Abstract.

We present a new and simple approach to the theory of multiple operator integrals that applies to unbounded operators affiliated with general von Neumann algebras. For semifinite von Neumann algebras we give applications to the Fréchet differentiation of operator functions that sharpen existing results, and establish the Birman-Solomyak representation of the spectral shift function of M. G. Krein in terms of an average of spectral measures in the type II setting. We also exhibit a surprising connection between the spectral shift function and spectral flow.

## 1. INTRODUCTION

In the seminal paper of Yu. L. Daletskii and S. G. Krein [16], the theory of multiple operator integrals emerged as an important tool in the differentiation theory of operator functions and in perturbation theory. On the other hand, an important concept in the theory of perturbations is the spectral shift function which first arose in the work of I. M. Lifshits [28] in solid state theory and put on a firm mathematical basis by M. G. Krein [25].

An important connection between these two theories was made by M. Sh. Birman and M. Z. Solomyak [4] who showed that the theory of double operator integrals led naturally to a new representation for the spectral shift function as an average of spectral measures.

A principal aim of this paper is to present a new approach to the theory of multiple operator integrals, which provides a coherent path to the theory

of differentiation of operator functions, the spectral shift function and the theory of spectral flow in the setting of type II von Neumann algebras. Our approach is conceptually simpler than those of [29, 30], although it applies to a somewhat narrower class of functions. On the other hand, since our approach does not depend on the vector-valued integration theory against a finitely additive measure as in [5, 29, 30], it is also suitable for general (non-semifinite) von Neumann algebras (see Section 4). Our approach to the theory of multiple operator integrals is quite different from earlier approaches to be found in [16, 31, 39, 40].

During the final stages in the preparation of this paper, the authors became aware of a preprint of V. V. Peller [32], where a similar approach to the theory of multiple operator integrals is presented in the setting of type I von Neumann algebras. While Peller's approach in the type I case applies to the class of integral projective tensor products, the present paper in the more general type II setting restricts attention to the natural Wiener classes and thus permits us to show Fréchet differentiability rather than Gateaux differentiability. In particular, we strengthen the differentiation results of [29] by showing that Gateaux differentiability can be replaced by Fréchet differentiability and we show the existence of higher order Fréchet derivatives of operator-valued functions.

Our present approach also allows us to consider perturbations of self-adjoint operators which are affiliated with semifinite von Neumann algebras. This is a substantial difference with [29, 30], which treated the more special case of (so-called)  $\tau$ -measurable operators [21]. The necessity of avoiding the latter restriction is especially clear in the applications. An important ingredient is the recent extension to the type II setting of the Krein spectral shift function [2]. When combined with our development of multiple operator integration together with the ideas of [4], we establish a (type II) extension of the important Birman-Solomyak formula, concerning spectral averaging (see Section 6).

Perhaps the most surprising connection of our study is with the theory of spectral flow, which is presented in Section 7. While the theory of spectral shift function (see the lectures [26] and the survey [3]) is a part of operator theory, the theory of spectral flow, which originated in the work of M. Atiyah, V. Patodi and I. M. Singer [1] on a generalization of the Atiyah-Singer index theorem, finds its proper analytic setting in the framework of non-commutative geometry created by A. Connes [14]. One of the main results of the latter theory is the odd local index theorem of A. Connes and H. Moscovici [15] which has recently been developed in the type II setting [11, 12]. This latter work inspired our result (in Section 7) that the theory of the spectral shift function and that of spectral flow coincide in the case of trace class perturbations.

## 2. NOTATIONS AND PRELIMINARIES

We denote by  $\mathcal{H}$  a separable complex Hilbert space, by  $\mathcal{N}$  a von Neumann algebra acting on  $\mathcal{H}$ , by  $\mathcal{B}(\mathcal{H})$  the algebra of all bounded linear operators acting on  $\mathcal{H}$  and by  $\text{Tr}$  the standard trace on  $\mathcal{H}$ . In case when  $\mathcal{N}$  is semifinite, we denote by  $\tau$  a faithful normal semifinite trace on  $\mathcal{N}$ , by  $L^1(\mathcal{N}, \tau)$  the set of  $\tau$ -trace class operators affiliated with  $\mathcal{N}$ , by  $\mathcal{L}^1(\mathcal{N}, \tau) = L^1(\mathcal{N}, \tau) \cap \mathcal{N}$  the set of all bounded  $\tau$ -trace class operators and by  $\mathcal{K}(\mathcal{N}, \tau)$  the set of all  $\tau$ -compact operators (see [21]) from  $\mathcal{N}$ . If  $S$  is a measure space we denote by  $B(S)$  the set of all bounded measurable complex-valued functions on  $S$ . The  $so$ -topology and  $so^*$ -topology denote, respectively, the strong operator topology and the strong\* operator topology. We denote the uniform norm on  $\mathcal{B}(\mathcal{H})$  by  $\|\cdot\|$ .

If  $\mathcal{E}$  is a  $*$ -ideal in a von Neumann algebra  $\mathcal{N}$  which is complete in some norm  $\|\cdot\|_{\mathcal{E}}$ , then we will call  $\mathcal{E}$  an invariant operator ideal (see [13, Definition 1.8]) if

- (1)  $\|S\|_{\mathcal{E}} \geq \|S\|$  for all  $S \in \mathcal{E}$ ,
- (2)  $\|S^*\|_{\mathcal{E}} = \|S\|_{\mathcal{E}}$  for all  $S \in \mathcal{E}$ ,
- (3)  $\|ASB\|_{\mathcal{E}} \leq \|A\| \|S\|_{\mathcal{E}} \|B\|$  for all  $S \in \mathcal{E}$  and  $A, B \in \mathcal{N}$ .

