**Figure 1: Summary of Observed Family-GenAI Profiles:** We interviewed 12 families about their use and co-use of text-based generative AI platforms (i.e., ChatGPT). We contextualized our findings into six observed Family-GenAI mediation profiles. The six profiles (i.e., skeptical, cautious, hands-on, together, trusting, and independent families) demonstrate different types of Family-GenAI use, with respect to the following three dimensions: parents’ *control* over children’s ChatGPT usage, families’ *trust* in ChatGPT’s safeguards and information quality, and families’ *frequency* of co-use.

## Abstract

Applications of Generative AI (GenAI), such as ChatGPT, have gained popularity among the public due to their ease of access, use, and support of educational and creative activities. Despite these benefits, GenAI poses unique risks for families, such as lacking sufficient safeguards tailored to protect children under 16 years of age and not offering parental control features. This study explores families’ use and co-use of GenAI, the perceived risks and opportunities of ChatGPT, and how parents mediate their children’s use of GenAI. Through semi-structured interviews with 12 families, we identified ways families used and mediated GenAI and factors that influenced parents’ GenAI mediation strategies. We contextualize our findings with a modified model of family mediation strategies,

drawing from previous family media and mediation frameworks. We provide insights for future research on family-GenAI interactions and highlight the need for more robust protective measures on GenAI platforms for families.

## 1 Introduction

Imagine a family that is looking for a third player for their favorite card game and teaching the rules to ChatGPT to play with them. Later, during a family debate, the parent suggests, “Let’s ask ChatGPT to settle this!” Scenarios like these are becoming increasingly common as generative AI (GenAI) and large language model (LLM)-based chatbots (e.g., ChatGPT, Gemini, Claude) become integral to daily life [6]. However, these interactions also raise concerns for

parents, ranging from fears such as, “*What if my child uses ChatGPT to cheat on homework?*” to more speculative worries like, “*I should be kind to AI in case it takes over the world one day.*” Understanding how GenAI is beginning to influence family routines and activities requires examining how families harness the potential of this emerging technology while navigating its associated risks.

Today’s parents may face struggles with deciding *whether* and *how* to integrate GenAI into their lives, much like they did with previous technologies such as the Internet, search engines, and smartphones [22, 38]. GenAI and LLM-based chatbots offer significant potential to support children’s creative and educational pursuits [12, 16, 19] because they can generate content and information in conversational, adaptable language [2]. While families may apply lessons from online safety with older technologies (e.g., Internet, TV, social media) to GenAI, their level of familiarity with GenAI may limit their ability to address its unique risks [57]. Parents often worry about inappropriate content and interactions online, and emerging research highlights new risks, such as emotional dependence on GenAI, misinformation from hallucinations, and unchecked trust in GenAI [48, 57]. Our study aims to explore how families navigate these risks and opportunities.

Parents use various mediation strategies to reduce the risks associated with their children’s use of media and technology [50]. These strategies depend on the technology’s features [35], parents’ perceptions of it [9], and family factors like the child’s age and parental attitudes [8, 41]. For instance, parents may overlook data privacy risks if they are unaware that GenAI platforms retain inputted prompts and responses unless manually deleted. Few studies have examined parents’ GenAI mediation strategies. While some studies show parents attempting to manage their children’s use of GenAI, they also highlight gaps in parental knowledge that limit their ability to address the technology’s risks [1, 57]. Although no technology is risk-free, effective use of GenAI can enhance family interactions [18], improve children’s social connections [29], and support academic learning [36]. Overall, this study aims to explore how and why parents mediate their children’s use of GenAI, focusing on the risks, opportunities, and the role of parental perceptions and family contexts. To our knowledge, little existing research addresses these perspectives in-depth.

We pose the following research questions:

- **RQ1:** What mediation strategies do parents use for GenAI?
- **RQ2:** What benefits or risks do parents perceive in their child’s use of GenAI?
- **RQ3:** What contextual factors shape families’ perceptions of GenAI and parents’ GenAI mediation strategies?

To address these questions, we take a multi-user perspective, focusing on *shared family use of GenAI*. We conducted exploratory semi-structured interviews with 12 families that consisted of at least one child with experience sharing a ChatGPT account with a parent. We analyze our findings using existing parental media mediation frameworks and propose a modified model for family use of GenAI. Our work aims to inform efforts to evaluate and improve family safety on GenAI platforms.

## 2 Related Work and Background

### 2.1 Children, Families, and GenAI

Since its release in 2022, ChatGPT and other GenAI tools have become increasingly prevalent in children’s lives. Surveys indicate that there are many users under 18 [14, 26, 27, 43, 46], with one study reporting children as young as five interacting with ChatGPT [39]. It is important to acknowledge that GenAI use exposes children to risks such as misinformation, data misuse [51], and more alarming concerns like deepfake pornography and harmful interactions [30, 33]. As a result, an increasing amount of research has focused on Child-Centered AI, and GenAI privacy and safety [5, 11, 15, 20, 40, 48, 53, 54, 57, 58]. At home, parents may try to manage potential risks of GenAI use by employing various mediation strategies [1, 57]. However, if parents are unfamiliar with GenAI, they may find it more difficult to manage their children’s GenAI use [57], and are likely to encounter limited ways to control use in-platform. Unlike streaming or social media platforms with tailored protections for minors [31, 55], many GenAI platforms currently lack child-specific safeguards. This is partly because many of the platforms require users to be 13 or older [37], though research and anecdotal evidence suggest limited enforcement of this rule [39, 43]. At the policy level, some researchers argue that overarching policies meant to protect children online, such as the Kids Online Safety Act and COPPA [10, 49], are ineffective or potentially harmful to young people [4, 23]. There is an urgent need for both platform-level protections and family-centered tools to better safeguard children in the evolving GenAI landscape.

**2.1.1 Technology at Home.** Along with addressing parental concerns, it is also important to acknowledge parents’ motivations for providing access to GenAI platforms at home. There is limited mediation literature about reasons for GenAI use in households with children, but work in adjacent fields provides valuable insights into what parents value or consider when introducing new technology. While most forms of technology present some sort of risk to children, both children and parents also report benefits from their use. Various devices and media can support family life and child development. For example, distanced family members can be connected through social media and devices [32]. High-quality interactive and non-interactive media, including device applications and television, have been linked to long-term educational outcomes and short-term promotion of play in young children [17, 24]. Families have also reported using media together (e.g., video games and Netflix) as a tool to bond with one another [47, 52]. Preliminary research on GenAI suggests that some parents believe GenAI can positively impact their children’s education and have used it to facilitate their children’s learning [39].

