphi}^n\|_{\mathcal{Q}_K(p, q) \rightarrow \mathcal{B}_\mu} &\leq \limsup_{|\varphi(z)| \rightarrow 1} 2 \frac{\mu(z) |\psi_1'(z)|}{(1 - |\varphi(z)|^2)^{\gamma+n-1}} \\ &+ \limsup_{|\varphi(z)| \rightarrow 1} 2 \frac{\mu(z) |(\psi_1(z)\varphi'(z) + \psi_2(z))|}{(1 - |\varphi(z)|^2)^{\gamma+n}} \\ &+ \limsup_{|\varphi(z)| \rightarrow 1} 2 \frac{\mu(z) |\psi_2(z)\varphi'(z)|}{(1 - |\varphi(z)|^2)^{\gamma+n+1}}. \end{aligned}$$

Hence, (10) implies that

$$\|T_{\psi_1, \psi_2, \varphi}^n\|_e \preceq A(\psi_1', \varphi, \gamma + n - 1) + A(\psi_1\varphi' + \psi_2', \varphi, \gamma + n) + A(\psi_2\varphi', \varphi, \gamma + n + 1),$$

and the proof is completed. \square

4. Essential norm of $T_{\psi_1, \psi_2, \varphi}^{m, n} : H^\infty \rightarrow \mathcal{B}_\mu$

Lemma 4.1. [20] *Let $\psi_1, \psi_2 \in \mathcal{H}(\mathbb{D})$, $\varphi \in \mathcal{S}(\mathbb{D})$, $m \in \mathbb{N}_0$, $n \in \mathbb{N}$ and μ be a radial weight such that the operator $T_{\psi_1, \psi_2, \varphi}^{m, n} : H^\infty \rightarrow \mathcal{B}_\mu$ is bounded. Then $T_{\psi_1, \psi_2, \varphi}^{m, n} : H^\infty \rightarrow \mathcal{B}_\mu$ is compact if and only if $\|T_{\psi_1, \psi_2, \varphi}^{m, n}\|_{\mathcal{B}_\mu} \rightarrow 0$ as $k \rightarrow \infty$ for each bounded sequence $\{f_k\}_{k \in \mathbb{N}}$ in H^∞ which converges to zero uniformly on compact subsets of \mathbb{D} as $k \rightarrow \infty$.*

Before stating the following theorem, note that since polynomials belong to H^∞ then the boundedness of the operator $T_{\psi_1, \psi_2, \varphi}^{m, n} : H^\infty \rightarrow \mathcal{B}_\mu$ implies that

$$\sum_{i \in \{m, m+1, n, n+1\}} \sup_{z \in \mathbb{D}} \mu(z) |E_i(z)| < \infty,$$

where

$$\begin{aligned} E_m(z) &= \psi_1'(z), & E_{m+1}(z) &= \psi_1(z)\varphi'(z) \\ E_n(z) &= \psi_2'(z), & E_{n+1}(z) &= \psi_2(z)\varphi'(z). \end{aligned}$$

Theorem 4.2. *Let $\psi_1, \psi_2 \in \mathcal{H}(\mathbb{D})$, $\varphi \in \mathcal{S}(\mathbb{D})$, $m \in \mathbb{N}_0$, $n \in \mathbb{N}$, $m + 1 < n$ and μ be a radial weight. Suppose that $T_{\psi_1, \psi_2, \varphi}^{m, n} : H^\infty \rightarrow \mathcal{B}_\mu$ is bounded. Then*

$$\begin{aligned} \|T_{\psi_1, \psi_2, \varphi}^{m, n}\|_{e, H^\infty \rightarrow \mathcal{B}_\mu} &\approx \max_{i \in \{m, m+1, n, n+1\}} \left\{ \limsup_{|\varphi(z)| \rightarrow 1} \frac{\mu(z) |E_i(z)|}{(1 - |\varphi(z)|^2)^i} \right\} \\ &\approx \max_{1 \leq i \leq 4} \left\{ \limsup_{|\varphi(w)| \rightarrow 1} \|T_{\psi_1, \psi_2, \varphi}^{m, n} f_{i, \varphi(w)}\|_{\mathcal{B}_\mu} \right\}, \end{aligned}$$

where $f_{i, \varphi(w)}(z) = \left(\frac{1 - |\varphi(w)|}{1 - \varphi(w)z} \right)^i$.

