Guillermo Moreno

Abstract: In this paper, we study the zero set of the Hopf construction map  $F_n: \mathbb{A}_n \times \mathbb{A}_n \to \mathbb{A}_n \times \mathbb{A}_0$  given by  $F_n(x, y) = (2xy, ||y||^2 - ||x||^2)$  for  $n \ge 4$ , where  $\mathbb{A}_n$  is the Cayley-Dickson algebra of dimension  $2^n$  on  $\mathbb{R}$ .

**Introduction:** Let  $f_1: S^3 \to S^2, f_2: S^7 \to S^4$  and  $f_3: S^{15} \to S^8$  be the classical Hopf maps; these can be defined using the Hopf construction: Let  $\mathbb{A}_1 = \mathbb{C}, \mathbb{A}_2 = \mathbb{H}$  and  $\mathbb{A}_3 = \emptyset$  be the complex, quaternion and octonion numbers respectively and  $F_n : \mathbb{A}_n \times \mathbb{A}_n \to \mathbb{A}_n \times \mathbb{R}$  are given by

$$
F_n(x, y) = (2xy, ||y||^2 - ||x||^2)
$$

for  $n = 1, 2, 3$ .

Now write  $S^{2^{n+1}-1} = \{(x, y) \in \mathbb{A}_n \times \mathbb{A}_n : ||x||^2 + ||y||^2 = 1\}$ . By definition,

$$
F_n|S^{2^{n+1}-1} = f_n
$$

are the Hopf maps. Since  $\mathbb{A}_n$  is a normed real algebra of dimension  $2^n$ , for  $n = 1, 2, 3$  we have that

$$
||(2xy, ||y||2 - ||x||2)||2 = 4||xy||2 + (||y||2 - ||x||2)2= 4||x||2||y||2 + ||y||4 + ||x||4 - 2||x||2||y||2= (||x||2 + ||y||2)2,
$$

so if  $||x||^2 + ||y||^2 = 1$ , then  $||F_n(x, y)|| = ||(2xy, ||y||^2 - ||x||^2)|| = 1$ . Now by the Cayley-Dickson doubling process ([D]) define

$$
\mathbb{A}_{n+1}=\mathbb{A}_n\times \mathbb{A}_n
$$

Keywords and phrases: Cayley-Dickson algebras, alternative algebras, zero divisors, flexible algebra,normed algebra.

<sup>2000</sup> Mathematics Subject Classification: 17A99, 55Q25.

with

$$
(a, b)(x, y) = (ax - \overline{y}b, ya + b\overline{x})
$$
 for  $a, b, x$  and y in  $\mathbb{A}_n$ 

and

$$
\overline{x} = (\overline{x}_1, -x_2)
$$
 if  $x = (x_1, x_2)$  in  $\mathbb{A}_{n-1} \times \mathbb{A}_{n-1}$ .

Thus, if  $\mathbb{A}_0 = \mathbb{R}$  with  $\overline{x} = x$  for x real number, then  $\mathbb{A}_1 = \mathbb{C}, \mathbb{A}_2 = \mathbb{H}$  and  $\mathbb{A}_3 = \emptyset$ , which are normed algebras i.e.;  $||xy|| = ||x|| ||y||$  for all  $x, y$  in  $\mathbb{A}_n$ .

For  $n \geq 4$ ,  $\mathbb{A}_n$  is no longer normed and also  $\mathbb{A}_n$  has zero divisors (see  $|K-Y|$  and  $|Mo_1|$ ).

Let us define  $X_n^{\infty} = \{(x, y) \in \mathbb{A}_n \times \mathbb{A}_n | F_n(x, y) = (0, 0)\}\$  and for r nonnegative real number  $(x, y) \in X_n^r$  if and only if  $xy = 0$  and  $||x|| = ||y|| =$ r. It is clear that for  $r > 0$  and  $s > 0$  real numbers.  $X_n^r$  is homeomorphic to  $X_n^s$ . Let us define  $X_n := X_n^1$ .

The set  $X_n$  show up in some important problems in algebraic topology: (1) Cohen's approach to the Arf invariant one problem. (See  $|C_1|$  and  $|C_2|$ ). (2) Adem-Lam construction of normed and non-singular bilinear maps.(See  $|A|$  and  $|L|$ ).

In this paper, we will show that for  $n \geq 4$ ,  $X_n$  is related to some Stiefel manifolds; using the algebra structure in  $\mathbb{A}_{n+1}$  we will construct the chain of inclusions

$$
X_n \subset W_{2^{n-1}-1,2} \subset V_{2^n-2,2} \subset V_{2^n-1,2}
$$

(see § 2 below) where  $V_{m,2}$  and  $W_{m,2}$  denote the real and complex Stiefel manifolds of 2-frames in  $\mathbb{R}^m$  and  $\mathbb{C}^m$  respectively.

In § 3 we show that we can attach to every element in  $W_{2n-1,2}$  in a canonical way, an eight dimensional vector subspace of  $\mathbb{A}_{n+1}$  and that, only for the elements in  $X_n$ , such vector subspace is isomorphic, as algebra, to  $\mathbb{A}_3 = \emptyset$  (the octonions).

In  $\S$  4 we describe  $X_n$  as a certain type of algebra monomorphisms from  $\mathbb{A}_3 = \emptyset$  to  $\mathbb{A}_{n+1}$  for  $n \geq 4$ .

This paper is a sequel of [Mo1] and we use freely the results of [Sch],we acknowledge with gratitude the hard work made by the reviwer.

#### §1. Pure and doubly pure elements in  $\mathbb{A}_{n+1}$ .

Throughout this paper we use the following notational conventions:

(1) Elements in  $\mathbb{A}_n$  will be denoted by Latin characters  $a, b, c, \ldots, x, y, z$ . and elements in  $\mathbb{A}_{n+1}$  will be denoted by Greek characters  $\alpha, \beta, \gamma, \ldots$ 

For example,

$$
\alpha = (a, b) \in \mathbb{A}_n \times \mathbb{A}_n.
$$

(2) When we need to represent elements in  $\mathbb{A}_n$  as elements in  $\mathbb{A}_{n-1}\times \mathbb{A}_{n-1}$ we use subscripts, for instance,  $a = (a_1, a_2)$ ,  $b = (b_1, b_2)$ , and so on, with  $a_1, a_2, b_1, b_2$  in  $\mathbb{A}_{n-1}$ .

Now  $\{e_0, e_1, \ldots, e_{2^n-1}\}\$  denotes the canonical basis in  $\mathbb{A}_n$ . Then by the doubling process

$$
\{(e_0,0),(e_1,0),\ldots,(e_{2^n-1},0),(0,e_0),\ldots,(0,e_{2^n-1})\}
$$

is the canonical basis in  $\mathbb{A}_{n+1} = \mathbb{A}_n \times \mathbb{A}_n$ . By standard abuse of notation, we also denote  $e_0 = (e_0, 0), e_1 = (e_1, 0), \ldots, e_{2^{n-1}} = (e_{2^{n-1}}, 0), e_{2^{n}} =$  $(0, e_0), \ldots, e_{2^{n+1}-1} = (0, e_{2^n-1})$  in  $\mathbb{A}_{n+1}$ .

For  $\alpha = (a, b) \in \mathbb{A}_n \times \mathbb{A}_n = \mathbb{A}_{n+1}$  we denote  $\tilde{\alpha} = (-b, a)$  (the complexification of  $\alpha$ ) so  $\tilde{e}_0 = (0, e_0)$  and  $\alpha \tilde{e}_0 = (a, b)(0, e_0) = (-b, a) = \tilde{\alpha}$ . Notice that  $\widetilde{\alpha} = -\alpha.$ 

The **trace** on  $\mathbb{A}_{n+1}$  is the linear map  $t_{n+1}$  :  $\mathbb{A}_{n+1} \to \mathbb{R}$  given by  $t_{n+1}(\alpha) =$  $\alpha + \overline{\alpha} = 2(\text{real part of } \alpha) \text{ so } t_{n+1}(\alpha) = t_n(a) \text{ when } \alpha = (a, b) \in \mathbb{A}_n \times \mathbb{A}_n.$ 

**Definition:**  $\alpha = (a, b)$  in  $\mathbb{A}_{n+1}$  is pure if

$$
t_{n+1}(\alpha) = t_n(a) = 0.
$$

 $\alpha = (a, b)$  in  $\mathbb{A}_{n+1}$  is doubly pure if it is pure and also  $t_n(b) = 0$ ; i.e.,  $\tilde{\alpha}$  is pure in  $\mathbb{A}_{n+1}$ .

Also  $2\langle a, b \rangle = t_n(a\overline{b})$  when  $\langle -, - \rangle$  is the inner product in  $\mathbb{R}^{2^n}$  (see [A]). Note that for a and b pure elements  $a \perp b$  if and only if  $ab = -ba$ .

**Notation:**  ${}_{\rho}A_n = \{e_o\}^{\perp} \subset A_n$  is the vector subspace consisting of pure elements in  $\mathbb{A}_n$ ; i.e.,  $\partial \mathbb{A}_n = \text{Ker}(t_n) = \mathbb{R}^{2^n - 1}$ .

 $\widetilde{\mathbb{A}}_{n+1} = {}_o\mathbb{A}_n \times {}_o\mathbb{A}_n = \{e_0, \widetilde{e}_0\}^\perp = \mathbb{R}^{2^{n+1}-2}$  is the vector subspace consisting of doubly pure elements in  $\mathbb{A}_{n+1}$ .

**Lemma 1.1.** For a and b in  $\widetilde{\mathbb{A}_n}$  we have that

1)  $a\widetilde{e}_0 = \widetilde{a}$  and  $\widetilde{e}_0 a = -\widetilde{a}$ .