We say that an operator ideal  $\mathcal{E}$  has property (F) if, for all nets  $\{A_\alpha\} \subset \mathcal{E}$  such that there exist  $A \in \mathcal{N}$  for which  $A_\alpha \rightarrow A$  in the  $so^*$ -topology and  $\|A_\alpha\|_{\mathcal{E}} \leq 1$  for all  $\alpha$ , it follows that  $A \in \mathcal{E}$  and  $\|A\|_{\mathcal{E}} \leq 1$ .

If  $\mathcal{E} = \mathcal{N} \cap E(\mathcal{N}, \tau)$  for some rearrangement invariant Banach function space  $E$  (see [19]) with the Fatou property (that is, if  $0 \leq f_\alpha \uparrow$  is an increasing net in  $E$ ,  $\sup_{\alpha} \|f_\alpha\|_E < \infty$  then  $\sup_{\alpha} f_\alpha$  exists in  $E$  and  $\|f_\alpha\|_E \uparrow \|f\|_E$ ), then [19, Proposition 1.6] together with Lemma 2.5 below shows that  $\mathcal{E}$  has the property (F).

Every von Neumann algebra with the uniform norm is an invariant operator ideal with property (F). If  $\mathcal{N}$  is a semifinite von Neumann algebra with a faithful normal semifinite trace  $\tau$  then the spaces  $\mathcal{L}^p(\mathcal{N}, \tau)$ ,  $\mathcal{L}^{p,+\infty}(\mathcal{N}, \tau)$  (see [27, 18]) are invariant operator ideals with the property (F).

For any  $C^1$ -function  $f: \mathbb{R} \rightarrow \mathbb{C}$ , we denote by  $f^{[1]}$  the continuous function

$$f^{[1]}(\lambda_0, \lambda_1) = \frac{f(\lambda_1) - f(\lambda_0)}{\lambda_1 - \lambda_0},$$

and for any  $C^{n+1}$ -function  $f: \mathbb{R} \rightarrow \mathbb{C}$

$$f^{[n+1]}(\lambda_0, \dots, \lambda_{n+1}) = \frac{f^{[n]}(\lambda_0, \dots, \lambda_{n-1}, \lambda_{n+1}) - f^{[n]}(\lambda_0, \dots, \lambda_{n-1}, \lambda_n)}{\lambda_{n+1} - \lambda_n}.$$

It is well known that  $f^{[n]}$  is a symmetric function.

We denote by  $W_n(\mathbb{R})$  the set of functions  $f \in C^n(\mathbb{R})$ , such that the  $j$ -th derivative  $f^{(j)}$ ,  $j = 0, \dots, n$ , is the Fourier transform of a finite measure  $m_f$  on  $\mathbb{R}$ .

The next lemma introduces a finite measure space which will be used in our definition of multiple operator integrals in Section 4 below.

**Lemma 2.1.** *If*

$$\Pi^{(n)} = \{(s_0, s_1, \dots, s_n) \in \mathbb{R}^{n+1} : |s_n| \leq \dots \leq |s_1| \leq |s_0|, \\ \text{sign}(s_0) = \dots = \text{sign}(s_n)\},$$

and if  $f \in W_n(\mathbb{R})$ ,  $\nu_f^{(n)}(s_0, \dots, s_n) = \frac{i^n}{\sqrt{2\pi}} m_f(ds_0) \dots ds_n$ , then  $(\Pi^{(n)}, \nu_f^{(n)})$  is a finite measure space.

*Proof.* The total variation of the measure  $\nu_f^{(n)}$  on the set  $\Pi^{(n)}$  (up to a constant) is equal to

$$\begin{aligned} \int_{\Pi^{(n)}} |m_f(ds_0)| ds_1 \dots ds_n &= \int_{\mathbb{R}} \Delta_{s_0} |m_f(ds_0)| \\ &= \frac{1}{n!} \int_{\mathbb{R}} s_0^n |m_f(ds_0)| \\ &= \frac{1}{n!} \int_{\mathbb{R}} |m_{f^{(n)}}(ds_0)| = \frac{1}{n!} \|m_{f^{(n)}}\|, \end{aligned}$$

where  $\Delta_{s_0}$  is the volume of the  $n$ -dimensional simplex of size  $s_0$ .  $\square$

We write for simplicity  $\Pi = \Pi^{(1)}$  and  $\nu_f = \nu_f^{(1)}$ .

The next two lemmas provide concrete representations (see section 4) for divided differences  $f^{[n]}$  of functions belonging to the class  $W_n(\mathbb{R})$ .

**Lemma 2.2.** *If  $f \in W_1(\mathbb{R})$ , then*

$$(1) \quad f^{[1]}(\lambda_0, \lambda_1) = \iint_{\Pi} \alpha_0(\lambda_0, \sigma) \alpha_1(\lambda_1, \sigma) d\nu_f(\sigma),$$

where  $\sigma = (s_0, s_1)$ ,  $\alpha_0(\lambda_0, \sigma) = e^{i(s_0 - s_1)\lambda_0}$ ,  $\alpha_1(\lambda_1, \sigma) = e^{is_1\lambda_1}$ ,  $s_0, s_1 \in \mathbb{R}$ .