PROOF. The first part of the theorem will be proved, the other is the same. Let $\{w_k\}$ be a sequence in \mathbb{D} such that $\lim_{k \rightarrow \infty} |\varphi(w_k)| = 1$. According to Lemma 1 of [20], there exist the functions $g_{i, w_k} \in H^\infty$ such that

$$g_{i, w_k}^j = \frac{\overline{w_k}^j \delta_{ij}}{(1 - |w_k|^2)^j}, \quad i, j \in \{m, m+1, n, n+1\}.$$

Also the sequence $\{g_{i, w_k}\}$ is bounded in H^∞ and converges to 0 uniformly on compact subsets of \mathbb{D} . So for every compact operator $K : H^\infty \rightarrow \mathcal{B}_\mu$, $\lim_{k \rightarrow \infty} \|K g_{i, w_k}\|_{\mathcal{B}_\mu} = 0$. using the norm in weighted Bloch space, we obtain

$$\begin{aligned} \|T_{\psi_1, \psi_2, \varphi}^{m, n} - K\|_{H^\infty \rightarrow \mathcal{B}_\mu} &\succeq \limsup_{k \rightarrow \infty} \|(T_{\psi_1, \psi_2, \varphi}^{m, n} - K)g_{i, \varphi(w_k)}\|_{\mathcal{B}_\mu} \\ &\geq \limsup_{k \rightarrow \infty} \|T_{\psi_1, \psi_2, \varphi}^{m, n} g_{i, \varphi(w_k)}\|_{\mathcal{B}_\mu} \\ &\geq \limsup_{k \rightarrow \infty} \sup_{z \in \mathbb{D}} \mu(z) |(T_{\psi_1, \psi_2, \varphi}^{m, n} g_{i, \varphi(w_k)})'(z)| \\ &\geq \limsup_{k \rightarrow \infty} \mu(w_k) |(T_{\psi_1, \psi_2, \varphi}^{m, n} g_{i, \varphi(w_k)})'(w_k)| \\ &= \limsup_{k \rightarrow \infty} \sum_{j \in \{m, m+1, n, n+1\}} \mu(w_k) |E_j(w_k)(w_k) g_{i, \varphi(w_k)}^{(j)}(\varphi(w_k))| \\ &= \limsup_{k \rightarrow \infty} \frac{\mu(w_k) |E_i(w_k) \overline{\varphi(w_k)}^i|}{(1 - |\varphi(w_k)|^2)^i} \\ &= \limsup_{k \rightarrow \infty} \frac{\mu(w_k) |E_i(w_k)|}{(1 - |\varphi(w_k)|^2)^i}. \end{aligned}$$

Therefore

$$\|T_{\psi_1, \psi_2, \varphi}^{m, n}\|_{H^\infty \rightarrow \mathcal{B}_\mu} = \inf_K \|T_{\psi_1, \psi_2, \varphi}^{m, n} - K\|_{H^\infty \rightarrow \mathcal{B}_\mu} \succeq \limsup_{|\varphi(z)| \rightarrow 1} \frac{\mu(z) |E_i(z)|}{(1 - |\varphi(z)|^2)^i}, \quad (11)$$

for every $i \in \{m, m+1, n, n+1\}$.