- 2)  $a\tilde{a} = -||a||^2\tilde{e}_0$  and  $\tilde{a}a = ||a||^2\tilde{e}_0$  so  $a \perp \tilde{a}$ .
- 3)  $\tilde{a}b = -a\tilde{b}$  with a a pure element.
- 4)  $a \perp b$  if and only if  $\tilde{a}b + \tilde{b}a = 0$ .
- 5)  $\widetilde{a} \perp b$  if and only if  $ab = \widetilde{b}\widetilde{a}$ .
- 6)  $a \perp b$  and  $\widetilde{a} \perp b$  if and only if  $\widetilde{a}b = ab$ .

**Proof:** Note that a is pure if and only if  $\overline{a} = -a$  and if  $a = (a_1, a_2)$  is doubly pure, then  $\overline{a}_1 = -a_1$  and  $\overline{a}_2 = -a_2$ .

- 1)  $\widetilde{e}_0 a = (0, e_0)(a_1, a_2) = (-\overline{a}_2, \overline{a}_1) = (a_2, -a_1) = -(-a_2, a_1) = -\widetilde{a}.$
- 2)  $a\widetilde{a} = (a_1, a_2)(-a_2, a_1) = (-a_1a_2 + a_1a_2, a_1^2 + a_2^2) = (0, -||a||^2e_0) =$  $-||a||^2\widetilde{e}_0.$ Similarly  $\tilde{a}a = (-a_2, a_1)(a_1, a_2) = (-a_2a_1 + a_2a_1, -a_2^2 - a_1^2) = ||a||^2 \tilde{e}_0.$

Now, since  $-2\langle \tilde{a}, a \rangle = a\tilde{a} + \tilde{a}a = 0$  we have  $a \perp \tilde{a}$ .

3)  $\widetilde{a}b = (-a_2, a_1)(b_1, b_2) = (-a_2b_1 + b_2a_1, -b_2a_2 - a_1b_1).$  $So \ \widetilde{ab} = (a_1b_1 + b_2a_2, b_2a_1 - a_2b_1) = (a_1, a_2)(b_1, b_2) = ab \ and \ then$  $-\widetilde{a}b = ab.$ 

Notice that in this proof we only use that  $\overline{a}_1 = -a_1$ ; i.e., a is pure and b doubly pure.

- 4)  $a \perp b \Leftrightarrow ab + ba = 0 \Leftrightarrow ab = -ba \Leftrightarrow \tilde{ab} = -\tilde{ba}$ .  $\Leftrightarrow -\widetilde{a}b = \widetilde{b}a \Leftrightarrow \widetilde{a}b + \widetilde{b}a = 0$  by (3).
- 5)  $\widetilde{a} \perp b \Leftrightarrow \widetilde{\widetilde{a}}b + \widetilde{b}\widetilde{a} = 0$  (by (4))  $\Leftrightarrow -ab + \widetilde{b}\widetilde{a} = 0$ .
- 6) If  $\tilde{a} \perp b$  and  $a \perp b$ , then by (3) and (4)  $\tilde{a}b = -\tilde{a}b = \tilde{ba} = -\tilde{b}a = a\tilde{b}$ . Conversely, put  $a = (a_1, a_2)$  and  $b = (b_1, b_2)$  in  $\mathbb{A}_{n-1} \times \mathbb{A}_{n-1}$  and define  $c := (a_1b_1 + b_2a_2)$  and  $d := (b_2a_1 - a_2b_1)$  in  $\mathbb{A}_{n-1}$ . Then  $a\tilde{b} = (a_1, a_2)(-b_2, b_1) = (-a_1b_2+b_1a_2, b_1a_1+a_2b_2)$  so  $a\tilde{b} = (-\overline{d}, \overline{c}).$

Now  $ab = (a_1, a_2)(b_1, b_2) = (a_1b_1 + b_2a_2, b_2a_1 - a_2b_1) = (c, d)$ , so  $\widetilde{ab} = (-d, c)$ and then  $\widetilde{a}b = (d, -c)$ .

Thus, if  $a\tilde{b} = \tilde{a}b$  then  $\overline{c} = -c$  and  $d = -\overline{d}$ . Then

$$
t_n(ab) = t_{n-1}(c) = c + \overline{c} = 0 \text{ and } a \perp b
$$
  

$$
t_n(\widetilde{a}b) = t_{n-1}(d) = d + \overline{d} = 0 \text{ and } \widetilde{a} \perp b.
$$
  
Q.E.D

**Corollary 1.2** For each  $a \neq 0$  in  $\widetilde{A}_n$  the four dimensional vector subspace generated by  $\{e_0, \tilde{a}, a, \tilde{e}_0\}$  is a copy of  $\mathbb{A}_2 = \mathbb{H}$  we denote it by  $\mathbb{H}_a$ .

**Proof:** We suppose that  $||a|| = 1$ , otherwise we take  $\frac{a}{||a||}$ . Construct the following multiplication table.

By lemma 2.1.  $a\tilde{e}_0 = \tilde{a}$ ;  $\tilde{e}_0 a = -\tilde{a}$ ;  $\tilde{a}\tilde{e}_0 = \tilde{\tilde{a}} = -a$ ;  $\tilde{e}_0\tilde{a} = -\tilde{\tilde{a}} = a$ ;  $a\tilde{a} = -\tilde{e}_0$  and  $\tilde{a}a = \tilde{e}_0$ .

Identifying  $e_0 \leftrightarrow e_0$ ,  $\tilde{a} \leftrightarrow e_1$ ,  $a \leftrightarrow e_2$  and  $\tilde{e}_0 \leftrightarrow e_3$  we have the multiplication table for  $\mathbb{A}_2 = \mathbb{H}$ 

Q.E.D.

# §2.- The Stiefel manifold  $V_{2<sup>n</sup>-1,2}$  in  $\mathbb{A}_{n+1}$  and a  $T^2$ -action.

Let  $\langle a, b \rangle_n$  denote the standard inner product of a and b in  $\mathbb{A}_n = \mathbb{R}^{2^n}$ . Now by  $[A]$  and  $[Mo<sub>1</sub>]$ 

$$
2\langle a,b\rangle_n = (ab + b\overline{a}) = t_n(ab).
$$

It is also well known that, for  $\alpha = (a, b)$  and  $\chi = (x, y)$  in  $\mathbb{A}_n \times \mathbb{A}_n = \mathbb{A}_{n+1}$ we have

$$
\langle \alpha, \chi \rangle_{n+1} = \langle a, x \rangle_n + \langle \overline{b}, \overline{y} \rangle_n.
$$

In particular, if  $\alpha$  and  $\chi$  are doubly pure elements in  $\mathbb{A}_{n+1}$  then y and b are pure elements in  $\mathbb{A}_n$ , therefore

$$
\langle \alpha, \chi \rangle_{n+1} = \langle a, x \rangle_n + \langle b, y \rangle_n.
$$

**Lemma 2.1** For  $\alpha = (a, b)$  in  $\mathbb{A}_{n+1}$  define  $\hat{\alpha} := (b, a)$ .

For  $\alpha \in \mathbb{A}_{n+1}$  we have that

i)  $\langle \alpha, \hat{\alpha} \rangle_{n+1} = 0$  i.e.  $\alpha \perp \hat{\alpha}$  in  $\mathbb{A}_{n+1}$  if and only if  $\langle a, b \rangle_n = 0$ , i.e.  $a \perp b$  in  $\mathbb{A}_n$ .

ii)  $\langle \tilde{\alpha}, \hat{\alpha} \rangle_{n+1} = 0$ , i.e.  $\tilde{\alpha} \perp \hat{\alpha}$  in  $\mathbb{A}_{n+1}$  if and only if  $||a|| = ||b||$  in  $\mathbb{A}_n$ . Proof:

i) 
$$
\langle \alpha, \hat{\alpha} \rangle_{n+1} = \langle (a, b), (b, a) \rangle_{n+1} = 2\langle a, b \rangle_n
$$
.  
\nii)  $\langle \tilde{\alpha}, \hat{\alpha} \rangle_{n+1} = \langle (-b, a), (b, a) \rangle_{n+1} = -\langle b, b \rangle_n + \langle a, a \rangle_n = -||b||^2 + ||a||^2$ .  
\nQ.E.D.

By §1, we know that for each  $\alpha \neq 0$  in  $\widetilde{A}_{n+1}$ .  $\mathbb{H}_{\alpha} =$  Span  $\{e_0, \widetilde{\alpha}, \alpha, \widetilde{e}_0\}$  is a copy of  $\mathbb{A}_2$  and that if  $\mathbb{H}^{\perp}_{\alpha}$  denotes the orthogonal complement of  $\mathbb{H}_{\alpha}$ , then  $\mathbb{A}_{n+1} = \mathbb{H}_{\alpha} \oplus \mathbb{H}_{\alpha}^{\perp}.$ 

Since  $\alpha$  is doubly pure,  $\hat{\alpha}$  is also doubly pure; i.e.,  $\hat{\alpha} \in \{e_0, \tilde{e}_0\}^{\perp}$  and if  $\hat{\alpha} \perp \alpha$  and  $\hat{\alpha} \perp \tilde{\alpha}$ , then  $\hat{\alpha} \in \mathbb{H}_{\alpha}^{\perp}$ . Now  $S^{\sqrt{2}}(\tilde{\mathbb{A}}_{n+1}) = S^{2^{n+1}-3}$  denotes the sphere of radius  $\sqrt{2}$  inside of  $\widetilde{\mathbb{A}}_{n+1}^{\alpha}$ .

