March, 1997

Abstract

This bibliography attempts to give a comprehensive overview of all the literature related to the Ashtekar connection and the Rovelli-Smolín loop variables. The original version was compiled by Peter Hübner in 1989, and it has been subsequently updated by Gabriela Gonzalez, Bernd Brügmann, Monica Pierri, Troy Schilling, Alejandro Corichi and Christopher Beetle. Information about additional literature, new preprints, and especially corrections are always welcome.

Pointers

Here are some suggestions, intended to serve as entry points into the literature.

First of all, for a complete and authoritative presentation of canonical gravity in the Ashtekar variables there is of course Ashtekar's latest book [2] which appeared in 1991. The most recent general introduction to the new variables by Ashtekar are his Les Houches lectures of 1992 [379].

The latest and up to date book in the 'loop representation' is the book by Gambini and Pullin [12], specially in lattice methods and the 'extended loop representation'. Many recent articles can be found in the book by Ehlers and Friedrich [9].

Rather complete reviews of canonical gravity in the Ashtekar variables can be found in Rovelli [189], Kodama [233] and Smolin [247]. For a critical appraisal of canonical quantum gravity see Kuchař [277]. An overview over different approaches to quantum gravity is given by Isham in [9].

More recent reviews on the two most prominent viewpoints, namely the 'connection' and 'loop-spin networks' representations are given by Ashtekar et. al. [385] on one side, and De Pietri and Rovelli [448] on the other. A *dialogue concerning the two chief World systems* is given in [487].

Finally let us mention a few more specialized references. A clear and detailed exposition of connection dynamics is given by Romano in [298]. For newer developments related to matter couplings (geometric approach) see Peldán [369]. The definition of the loop representation is discussed in Brüggmann [7]. Pullin [372] gives an introduction to results obtained via the loop representation in (unreduced) quantum gravity.