**2.1.2 Evaluating Families’ Technology Use.** Families’ knowledge, needs, and goals shape their home technologies and related rules. According to a national survey by Rideout and Robb [44] on children’s screen media use in the US, parents from historically marginalized racial and socioeconomic backgrounds are more likely to view screen media as educational. Additionally, parents’ mediation strategies have been correlated with parents’ attitudes toward specific media [9]. These attitudes and perceptions may be motivated by the amount of knowledge a parent has obtained about the media

based on their personal experiences and the external educational resources they may access to [35], as well as their personal and their children's behaviors [28]. At this time, there is little available work to draw parallel conclusions about GenAI, but at least one study has noted that parents' occupations may contribute to whether they use GenAI tools for work or entertainment [1].

## 2.2 Adapting Parental Mediation Strategies For Emerging Technologies

In their seminal work, Valkenburg et al. [50] identified three types of parental mediation for traditional media (*i.e.*, television): *restrictive* mediation (limiting access or use), *instructive* or *active* mediation (parent-child conversations about media content), and *co-use* (parents and children using media together). These strategies have remained relevant across technologies [34, 35, 57], but their definitions have evolved to address new aspects of emerging media. Scholars have also identified additional strategies tailored to modern technologies, such as *monitoring* internet use [35], *preparing* hybrid digital toys for children [56], and *learning* from children during co-use [9]. The specific features of technologies often determine the suitability of certain strategies; for example, parents tend to favor co-use and instructive mediation over restrictive approaches for digital educational programs [56]. Over time, parental strategies for the same technology may also shift as perceptions and societal norms evolve. While Mascheroni and Ólafsson [25] suggested that monitoring children's mobile phone use was difficult because devices were meant to be private, Ren and Zhu [42] later highlighted monitoring as a common mediation strategy for managing mobile phone use.

Although limited, emerging research on GenAI mediation strategies suggests, parents rely on both established and new approaches. Both Yu et al. [57] and Abel and Magnusson [1] found evidence of parents using instructive, restrictive, and co-use mediation strategies to manage GenAI use. However, parents' limited understanding of GenAI's mechanisms often prevented them from addressing risks specific to the technology (*e.g.*, not understanding the implications of generative chatbots). Beyond traditional strategies, some parents have adopted approaches to prepare for their child's use of GenAI. For instance, Abel and Magnusson [1] observed parents educating themselves and their children about GenAI in anticipation of future use, while Quan et al. [39] found parents occasionally encouraged their children to engage with GenAI. Given the gaps in understanding how family dynamics influence the adoption and mediation of GenAI, this study aims to explore parents' perceptions of GenAI's risks and benefits and to identify family characteristics that shape how GenAI is (co-)used and mediated at home.

In this work, we aimed to explore how families with children navigate the access and use of a shared ChatGPT account via semi-structured interviews. Our work differs from prior work on children's or individuals' use of GenAI by focusing on families with children to reveal unique insights about their various experiences within this domain. We draw insights from relevant family media mediation literature and propose an adapted version of prior theoretical models (*e.g.*, Nikken and Jansz [34]) to describe family-GenAI mediation and interactions. Based on our findings, we also

identify several risks and opportunities unique to GenAI that families may encounter when using GenAI platforms. Throughout this investigation, we take a "multi-user perspective" to capture both parents' and children's experiences using GenAI.

## 3 Methods

### 3.1 Participants and Recruitment

We recruited 12 U.S.-based families via paid advertisement on social media platforms (Meta Ads<sup>1</sup>) and e-mail lists. We distributed our pre-screening survey in our advertisements and contacted eligible respondents who (1) was a parent of at least one child between the ages of 8 and 18 who had shared a ChatGPT account with them and was willing to take part in the study, (2) spoke English, and (3) resided in the United States. All interviews were conducted over Zoom. Participants over 18 (*i.e.*, the parents in each family) signed a consent form before participating in the study. Minors were verbally assented at the start of each Zoom call. Parents were also asked to complete a demographics form at the end of the call. Families were compensated \$25 after the interview. Of the 12 families, two had two children present during the interview, and two had two parents present. All other family interviews consisted of one child and one parent. Fourteen parents total participated in the study (10 mothers and four fathers). 42% of the participating children were girls, and 58% were boys. 71% of the participating parents held at least a Bachelor's degree, and all participating parents reported that they were at least "slightly familiar with new technologies." Detailed demographics of the participating families can be found in Table 1.

### 3.2 Procedure

Semi-structured interviews were conducted with all interested family members present. Two experimenters facilitated the first eight participating families from early February to mid-April 2024, and one experimenter facilitated the remaining four families in May 2024. Interviews were held remotely over Zoom and lasted between 45 and 90 minutes. Experimenters began each interview by asking families to verify they had access to a valid ChatGPT account. Next, families were asked to describe their initial reactions to ChatGPT, examples of their current and past (co-)use of ChatGPT, account-sharing habits, and any conflicts they encountered while sharing an account. Finally, experimenters prompted conversations about online safety concerns, what actions parents took to mediate these concerns, and whether these actions were based on prior experiences with other platforms. Our institution's ethics review board approved our study protocol. Relevant study resources (*e.g.*, semi-structured interview protocol) can be found in our open access repository<sup>2</sup>.

### 3.3 Data Analysis

We conducted a thematic analysis [7] to identify patterns and themes relevant to our research objectives. The first three authors facilitated the interview sessions, the first and third authors revised

**Table 1: Demographics**

ID	Child Demographics				Parent Demographics		Family Annual Income
	Gender	Age Range	Child Race	School	Parent 1 Education	Parent 2 Education	
F1	M	13-16	African American	Public	Highschool	Some College	\$100k - \$150k
F2	M	8-12	White	Public	Bachelor's	Master's	\$100k - \$150k
F3	M	8-12	White	N/A	Doctoral	Master's	\$150k - \$200k
F4	M	8-12	Asian	Home	Bachelor's	Master's	\$100k - \$150k
F5	F	8-12	African American	Charter	Bachelor's	Associate's	\$100k - \$150k
F6	M	13-16	White	Charter	Bachelor's	Master's	Less than \$15k
F7	M/M	13-16/13-16	White	Public	Master's	Professional degree	\$150k - \$200k
F8	F	8-12	White	Public	Doctoral	Bachelor's	\$75k - \$100k
F9	M/F	8-12/8-12	Asian	Public	Bachelor's	Master's	Prefer not to answer
F10	F	8-12	Asian	Public	Doctoral	Doctoral	\$100k - \$150k
F11	F	8-12	White	Public	Master's	Doctoral	\$150k - \$200k
F12	F	8-12	White	Public	Doctoral	Doctoral	\$200k or more