*Proof.* We have

$$\begin{aligned} \iint_{\Pi} \alpha_0(\lambda_0, \sigma) \alpha_1(\lambda_1, \sigma) d\nu_f(\sigma) &= \frac{i}{\sqrt{2\pi}} \int_{\mathbb{R}} m_f(ds_0) \int_0^{s_0} e^{is_0\lambda_0 - is_1\lambda_0 + is_1\lambda_1} ds_1 \\ &= \frac{1}{(\lambda_0 - \lambda_1)\sqrt{2\pi}} \int_{\mathbb{R}} m_f(ds_0) (e^{is_0\lambda_0} - e^{is_0\lambda_1}) \\ &= \frac{1}{\lambda_0 - \lambda_1} (f(\lambda_0) - f(\lambda_1)) = f^{[1]}(\lambda_0, \lambda_1), \end{aligned}$$

where the repeated integral can be replaced by the double integral by Fubini's theorem and Lemma 2.1.  $\square$

**Lemma 2.3.** *If  $f \in W_n(\mathbb{R})$ , then, for all  $\lambda_0, \dots, \lambda_n \in \mathbb{R}$ ,*

$$\begin{aligned} f^{[n]}(\lambda_0, \dots, \lambda_n) &= \int_{\Pi^{(n)}} e^{i((s_0-s_1)\lambda_0+\dots+(s_{n-1}-s_n)\lambda_{n-1}+s_n\lambda_n)} d\nu_f^{(n)}(s_0, \dots, s_n). \end{aligned}$$

*Proof.* By Lemma 2.2 and induction, we have

$$\begin{aligned} &\int_{\Pi^{(n+1)}} e^{i((s_0-s_1)\lambda_0+\dots+(s_n-s_{n+1})\lambda_n+s_{n+1}\lambda_{n+1})} d\nu_f^{(n+1)}(s_0, \dots, s_{n+1}) \\ &= \int_{\Pi^{(n)}} e^{i((s_0-s_1)\lambda_0+\dots+s_n\lambda_n)} \left( \int_0^{s_n} i e^{is_{n+1}(\lambda_{n+1}-\lambda_n)} ds_{n+1} \right) d\nu_f^{(n)}(s_0, \dots, s_n) \\ &= \frac{1}{\lambda_{n+1} - \lambda_n} \int_{\Pi^{(n)}} e^{i((s_0-s_1)\lambda_0+\dots+s_n\lambda_n)} (e^{is_n(\lambda_{n+1}-\lambda_n)} - 1) d\nu_f^{(n)}(s_0, \dots, s_n) \\ &= \frac{1}{\lambda_{n+1} - \lambda_n} (f^{[n]}(\lambda_0, \dots, \lambda_{n-1}, \lambda_{n+1}) - f^{[n]}(\lambda_0, \dots, \lambda_{n-1}, \lambda_n)) \\ &= f^{[n+1]}(\lambda_0, \dots, \lambda_{n+1}). \end{aligned}$$

□

**Lemma 2.4.** *If  $f \in W_{n+1}(\mathbb{R})$ , then, for all  $\lambda_0, \dots, \lambda_{n+1} \in \mathbb{R}$ ,*

$$\begin{aligned} f^{[n+1]}(\lambda_0, \dots, \lambda_{n+1}) &= i \int_{\Pi^{(n)}} \int_0^{s_j-s_{j+1}} e^{i((s_0-s_1)\lambda_0+\dots+u\lambda_{n+1}+(s_j-s_{j+1}-u)\lambda_j+\dots+s_n\lambda_n)} \\ &\quad \times du d\nu_f^{(n)}(s_0, \dots, s_n). \end{aligned}$$

*Proof.* The right hand side is equal to

$$\begin{aligned} &i \int_{\Pi^{(n)}} e^{i((s_0-s_1)\lambda_0+\dots+(s_j-s_{j+1})\lambda_j+\dots+s_n\lambda_n)} \int_0^{s_j-s_{j+1}} e^{iu(\lambda_{n+1}-\lambda_j)} \\ &\quad \times du d\nu_f^{(n)}(s_0, \dots, s_n) \\ &= \frac{1}{\lambda_{n+1} - \lambda_j} \int_{\Pi^{(n)}} e^{i((s_0-s_1)\lambda_0+\dots+(s_j-s_{j+1})\lambda_j+\dots+s_n\lambda_n)} \\ &\quad (e^{(s_j-s_{j+1})(\lambda_{n+1}-\lambda_j)} - 1) d\nu_f^{(n)}(s_0, \dots, s_n) \\ &= \frac{1}{\lambda_{n+1} - \lambda_j} \int_{\Pi^{(n)}} \left( e^{i((s_0-s_1)\lambda_0+\dots+(s_j-s_{j+1})\lambda_{n+1}+\dots+s_n\lambda_n)} \right. \\ &\quad \left. - e^{i((s_0-s_1)\lambda_0+\dots+(s_j-s_{j+1})\lambda_j+\dots+s_n\lambda_n)} \right) d\nu_f^{(n)}(s_0, \dots, s_n) \\ &= \frac{1}{\lambda_{n+1} - \lambda_j} (f^{[n]}(\lambda_0, \dots, \lambda_{j-1}, \lambda_{n+1}, \lambda_{j+1}, \dots, \lambda_n) \\ &\quad - f^{[n]}(\lambda_0, \dots, \lambda_{j-1}, \lambda_j, \lambda_{j+1}, \dots, \lambda_n)) = f^{[n+1]}(\lambda_0, \dots, \lambda_{n+1}). \end{aligned}$$

□

**Lemma 2.5.** *Let  $(\mathcal{N}, \tau)$  be a semifinite von Neumann algebra. If  $A_\alpha \in \mathcal{N}$ ,  $\alpha \in I$ , is a uniformly bounded net converging in the so-topology to an operator  $A \in \mathcal{N}$  and if  $V \in \mathcal{L}^1(\mathcal{N}, \tau)$ , then the net  $\{A_\alpha V\}_{\alpha \in I}$  converges to  $AV$  in  $L^1(\mathcal{N}, \tau)$ .*

*Proof.* Without loss of generality, we can assume that  $A = 0$ . Since the net  $\{A_\alpha\}_{\alpha \in I}$  is uniformly bounded, we have  $A_\alpha \rightarrow 0$  in the  $\sigma$ -strong operator topology (see e.g. [6, Proposition 2.4.1]). Since the  $\sigma$ -strong topology does not depend on representation [6, Theorem 2.4.23], it can be assumed that  $\mathcal{N}$  acts on  $L^2(\mathcal{N}, \tau)$  in the left regular representation, in particular  $\|A_\alpha y\|_2 \rightarrow 0$  for every  $y \in \mathcal{L}^2(\mathcal{N}, \tau)$ . Without loss of generality, we may suppose that  $V \geq 0$ . Let  $y = V^{1/2} \in \mathcal{L}^2(\mathcal{N}, \tau)$ . Then

$$\tau(|A_\alpha V|) = \tau(u_\alpha A_\alpha y^2) = \tau(A_\alpha y (u_\alpha^* y)^*) \leq \|A_\alpha y\|_2 \cdot \|u_\alpha^* y\|_2 \rightarrow 0,$$

where  $u_\alpha^*$  is the partial isometry from the polar decomposition of  $A_\alpha V$ . □