Thus, we have a description of the real Stiefel manifold of 2- orthonormal frames in  $\mathbb{R}^{2^{n}-1}$  as follows:

$$
V_{2^{n}-1,2} = \{(a,b) \in {}_{o}\mathbb{A}_{n} \times {}_{o}\mathbb{A}_{n} = \widetilde{\mathbb{A}}_{n+1} : ||a|| = ||b|| = 1, a \perp b\}
$$

and

$$
V_{2^{n}-1,2} = \{ \alpha \in S^{\sqrt{2}}(\widetilde{\mathbb{A}}_{n+1}) : \hat{\alpha} \in \mathbb{H}_{\alpha}^{\perp} \}.
$$

**Lemma 2.2.** If r and s are in R with  $r^2 + s^2 = 1$  and  $(a, b) \in V_{2n-1,2}$  then  $-ra - sb, sa + rb) \in V_{2n-1,2}.$ 

**Proof:** Suppose that  $||a|| = ||b|| = 1$  and  $a \perp b$  in  $\mathbb{A}_n$ . Then  $||ra - sb||^2 =$  $|r^2||a||^2 + s^2||b||^2 - 2rs\langle a,b\rangle_n$  and  $||sa + rb||^2 = s^2||a||^2 + r^2||b||^2 + 2rs\langle a,b\rangle_n$ , so  $||ra - sb||^2 = ||sa + rb||^2 = r^2 + s^2 = 1.$ 

$$
\langle ra - sb, sa + rb \rangle_n = rs \langle a, a \rangle_n - sr \langle b, b \rangle_n - s^2 \langle b, a \rangle_n + r^2 \langle a, b \rangle_n
$$
  
=  $rs||a||^2 - rs||b||^2 + 0 = rs - sr = 0.$ 

Corollary 2.3.  $S^1 \times V_{2n-1,2} \stackrel{a}{\rightarrow} V_{2n-1,2}$  given by

$$
((r, s), \alpha) \mapsto r\alpha + s\widetilde{\alpha} = (ra - sb, sa + rb)
$$

defines a smooth, free  $S^1$ -action on  $V_{2n-1,2}$ .

### **Proof:** Clearly  $(1,0) \cdot \alpha = \alpha$  and

 $(r, s)[(q, t) \cdot \alpha] = ((r, s)(q, t)) \cdot \alpha = (rq - st, rt + sq) \cdot \alpha$  so a defines an action. It is a smooth action because it is a restriction of a linear action of  $GL_2(\mathbb{R})$  on  $\widetilde{A}_{n+1} = \mathbb{R}^{2^{n+1}-2}$ .

Finally, a is a free action: if  $r\alpha + s\tilde{\alpha} = \alpha$  then  $r = 1$  and  $s = 0$ , because  $\alpha \perp \tilde{\alpha}$  in  $\mathbb{A}_{n+1}$ .

Q.E.D.

Now, we identify  $V_{2<sup>n</sup>−2,2}$ , the real Stiefel manifold of 2-orthonormal frames on  $\mathbb{R}^{2^{n}-2}$ , as a submanifold of  $V_{2^{n}-1,2}$  as follows:

$$
V_{2^{n}-2,2} = \{(a,b) \in V_{2^{n}-1,2} | (a,b) \in \widetilde{\mathbb{A}}_n \times \widetilde{\mathbb{A}}_n \};
$$

i.e.,  $(a, b) \in V_{2n-1,2}$  belongs to  $V_{2n-2,2}$  whenever a and b are doubly pure elements in  $\mathbb{A}_n$  and we have the known fibration [Wh]

$$
S^{2^{n}-4} \rightarrow V_{2^{n}-2,2} \rightarrow S(\widetilde{\mathbb{A}}_{n}) = S^{2^{n}-3}
$$
  
(a, b) \rightarrow b

thus,  $V_{2n-2,2}$  has dimension  $2^{n} - 3 + 2^{n} - 4 = 2^{n+1} - 7$ .

Since  $-ra - sb$  and  $(sa + rb)$  are doubly pure elements in  $\mathbb{A}_n$  when a and b are doubly pure elements, we have that

 $V_{2n-2,2}$  is a  $S^1$ -invariant submanifold of  $V_{2n-1,2}$ ;

i.e., if  $\alpha \in V_{2^{n}-2,2}$  then  $(r, s) \cdot \alpha \in V_{2^{n}-2,2}$  for all  $(r, s) \in S^1$ .

We note that  $A_{n+1}$  becomes a complex vector space by defining  $i\dot{\alpha} = \tilde{\alpha}$  thus as a complex vector space

$$
\widetilde{\mathbb{A}}_{n+1} = \mathbb{A}_n \times \mathbb{A}_n \cong \mathbb{C} \otimes_{\mathbb{R}} \mathbb{A}_n
$$

The isomorphism takes  $1 \otimes x$  to  $(x, 0)$  and  $i \otimes y$  to  $(0, y)$  and  $S<sup>1</sup>$  (the set of modulo 1 complex numbers) acts naturally by multiplication on  $\mathbb{C}$ , hence on  $\mathbb{A}_{n+1}.$ 

Now, we identify the complex Stiefel manifold  $W_{2n-1-1,2}$  of 2-orthonormal frames in  $\mathbb{C}^{2^{n-1}-1}$  as a submanifold of  $V_{2^{n}-2,2}$  in terms of the Cayley-Dickson algebra  $\mathbb{A}_{n+1}$  for  $n \geq 3$ .

It is known that for a, b and x in  $\mathbb{A}_n$ ,  $\langle ax, b \rangle_n = \langle a, b\overline{x} \rangle_n$ . (See [A]). Thus if x is a pure element, i.e.,  $\overline{x} = -x$  then  $\langle ax, b \rangle_n = -\langle a, bx \rangle_n$ . That is, right multiplication by a pure non-zero element is a skew-symmetric linear map. In particular  $\langle \tilde{a}, b \rangle_n = -\langle a, b \rangle_n$ .

**Proposition 2.4.** For  $n \geq 3$ , the map  $\mathcal{H}_n : \widetilde{A}_n \times \widetilde{A}_n \to \mathbb{C}$  given by

$$
\mathcal{H}_n(a,b) = 2\langle a,b\rangle_n - 2i\langle \widetilde{a},b\rangle_n
$$

defines a Hermitian inner product in  $\widetilde{\mathbb{A}}_n$ .

**Proof:** Clearly  $\mathcal{H}_n$  is R-linear and

$$
\overline{\mathcal{H}_n(a,b)} = 2\langle a,b\rangle_n + 2i\langle \widetilde{a},b\rangle_n
$$
  
= 2\langle a,b\rangle\_n - 2i\langle a,\widetilde{b}\rangle\_n  
= \mathcal{H}\_n(b,a).

On the other hand,

$$
\mathcal{H}_n(\widetilde{a},b) = 2\langle \widetilde{a},b\rangle_n - 2i\langle \widetilde{\widetilde{a}},b\rangle_n \n= 2\langle \widetilde{a},b\rangle_n + 2i\langle a,b\rangle_n \n= 2i\langle a,b\rangle_n - 2i^2\langle \widetilde{a},b\rangle_n \n= i\mathcal{H}_n(a,b).
$$

Q.E.D.

**Proposition 2.5.** For  $n \geq 3$ 

$$
W_{2^{n-1}-1,2} = \{(a,b) \in V_{2^n-2,2} | b \in \mathbb{H}_a^{\perp} \}.
$$

**Proof:** First of all, we observe that  $b \in \mathbb{H}_a^{\perp}$  for a and b in  $\widetilde{A}_n$  if and only if  $b \perp a$  and  $b \perp \tilde{a}$ , i.e.  $\mathcal{H}_n(a, b) = 0$ . If  $||a|| = ||b|| = 1$  and  $\mathcal{H}_n(a, b) = 0$  then  $(a, b) \in W_{m,2}$ , where  $m = \frac{1}{2}$  $\frac{1}{2}(2^n-2)=2^{n-1}-1.$ 

Q.E.D.

**Proposition 2.6.**  $W_{2^{n-1}-1,2}$  is  $S^1$ -invariant.

**Proof:** Suppose  $(a, b) \in \widetilde{\mathbb{A}}_n \times \widetilde{\mathbb{A}}_n$  with  $||a|| = ||b|| = 1$  and  $b \in \mathbb{H}_a^{\perp}$ . From this, we have  $b \perp a$ , and  $\widetilde{b} \perp a$  (equivalently  $\widetilde{a} \perp b$ ).

Now  $r(a, b) + s(-b, a) = (ra - sb, rb + sa)$  and we know that  $-ra - sb) \perp$  $(rb + sa).$ 

To finish, we need to show that  $-ra - sb) \perp (rb + sa)$ .

$$
\begin{array}{rcl}\n\widetilde{\langle ra - sb, rb + sa \rangle_n} & = & \langle r\widetilde{a} - s\widetilde{b}, rb + sa \rangle_n \\
& = & r^2 \langle \widetilde{a}, b \rangle_n - s^2 \langle \widetilde{b}, a \rangle_n + rs \langle \widetilde{a}, a \rangle_n - rs \langle \widetilde{b}, a \rangle_n \\
& = & 0,\n\end{array}
$$

therefore  $-ra - sb) \in \mathbb{H}_{rb + sa}$ .

Q.E.D.

Note that we have a fibration

$$
S^{2^{n}-5} \rightarrow W_{2^{n-1}-1,2} \xrightarrow{\pi} S(\widetilde{\mathbb{A}}_{n}) = S^{2^{n}-3}
$$

$$
(a,b) \mapsto b
$$

 $\pi^{-1}(b) = S(\mathbb{H}_b^{\perp}) = S^{2^n - 5}$  since dim  $\mathbb{H}_b^{\perp} = 2^n - 4$ . Thus dim  $W_{2^{n-1}-1,2} = 2^n - 5 + 2^n - 3 = 2^{n+1} - 8$ .

In [Mo<sub>1</sub>] it is shown that for a and b in  $\mathbb{A}_n$  with  $n \geq 4$  and  $||a|| = ||b|| = 1$ , then

if  $ab = 0$  then i)  $(a, b) \in \widetilde{A}_n \times \widetilde{A}_n$ . ii)  $b \in \mathbb{H}_a^{\perp}$  (or equivalently  $a \in \mathbb{H}_b^{\perp}$ ). Thus

$$
X_n := \{(a, b) \in \mathbb{A}_n \times \mathbb{A}_n : ||a|| = ||b|| = 1 \text{ and } ab = 0\}
$$

is a subset of  $W_{2n-1-1,2}$ .