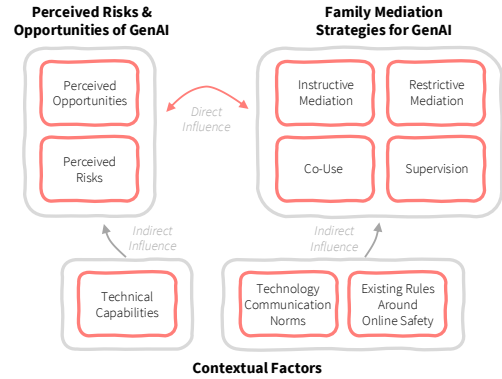

Columns 1 & 8 are family demographics, columns 2-5 are child demographics, and columns 6-7 are parent demographics. All demographics were self-reported by parents. All occupation information addressed in the later passage was self-disclosed during the interview; we did not explicitly collect any information about location or occupation information to maintain families' privacy.

the auto-generated audio transcripts, and the first and second authors collaboratively coded the interviews with active feedback from the third author. Later, all authors analyzed and evaluated the identified themes together via affinity diagramming, discussed conflicts, and then consolidated the themes. We then situated our findings in existing family media mediation frameworks (e.g., Nikken and Jansz [35], Valkenburg et al. [50]). This process allowed us to structure our findings in two parts. First, we propose a model that connects the contextual factors identified in our data with prior theoretical models, and summarize the prominent factors that contributed to families' mediation patterns for GenAI (see Section 4). Second, we leverage the relationships identified in our proposed model (see Section 5) by grouping families into observed profiles that explore families' perceptions of GenAI, contextual factors, and GenAI usage.

To maintain confidentiality, participants are referred to using descriptive labels containing a letter and number. Letters refer to the role of the participant, with P representing a parent, C a child, and S a sibling, while the number specifies which family they belong to (see Table 1 for family IDs). F is used when referring to the whole family, and Pa and Pb are used to refer to specific parents in families where more than one parent participated.

#### 4 Proposed Model: Family-AI Mediation

In this section, we describe and define the key elements that instantiate our proposed model for Family-GenAI mediation (see Figure 2). We first evaluated how participating parents *mediated* their children's ChatGPT usage and utilized previous parental mediation research [35, 50] to inform our categorization process. We identified potential reasons contributing to these mediation patterns, which were grounded by (1) concern- or benefit-driven factors or (2) family contextual factors. For example, if a parent is concerned that a child might ask ChatGPT to do their homework, they might monitor the platform or use it together with their children (i.e.,

**Figure 2: The proposed Family-GenAI Mediation model. Identified mediation strategies are based on previous parental mediation research, as suggested in Section 2.**

concern-driven factors). In another family, a parent with technical knowledge may set router-level limitations for inappropriate content instead of or in addition to instructing their children about what content to avoid (family contextual factors). We elaborate on these factors in Section 5 and Table 2. We then developed a new model reflecting the factors contributing to parents' GenAI mediation decisions. The model consists of three core components: (1) parents' GenAI mediation strategies, (2) parents' perceptions of GenAI, and (3) contextual factors. We propose that parents' **perceived opportunities & risks of GenAI** and **GenAI mediation strategies** *directly impact* each other, while both are *indirectly bounded* by several **contextual factors**, including families' technical capabilities, communication norms, and existing rules around online safety. We further elaborate on these three core components of our proposed model in the sections below.

#### 4.1 Family-GenAI Mediation Strategies

We identified four types of mediation strategies for GenAI that families used: **instructive mediation**, **restrictive mediation**, **co-use**, and **supervision**. Instructive mediation involved parents actively discussing the guidelines for ChatGPT usage, such as discussing usage rules or having a broader conversation about GenAI's risks and features. Restrictive mediation involved limiting children's access to ChatGPT, including requiring explicit parental permission before use. Co-use strategies involved joint interactions, such as parents and children using ChatGPT together or sharing its outputs with each other. Supervision strategies included parents monitoring children's interactions with ChatGPT, screening prompts, and only allowing their children access to ChatGPT on shared devices. We also observed two families that did not enforce any specific mediation strategies.

#### 4.2 Perceived Risks & Opportunities of GenAI

Parents' **negative and positive perceptions toward ChatGPT** directly impacted how they mediated its use. *AI-related concerns* included trepidations toward the platform (e.g., how the model collects and consumes user data, AI uprising), children's potential misuse (e.g., cheating via ChatGPT), and a lack of regulation over ChatGPT's outputs (e.g., giving inappropriate answers that may not be suitable for children). Some parents discussed the potential *benefits of GenAI*, suggesting ChatGPT could help children's creativity and learning. Several families shared unique co-use cases, such as including ChatGPT as a third player in a game, using ChatGPT to resolve family conflicts, or sharing and discussing ChatGPT outputs together.

#### 4.3 Contextual Factors

**Contextual factors**, or factors related to families' backgrounds and mediation practices outside of GenAI, indirectly influenced how families perceived and used GenAI platforms. Contextual factors included families having *existing rules around online safety* that transferred to GenAI, families' *technology communication norms* or how they have discussions around online safety, and parents' *technical capabilities and prior knowledge* of GenAI. For example, families with a limited understanding of LLMs expressed more confusion toward GenAI's data collection practices.

#### 4.4 Connections between Factors

In this section, we describe how the elements of the proposed model are connected. Specifically, we discuss how contextual factors *indirectly impact* (1) perceived opportunities & risks of GenAI and (2) GenAI mediation strategies, and how (3) GenAI mediation strategies and perceived opportunities and risks of GenAI *directly impact* each other.

**4.4.1 Contextual Factors  $\Rightarrow$  Perceived Opportunities & Risks of GenAI.** Our findings demonstrate how technical capabilities (i.e., parents' familiarity with technology and GenAI) shaped parents' attitudes towards their children's GenAI use. Several parents who were familiar with GenAI (P4, Pb9, P12) chose to introduce ChatGPT to their children to highlight its features; nearly all of their children used ChatGPT for mostly creative purposes (e.g., writing, generating

ideas or images). Additionally, parents' occupation may shape their attitudes toward and usage of ChatGPT. Parents in educational and technological fields utilized ChatGPT for more creative use cases (e.g., writing poems), and mentioned concerns related to academic integrity, misinformation, and over-reliance on GenAI. P7, P8, and P12—all educators—expressed that their children might become less creative if they became overly dependent on GenAI's answers. A couple of parents with technology-based careers (P4, P9) expressed concerns about intellectual property and data consumption.

**4.4.2 Contextual Factors  $\Rightarrow$  GenAI Mediation Strategies.** Our findings suggest that contextual factors also *indirectly* influence families' mediation (access/control) strategies. In particular, how families used and mediated other types of technology often affected how they handled ChatGPT. Almost half of the families (F2, F4, F8, F9, F11) mentioned that they *had conversations about online safety together*. Parents who encouraged open and frequent communication about technology with their children were less interested in setting "hard" or strict usage rules for technology. We also observed that *families' existing online safety rules sometimes transferred to GenAI*. Half of the families (F5, F6, F8, F9, F10, F11) applied their existing online safety control strategies to ChatGPT. For instance, families with device restrictions (F5, F8, F9, F11) for other media also restricted children's access to ChatGPT. P6 had rules against sharing personal information online and ensured their child knew how to anonymize their information when using ChatGPT.