**Lemma 2.6.** *Let  $A, B \in \mathcal{N}$  and suppose that one of these operators is  $\tau$ -trace-class. If  $T = T^*$  is affiliated with  $\mathcal{N}$  and if  $T = \int_{\mathbb{R}} \lambda dE_\lambda$  is the spectral resolution of  $T$ , then the (complex) measure  $\mu(a, b) := \tau(AE_{(a,b)}B)$  is countably additive (and has finite variation).*

*Proof.* Since the spectral resolution of a self-adjoint operator is strong operator  $\sigma$ -additive (see e.g. [36, VIII.3]), the assertion of the lemma follows from Lemma 2.5. □

### 3. INTEGRATION OF OPERATOR-VALUED FUNCTIONS

**Lemma 3.1.** *An invariant operator ideal  $\mathcal{E}$  has property (F) if and only if the unit ball of  $\mathcal{E}$  endowed with so\*-topology is a complete separable metrisable space.*

*Proof.* The "if" part is evident. Since  $\mathcal{H}$  is separable, the unit ball  $(\mathcal{B}(\mathcal{H})_1, so^*)$  of  $\mathcal{B}(\mathcal{H})$  is a metrisable space [17, Proposition I.3.1]. Hence, the unit ball  $(\mathcal{E}_1, so^*)$  of  $\mathcal{E}$  is also metrisable. Since  $\mathcal{H}$  is separable the unit ball  $(\mathcal{B}(\mathcal{H})_1, so^*)$  is also separable. Thus, every subset of  $(\mathcal{B}(\mathcal{H})_1, so^*)$  is separable [20, I.6.12], and in particular  $\mathcal{E}_1$ . Since the unit ball  $(\mathcal{B}(\mathcal{H})_1, so^*)$  is complete [6, Prop. 2.4.1], the property (F) of  $\mathcal{E}$  implies that  $(\mathcal{E}_1, so^*)$  is also complete. □

Let  $(S, \Sigma, \nu)$  be a finite measure space and  $\mathcal{E}$  be an invariant operator ideal with property (F). A bounded function  $f: (S, \nu) \rightarrow \mathcal{E}$  will be called

(i) weakly measurable if, for any  $\eta, \xi \in \mathcal{H}$ , the function  $\langle f(\cdot)\eta, \xi \rangle$  is measurable;

(ii) \*-measurable if, for all  $\eta \in \mathcal{H}$ , the functions  $f(\cdot)\eta, f(\cdot)^*\eta: (S, \nu) \rightarrow \mathcal{H}$

are Bochner measurable from  $S$  into  $\mathcal{H}$ ;

(iii)  $so^*$ -measurable if there exist a sequence of simple (finitely-valued) measurable functions  $f_n: S \rightarrow \mathcal{E}$  such that  $f_n(\sigma) \rightarrow f(\sigma)$  in the  $so^*$ -topology for a. e.  $\sigma \in S$ .

**Proposition 3.2.** *If  $\mathcal{E}$  has property (F), then, for any  $\mathcal{E}$ -bounded function  $f: (S, \nu) \rightarrow \mathcal{E}$ , the following conditions are equivalent.*

- (i)  $f$  is weakly measurable,
- (ii)  $f$  is  $*$ -measurable,
- (iii)  $f$  is  $so^*$ -measurable.

*Proof.* The implications (iii)  $\Rightarrow$  (ii)  $\Rightarrow$  (i) are evident (and do not depend on property (F)). That (i)  $\Rightarrow$  (iii) follows from Lemma 3.1 and [41, Propositions 1.9 and 1.10].  $\square$

We denote the set of all  $\|\cdot\|$ -bounded  $*$ -measurable functions  $f: S \rightarrow \mathcal{E}$  by  $\mathcal{L}_\infty^{so^*}(S, \nu; \mathcal{E})$ . Examples of such functions are bounded  $\|\cdot\|$ -Bochner-measurable functions and, in the case that  $S$  is a locally compact space, all  $so^*$ -continuous bounded functions.

The following lemma is a simple consequence of the previous proposition (cf. [29, Lemmas 5.5, 5.6]).

**Lemma 3.3.** [29] (i) *The set  $\mathcal{L}_\infty^{so^*}(S, \nu; \mathcal{E})$  is a  $*$ -algebra;*  
(ii) *if  $\phi \in B_{\mathbb{R}}(\mathbb{R})$ ,  $f \in \mathcal{L}_\infty^{so^*}(S, \nu; \mathcal{B}(\mathcal{H})_{sa})$ , then  $\phi(f) \in \mathcal{L}_\infty^{so^*}(S, \nu)$ .*

For any bounded function  $f \in \mathcal{L}_\infty^{so^*}(S, \nu; \mathcal{E})$ , we define the integral  $\int_S f(\sigma) d\nu(\sigma)$  by the formula

$$(2) \quad \left( \int_S f(\sigma) d\nu(\sigma) \right) \eta = \int_S f(\sigma) \eta d\nu(\sigma),$$

where the last integral is a Bochner integral. Evidently, such an integral exists and it is a bounded linear operator with (uniform) norm less or equal to  $|\nu| \|f\|_\infty$ .