Thus we have a chain of inclusions for  $n \geq 3$ ,

$$
X_n \subset W_{2^{n-1}-1,2} \subset V_{2^n-2,2} \subset V_{2^n-1,2}.
$$

Now we show that  $X_n$  and  $W_{2^{n-1}-1,2}$  admit a  $T := S^1 \times S^1$  action.

**Lemma 2.7** For  $(a, b) \in V_{2n-2,2}$  and  $r, s, q, p$  in  $\mathbb{R}$  with  $r^2 + s^2 = 1$  and  $p^2 + q^2 = 1$  define τ

$$
(a, b) \stackrel{\tau}{\mapsto} (ra + s\tilde{a}, pb + q\tilde{b}).
$$

i) If  $(a, b) \in W_{2^{n-1}-1,2}$  then  $-ra + s\tilde{a}, \underline{pb} + q\tilde{b}) \in W_{2^{n-1}-1,2}$ . ii) If  $(a, b) \in X_n$  then  $-ra + s\tilde{a}, pb + q\tilde{b} \in X_n$ . iii)  $\tau$  defines a free T-action on  $W_{2^{n-1}-1,2}$  and  $X_n$  respectively.

**Proof:** By direct calculations. If  $a \perp b$  and  $\tilde{a} \perp b$  then

$$
\langle ra + s\tilde{a}, pb + q\tilde{b}\rangle_n = rp\langle a, b\rangle_n + sq\langle \tilde{a}, \tilde{b}\rangle_n + rq\langle a, \tilde{b}\rangle_n + sp\langle \tilde{a}, b\rangle_n
$$
  
= 0 + 0 + 0 + 0  
= 0

similarly.

$$
\langle ra + s\tilde{b}, (pb + q\tilde{b})\tilde{e_0}\rangle_n = \langle ra + s\tilde{a}, p\tilde{b} - qb\rangle_n
$$
  
=  $rp\langle a, \tilde{b}\rangle_n + sp\langle \tilde{a}, \tilde{b}\rangle_n - rq\langle a, b\rangle_n - sq\langle \tilde{a}, b\rangle_n$   
=  $0 + 0 + 0 + 0$   
= 0.

If  $ab = 0$  then

$$
(ra + s\tilde{a})(pb + q\tilde{b}) = rp(ab) + sq\tilde{a}\tilde{b} + sp\tilde{a}b + rqa\tilde{b}
$$
  
= 0.

Also

$$
||ra + s\tilde{a}||^2 = r^2||a||^2 + s^2||\tilde{a}||^2 = (r^2 + s^2)||a||^2 = 1
$$
 and  

$$
||pb + q\tilde{b}||^2 = p^2||b||^2 + q^2||\tilde{b}||^2 = (p^2 + q^2)||b||^2 = 1
$$

Therefore we proved (i) and (ii).

Finally  $(re^{i} + s\tilde{a}, p\tilde{b} + q\tilde{b}) = (a, b)$  if and only if  $r = 1, s = 0, p = 1$  and  $q=0.$ 

Clearly this action is smooth and free (see Corollary 2.5).

Q.E.D.

# § 3.  $X_n$ , Octonions and a  $S^3$  action.

In this section, we show that we can attach to every element in  $X_n$  a copy of  $\mathbb{A}_3 = \emptyset$ , the octonions inside of  $\mathbb{A}_{n+1}$  for  $n > 3$ . This allows us to identify  $X_n$  with a subset of algebra monomorphisms of  $\mathbb{A}_3$  into  $\mathbb{A}_{n+1}$ , which is our main goal in § 4.

We recall some notation from § 1.

Let  $e_0 \in A_{n-1}$  be the unit so  $(e_0, 0) = e_0$  is the unit in  $A_n$  and  $\widetilde{e}_0 = (0, e_0)$ in  $\mathbb{A}_n$ .

For  $\widetilde{e}_0$  in  $\mathbb{A}_n$  we denote  $\varepsilon = (\widetilde{e}_0, 0)$  in  $\mathbb{A}_{n+1}$ .

For example for  $n = 4$ ,  $\tilde{e}_0 = e_8$  in  $\mathbb{A}_4$ , and  $\varepsilon = (e_8, 0)$  in  $\mathbb{A}_5$ 

In general  $\tilde{e}_0 = e_{2^n}$  in  $\mathbb{A}_{n+1}$  and  $\varepsilon = e_{2^{n-1}}$  in  $\mathbb{A}_{n+1}$ . Since  $\varepsilon$  is a doubly pure element of norm one, we have that  $\mathbb{H}_{\varepsilon} = \text{Span}\{e_0, \tilde{\varepsilon}, \varepsilon, \tilde{e}_0\} \subset \mathbb{A}_{n+1}$  is a copy of  $\mathbb{A}_2$  and a direct sum decomposition  $\mathbb{A}_{n+1} = \mathbb{H}_{\varepsilon} \oplus \mathbb{H}_{\varepsilon}^{\perp}$ .

By definition  $\alpha = (a, b) \in \mathbb{A}_n \times \mathbb{A}_n = \mathbb{A}_{n+1}$  is doubly pure in  $\mathbb{A}_{n+1}$  with doubly pure entries in  $\mathbb{A}_n$  if and only if  $\alpha \in \mathbb{H}_{\varepsilon}^{\perp}$ .

In section  $\S 2$  we constructed the chain

$$
X_n\subset W_{2^{n-1}-1,2}\subset V_{2^n-2,2}\subset V_{2^n-1,2}\subset\mathbb{A}_{n+1}
$$

for  $n \geq 3$  with  $X_3 = \Phi$ , the empty set.

Therefore, by definition,  $V_{2^n-2,2} = V_{2^n-1,2} \cap \mathbb{H}_{\varepsilon}^{\perp}$ .

**Lemma 3.1.** For  $\alpha \in \mathbb{H}_{\varepsilon}^{\perp} \subset \mathbb{A}_{n+1}$  with  $\alpha = (a, b) \in \widetilde{\mathbb{A}}_n \times \widetilde{\mathbb{A}}_n$ , 1)  $(\alpha \varepsilon) \in \mathbb{H}_{\varepsilon}^{\perp}$  and  $\alpha \varepsilon = (\tilde{\alpha}, -\tilde{b}).$ 2)  $\alpha \tilde{\varepsilon} \in \mathbb{H}_{\varepsilon}^{\perp}$  and  $\alpha \tilde{\varepsilon} = \tilde{\alpha} \varepsilon = -\tilde{\alpha} \tilde{\varepsilon} = (-\tilde{b}, -\tilde{a}).$ 

Proof: By direct calculation

$$
\alpha \varepsilon = (a, b)(\widetilde{e}_0, 0) = (a\widetilde{e}_0, -b\widetilde{e}_0) = (\widetilde{a}, -\widetilde{b}) \in \widetilde{\mathbb{A}}_n \times \widetilde{\mathbb{A}}_n = \mathbb{H}_{\varepsilon}^{\perp}
$$

and

$$
\alpha \tilde{\varepsilon} = (a, b)(0, \tilde{\varepsilon}_0) = (\tilde{\varepsilon}_0 b, \tilde{\varepsilon}_0 a) = (-\tilde{b}, -\tilde{a})
$$

by Lemma 1.1 (1).

Finally using Lemma 1.1 (6) and (3) respectively  $\alpha \tilde{\varepsilon} = \tilde{\alpha} \varepsilon = -\tilde{\alpha} \varepsilon \in \mathbb{H}_{\varepsilon}^{\perp}$ .

Q.E.D.

**Corollary 3.2.** For a non-zero  $\alpha$  in  $\mathbb{H}_{\varepsilon}^{\perp} \subset \mathbb{A}_{n+1}$  and  $n \geq 3$ ,

$$
\emptyset_{\alpha} := Span\{e_0, \tilde{\varepsilon}, \varepsilon, \tilde{e}_0, \tilde{\alpha}, \alpha \varepsilon, \tilde{\varepsilon} \alpha, \alpha\} \subset \mathbb{A}_{n+1}
$$

is an 8-dimensional vector subspace of  $\mathbb{A}_{n+1} = \mathbb{R}^{2^{n+1}}$ .

**Proof:** By definition  $\{e_0, \tilde{\varepsilon}, \varepsilon, \tilde{e}_0\}$ ,  $\{e_0, \tilde{\alpha}, \alpha, \tilde{e}_0\}$ ,  $\{\varepsilon, \alpha, \tilde{\varepsilon}, \tilde{\alpha}\}$  are an orthogonal set of vectors and  $\alpha \varepsilon \in \mathbb{H}_{\varepsilon}^{\perp} \cap \mathbb{H}_{\alpha}^{\perp}$ . Also by Lemma 3.1.  $\tilde{\varepsilon} \alpha = -\alpha \tilde{\varepsilon} \in \mathbb{H}_{\varepsilon}^{\perp} \cap \mathbb{H}_{\alpha}^{\perp}$ . Thus  $\{e_0, \tilde{\varepsilon}, \varepsilon, \tilde{e}_0, \tilde{\alpha}, \alpha \varepsilon, \tilde{\varepsilon} \alpha, \alpha\}$  is an orthogonal set of vectors in  $\mathbb{A}_{n+1}$ . Q.E.D.

**Remark:** In particular for  $\alpha \in V_{2n-2,2}$  we have that  $\alpha_{\alpha} \cong \mathbb{R}^8 \subset \mathbb{A}_{n+1}$  and  $\varphi_{\alpha} \oplus \varphi_{\alpha}^{\perp} = \mathbb{A}_{n+1}.$ 

**Lemma 3.3.** For  $\alpha \in V_{2^{n}-2,2}$ .  $\alpha \in W_{2^{n-1}-1,2}$  if and only if  $\hat{\alpha} \in \varnothing_{\alpha}^{\perp}$ .