**4.4.3 Mediation Strategies  $\Leftrightarrow$  Perceived Opportunities & Risks of GenAI.** Families' perceptions of GenAI *directly* influenced *how and why* parents enforced different mediation strategies toward GenAI. We identified several GenAI-related concerns that emerged from family rules and access restrictions. For example, P6 and Pa11 and Pb11 had privacy-related concerns and encouraged their children not to share personal information with ChatGPT. P4 and P10, who were concerned about misinformation, taught their children to double-check ChatGPT's outputs using other informational sources. P5, P8, and Pb11, who expressed concerns about GenAI but encouraged their children to use it, reported co-using ChatGPT with their children to minimize risks while maximizing the benefits of the platform. Conversely, our proposed model also captures how different GenAI mediation strategies directly influenced families' perceptions toward GenAI. Some parents who co-used ChatGPT with their children noted its beneficial use cases afterward. For example, P7 did not consider ChatGPT to be reliable or useful, but was amused by its outputs and encouraged their children to share interesting ChatGPT-generated essays with the family.

### 5 Family Profiles: Instantiating the Family-GenAI Mediation Model

In this section, we elaborate on specific findings with *family profiles* that explain the Family-GenAI Mediation Model described in Section 4. These case studies provide practical examples of how the Family-GenAI Mediation Model is instantiated in practice. Table 3 represents a summary of notable characteristics of each type of family with respect to control, trust, and co-use patterns.

Category and Label in Model	Descriptive Examples (Participant ID)
<b>Perceived Opportunities &amp; Risks: Benefits of GenAI</b>	Co-using ChatGPT allows for family interactions. (F2, 3, 5, 6, 7, 8, 11, 12) Parent encourages child to use new technology. (F4, 6, 7, 9) ChatGPT is helpful as a learning tool. (F3)
<b>Perceived Opportunities &amp; Risks: Concerns toward GenAI</b>	Parent is concerned about child having inappropriate interactions or cheating with GenAI. (F5, 6, 7, 8, 9, 11, 12) Parent is concerned about child over-relying on GenAI. (F7, 8, 9, 11, 12) Parent worries that ChatGPT does not secure user privacy. (F4, 5, 6) Parent expresses confusion on how ChatGPT collects user data. (F5, 6, 8) Parent worries that ChatGPT may output inappropriate or incorrect content. (F4, 10)
<b>Contextual Factors: Capabilities</b>	Parent has an academic occupation (e.g., teacher, researcher). (F7, 8, 10, 11, 12) Parent states high familiarity with GenAI and new technology. (F4, 9, 10, 12) Parent does not have a strong understanding of GenAI*. (F5, 6, 8, 11) Child's school restricts access to ChatGPT and other websites. (F7, 9, 10)
<b>Contextual Factors: Technology Communication Norms</b>	Family has conversations about online safety. (F2, 4, 8, 9, 11)
<b>Contextual Factors: Rules around general online safety</b>	Parent monitors child's device usage and/or child shares devices with parent. (F1, 2, 3, 5, 8, 9, 11, 12) Parent uses age and/or content restrictions. (F3, 5, 6, 7, 8, 9, 10, 12) Child has no social media account or shares accounts with parent. (F2, 6, 7, 8, 10, 11, 12) Parent instructs child not to share personal information online. (F3, 5, 6, 8, 11)
<b>Family-GenAI Mediation: No Mediation</b>	Parents do not enforce any mediation strategies. (F1, 4)
<b>Family-GenAI Mediation: Instructive Mediation</b>	Family discusses rules for using ChatGPT. (F6) Family has conversations about GenAI. (F4, 6, 10)
<b>Family-GenAI Mediation: Restrictive Mediation</b>	Parent restricts access to ChatGPT (e.g., child needs to ask for permission to use ChatGPT). (F5, 6, 8, 9, 10, 11)
<b>Family-GenAI Mediation: Co-use</b>	Child and parent occasionally use ChatGPT together and discuss ChatGPT-generated content. (F2, 3, 7, 9, 12) Child only uses ChatGPT with parent. (F5, 6, 8, 11)
<b>Family-GenAI Mediation: Supervision</b>	Parent monitors child's interactions with ChatGPT. (F10) Parent screens child's prompts before they are submitted to ChatGPT (F9) Child has access to ChatGPT on shared devices. (F2, F3, F7)

**Table 2: Family-GenAI Mediation Model & Summary including factors that contribute to GenAI mediation strategies. \*Parent self-reported being confused about GenAI.**

### 5.1 A Skeptical Family: Sets protective measures for prompting ChatGPT

While the “Skeptical” family in this study (F6) acknowledged that using technology can sometimes be beneficial, they were wary about the safety of GenAI and utilized protective measures when using ChatGPT. Despite prior experience using GenAI-based products, P6 did not feel that they could trust ChatGPT: “*ChatGPT is new, and I’m not sure how secure it is.*” One of their main concerns with ChatGPT stemmed from their experiences with privacy breaches online; P6 stated that they had received many emails from companies about their data being leaked and decided to implement “*some guardrails around which programs and apps [C6] uses*” to

protect their child from having their personal information mishandled. This concern and practice transferred to other GenAI products. Although they mentioned trying GenAI-based online therapists, P6 said, “*I do not give real data about myself*”. Instead, they stated that they would “*give it, like, generic scenarios, or I’m gonna fake a scenario. But I know what the emotional content is about in that scenario.*” These concerns were then communicated to the child through conversations about ChatGPT and GenAI.