**Lemma 3.4.** *If  $\mathcal{E}$  has property (F), and if the sequence  $f_n \in \mathcal{L}_\infty^{so^*}(S, \nu; \mathcal{E})$ ,  $n = 1, 2, \dots$  is  $\mathcal{E}$ -bounded and  $\nu$ -a. e. converges to  $f: S \rightarrow \mathcal{B}(\mathcal{H})$  in the  $so^*$ -topology, then  $f \in \mathcal{L}_\infty^{so^*}(S, \nu; \mathcal{E})$ .*

*Proof.* We have that, for any  $\eta \in \mathcal{H}$ , the sequence  $f_n(\sigma)\eta$  converges to  $f(\sigma)\eta$  for  $\nu$ -a.e.  $\sigma \in S$ . Since the  $\mathcal{H}$ -valued functions  $f_n(\cdot)\eta$  are Bochner measurable and since the pointwise limit of a sequence of Bochner measurable functions is a Bochner measurable function, we have that  $f \in \mathcal{L}_\infty^{so^*}(S, \nu)$ . That  $f(\sigma) \in \mathcal{E}$  for a. e.  $\sigma \in S$  follows from property (F).  $\square$

**Lemma 3.5.** *If  $\mathcal{E}$  has property (F),  $f \in \mathcal{L}_\infty^{so^*}(S, \nu; \mathcal{E})$  and if  $f$  is uniformly  $\mathcal{E}$ -bounded, then  $\int_S f d\nu \in \mathcal{E}$ .*

*Proof.* By Proposition 3.2, we can choose a sequence of simple functions  $f_n \in \mathcal{L}_\infty^{so^*}(S, \nu; \mathcal{E})$  converging a. e. in  $so^*$ -topology to  $f$ . Evidently,  $A_n := \int_S f_n d\nu \in \mathcal{E}$  for all  $n \in \mathbb{N}$ . By the definition (2) of operator-valued integral, the sequence  $\{A_n\}_{n=1}^\infty$  converges to  $\int_S f d\nu$  in the  $so^*$ -topology by the Lebesgue Dominated Convergence Theorem for the Bochner integral. That  $\int_S f d\nu \in \mathcal{E}$  now follows from the property (F) of  $\mathcal{E}$ .  $\square$

**Corollary 3.6.** *Under the assumptions of Lemma 3.4, we have*

$$\int_S f_n d\nu \rightarrow \int_S f d\nu$$

*in the  $so^*$ -topology.*

**Lemma 3.7.** *For any  $A \in \mathcal{B}(\mathcal{H})$  and  $B \in \mathcal{L}_\infty^{so^*}(S, \nu; \mathcal{E})$*

$$A \int_S B(\sigma) d\nu(\sigma) = \int_S AB(\sigma) d\nu(\sigma)$$

The lemma follows directly from [43, Corollary V.5.2].

**Lemma 3.8.** *If  $(S_i, \Sigma_i, \nu_i)$ ,  $i = 1, 2$  are two finite measure spaces and if  $f \in \mathcal{L}_\infty^{so^*}(S_1 \times S_2, \nu_1 \times \nu_2)$ , then  $f(\cdot, t) \in \mathcal{L}_\infty^{so^*}(S_1, \nu_1)$  for almost all  $t \in S_2$  and*

$$(3) \quad \int_{S_2} \int_{S_1} f(s, t) d\nu_1(s) d\nu_2(t) = \int_{S_1 \times S_2} f(s, t) d(\nu_1 \times \nu_2)(s, t).$$

*Proof.* Since  $f(\cdot, \cdot)$  is integrable, for any  $\eta \in \mathcal{H}$  there exists a  $\nu_2$ -measure zero set  $A_\eta \subset S_2$  such that for all  $t \notin A_\eta$  the function  $f(\cdot, t)\eta$  is Bochner integrable (see [20, Theorem III.11.13]). If  $\{\xi_j\}_{j=1}^\infty$  is an orthonormal basis in  $\mathcal{H}$  and  $A = \bigcup_{j=1}^\infty A_{\xi_j}$ , then  $\nu_2(A) = 0$  and, for any  $\eta \in \mathcal{H}$  and  $t \notin A$ , we have

$$f(\cdot, t)\eta = \sum_{j=1}^\infty c_n f(\cdot, t)\xi_n,$$

where  $\eta = \sum_{j=1}^\infty c_n \xi_n$ . Since linear combinations and uniformly bounded pointwise limits of sequences of Bochner integrable functions on the measure space  $(S, \nu)$  are Bochner integrable (by the Lebesgue Dominated Convergence Theorem), it follows that  $f(\cdot, t)\eta$  is integrable for  $t \notin A$ . Similarly, there exists a  $\nu_2$ -measure zero set  $A'$  such that  $f(\cdot, t)^*\eta$  is integrable for all  $\eta \in \mathcal{H}$  and  $t \notin A'$ . Hence,  $f(\cdot, t)$  is integrable for all  $t \notin A \cup A'$  and the operator-valued function  $g(t) := \int_{S_1} f(s, t) d\nu_1(s)$  is well-defined. Now, the integral  $g(t)\eta = \int_{S_1} f(s, t)\eta d\nu_1(s)$  exists and is equal to  $\int_{S_1 \times S_2} f(s, t)\eta d(\nu_1 \times \nu_2)(s, t)$  by Fubini's theorem for the Bochner integral of  $\mathcal{H}$ -valued functions [20, Theorem III.11.13]. The latter means that the equality (3) holds.  $\square$

**Lemma 3.9.** *If  $f \in \mathcal{L}_\infty^{so^*}(S, \nu; \mathcal{N})$ , then*

(i)  $X := \int_S f(\sigma) d\nu(\sigma)$  *belongs to  $\mathcal{N}$ ;*

(ii)  $X$  *as an element of the  $W^*$ -algebra  $\mathcal{N}$  does not depend on any representation of  $\mathcal{N}$ .*

*Proof.* (i) Let  $A' \in \mathcal{N}'$ . Then by Lemma 3.7

$$\begin{aligned} A'X\eta &= \int_S A'f(\sigma)\eta d\nu(\sigma) \\ &= \int_S f(\sigma)A'\eta d\nu(\sigma) = \int_S f(\sigma) d\nu(\sigma)A'\eta = XA'\eta \end{aligned}$$

for any  $\eta \in \mathcal{H}$ . Hence,  $X \in \mathcal{N}$ .