Now, let $\{r_k\} \subset (0, 1)$ be a sequence such that $r_k \rightarrow 1$ as $k \rightarrow \infty$. Since $T_{\psi_1, \psi_2, \varphi}^{m, n} : H^\infty \rightarrow \mathcal{B}_\mu$ is bounded, we have

$$\sum_{j \in \{m, m+1, n, n+1\}} \sup_{z \in \mathbb{D}} \frac{\mu(z) |E_j(z)|}{(1 - |\varphi(z)|^2)^j} < \infty,$$

see [20], Theorem 1. It is easy to see that if we replace $r_k \varphi$ by φ , then we have

$$\sum_{j \in \{m, m+1, n, n+1\}} \sup_{z \in \mathbb{D}} \frac{\mu(z) |E_j(z)|}{(1 - |r_k \varphi(z)|^2)^j} < \infty,$$

which implies that $T_{\psi_1, \psi_2, r_k \varphi}^{m, n} : H^\infty \rightarrow \mathcal{B}_\mu$ be bounded. So it is compact. Then

$$\|T_{\psi_1, \psi_2, \varphi}^{m, n}\|_{e, H^\infty \rightarrow \mathcal{B}_\mu} \leq \|T_{\psi_1, \psi_2, \varphi}^{m, n} - T_{\psi_1, \psi_2, r_k \varphi}^{m, n}\|_{H^\infty \rightarrow \mathcal{B}_\mu}. \quad (12)$$

For simplifying the calculations, we set $f_r(z) = f(rz)$, $0 < r < 1$. Then we have

$$\begin{aligned} \|T_{\psi_1, \psi_2, \varphi}^{m, n} - T_{\psi_1, \psi_2, r_k \varphi}^{m, n}\|_{H^\infty \rightarrow \mathcal{B}_\mu} &= \sup_{\|f\|_{H^\infty} \leq 1} \|(T_{\psi_1, \psi_2, \varphi}^{m, n} - T_{\psi_1, \psi_2, r_k \varphi}^{m, n})f\|_{\mathcal{B}_\mu} \\ &\leq \sup_{\|f\|_{H^\infty} \leq 1} (|\psi_1(0)| |f^{(m)}(\varphi(0)) - f^{(m)}(r_k \varphi(0))| \\ &\quad + |\psi_2(0)| |f^{(n)}(\varphi(0)) - r_k f^{(n)}(r_k \varphi(0))|) \\ &\quad + \sup_{\|f\|_{H^\infty} \leq 1} \sum_{i \in \{m, m+1, n, n+1\}} \sup_{z \in \mathbb{D}} \mu(z) |E_i(z)| (f - f_{r_k})^{(i)}(\varphi(z)). \end{aligned}$$

Letting $k \rightarrow \infty$ we get

$$|\psi_1(0)| |f^{(m)}(\varphi(0)) - f^{(m)}(r_k \varphi(0))| \rightarrow 0, \quad |\psi_2(0)| |f^{(n)}(\varphi(0)) - r_k f^{(n)}(r_k \varphi(0))| \rightarrow 0.$$

Also

$$\begin{aligned} &\sum_{i \in \{m, m+1, n, n+1\}} \sup_{z \in \mathbb{D}} \mu(z) |E_i(z)| (f - f_{r_k})^{(i)}(\varphi(z)) \\ &\leq \sum_{i \in \{m, m+1, n, n+1\}} \sup_{|\varphi(z)| \leq \delta} \mu(z) |E_i(z)| (f - f_{r_k})^{(i)}(\varphi(z)) \\ &\quad + \sum_{i \in \{m, m+1, n, n+1\}} \sup_{|\varphi(z)| > \delta} \mu(z) |E_i(z)| (f - f_{r_k})^{(i)}(\varphi(z)) \end{aligned}$$

and letting $k \rightarrow \infty$ we obtain

$$\sum_{i \in \{m, m+1, n, n+1\}} \sup_{|\varphi(z)| \leq \delta} \mu(z) |E_i(z)| (f - f_{r_k})^{(i)}(\varphi(z)) \rightarrow 0.$$