**5.1.1 Suspicions for Location Tracking and GenAI.** Both C6 and P6 distrusted what ChatGPT stated about its capabilities. During the interview, we encouraged the family to test whether ChatGPT actively tracks users’ location data. F6 asked ChatGPT to locate a restaurant near them, and ChatGPT consistently responded that

Family Profiles	Description (Family ID)
<b>A Skeptical Family</b>	<p><b>Dimensions (F6):</b> High control, low trust, medium co-use</p> <p><b>Characteristics:</b> Concerned toward the safety of GenAI; sees value in technology use; mediates concerns by setting protective measures for using ChatGPT</p> <p><b>Representative Quote:</b> "I'm putting some guardrails around which programs and apps my child uses." (P6)</p>
<b>A Cautious Family</b>	<p><b>Dimensions (F10):</b> High control, high trust, low co-use</p> <p><b>Characteristics:</b> Concerned about exposure to developmentally inappropriate content; trusts the platform's safety measures; mediates concerns by setting exploratory rules for monitoring ChatGPT use</p> <p><b>Representative Quote:</b> "I would like to keep an eye on them while my child is using ChatGPT" (P10)</p>
<b>A Hands-On Family</b>	<p><b>Dimensions (F9):</b> High control, medium trust, medium co-use</p> <p><b>Characteristics:</b> Concerned about ethical boundaries of cheating; trusts school policies and guardrails; mediates concerns by actively screening children's ChatGPT use</p> <p><b>Representative Quote:</b> "My child comes to me. I use my personal judgment on if it's appropriate or not to ask [ChatGPT something]." (P9)</p>
<b>A Use Together Family</b>	<p><b>Dimensions (F5, 8, 11):</b> High control, medium trust, high co-use</p> <p><b>Characteristics:</b> Concerned about ethical misuse and developmental risks for children; trusts the information quality or children's self-regulation; mediates concerns by actively using ChatGPT together and requiring permission for use</p> <p><b>Representative Quote:</b> "[We] try to share accounts with [my child] so we can, you know, see what they use it for and so that we can talk about what they've used it for, things like that." (P11)</p>
<b>A Trusting Family</b>	<p><b>Dimensions (F2, 3, 7, 12):</b> Medium control, high trust, medium co-use</p> <p><b>Characteristics:</b> Concerned about beyond-human capabilities of ChatGPT; trusts ChatGPT's built-in protections; addresses concerns by co-using ChatGPT, but sometimes puts trust and responsibility in ChatGPT's existing safeguards</p> <p><b>Representative Quote:</b> "I mean I don't really have any [concerns]... There are limits built in[to ChatGPT]. So I think it's one of the interesting tools that I actually feel [I can trust]." (P7)</p>
<b>An Independent Family</b>	<p><b>Dimensions (F1, 4):</b> Low control, medium trust, low co-use</p> <p><b>Characteristics:</b> Relaxed on rules</p> <p><b>Representative Quote:</b> "My child has to learn how to navigate and do this stuff himself. I can't always be there for them." (P1)</p>

**Table 3: Observed Family Profiles:** We represent each category of case studies and describe how the Family-GenAI Mediation Model is instantiated for each observed family category, grouped by degree of control. We discuss the dimensions of each family with respect to the control, trust, and co-use patterns. We describe family characteristics and share a representative quote of the family categories.

it could not access real-time location data and recommended using online map applications instead. The response did not include any solicitation from the user to share their location, but both C6 and P6 felt that ChatGPT was lying. "It's lying. And now I think it does [know our location]," C6 stated, with P6 adding, "I think it knows [our location]... but it's not allowed to say because it would, hmm, violate [OpenAI's] terms of service." P6 also felt GenAI-based products were tailored to the user, so users had to be more careful about what they shared with GenAI. They explained that they would "lie to [Gen]AI", but they would not "lie to Google": "I use Google for health stuff. But I Google so many things that Google must be really confused about me ... I might even be helping a friend because her child has a rash. So then, I say, 'What does measles look like?' But it's not about me."

**5.1.2 Family-GenAI Co-use in Games.** Despite their skepticism and distrust toward ChatGPT, the family also had positive co-use experiences on the platform. F6 shared that they often played games together but were limited to two-player games as they were the only people in their household. ChatGPT's interactive, human-like features enabled new gameplay structures for F6. P6 said, "You know, it's hard to play a lot of games with just two people. So ChatGPT plays that [role]. They're holding the cards... So then that helps us play a good game." They also encouraged C6 to interact with ChatGPT: "I really believe that technology is so useful that it would be harmful for me to keep [C6] off of his screens, because he's learning and leaping forward massively." Acknowledging the potential risks and benefits of ChatGPT, P6 decided to encourage their child's use while still setting protective restrictions. During the interview, C6 often validated P6's feelings and reasoning for setting the rules that they did. The

“Skeptical” family frequently discussed risks and opportunities of GenAI: “We’ve talked at dinner and at lunch... stuff about, ‘do we have any concerns about the usage of [Gen]AI?’, and we both do have some concerns about it.”

## 5.2 A Cautious Family: Sets exploratory rules for monitoring ChatGPT use

The “Cautious” family in this study (F10) trusted ChatGPT’s in-platform safeguards and safety features, but P10 still monitored C10’s use because they were worried that ChatGPT might *generate inappropriate output*. Having self-disclosed as being proficient in programming and technology, P10 explained that they knew ChatGPT had safety mechanisms. However, they also mentioned that they knew these mechanisms could be bypassed: “Earlier this year, [there were] some kind of trick prompts [people used to dupe ChatGPT successfully].” Thus, they still felt it was necessary to monitor their child’s use of ChatGPT closely: “I know technology always has some [issues]... **I would like to keep an eye on [my children] while [they are] using ChatGPT.**” Relatedly, P10 felt that it was important for them to understand any technology they allowed their child to use.

**5.2.1 Distinct Mediation of ChatGPT and Social Media.** While P10 actively monitored C10’s ChatGPT interactions after they occurred (and were thus labeled as having high control over their usage), they did not transfer some of their rules for other technologies to GenAI. For example, C10 was allowed to use age-restricted Google and YouTube accounts and a personal device with a child lock on it, but P10 was not concerned about having this type of mediation for ChatGPT. Although this may be due to the lack of age-restricted accounts on ChatGPT, P10 felt that ChatGPT was not “addictive”, but social media could be (e.g., Al-Samarraie et al. [3]). When discussing why they disliked social media, they stated, “I think there’s a difference... ChatGPT [gives you] the information. It’s not necessarily [playing] those sorts of [addictive] video... [or] a quick song like YouTube.” While discussing social media, P10 said, “You get nothing from it, just feel lost. And there’s lots of studies showing those short clip videos has [sic] a very negative impact on your- on your brain, on your mental health, and addiction... Although social media is just to have a very tiny bit of information... It’s- it’s not an article. An article gives you a way to really think those things through. If you want to explain something, want to present something, you-you’d... better read an article instead of 140 characters on Twitter, or [watching] those 20-second videos.”

**5.2.2 Contextual Factors: Family-GenAI Communications around GenAI and Rule Exploring.** Besides monitoring C10’s interactions with GenAI, P10 had conversations about the technology with them to build their knowledge about it. F10 did not co-use ChatGPT, as P10 felt it was important for children to explore the technology on their own (with monitoring) to understand how it worked: “If you make the rule, you need to make sure [the child] understands the rule. If you understand something, it becomes your knowledge.” As far as whether they had plans to implement any usage rules for ChatGPT, P10 said, “I don’t have any- any kind of a [specific ChatGPT] rule... I trust it. For now.”