(ii) This follows from the fact that two representations of a von Neumann algebra can be obtained from each other by ampliation, reduction and spatial isomorphism [17], since for each of these isomorphisms the claim is evident.  $\square$

**Lemma 3.10.** *If  $(\mathcal{N}, \tau)$  is a semifinite von Neumann algebra, if  $f \in \mathcal{L}_\infty^{so^*}(S, \nu; \mathcal{L}^1(\mathcal{N}, \tau))$  and if  $f$  is uniformly  $\mathcal{L}^1(\mathcal{N}, \tau)$ -bounded, then  $X := \int_S f(\sigma) d\nu(\sigma) \in \mathcal{L}^1(\mathcal{N}, \tau)$ , the function  $\tau(f(\cdot))$  is measurable and*

$$\tau\left(\int_S f(\sigma) d\nu(\sigma)\right) = \int_S \tau(f(\sigma)) d\nu(\sigma).$$

*Proof.* Lemma 3.5 implies that  $X \in \mathcal{L}^1(\mathcal{N}, \tau)$ , so that the left hand side of the equality above makes sense.

By [29, Lemma 5.9], the function  $\tau(f(\cdot))$  is measurable.

By linearity and by Lemma 3.3(i), we can assume that  $f(\cdot) \geq 0$ . By Lemma 3.9(ii), we can assume that  $\mathcal{N}$  acts on  $L^2(\mathcal{N}, \tau)$  in the left regular representation. Let  $E$  be an arbitrary  $\tau$ -finite projection from  $\mathcal{N}$ . Then  $E \in L^2(\mathcal{N}, \tau)$  and by the definition (2) of the operator-valued integral

$$XE = \int_S f(\sigma)E d\nu(\sigma),$$

where the right hand side is a Bochner integral in  $L^2(\mathcal{N}, \tau)$ . Since  $E$  is  $\tau$ -finite, the convergence in  $L^2(\mathcal{N}, \tau)$  of the Bochner integral implies convergence in  $L^1(\mathcal{N}, \tau)$ , so that we have

$$\tau(XE) = \int_S \tau(f(\sigma)E) d\nu(\sigma).$$

Now, normality of the trace  $\tau$  and the dominated convergence theorem imply that

$$\tau(X) = \int_S \tau(f(\sigma)) d\nu(\sigma).$$

$\square$

## 4. MULTIPLE OPERATOR INTEGRALS

In this section, we define multiple operator integrals of the form

$$\int_{\mathbb{R}^{n+1}} \phi(\lambda_0, \dots, \lambda_n) dE_{\lambda_0}^{B_0} V_1 dE_{\lambda_1}^{B_1} V_2 dE_{\lambda_2}^{B_2} \dots V_n dE_{\lambda_n}^{B_n}.$$

We denote by  $B(\mathbb{R}^{n+1})$  the set of all bounded Borel functions on  $\mathbb{R}^{n+1}$ . Throughout this section, we consider the set of those functions  $\phi \in B(\mathbb{R}^{n+1})$  which admit a representation of the form

$$(4) \quad \phi(\lambda_0, \lambda_1, \dots, \lambda_n) = \int_S \alpha_0(\lambda_0, \sigma) \dots \alpha_n(\lambda_n, \sigma) d\nu(\sigma),$$

where  $(S, \nu)$  is a finite measure space and  $\alpha_0, \dots, \alpha_n$  are bounded Borel functions on  $\mathbb{R} \times S$ . Similar representations (for the case  $n = 1$ ) were discussed in [29].

**Definition 4.1.** For arbitrary self-adjoint operators  $B_0, \dots, B_n$  on the Hilbert space  $\mathcal{H}$ , bounded operators  $V_1, \dots, V_n$  on  $\mathcal{H}$  and any function  $\phi \in B(\mathbb{R}^{n+1})$  which admits a representation given by (4), the multiple operator integral  $T_\phi^{B_0, \dots, B_n}(V_1, \dots, V_n)$  is defined as

$$(5) \quad T_\phi^{B_0, \dots, B_n}(V_1, \dots, V_n) := \int_S \alpha_0(B_0, \sigma) V_1 \dots V_n \alpha_n(B_n, \sigma) d\nu(\sigma),$$

where the integral is taken in the sense of definition (2).

**Remark 4.2.** By [29, Lemma 5.13] and Lemma 3.3(i) applied to  $\mathcal{E} = \mathcal{B}(\mathcal{H})$ , the function  $\sigma \mapsto \alpha_0(B_0, \sigma) V_1 \dots V_n \alpha_n(B_n, \sigma)$  is  $*$ -measurable and therefore the integral above exists.

**Lemma 4.3.** The multiple operator integral in Definition 4.1 is well-defined in the sense that it does not depend on the representation (4) of  $\phi$ .

*Proof.* We first prove that if the operators  $V_1, \dots, V_n$  are all one-dimensional, then the right hand side of (5) does not depend on the representation of  $\phi$  given by (4).

For  $\eta, \xi \in \mathcal{H}$ , we denote by  $\theta_{\eta, \xi}$  the one-dimensional operator defined by formula  $\theta_{\eta, \xi} \zeta = \langle \eta, \zeta \rangle \xi$ ,  $\zeta \in \mathcal{H}$ . It is clear that  $\text{Tr}(\theta_{\eta, \xi}) = \langle \eta, \xi \rangle$ ,  $A\theta_{\eta, \xi} = \theta_{\eta, A\xi}$  for any  $A \in \mathcal{B}(\mathcal{H})$  and that  $\theta_{\eta_1, \xi_1} \dots \theta_{\eta_n, \xi_n} = \langle \eta_1, \xi_2 \rangle \dots \langle \eta_{n-1}, \xi_n \rangle \theta_{\eta_n, \xi_1}$ .