**Proof:** Recall that by definition  $\hat{\alpha} = (b, a)$  if  $\alpha = (a, b)$  so  $\hat{\alpha} \in (\text{Span}((\{e_0, \tilde{\varepsilon}, \varepsilon, \tilde{e}_0, \alpha, \tilde{\alpha}\}))^{\perp}$  (see Lemma 2.1. above). Now

$$
\langle \hat{\alpha}, \tilde{\varepsilon} \alpha \rangle_{n+1} = \langle (b, a), (\tilde{b}, \tilde{a}) \rangle_{n+1} = \langle b, \tilde{b} \rangle_n + \langle a, \tilde{a} \rangle_n = 0
$$
  

$$
\langle \hat{\alpha}, \alpha \varepsilon \rangle_{n+1} = \langle (b, a), (\tilde{a}, -\tilde{b}) \rangle_{n+1} = \langle b, \tilde{a} \rangle_n - \langle a, \tilde{b} \rangle_n = 2 \langle b, \tilde{a} \rangle_n,
$$

so  $\hat{\alpha} \perp (\alpha \infty)$  in  $\mathbb{A}_{n+1}$  if and only if  $\tilde{\alpha} \perp b$  in  $\mathbb{A}_n$  i.e.  $b \in \mathbb{H}_a^{\perp}$ . Therefore  $\hat{\alpha} \in \mathfrak{g}_{\alpha}^{\perp}$  if and only if  $b \in \mathbb{H}_a^{\perp}$ .

$$
Q.E.D.
$$

Thus  $W_{2^{n-1}-1,2} = \{ \alpha \in V_{2^{n}-2,2} | \hat{\alpha} \in \mathfrak{g}_{\alpha}^{\perp} \}.$ 

**Theorem 3.4** For  $\alpha \in W_{2^{n-1}-1,2}$  and  $n \geq 4$ , the following statements are equivalent.

i)  $\alpha \in X_n$ 

ii)  $\alpha$  alternate with  $\varepsilon$  i.e.,  $(\alpha, \alpha, \varepsilon) = 0$ 

iii) The vector subspace of  $\mathbb{A}_{n+1}$ 

$$
V(\alpha;\varepsilon):=\mathrm{Span}\{e_0,\alpha,\varepsilon,\alpha\varepsilon\}.
$$

is multiplicatively closed and isomorphic to  $\mathbb{A}_2 = \mathbb{H}$ .

iv)  $\phi_{\alpha}$  is multiplicatively closed and isomorphic to  $\mathbb{A}_3 = \emptyset$ .

v)  $\hat{\alpha} \in \text{Ker} L_{\alpha} \subset \varphi_{\alpha}^{\perp}$ , where  $L_{\alpha}$  is left multiplication by  $\alpha$ .

Proof. First of all, we calculate

 $\alpha(\alpha \varepsilon) = (a, b)[(a, b)(\tilde{e}, 0)] = (a, b)(\tilde{a}, -\tilde{b}) = (a\tilde{a} - \tilde{b}b, -\tilde{b}a - b\tilde{a})$ 

= 
$$
(-||a||^2 \tilde{e}_0 - ||b||^2 \tilde{e}_0, -\tilde{b}a - \tilde{b}a)
$$
 (by Lemma 1.1 (2) and (5))  
=  $-||\alpha||^2 \varepsilon + 2(0, \tilde{b}a)$ .

Therefore  $\alpha(\alpha \varepsilon) = \alpha^2 \varepsilon = -||\alpha||^2 \varepsilon$  if and only if  $ba = 0$ , i.e.  $\alpha \in X_n$  and we have (i) $\Leftrightarrow$  (ii).

Clearly if  $\alpha \in W_{2^{n-1}-1,2}$  then  $\{e_0, \alpha, \varepsilon, \alpha \varepsilon\}$  form an orthonormal set of vectors so  $\dim_{\mathbb{R}}(V(\alpha;\varepsilon)) = 4$  so  $-||\alpha||^2 = \alpha^2 = (\alpha \varepsilon)^2$  and  $\alpha(\alpha \varepsilon) = -||\alpha||^2 \varepsilon$ if and only if  $V(\alpha; \varepsilon) = \mathbb{H}$ , and we prove (ii) $\Leftrightarrow$ (iii).

To prove (iii) $\Leftrightarrow$ (iv) we stablish the following correspondence between the canonical basis in  $\mathbb{A}_3$  and the orthonormal basis of  $\mathfrak{g}_\alpha$ .

$$
e_1 \to \tilde{\varepsilon}; e_2 \mapsto \varepsilon; e_3 \to \tilde{e}_0; ||\alpha||e_4 \to \tilde{\alpha}; ||\alpha||e_5 \to \alpha\varepsilon; ||\alpha||e_6 \to \tilde{\varepsilon}\alpha; ||\alpha||e_7 \to \alpha
$$

Using ii) it is a routine calculation to see that this correspondence define an algebra isomorphism. (See also Lemma 4.4 (1) below).

Finally by Lemma 3.3. we know  $\hat{\alpha} \in \varphi_{\alpha}^{\perp}$  and

$$
\alpha \hat{\alpha} = (a, b)(b, a) = (ab + ab, a^2 - b^2) = (2ab, ||b||^2 - ||a||^2)
$$

is the Hopf construction. So  $\alpha \hat{\alpha} = 0$  in  $\mathbb{A}_{n+1}$  if and only if  $\alpha \in X_n$ . Recall that  $\mathbb{A}_3 \cong \emptyset_\alpha$  does not admit zero divisors.

Q.E.D.

**Theorem 3.5.**  $\mathbb{H}_{\varepsilon}^{\perp}$  admits a left  $\mathbb{H}_{\varepsilon}$ -module structure for  $n \geq 3$ .

**Proof:** For  $\alpha = (a, b)$  in  $\mathbb{H}_{\varepsilon}^{\perp} = \widetilde{\mathbb{A}}_n \times \widetilde{\mathbb{A}}_n$  and  $u = re_0 + s\widetilde{\varepsilon} + q\varepsilon + p\widetilde{e}_0$  with  $r, s, q$  and p in R.

Define

$$
u \cdot \alpha = \alpha u = r\alpha + s\alpha \tilde{\varepsilon} + q\alpha \varepsilon + p\tilde{\alpha}.
$$

Trivially  $\widetilde{\alpha} \in \mathbb{H}_{\varepsilon}^{\perp}$  and  $(\alpha \widetilde{\varepsilon})$  and  $(\alpha \varepsilon)$  are in  $\mathbb{H}_{\varepsilon}^{\perp}$  by Lemma 3.1.(2) and (1) respectively.

Since  $\tilde{\varepsilon}, \varepsilon$  and  $\tilde{\varepsilon}_0$  are alternative elements in  $\mathbb{A}_{n+1}$  (actually they belong to the canonical basis) we have that  $\tilde{\varepsilon} \cdot \alpha = (\alpha \tilde{\varepsilon})\tilde{\varepsilon} = \alpha(\tilde{\varepsilon})^2 = -||\alpha||^2 e_0 = \tilde{\varepsilon} \cdot \alpha$ and similarly  $\varepsilon \cdot (\varepsilon \cdot \alpha) = \varepsilon^2 \cdot \alpha$  and  $\tilde{e}_0 \cdot (\tilde{e}_0 \cdot \alpha) = \tilde{e}_0^2 \cdot \alpha$ .

Now  $\varepsilon \cdot (\widetilde{e}_0 \cdot \alpha) = \varepsilon \cdot (\alpha \widetilde{e}_0) = \varepsilon \cdot \widetilde{\alpha} = \widetilde{\alpha} \varepsilon$  and  $(\varepsilon \widetilde{e}_0) \cdot \alpha = \widetilde{\varepsilon} \cdot \alpha = \alpha \widetilde{\varepsilon} = \widetilde{\alpha} \varepsilon$ by Lemma 3.1 (2).

Similarly

$$
\begin{array}{rcl}\n\widetilde{\varepsilon} \cdot (\widetilde{e}_0 \cdot \alpha) & = & (\widetilde{\varepsilon} \widetilde{e}_0) \cdot \alpha = \varepsilon \alpha \\
\widetilde{e}_0 \cdot (\widetilde{\varepsilon} \cdot \alpha) & = & (\widetilde{e}_0 \widetilde{\varepsilon}) \cdot \alpha = \alpha \varepsilon \\
\varepsilon \cdot (\widetilde{e}_0 \cdot \alpha) & = & (\varepsilon \widetilde{e}_0) \cdot \alpha = \widetilde{\alpha} \varepsilon \\
\widetilde{e}_0 \cdot (\varepsilon \cdot \alpha) & = & (\widetilde{e}_0 \varepsilon) \cdot \alpha = -\alpha \widetilde{\varepsilon}.\n\end{array}
$$

Finally  $\widetilde{\varepsilon} \cdot (\varepsilon \cdot \alpha) = \widetilde{\varepsilon} \cdot (\alpha \varepsilon) = (\alpha \varepsilon) \widetilde{\varepsilon} = (\widetilde{\alpha \varepsilon}) \varepsilon = -\widetilde{(\alpha \varepsilon)} \varepsilon = -\widetilde{\alpha} = (\widetilde{\varepsilon} \varepsilon) \cdot \alpha$  and  $\varepsilon \cdot (\widetilde{\varepsilon} \cdot \alpha) = \varepsilon \cdot (\alpha \widetilde{\varepsilon}) = (\alpha \widetilde{\varepsilon}) \varepsilon = (\widetilde{\alpha} \varepsilon) \varepsilon = \widetilde{\alpha} = \varepsilon \cdot (\widetilde{\varepsilon} \alpha).$ 

By Lemma 3.1 and Lemma 1.1. and we are done.

Q.E.D.