## 5.3 A Hands-On Family: Actively screens child’s ChatGPT use

The “Hands-on” family (F9) actively screened their children’s ChatGPT questions or prompts either before or after they were submitted to the platform. Pa9 and Pb9 were mainly concerned about whether their children could clearly distinguish between *using ChatGPT to cheat versus to support learning*. Pb9 aimed to make sure that their children “don’t just copy and paste” or plagiarize ChatGPT outputs for their own use. As a result, they required their children to ask them for permission to use the platform and reviewed the types of prompts their children wanted to input before doing so: “**They come to me. I use my personal judgment on if it’s appropriate or not to ask.**”

**5.3.1 Parents’ Prioritize Traditional Resources over ChatGPT.** Both parents believed that although learning how to use ChatGPT might benefit their children’s futures (e.g., if they need to use it at a job), it was not a necessary tool in schools, with Pb9 stating, “except for research[ing information], there’s really no need for ChatGPT.” Both parents preferred that their children use other resources, such as Google, and *encouraged their children to approach them for help*. In characterizing themselves as trustworthy sources of information, Pb9 dubbed themselves and Pa9 as the “older ChatGPT”, or a more rudimentary form of ChatGPT.

**5.3.2 Family-GenAI Creative Co-use Patterns.** Despite their concerns about ChatGPT, both parents actively encouraged their children to interact with the GenAI to learn about what it could do. Having learned about ChatGPT through their technology-based job, Pb9 decided to create a shared account “just for educational purposes only ... [to] showcase what’s possible for the kids.” Pb9 would occasionally co-use ChatGPT with C9 and S9 as a writing tool (e.g., to edit an essay or explore a story idea). Pb9 mentioned that although they wanted to be “mindful” about risks, they also did not want to “restrict [C9 and S9] from access [to] being creative” online.

**5.3.3 Contextual Factors: Challenges in Managing ChatGPT Use at School.** F9 had general parental controls on the children’s devices and router-level settings configured that filtered through content on all platforms, including ChatGPT. However, they highlighted that these mediation strategies were not foolproof. For instance, Pb9 hoped that the school district would set up some guardrails for ChatGPT use, but acknowledged that, “It’s a- a challenge in general... Unless you build a special custom portal that has all these guardrails around what you can or cannot ask.”

## 5.4 A Use Together Family: Actively co-using ChatGPT together

“Use Together” families (F5, F8, F11) frequently co-used ChatGPT with one another. All three families shared accounts, and the children in every family reported minimal instances of using ChatGPT alone (sometimes due to a lack of desire to do so) and mentioned that they had to receive permission from their parents to use it. None of the children were interested in opening a personal ChatGPT account. Additionally, none of the participating children in these families had personal devices

**5.4.1 Contextual Factors: Occupations, Concerns, and Family Conversations.** A distinguishing factor of “Use Together” families was their *perceptions of ChatGPT*. For these three families, parents’ concerns were driven by what they knew about ChatGPT from their jobs. For instance, both P8 and Pb11 were teachers, and both mentioned having students who used ChatGPT to cheat. Furthermore, most of the parents (besides Pb11) self-described themselves as *not familiar* with how ChatGPT functioned. P5 and P8 both explicitly expressed confusion about how ChatGPT collects user data, and Pa11 mentioned that as someone who was not “tech-savvy”, they were nervous about what ChatGPT could look like in the future. P5, who was also concerned about data safety, said, “*If [OpenAI or ChatGPT] are ever hacked... [Hackers would] know that [a] person at this address has three daughters.*” P5 was unaware of some of the platform’s safety measures; when they asked ChatGPT to identify a good bakery, they found it odd that it recommended asking a local friend for an answer instead. P8 was confused about ChatGPT’s data collection practices and transparency: “*In terms of thinking about the data that it collects... I don’t understand fully what ChatGPT is taking from me.*” Despite these confusions and concerns, the “Use Together” families expressed that they *feel safe* using ChatGPT due to their harmless use cases. P5 and P11 both trusted their children to use ChatGPT safely. P8 considered ChatGPT an entertaining tool for the family: “*So it’s still very much like more creative fun. Silly at home [stuff].*” P11 also explained that discussing professional concerns about students cheating and online safety with their children helped raise awareness of the risks and opportunities of using ChatGPT: “*I think she’s heard me complain enough about the threat of students cheating and how- how obvious it is when students plagiarize, especially from things like ChatGPT. So I think she kinda knows not to do that stuff. She’s kind of in and around these conversations about internet safety.*”

**5.4.2 Comparisons Between ChatGPT and Other Media.** “Use Together” families perceived ChatGPT as safer than social media platforms, such as YouTube. Thus, parents had more relaxed rules for ChatGPT compared to other platforms. P8 mentioned that they knew “*a lot of researchers who have talked about the dangers [of social media], like the psychological issues behind young people with cell phones and having access to social media.*” They also pointed out that C8 did not have access to any social media accounts and was not allowed to post public comments on YouTube. Pb11 shared similar concerns about social media, but focused more on the content presented on the platforms. They considered **text-based LLMs like ChatGPT to be safer than social media** because no visual content was being presented to users: “*I think because ChatGPT has certain features that are just very different from those other kinds of social media platforms, then it seems a little safer in that way. I mean, there’s obviously still risks and things that she could get into that might be nefarious, too, but at least [ChatGPT] doesn’t have some of those qualities that these other [social media] platforms have.*”

**5.4.3 Family-GenAI Co-Use Patterns.** Compared to the other families in this study, “Use Together” families reported frequent *co-use of devices and media*, including ChatGPT, and minimal rules specific to ChatGPT. Parents in this group felt that **co-use could enhance bonds between family members**. For example, F5 regularly worked on math problems from school together and had

begun using ChatGPT to review and discuss their answers. F5 also mentioned that they sometimes used ChatGPT to help resolve family conflicts: P5 brought up a time they asked ChatGPT to explain the steps in solving a math problem, as P5 and C5 disagreed on the ‘proper’ way of doing so. F8 and F11 also mentioned co-use cases where the family used ChatGPT to generate stories (e.g., short stories, fanfiction) or written work together.