Let  $V_j = \theta_{\eta_j, \xi_j}$ ,  $j = 0, \dots, n$ . Then

$$\begin{aligned}
E &:= \operatorname{Tr} \left( V_0 \int_S \alpha_0(B_0, \sigma) V_1 \dots V_n \alpha_n(B_n, \sigma) d\nu(\sigma) \right) \\
&= \operatorname{Tr} \int_S V_0 \alpha_0(B_0, \sigma) V_1 \dots V_n \alpha_n(B_n, \sigma) d\nu(\sigma) \\
&= \operatorname{Tr} \int_S \theta_{\eta_0, \xi_0} \alpha_0(B_0, \sigma) \theta_{\eta_1, \xi_1} \dots \theta_{\eta_n, \xi_n} \alpha_n(B_n, \sigma) d\nu(\sigma) \\
&= \int_S \operatorname{Tr} (\theta_{\eta_0, \xi_0} \alpha_0(B_0, \sigma) \theta_{\eta_1, \xi_1} \dots \theta_{\eta_n, \xi_n} \alpha_n(B_n, \sigma)) d\nu(\sigma) \\
&= \int_S \operatorname{Tr} (\alpha_0(B_0, \sigma) \theta_{\eta_1, \xi_1} \dots \theta_{\eta_n, \xi_n} \alpha_n(B_n, \sigma) \theta_{\eta_0, \xi_0}) d\nu(\sigma) \\
&= \int_S \operatorname{Tr} (\theta_{\eta_1, \alpha_0(B_0, \sigma) \xi_1} \dots \theta_{\eta_n, \alpha_{n-1}(B_{n-1}, \sigma) \xi_n} \theta_{\eta_0, \alpha_n(B_n, \sigma) \xi_0}) d\nu(\sigma) \\
&= \int_S \langle \eta_0, \alpha_0(B_0, \sigma) \xi_1 \rangle \langle \eta_1, \alpha_1(B_1, \sigma) \xi_2 \rangle \dots \langle \eta_n, \alpha_n(B_n, \sigma) \xi_0 \rangle d\nu(\sigma).
\end{aligned}$$

Now, since  $\langle \eta, \alpha(B) \xi \rangle = \int_{\mathbb{R}} \alpha(\lambda) \langle \eta, dE_{\lambda}^B \xi \rangle$ , we have that

$$E = \int_S \int_{\mathbb{R}} \alpha_0(\lambda_0, \sigma) \langle \eta_0, dE_{\lambda_0}^{B_0} \xi_1 \rangle \dots \int_{\mathbb{R}} \alpha_n(\lambda_n, \sigma) \langle \eta_n, dE_{\lambda_n}^{B_n} \xi_0 \rangle d\nu(\sigma).$$

Since the measure  $\langle \eta, dE_{\lambda} \xi \rangle$  has finite total variation, Fubini's theorem implies

$$\begin{aligned}
E &= \int_S \left( \int_{\mathbb{R}^{n+1}} \alpha_0(\lambda_0, \sigma) \dots \alpha_n(\lambda_n, \sigma) \langle \eta_0, dE_{\lambda_0}^{B_0} \xi_1 \rangle \dots \langle \eta_n, dE_{\lambda_n}^{B_n} \xi_0 \rangle \right) d\nu(\sigma) \\
&= \int_{\mathbb{R}^{n+1}} \left( \int_S \alpha_0(\lambda_0, \sigma) \dots \alpha_n(\lambda_n, \sigma) d\nu(\sigma) \right) \langle \eta_0, dE_{\lambda_0}^{B_0} \xi_1 \rangle \dots \langle \eta_n, dE_{\lambda_n}^{B_n} \xi_0 \rangle \\
&= \int_{\mathbb{R}^{n+1}} \phi(\lambda_0, \dots, \lambda_n) \langle \eta_0, dE_{\lambda_0}^{B_0} \xi_1 \rangle \dots \langle \eta_n, dE_{\lambda_n}^{B_n} \xi_0 \rangle.
\end{aligned}$$

We recall that, if  $A, B$  are bounded operators, then  $A = B$  if and only if the equality  $\operatorname{Tr}(VA) = \operatorname{Tr}(VB)$  holds for all one-dimensional operators  $V$ . It now follows immediately that the multiple operator integral does not depend on the representation (4) of  $\phi$  in the case that the operators  $V_1, \dots, V_n$  are one-dimensional.

By linearity, it follows that the definition of multiple operator integral does not depend on the representation (4) in the case of finite-dimensional operators  $V_1, \dots, V_n$ . Since every bounded operator is an  $so$ -limit of a sequence of finite-dimensional operators, the claim follows from Proposition 4.9.  $\square$

**Lemma 4.4.** *If  $\mathcal{N}$  is a von Neumann algebra, if  $B_0, \dots, B_n$  are self-adjoint operators affiliated with  $\mathcal{N}$  and if  $V_1, \dots, V_n \in \mathcal{N}$ , then  $T_\phi^{B_0, \dots, B_n}(V_1, \dots, V_n) \in \mathcal{N}$ .*

This follows from Lemma 3.9.

The following observation is a direct consequence of Lemma 2.3 and Definition 4.1.