Now we define a  $S^3$  action on  $X_n$ . Consider the unit sphere inside of  $\mathbb{H}_{\varepsilon} \subset \mathbb{A}_{n+1}$ .

$$
S^3 = S(\mathbb{H}_{\varepsilon}) = \{ re_0 + s\tilde{\varepsilon} + q\varepsilon + p\tilde{e}_0|r^2 + s^2 + q^2 + p^2 = 1 \}.
$$
  
For  $\alpha \in \mathbb{H}_{\varepsilon}^{\perp}$  with  $\alpha = (a, b) \in \tilde{A}_n \times \tilde{A}_n$  define  $\mathbb{H}_{\varepsilon}^{\perp} \times S^3 \to \mathbb{H}_{\varepsilon}^{\perp}$  by

$$
\alpha(re_0 + s\tilde{\varepsilon} + q\varepsilon + p\tilde{e}_0) = r\alpha + s\alpha\tilde{\varepsilon} + q\alpha\varepsilon + p\alpha\tilde{e}_0 = r\alpha + s\tilde{\alpha}\varepsilon + q\alpha\varepsilon + p\tilde{\alpha}
$$
  
=  $r(a, b) + s(-\tilde{b}, -\tilde{a}) + q(\tilde{a}, -\tilde{b}) + p(-b, a)$   
=  $(ra - s\tilde{b} + q\tilde{a} - pb, rb - s\tilde{a} - q\tilde{b} + pa).$ 

By definition this is a group action which is smooth and free of fixed points.

**Corollary 3.6** The above action of  $S^3 = S(\mathbb{H}_{\varepsilon})$  on  $\mathbb{H}_{\varepsilon}^{\perp}$  is a group action which is smooth, orthogonal and free of fixed points.

**Proof:** By Theorem 3.5 this is a smooth group action because it is a restriction of a linear action. Since right multiplication by  $\tilde{e}_0$ ,  $\varepsilon$  and  $\tilde{\varepsilon}$  are orthogonal linear transformations, we have that the action is orthogonal.

Finally this action is free of fixed points because  $\{e_0, \tilde{\varepsilon}, \varepsilon, \varepsilon\}$  is an orthonormal basis, so  $\alpha(re_0 + s\tilde{\epsilon} + q\epsilon + p\tilde{e}_0) = \alpha$  if and only if  $r = 1, s = q = p = 0$ . Q.E.D.

## Theorem 3.8.

- i) The subsets  $X_n$  and  $W_{2n-1-1,2}$  of  $\mathbb{H}_{\varepsilon}^{\perp}$  are  $S^3$ -equivariant.
- ii) For  $\alpha$  and  $\beta$  in  $W_{2^{n-1}-1,2,1}$

 $\varphi_{\alpha} = \varphi_{\beta}$ , as vector spaces, if and only if  $\alpha$  and  $\beta$  lie in the same  $S^3$ -orbit.

**Proof.** For  $\alpha \in \mathbb{H}_{\varepsilon}^{\perp}$  with  $\alpha = (a, b) \in \tilde{A}_n \times \tilde{A}_n$  and  $r, s, q$  and  $p$  in  $\mathbb{R}$  with  $r^2 + s^2 + q^2 + p^2 = 1$  we have that

$$
\alpha(re_0+s\tilde{\varepsilon}+q\varepsilon+s\tilde{e}_0)=(ra-s\tilde{b}+q\tilde{a}-pb,rb-s\tilde{a}-q\tilde{b}+pa).
$$

Suppose that  $\alpha \in W_{2^{n-1}-1,2}$  then  $\langle \tilde{a}, b \rangle_n = -\langle a, \tilde{b} \rangle_n = 0$ ;  $\langle a, b \rangle_n = \langle \tilde{a}, \tilde{b} \rangle_n = 0$ and by definition  $\langle a, \tilde{a} \rangle_n = \langle b, \tilde{b} \rangle_n = 0$  with  $||a|| = ||\tilde{a}|| = ||\tilde{b}|| = ||b|| = 1$  so  $\langle ra - s\tilde{b} + q\tilde{a} - pb, rb - s\tilde{a} - q\tilde{b} + pa \rangle = p||a||^2 + sq||b||^2 - qs||\tilde{a}||^2 - pr||b||^2 = 0$ and  $(\alpha(re_0 + s\tilde{\varepsilon} + q\varepsilon + s\tilde{e}_0)) \in V_{2^n-2,2}$ .

Similarly  $\langle ra - s\tilde{b} + q\tilde{a} - pb, r\tilde{b} + sa + qb + p\tilde{a} \rangle = 0$  and

$$
\alpha(re_0+s\tilde{\varepsilon}+q\varepsilon+s\tilde{e}_0)\in W_{2^{n-1}-1,2}.
$$

A direct calculation shows that if  $ab = 0$  then

$$
ab=\tilde{a}b=a\tilde{b}=\tilde{a}\tilde{b}=0
$$

$$
(ra - s\tilde{b} + q\tilde{a} - pb)(rb - s\tilde{a} - q\tilde{b} + pa) =
$$
  

$$
-rsa\tilde{a} + rpa^2 - sr\tilde{b}b + sq\tilde{b}^2 - qs\tilde{a}^2 + qpaa - prb^2 + pqb\tilde{b} =
$$

$$
-rs(-||a||^2\tilde{e}_0+||b||^2\tilde{e}_0)+pq(-||a||^2\tilde{e}_0+||b||^2\tilde{e}_0)+rp(a^2-b^2)+sq(\tilde{b}^2-\tilde{a}^2)=0
$$

because  $||a||^2 = ||b||^2 = 1$  and  $a^2 = b^2 = -e_0$ , so we have (i).

To prove ii) we notice that  $\varphi_{\alpha} = \mathbb{H}_{\varepsilon} \oplus \text{Span}\{\tilde{\alpha}, \alpha \varepsilon, \tilde{\varepsilon} \alpha, \alpha\}$ . Then if  $\beta =$  $r\alpha + s\tilde{\alpha}\varepsilon + q\alpha\varepsilon + p\tilde{\alpha}$  (recall that  $\tilde{\alpha}\varepsilon = -\tilde{\varepsilon}\alpha$  by Lemma 4.1) and  $||\beta|| = 1$  then  $r^2 + s^2 + q^2 + p^2 = 1$  and  $\alpha \equiv \beta \mod S^3$  if and only if  $\alpha_{\beta} \subset \alpha_{\alpha}$  but

$$
\dim \phi_{\beta} = \dim \phi_{\alpha} = 8 \text{ and } \phi_{\beta} = \phi_{\alpha}.
$$

Q.E.D. **Remark:** Notice that  $T = S^1 \times S^1$ , as in Lemma 2.7. and  $S^3 = S(\mathbb{H}_{\varepsilon})$ intersect on a copy of  $S^1$ .

Suppose that  $r^2 + s^2 + p^2 + q^2 = 1$  and  $u^2 + v^2 = 1$   $t^2 + m^2 = 1$  in  $\mathbb{R}$ . If  $(ra - s\tilde{b} + q\tilde{a} - pb, rb - s\tilde{a} - q\tilde{b} + pa) = (ua + v\tilde{a}, tb + m\tilde{b})$  then  $r = u$ ,  $q = v, s = 0, p = 0, r = t, -q = m$  so

$$
S(\mathbb{H}_{\varepsilon}) \cap T = S^1 = \{ (r, -q) | r^2 + q^2 = 1 \}.
$$

### §4.  $X_n$  and monomorphisms from  $\mathbb{A}_3$  to  $\mathbb{A}_{n+1}$ .

In this chapter  $1 \leq m \leq n$ .

.

**Definition.** An algebra monomorphism from  $\mathbb{A}_m$  to  $\mathbb{A}_n$  is a linear monomorphism  $\varphi : \mathbb{A}_m \to \mathbb{A}_n$  such that

i)  $\varphi(e_0) = e_0$  (the first  $e_0$  is in  $\mathbb{A}_m$  and the second  $e_0$  in  $\mathbb{A}_n$ )

ii)  $\varphi(xy) = \varphi(x)\varphi(y)$  for all x and y in  $\mathbb{A}_m$ .

By definition we have that  $\varphi(re_0) = r\varphi(e_0)$  for all r in R so  $\varphi(\varphi_m) \subset$  $\varphi(\alpha \wedge n)$  and  $\varphi(\overline{x}) = \overline{\varphi(x)}$  therefore  $||\varphi(x)||^2 = \varphi(x)\overline{\varphi(x)} = \varphi(x)\varphi(\overline{x}) =$  $\varphi(x\overline{x}) = \varphi(||x||^2) = ||x||^2$  for all  $x \in \mathbb{A}_m$  and  $||\varphi(x)|| = ||x||$  and  $\varphi$  is an orthogonal linear transformation from  $\mathbb{R}^{2^m-1}$  to  $\mathbb{R}^{2^n-1}$ .

The *trivial* monomorphism is the one given by  $\varphi(x) = (x, 0, 0, \ldots, 0)$  for  $x \in \mathbb{A}_m$  and 0 in  $\mathbb{A}_m$ 

 $\mathcal{M}(\mathbb{A}_m; \mathbb{A}_n)$  denotes the set of algebra monomorphisms from  $\mathbb{A}_m$  to  $\mathbb{A}_n$ . For  $m = n$ ,  $\mathcal{M}(\mathbb{A}_m; \mathbb{A}_n) = \text{Aut}(\mathbb{A}_n)$  the group of algebra automorphisms of  $\mathbb{A}_n$ 

Proposition 4.1.  $\mathcal{M}(\mathbb{A}_1; \mathbb{A}_n) = S(\mathbb{A}_n) = S^{2^n - 2}$ .

**Proof:**  $\mathbb{A}_1 = \mathbb{C} = Span\{e_0, e_1\}.$ 

If  $x \in A_1$  then  $x = re_0 + se_1$  and for  $w \in \mathcal{A}_n$  with  $||w|| = 1$  we have that  $\varphi_w(x) = re_0 + sw$  define an algebra monomorphism from  $\mathbb{A}_1$  to  $\mathbb{A}_n$ . This can be seen by direct calculations, recalling that, Center  $(A_n) = \mathbb{R}$  for all n and that every associator with one real entries vanish.

Conversely, for  $\varphi \in \mathcal{M}(\mathbb{A}_1; \mathbb{A}_n)$ , set  $w = \varphi(e_1)$  so  $||w|| = 1$  and  $\varphi_w = \varphi$ . Q.E.D.