## 5.5 A Trusting Family: Transfers responsibility to ChatGPT to support mediation

“Trusting” families (F2, F3, F7, F12) had *few concerns* specific to GenAI and were trusting of GenAI, but still employed several online safety rules and sometimes *applied mediation strategies together as a family*. P7 and P12 had minor concerns, while P2 and P3 had no concerns about their children’s ChatGPT use. Both P7 and P12 were educators, which contributed to their worries about their children cheating and over-relying on ChatGPT. In describing their concerns, P12 said, “*I think there’s the academic integrity impacts. And then, just baseline writing ability and creativity stunting that might happen if you were to rely entirely on these models than to kind of create any sort of academic outputs that you’re being asked to do.*” P7 was also nervous that GenAI use might discourage creativity: “*...And then [Gen]AI generated those four things, and then [my child] put those four things on his poster... What could happen [in the future]? It’s all fancy, and it took me, you know, five minutes to [generate] four things [on ChatGPT]. And this is why [GenAI] is problematic- because it takes away human creativity.*”

**5.5.1 Reasons for Trust in GenAI.** Two families (F2, F7) discussed why they had high trust in ChatGPT and minimal safety concerns about the platform. F2 described that they trusted ChatGPT over Google because it had protective measures. To demonstrate this during the interview, C2 tested both ChatGPT and Google by inputting P2’s phone number into the prompt box. ChatGPT did not return anything, while Google provided detailed personal information based on the number. P2 was impressed by ChatGPT’s response but was worried by Google’s: “*When he Googles, it gives my age, my address... So yeah, [my child’s other parent] comes up first, which is weird.*” Notably, P2 had limited knowledge about how ChatGPT is trained from past user data. In terms of the risks of using ChatGPT, P7 only cited minor concerns, and said, “*I don’t really have [concerns]... to me, it seems like, well, there are limits built in [to ChatGPT]. So I think it’s one of the interesting tools that I actually feel [I can trust].*”

P2, P3, and P12 trusted their children to use ChatGPT safely and appropriately. Although P12 did not have particularly high trust in ChatGPT, they trusted C12 to make smart decisions online, stating, “*Yeah, we are operating with a lot of trust [in our child]. [She] is a good kid who’s never given us any reason to doubt.*” C12 then mentioned that they only used ChatGPT to generate images when using the platform alone; F12 did not mention any concerns about ChatGPT outputting inappropriate imagery. Similarly, P2 trusted C2 and ChatGPT’s safeguards, stating, “*He would have to type in something very specific to get to something inappropriate on ChatGPT... I trust him that he’s not looking up things he shouldn’t be.*” P3 did not feel that C3 had any nefarious reasons to use ChatGPT, stating, “*I mean, that might come a point where I, you know, I don’t*

like what he's doing with [ChatGPT]. But right now, I think it helps his language and vocabulary, and he's doing something creative with it."

**5.5.2 Family-GenAI Co-Use and Communications around GenAI.** "Trusting" families often discussed GenAI and online safety with one another and sometimes co-used ChatGPT, including exploring the mechanics of the technology together (F7) and generating content together (F7, F12). When explaining why they proactively learned about ChatGPT together, P7 said, "...With the Internet, we're teaching them how to do those [appropriate] things and how not to do those [inappropriate] things." C7 and S7 would also generate stories based on their parents' occupations and share parts of the output with their parents. P12 highlighted a positive experience co-using ChatGPT with C12 to generate a story: "We were like, 'write a story about an obese horse who is working to lose some weight.' And it came up with this amazing story. I think we even made it so that the horse's name was going to be Charger, just like our obese horse, and it was a great story about this horse who, you know, was gonna stay away from the sugar cubes and focus more on eating vegetables and grass and exercising. And... what a great story!"

## 5.6 An Independent Family: Relaxed on rules

In "Independent" families (F1, F4), each family member used ChatGPT individually. Parents did not enforce any controls, and both families were open with each other about their technology use. For example, C1's technology use (including ChatGPT) was rarely controlled at home, and the only mediation strategy that P1 employed was checking C1's device for any exposure to inappropriate content from other people: "It's more the people he's talking to. So I just wanna make sure that they're being appropriate... I trust him. I don't trust other people." P4 did not have family rules: "We're quite lax that way." P1 exhibited minimal concerns about GenAI and expressed trust in C1's usage: "Oh, no, I mean, he's a good kid, and we taught him to tell the truth. So I'm not really concerned about it. He knows right from wrong." P1 also felt that children should learn about technologies independently because they would eventually have to navigate them on their own: "**He has to learn how to navigate and do this stuff himself. I can't always be there for him.**" P4 did not feel concerned about their children asking ChatGPT inappropriate questions. However, they paused the study at one point to teach their children about "cross-validating information" and "researching different information sources" by comparing the strengths and limitations of different technologies (e.g., Google, Alexa, smartwatches). P4 also indicated that children nowadays consider GenAI their "search engine" by comparing prompt engineering and searching keywords: "Whereas I am still old school. I was there when the first search engines were made, and we were taught how to phrase the terms in order to get the best results." Both F1 and F4 discussed technology use with their children often, which contributed to their relaxed attitude toward rules. P1 stated, "We don't really have any [secrets]... Everybody knows the password of everything."

## 6 Discussion

We investigated how the perceptions of GenAI and contextual characteristics of families contributed to their GenAI mediation strategies. In our findings, we proposed an adapted version of parental media mediation literature in the context of Family-GenAI interactions. We then applied this model to describe six observed Family-GenAI mediation and use profiles. Overall, our findings suggest that although most parents used at least one type of mediation strategy to manage their children's interactions with ChatGPT and similar GenAI, they did not always utilize the same mediation strategies they had for other media their children accessed due to varying perspectives on or knowledge about GenAI. GenAI was often viewed as different from existing media (e.g., social media, television, or video platforms), therefore lending itself to different mediation strategies. Our results carry design implications for GenAI platform providers and research implications for broadening existing parental media mediation frameworks.

It should be noted that these findings, as well as several of our profiles, align with Rubin et al.'s recent publication [45], which also presented profiles to describe how parents' perceptions of GenAI affected how they use GenAI with their families. Though our research took a slightly different approach in its inclusion of children's perspectives within each family, we consider our results to be complementary to Rubin et al.'s.

### 6.1 Reflecting on Family-AI Mediation Patterns

By connecting parents' GenAI mediation strategies to the existing parental media mediation frameworks, we observed how families adapted existing strategies to this new technology. We also observed the lack of transfer for certain types of strategies and concerns.

**6.1.1 Existing online safety rules are insufficient for GenAI.** Although most of the participating families reported adapting some mediation strategies they used for other online media (e.g., TV media, news outlets) to GenAI, GenAI may have unique nuances that need careful attention. Specifically, GenAI is interactive and mimics human capabilities, but is incapable of human-like thinking. While these attributes create opportunities for positive user outcomes, GenAI lacks a governance framework and generates information that might be incomplete, incorrect, and difficult to validate. These nuances require families to learn new ways to mediate this fast-evolving media source. We anticipate that GenAI-tailored mediation strategies will evolve with time and experience. For example, parents or educators might experiment with new mediation strategies for GenAI as they learn more about the technology. However, they may need support in learning how to develop or tailor mediation strategies to GenAI's unique affordances.