Moreover for every $f \in H^\infty$, $\|f\|_\infty \leq 1$ we get

$$\begin{aligned}
& \sum_{i \in \{m, m+1, n, n+1\}} \sup_{|\varphi(z)| > \delta} \mu(z) |E_i(z) (f - f_{r_k})^{(i)}(\varphi(z))| \\
& \leq \sum_{i \in \{m, m+1, n, n+1\}} \sup_{|\varphi(z)| > \delta} \mu(z) |E_i(z) \|f^{(i)}(\varphi(z))\| \\
& \quad + \sum_{i \in \{m, m+1, n, n+1\}} \sup_{|\varphi(z)| > \delta} \mu(z) |E_i(z) \|r_k^i f^{(i)}(r_k \varphi(z))\| \\
& \preceq \sum_{i \in \{m, m+1, n, n+1\}} \sup_{|\varphi(z)| > \delta} \frac{\mu(z) |E_i(z)|}{(1 - |\varphi(z)|^2)^i} \|f\|_\infty \\
& \quad + \sum_{i \in \{m, m+1, n, n+1\}} \sup_{|\varphi(z)| > \delta} \frac{\mu(z) r_k^i |E_i(z)|}{(1 - |r_k \varphi(z)|^2)^i} \|f\|_\infty \\
& \preceq \sum_{i \in \{m, m+1, n, n+1\}} \sup_{|\varphi(z)| > \delta} \frac{\mu(z) |E_i(z)|}{(1 - |\varphi(z)|^2)^i}.
\end{aligned}$$

If $\delta \rightarrow 1$, then

$$\|T_{\psi_1, \psi_2, \varphi}^{m, n} - T_{\psi_1, \psi_2, r_k \varphi}^{m, n}\|_{H^\infty \rightarrow \mathcal{B}_\mu} \preceq \sum_{i \in \{m, m+1, n, n+1\}} \limsup_{|\varphi(z)| \rightarrow 1} \frac{\mu(z) |E_i(z)|}{(1 - |\varphi(z)|^2)^i}.$$

Finally

$$\|T_{\psi_1, \psi_2, \varphi}^{m, n}\|_{e, H^\infty \rightarrow \mathcal{B}_\mu} \preceq \sum_{i \in \{m, m+1, n, n+1\}} \limsup_{|\varphi(z)| \rightarrow 1} \frac{\mu(z) |E_i(z)|}{(1 - |\varphi(z)|^2)^i}. \quad (13)$$

□

By using the same method we can prove the following theorem.

Theorem 4.3. *Let $\psi_1, \psi_2 \in \mathcal{H}(\mathbb{D})$, $\varphi \in \mathcal{S}(\mathbb{D})$, $m \in \mathbb{N}_0$, $n \in \mathbb{N}$, $m+1 = n$ and μ be a radial weight. Suppose that $T_{\psi_1, \psi_2, \varphi}^{m, n} : H^\infty \rightarrow \mathcal{B}_\mu$ is bounded. Then*

$$\begin{aligned}
\|T_{\psi_1, \psi_2, \varphi}^{m, n}\|_{e, H^\infty \rightarrow \mathcal{B}_\mu} & \approx \max_{i \in \{m, n+1\}} \left\{ \limsup_{|\varphi(z)| \rightarrow 1} \frac{\mu(z) |E_i(z)|}{(1 - |\varphi(z)|^2)^i}, \limsup_{|\varphi(z)| \rightarrow 1} \frac{\mu(z) |\psi_1(z) \varphi'(z) + \psi_2'(z)|}{(1 - |\varphi(z)|^2)^n} \right\} \\
& \approx \max_{1 \leq i \leq 3} \left\{ \limsup_{|\varphi(w)| \rightarrow 1} \|T_{\psi_1, \psi_2, \varphi}^{m, n} f_{i, \varphi(w)}\|_{\mathcal{B}_\mu} \right\}.
\end{aligned}$$