Remark: In particular, we have that

$$
Aut(\mathbb{A}_1) = S^0 = \mathbb{Z}/2 = \{\text{Identity, conjugation}\} = \{\varphi_{e_1}, \varphi_{-e_1}\}.
$$

To calculate  $\mathcal{M}(\mathbb{A}_2; \mathbb{A}_n)$  for  $n \geq 2$  we need to recall (see [Mo<sub>2</sub>]).

**Definition:** For a and b in  $\mathbb{A}_n$ . We say that a alternate with b, we denote it by  $a \rightsquigarrow b$ , if  $(a, a, b) = 0$ .

We say that a alternate strongly with b, we denote it by a  $\leftrightarrow$  b, if  $(a, a, b) = 0$  and  $(a, b, b) = 0$ .

Clearly a alternate strongly with  $e_0$  for all a in  $\mathbb{A}_n$  and if a and b are linearly dependent then  $a \leftrightarrow b$  (by flexibility).

Also, by definition, a is an alternative element if and only if  $a \rightarrow x$  for all x in  $\mathbb{A}_n$ .

By Lemma 1.1 (1) and (2) we have that for any doubly pure element  $a$  in  $\mathbb{A}_n$   $(a, a, \tilde{e}_0) = 0$  and (by the above remarks)  $\tilde{e}_0$  alternate strongly with any a in  $\mathbb{A}_n$ .

For a and b pure elements in  $\mathbb{A}_n$ , we define the vector subspace of  $\mathbb{A}_n$ 

$$
V(a;b) = Span\{e_0, a, b, ab\}.
$$

**Lemma 4.2.** If  $(a, b) \in V_{2n-1,2}$  and  $a \leftrightarrow b$  then  $V(a, b) = \mathbb{A}_2 = \mathbb{H}$  the quaternions.

**Proof:** Suppose that  $(a, b) \in V_{2n-1,2}$  and that  $(a, a, b) = 0$  then we have

$$
\langle ab, a \rangle = \langle b, \overline{a}a \rangle = \langle b, ||a||^2 e_0 \rangle = ||a||^2 \langle b, e_0 \rangle = 0
$$
  

$$
\langle ab, a \rangle = \langle a, b\overline{b} \rangle = \langle a, ||b||^2 e_0 \rangle = ||b||^2 \langle a, e_0 \rangle = 0
$$
  

$$
||ab||^2 = \langle ab, ab \rangle = \langle \overline{a}(ab), b \rangle = \langle -a(ab), b \rangle = \langle -a^2b, b \rangle
$$
  

$$
= -a^2 \langle b, b \rangle = ||a||^2 ||b||^2 = 1
$$

so  $\{e_0, a, b, ab\}$  is an orthonormal set of vectors in  $\mathbb{A}_n$ .

Finally using also that  $(a, b, b) = 0$  and  $ab = -ba$  we may check by direct calculation that the multiplication table of  $\{e_0, a, b, ab\}$  coincides with the one of the quaternions and by the identification  $e_0 \mapsto e_0, a \mapsto e_1, b \mapsto e_2$  and  $ab \mapsto e_3$  we have an algebra isomorphism between  $\mathbb{A}_2 = \mathbb{H}$  and  $V(a; b)$ . Q.E.D.

**Proposition 4.3.**  $\mathcal{M}(\mathbb{A}_2; \mathbb{A}_n) = \{(a, b) \in V_{2^n-1,2} | a \leftrightarrow b \}$  for  $n \geq 2$ . In particular

$$
Aut(\mathbb{A}_2) = \mathcal{M}(\mathbb{A}_2; \mathbb{A}_2) = V_{3,2} = SO(3)
$$

and

$$
\mathcal{M}(\mathbb{A}_2, \mathbb{A}_3) = V_{7,2}.
$$

Proof. The inclusion "⊃" follows from Lemma 4.2. Conversly suppose that  $\varphi \in \mathcal{M}(\mathbb{A}_2, \mathbb{A}_n)$  then  $\varphi(e_0) = e_0$ ,  $(\varphi(e_1), \varphi(e_2)) \in V_{2^n-1,2}$  and  $V(\varphi(e_1), \varphi(e_2)) =$  $\text{Im}\varphi = \mathbb{H} \subset \mathbb{A}_n.$ 

Since  $\mathbb{A}_2$  is an asociative algebra and  $\mathbb{A}_3$  is an alternative algebra we have that  $a \leftrightarrow b$  for any two elements in  $\mathbb{A}_n$  for  $n = 2$  or  $n = 3$ .

Q.E.D.

**Remark.** Recall that  $\tilde{A}_n = \{e_0, \tilde{e}_0\}^{\perp} = \mathbb{R}^{2^{n}-2}$  denotes the vector subspace of doubly pure elements. Since  $a \leftrightarrow \tilde{e}_0$  for any element in  $\tilde{A}_n$ , we have that, if  $a \in S(\tilde{\mathbb{A}}_n)$  i.e.,  $||a|| = 1$  then  $(a, \tilde{e}_0) \in V_{2n-1,2}$  and the assignment  $a \mapsto (a, \tilde{e}_0)$  defines an inclusion from  $S(\tilde{\mathbb{A}}_n) = S^{2^n-3} \hookrightarrow \mathcal{M}(\mathbb{A}_2; \mathbb{A}_n) \subset V_{2^n-1,2}$ which resembles "the bottom cell" inclusion in  $V_{2n-1,2}$ .

Now we show that  $X_n$  can be identified with a subset of  $\mathcal{M}(\mathbb{A}_3; \mathbb{A}_{n+1})$  for  $n \geq 4$ .

**Lemma 4.4.** For  $\alpha \in \mathbb{H}_{\varepsilon}^{\perp} \subset \mathbb{A}_{n+1}$  and  $n \geq 4$ . (1) If  $||\alpha|| = 1$  then  $\alpha_{\alpha} = \text{Span}\{e_0, \tilde{\varepsilon}, \varepsilon, \tilde{e}_0, \tilde{\alpha}, \alpha \varepsilon, \tilde{\varepsilon} \alpha, \alpha\}$  is isomorphic as algebra to  $\mathbb{A}_3$  if and only if  $(\alpha, \alpha, \varepsilon) = 0$ . (2) If  $\alpha = (a, b) \in \widetilde{\mathbb{A}}_n \times \widetilde{\mathbb{A}}_n$  then  $(\alpha, \alpha, \varepsilon) = (0, -(a, \widetilde{e}_0, b)) \in \widetilde{\mathbb{A}}_n \times \widetilde{\mathbb{A}}_n$ 

**Proof.** (1) By definition  $\tilde{e}_0 = e_{2^n}$  and  $\varepsilon = e_{2^{n-1}}$  are elements in the canonical basis so they are alternative elements (See [Sch]). Since  $\mathbb{H}_{\alpha}$  is associative for all  $\alpha$  then  $(\alpha, \alpha, \widetilde{e}_0) = 0$ .

Clearly if  $\phi_{\alpha} \cong A_3$  then  $(\alpha, \alpha, \varepsilon) =$  because  $\phi_{\alpha}$  is an alternative algebra. Conversely, assume that  $(\alpha, \alpha, \varepsilon) = 0$ .

We have the following multiplication table that under the mapping  $e_0 \mapsto e_0$ ;  $e_1 \mapsto \tilde{\varepsilon}$ ;  $e_2 \mapsto \varepsilon$ ;  $e_3 \mapsto \tilde{e}_0$ ;  $e_4 \mapsto \tilde{\alpha}$ ;  $e_5 \mapsto \alpha \varepsilon$ ;  $e_0 \mapsto \tilde{\varepsilon}\alpha$  and  $e_7 \mapsto \alpha$ 

becomes an algebra monomorphism from  $\mathbb{A}_3$  into  $\mathbb{A}_{n+1}$ 

$e_0$	$\widetilde{\varepsilon}$	$\varepsilon$	$\widetilde{e}_0$	$\widetilde{\alpha}$	$\alpha\varepsilon$	$\widetilde{\varepsilon }\alpha$	$\alpha$
$\widetilde{\varepsilon}$		$\overline{\widetilde{e}_0}$	$-\varepsilon$	$\alpha\varepsilon$	$-\widetilde{\alpha}$	$\alpha$	$\overline{\widetilde{\varepsilon}\alpha}$
$\varepsilon$	$\widetilde{e}_0$	$e_0$	$\widetilde{\varepsilon}$	$\widetilde{\varepsilon}\alpha$	$\alpha$	$\widetilde{\alpha}$	$\alpha\varepsilon$
$\widetilde{e}_0$	$\varepsilon$	$\widetilde{\varepsilon}$	$e_0$	$\alpha$	$\varepsilon \alpha$	$\alpha\varepsilon$	$-\alpha$
$\widetilde{\alpha}$	$\alpha\varepsilon$	$\varepsilon \alpha$	$-\alpha$		$\widetilde{\varepsilon}$	ε	$\tilde{e}_0$
$\alpha\varepsilon$	$\widetilde{\alpha}$	$-\alpha$	$\widetilde{\varepsilon}\alpha$		$e_0$		$\varepsilon$
$\widetilde{\varepsilon }\alpha$	$\alpha$	$\widetilde{\alpha}$	$\alpha\varepsilon$	$-\varepsilon$	$\widetilde{e}_0$		٤.
$\alpha$	$\varepsilon \alpha$	$\alpha\varepsilon$	$\widetilde{\alpha}$	$\widetilde{e}_0$	$-\varepsilon$	$\widetilde{\varepsilon}$	$e_{0}$

Notice that this table is skew-symmetric with  $-e_0$ 's along the diagonal.