**6.1.2 Participating parents considered GenAI to be safer and more trustworthy than other emerging technologies and media.** Parents in our study expressed concerns about the safety of other interactive technologies, such as social media and voice assistants. Half of the parents worried about their children being addicted to social media or being spied on via phones or voice assistants, and eight families expressed greater trust in GenAI than other technologies and media. This concern misalignment may be because GenAI is a relatively recent technology that families have limited

experience with. As a result, families may still be shaping their mental models of this technology. Since we recruited families who used GenAI on shared accounts, they may have been more trusting of the platform than families not on GenAI platforms. Concerns about ChatGPT or GenAI were more similar to their concerns about search engines (*i.e.*, Google) than social media, suggesting ChatGPT is more often perceived as an *information resource* rather than a social or entertainment platform. For example, the parent in F4 shared an analogy of how their generation learned to shift from encyclopedias to search engines, similar to how children nowadays substitute search engines with ChatGPT. However, ChatGPT is a *language model* trained on existing data, and users were not clearly informed of this. However, the assumption that ChatGPT produces search-engine-quality information could create vulnerabilities if families become overly reliant on GenAI. Parents' trust in ChatGPT might also be based on their awareness of the built-in guardrails. Even families who recognized that such mechanisms could be bypassed still felt ChatGPT was safer than social media. However, these guardrails may not be sufficiently comprehensive [21] and are not tailored to children's and families' use.

**6.1.3 Participating parents did not know how to tailor existing mediation strategies to GenAI.** In reflecting on GenAI, participants were most concerned about the technology (1) violating their children's privacy, (2) negatively influencing behavior and learning (*e.g.*, over-reliance, cheating), (3) generating inappropriate content or misinformation (consistent with Yu et al. [57]). The strategies parents used to mitigate these risks were often related to managing their children's behaviors and practices, including not revealing private information, having family conversations around safe use of the Internet, practicing how to validate information. No families implemented any ChatGPT-specific *technical safety* mediation strategies similar to what they might do on other websites (*e.g.*, router-level block for certain websites). In this context, technical safety [35] refers to mediation implemented on applications on the devices, such as a blocklist filter to mediate children's website access. We consider two possible explanations for this: (1) not knowing *what* technical mediation to implement and (2) *how* to implement them. First, GenAI has unique affordances that distinguish it from other media, which introduces new risks and opportunities. It is possible that parents may have difficulty identifying the appropriate technical tools to manage ChatGPT use. Furthermore, parents who have existing technical tools may be unsure of how to tailor them to ChatGPT. Although families may develop or adapt mediation strategies with time and experience, limited resources are available for parents hoping to implement GenAI-specific technical safety measures. These observations highlight a gap in learning resources tailored to the Family-GenAI context that should be addressed in future work in this field.

**6.1.4 Co-use can potentially support family bonding.** A promising and positive observation from this study was the number of families that co-used ChatGPT together. Many families shared reasons for co-using AI to spend time together, including solving homework problems (F5), editing their writing (F11), disputing debates (F2, F5), and generating and sharing stories with one another (F7, F8, F12). We also observed at least one family (F6) who assigned ChatGPT a facilitating 'role' during their game nights. Notably, being able to

use ChatGPT allowed the family, which only consisted of a parent and a child, to try games that they would otherwise need a third person to play. Overall, there are opportunities for future work to explore emergent and novel joint-media engagement specific to GenAI.

## 6.2 Design Implications – Platform Providers and Developers

Here, we translate our aforementioned reflections into practical design implications for platform providers and developers.

- **Provide Parental Controls:** GenAI platforms should introduce parental control modes, enabling parents to customize content permissions for their children and monitor their children's usage. These controls would be particularly beneficial to parents with less technical experience who may otherwise have limited resources for protecting their children from the potential risks of GenAI use.
- **Support Third-Party Controls:** Third-party technical solutions can help address users' concerns. Since ChatGPT allows users to create custom GPT profiles or to fine-tune models, developers may consider developing or allowing third-party developers to develop child-safe profiles based on parents' concerns and mediation patterns. They can offer an interface for parents and children to interact with and negotiate control strategies.
- **Increase Transparency:** Developers should be more transparent about their platforms' data collection, storage, and retrieval processes. For example, if parents are concerned about *privacy*, chatbots could print clear statements about how they collect user information and how that information will be processed.
- **Empower Families:** Platforms should offer parents options to implement their desired mediation strategies. For instance, the interface could report children's chatbot queries in real time or notify parents if personal information is shared with the chatbot. Platforms could offer profile options meant for family use that provide ways for families to tailor based on their concerns, use cases, desired controls, etc. To promote co-use, platforms may consider providing prompts that encourage family interactions (*e.g.*, game ideas) and conversations (*e.g.*, about online safety and misinformation).

## 6.3 Limitations and Future Work

While our study provides insights into *how* and *why* parents mediate their children's GenAI usage, it has several limitations.

First, our small sample size (N=12), while typical of qualitative research, limits the generalizability of our findings. We also specifically targeted families who shared a ChatGPT account and recruited participants via social media advertisements. While this meant we could recruit participants beyond our local area, it also constrained our sample size due to challenges in screening spam entries and identifying eligible families. Furthermore, our participant pool likely reflects a bias toward technology-savvy families who already use social media and GenAI, resulting in higher-than-average

**Figure 3: Illustration of how family profiles (in Section 5) are situated with respect to these three dimensions: Control over GenAI usage, Trust over GenAI, and Co-Use toward GenAI.**

education levels and potentially greater trust in the technology. Future work could focus more on families who are less familiar with technology in general or are more hesitant about using ChatGPT, as they might employ different mediation strategies. Including families that do not use ChatGPT would further diversify the sample and provide broader insights.

Second, our study focused primarily on ChatGPT. Although we welcomed insights on other LLM-based GenAI tools (e.g., Deepseek, Gemini), our recruitment efforts were tailored to ChatGPT, as it was the most commonly used platform during the time of recruitment.

Third, interviewing children and parents together may have influenced participants' responses. While parental presence can help children provide more detailed answers, it might also limit or shape what children are willing to share [13]. Interviewing family members both together and individually could provide deeper insights into inter-family concerns, such as the shared use of a conversational agent capable of storing prior interactions.

## 7 Conclusion

This study explored families' use and co-use experiences on text-based GenAI platforms (i.e., ChatGPT). We identified Family-AI mediation and use scenarios and proposed a model to describe how families determine the types of mediation strategies they use, and inversely, how these strategies may affect their perceptions of GenAI. Additionally, we identified six family profiles (i.e., skeptical, cautious, hands-on, use together, trusting, and independent) with variations in parents' level of control over their children's GenAI use and families' trust toward and co-usage of GenAI. Our work highlights the unique risks and opportunities families with children face in their interactions with GenAI, and offers considerations for GenAI designers and developers interested in creating platforms that are both safe and valuable for children and their parents.