The nontrivial calculations are:  
\n
$$
\begin{aligned}\n\widetilde{\varepsilon}\widetilde{\alpha} &= \alpha \varepsilon \text{ (by Lemma 1.1 (5))}.\\
\widetilde{\varepsilon}(\alpha \varepsilon) &= -\varepsilon \alpha \widetilde{\alpha} = \varepsilon (\varepsilon \alpha) = \varepsilon^2 \alpha = -\widetilde{\varepsilon_0} \alpha = -\widetilde{\alpha} \text{ (by Lemma 1.1 (3))}.\\
\varepsilon(\widetilde{\varepsilon}\alpha) &= -\varepsilon(\varepsilon \alpha) = -\widetilde{\varepsilon}(\varepsilon \alpha) = \varepsilon(\varepsilon \alpha) = -\widetilde{\alpha} \text{ (by Lemma 1.1 (1) and (6).}\\
\widetilde{\alpha}(\alpha \varepsilon) &= -\alpha(\alpha \varepsilon) = -\alpha^2 \varepsilon = \widetilde{\varepsilon} \text{ because } (\alpha, \alpha, \varepsilon) = 0 \text{ and } ||\alpha|| = 1.\\
\widetilde{\alpha}(\widetilde{\varepsilon}\alpha) &= -\widetilde{\alpha}(\varepsilon \alpha) = +\widetilde{\widetilde{\alpha}}(\alpha \varepsilon) = -\alpha(\alpha \varepsilon) = \varepsilon,\\
\text{so we are done with (1).}\n\end{aligned}
$$

To prove (2) we perform similar calculation as in Theorem 3.4.

$$
\alpha(\alpha \varepsilon) = (a, b)[(a, b)(\tilde{e}_0, 0)] = (a, b)(\tilde{a}, -\tilde{b}) = (a\tilde{a} - \tilde{b}b, -\tilde{b}a - b\tilde{a})
$$
  
\n
$$
= (-||a||^2 \tilde{e}_0 - ||b||^2 e_0, -(b\tilde{e}_0)a + b(\tilde{e}_0a))
$$
  
\n
$$
= -||\alpha||^2 \varepsilon - (0, (b, \tilde{e}_0, a))
$$

Therefore

$$
(\alpha, \alpha, \varepsilon) = \alpha^2 \varepsilon - \alpha(\alpha \varepsilon) = -||\alpha||^2 - \alpha(\alpha \varepsilon)
$$
  
= 
$$
(0, (b, \tilde{\varepsilon}_0, a)) = -(0, (a, \tilde{\varepsilon}_0, b))
$$
 by flexibility.

Q.E.D.

Notation: For  $n\geq 4$  consider the following subsets of  $\mathbb{A}_{n+1}$ 

$$
\mathbb{E}_n = \{ \alpha \in \mathbb{H}_{\varepsilon}^{\perp} | (\alpha, \alpha, \varepsilon) = 0 \},
$$
  
\n
$$
S(\mathbb{E}_n) = \{ \alpha \in \mathbb{E}_n : ||\alpha|| = 1 \},
$$
  
\n
$$
P(n) = \{ (a, b) \in \widetilde{\mathbb{A}}_n \times \widetilde{\mathbb{A}}_n | a \text{ and } b \text{ are } \mathbb{C} - \text{collinear} \},
$$
  
\n
$$
\overline{X}_n = \{ (a, b) \in \widetilde{\mathbb{A}}_n \times \widetilde{\mathbb{A}}_n | a \neq 0, b \neq 0 \text{ and } ab = 0 \}
$$

and also the following subset of monomorphisms

$$
\mathcal{M}_2(\mathbb{A}_3; \mathbb{A}_{n+1}) = \{ \varphi \in \mathcal{M}(\mathbb{A}_3; \mathbb{A}_{n+1}) | \mathbb{H}_{\varepsilon} \subset \mathrm{Im} \varphi \}.
$$

**Remark:** By Lemma 4.4 (1) we may identify  $S(\mathbb{E}_n)$  and  $\mathcal{M}_2(\mathbb{A}_3; \mathbb{A}_{n+1})$ , that is, there is a one to one correspondence between this two sets.

**Theorem 4.5.** For  $n \geq 4$ 

- (i)  $P(n)$  and  $\overline{X}_n$  are subsets of  $\mathbb{E}_n$  with  $P(n) \cap \overline{X}_n = \Phi$ .
- (ii) There is a continous retract

$$
R: \mathbb{E}_n \backslash P(n) \to \overline{X}_n.
$$

**Proof:** If  $(a, b) \in P(n)$  then  $b \in \mathbb{H}_a$  or  $a \in \mathbb{H}_b$  and  $(a, \tilde{e}_0, b) = 0$  (recall that  $\mathbb{H}_a$  and  $\mathbb{H}_b$  are associative), so by Lemma 4.4 (2)  $(\alpha, \alpha, \varepsilon) = 0$  in  $\mathbb{A}_{n+1}$  when  $\alpha = (a, b)$  so  $P(n) \subset \mathbb{E}_n$ .

On the other hand if  $(a, b) \in \overline{X}_n$  then  $ab = 0$  and  $b \in \mathbb{H}_a^{\perp} \subset \mathbb{A}_n$  and by Lemma 1.1  $(1)$ ,  $(6)$  and  $(3)$ 

$$
(a, \widetilde{e}_0, b) = (a\widetilde{e}_0)b - a(\widetilde{e}_0b) = \widetilde{a}b + a\widetilde{b} = \widetilde{a}b + \widetilde{a}b = 2\widetilde{a}b = -2\widetilde{a}b.
$$

Therefore if  $ab = 0$  then  $(a, \widetilde{e}_0, b) = 0$  and  $(\alpha, \alpha, \varepsilon) = 0$  in  $\mathbb{A}_{n+1}$  for  $\alpha = (a, b)$ by Lemma 4.4 (2) so  $\overline{X}_n \subset \mathbb{E}_n$ .

Now if  $(a, b) \in P(n) \cap \overline{X}_n$  then  $b \in \mathbb{H}_a$  and  $ab = 0$ , but  $\mathbb{H}_a$  is associative and  $a = 0$  or  $b = 0$  which is a contradiction, therefore  $P(n) \cap \overline{X}_n$  is the empty set and we are done with (i).

To prove (ii) suppose that  $\alpha = (a, b) \in \widetilde{A}_n \times \widetilde{A}_n$  with  $a \neq 0$ . Since

$$
\mathbb{A}_n=\mathbb{H}_a\oplus\mathbb{H}_a^\perp
$$

then there are unique elements c and d in  $\mathbb{H}_a$  and  $\mathbb{H}_a^{\perp}$  respectively such that  $b = c + d$ . Now

$$
(a, \widetilde{e}_0, b) = (a, \widetilde{e}_0, c + d) = (a, \widetilde{e}_0, c) + (a, \widetilde{e}_0, d) = 0 + (a, \widetilde{e}_0, d)
$$

because  $\mathbb{H}_a$  is associative.

But by Lemma 1.1 (1), (6) and (3)

$$
(a,\widetilde{e}_0,d)=(a\widetilde{e}_0)d-a(\widetilde{e}_0d)=\widetilde{a}d+a\widetilde{d}=\widetilde{ad}+\widetilde{a}d=-2\widetilde{ad}.
$$

Therefore  $(a, \widetilde{e}_0, b) = -2\widetilde{ad}$ .

Suppose that  $\alpha = (a, b)$  is in  $\mathbb{E}_n \backslash P(n)$  then  $a \neq 0, b \neq 0$ ,

$$
b = c + d \in \mathbb{H}_a \oplus \mathbb{H}_a^{\perp}
$$

with  $d \neq 0$  and  $(a, \tilde{e}_0, b) = 0$  by Lemma 4.6 (2). Thus we have that  $ad = 0$ .

Let us define  $R : \mathbb{E}_n \backslash P(n) \to \overline{X}_n$  as  $R(a, b) = (a, d)$ .

Then  $R(a, b) = (a, b)$  if  $(a, b) \in \overline{X}_n$  and R is continuous, because it is the restriction of the projection map

$$
\widetilde{\mathbb{A}}_n \times \mathbb{A}_n \rightarrow \widetilde{\mathbb{A}}_n \times (\mathbb{H}_a \oplus \mathbb{H}_a^{\perp}) \rightarrow \widetilde{\mathbb{A}}_n \times \mathbb{H}_a^{\perp}
$$
  
\n $(a, b) \rightarrow (a, c + d) \rightarrow (a, d)$ 

which is obviously continuous.

Q.E.D.

**Remarks:** (1) Recall that  $\widetilde{A}_n$  is a complex vector space by making  $ia = \widetilde{a}$ . By definition  $(a, b) \in P(n)$  if and only if a and b are C-collinear for  $(a, b) \in \widetilde{\mathbb{A}}_n \times \widetilde{\mathbb{A}}_n$ . So

$$
P(n) \cong (((\widetilde{\mathbb{A}}_n \backslash \{0\}) \times \mathbb{C}) \cup \widetilde{\mathbb{A}}_n).
$$

(2) Consider the map  $w_n : \widetilde{\mathbb{A}}_n \times \widetilde{\mathbb{A}}_n \to \widetilde{\mathbb{A}}_n$  given by

$$
w_n(a, b) = (a, \widetilde{e}_0, b).
$$

Since every associator is a pure element  $(a, \tilde{e}_0, b) \perp \tilde{e}_0$  because  $(a, -, b)$  is a skew-symmetric linear transformation (see [Mo<sub>1</sub>]) then  $(a, \tilde{e}_0, b) \in A_n$ .

Now  $w_n$  is a polynomia map, actually is a quadraic map, and  $\mathbb{E}_n = w_n^{-1}(0)$ is a real algebraic set in  $\widetilde{\mathbb{A}}_n \times \widetilde{\mathbb{A}}_n = \mathbb{H}_{\varepsilon}^{\perp} = \mathbb{R}^{2^{n+1}-4}$  with 0 in  $\widetilde{\mathbb{A}}_n$  a singular value, by Lemma  $4.4$   $(2)$ .

(3)  $X_n$  is a contraction of  $\overline{X_n}$  via normalization on each coordinate.