**Lemma 4.5.** *If  $f \in W_n(\mathbb{R})$ , then*

$$(6) \quad T_{f^{[n]}}^{B_0, \dots, B_n}(V_1, \dots, V_n) = \int_{\Pi^{(n)}} e^{i(s_0 - s_1)B_0} V_1 e^{i(s_1 - s_2)B_1} V_2 \dots V_n e^{is_n B_n} d\nu_f^{(n)}(s_0, \dots, s_n).$$

**Lemma 4.6.** *If  $\mathcal{E}$  is an invariant operator ideal with property (F) and if one of the operators  $V_1, \dots, V_n$  belongs to  $\mathcal{E}$ , then*

$$T_\phi^{B_0, \dots, B_n}(V_1, \dots, V_n) \in \mathcal{E}.$$

In case that  $n = 2$ , this yields

$$\left\| T_\phi^{B_1, B_2} \right\|_{\mathcal{E} \rightarrow \mathcal{E}} \leq \|\phi\|,$$

where (see [29])

$$(7) \quad \|\phi\| = \inf \left\{ \int_S \|\alpha(\cdot, \sigma)\|_\infty \|\beta(\cdot, \sigma)\|_\infty d\nu(\sigma) : \phi(\lambda, \mu) = \int_S \alpha(\lambda, \sigma) \beta(\mu, \sigma) d\nu(\sigma) \right\}.$$

*Proof.* Follows from Lemmas 3.3(i) and 3.5.  $\square$

**Remark 4.7.** *If  $V \in \mathcal{L}^2(\mathcal{N}, \tau)$  and if  $n = 2$ , then the preceding definition coincides with the definition of double operator integral as a spectral integral given in [5] and [29].*

**Corollary 4.8.** *If  $V_1, \dots, V_n \in \mathcal{N}$ ,  $V_j \in \mathcal{L}^1(\mathcal{N}, \tau)$  for some  $j = 1, \dots, n$ ,  $B_0, \dots, B_n$  are self-adjoint operators affiliated with  $\mathcal{N}$ ,  $\phi \in B(\mathbb{R}^{n+1})$  and  $\phi(\lambda_0, \dots, \lambda_n)$  admits the representation (4), then*

$$(8) \quad \tau \left( T_\phi^{B_0, \dots, B_n}(V_1, \dots, V_n) \right) = \int_S \tau (\alpha_0(B_0, \sigma) V_1 \alpha_1(B_1, \sigma) \dots V_n \alpha_n(B_n, \sigma)) d\nu(\sigma)$$

*Proof.* It is enough to note that the operator-valued function

$$\sigma \mapsto \alpha_0(B_0, \sigma) V_1 \alpha_1(B_1, \sigma) \dots V_n \alpha_n(B_n, \sigma)$$

is  $*$ -measurable by [29, Lemma 5.11] and Lemma 3.3(i), so that we can apply Lemma 3.10.  $\square$

**Proposition 4.9.** (i) If a sequence of self-adjoint operators  $V_j^{(k_j)} \in \mathcal{B}(\mathcal{H})$ ,  $j = 1, \dots, n$ , converges to  $V_j \in \mathcal{B}(\mathcal{H})$  in the  $so$ -topology (respectively, norm topology) as  $k_j \rightarrow \infty$ , then

$$T_\phi^{B_0, \dots, B_n}(V_1^{(k_1)}, \dots, V_n^{(k_n)}) \rightarrow T_\phi^{B_0, \dots, B_n}(V_1, \dots, V_n)$$

in the  $so$ -topology (respectively, norm topology) as  $k_1, \dots, k_n \rightarrow \infty$ .

(ii) If a sequence of self-adjoint operators  $B_j^{(k_j)}$ ,  $j = 0, \dots, n$  resolvent strongly converges to  $B_j$  as  $k_j \rightarrow \infty$  and  $V_1, \dots, V_n \in \mathcal{B}(\mathcal{H})$ , then

$$T_\phi^{B_0^{(k_0)}, \dots, B_n^{(k_n)}}(V_1, \dots, V_n) \rightarrow T_\phi^{B_0, \dots, B_n}(V_1, \dots, V_n)$$

in the  $so$ -topology as  $k_0, \dots, k_n \rightarrow \infty$ .

*Proof.* We prove the part (ii), the proof of part (i) is similar (and simpler). Suppose that

$$\phi(\lambda_0, \dots, \lambda_n) = \int_S \alpha_0(\lambda_0, \sigma) \dots \alpha_n(\lambda_n, \sigma) d\nu(\sigma)$$

is a representation of  $\phi$  given by (4). Since  $\alpha(\cdot, \sigma)$  is a bounded function for every  $\sigma \in S$ , the operators  $\alpha(B_j^{(k_j)}, \sigma)$  converge to  $\alpha(B_j, \sigma)$  in the  $so$ -topology [36, Theorem VIII.20(b)]. Since multiplication of operators is jointly continuous in the  $so$ -topology on the unit ball of  $\mathcal{N}$  [6, Proposition 2.4.1], the operator  $\alpha(B_0^{(k_0)}, \sigma)V_1 \dots V_n \alpha(B_n^{(k_n)}, \sigma)$  converges in the  $so$ -topology to  $\alpha(B_0, \sigma)V_1 \dots V_n \alpha(B_n, \sigma)$ ,  $\sigma \in S$ . Now, an application of the Dominated Convergence Theorem for the Bochner integral of  $\mathcal{H}$ -valued functions [20, Corollary III.6.16] completes the proof.  $\square$

This new definition of multiple operator integral enables us to give a simple proof of the following

**Proposition 4.10.** *The multiple operator integral has the properties:*

(i) if  $\phi_1$  and  $\phi_2$  admit a representation of the type given in (4), then so does  $\phi_1 + \phi_2$  and

$$(9) \quad T_{\phi_1 + \phi_2}^{B_1, \dots, B_n} = T_{\phi_1}^{B_1, \dots, B_n} + T_{\phi_2}^{B_1, \dots, B_n},$$

(ii) in the case of double operator integrals, if  $\phi_1$  and  $\phi_2$  admit a representation of the type given in (4), then so does  $\phi_1 \phi_2$  and

$$T_{\phi_1 \phi_2}^{B_1, B_2} = T_{\phi_1}^{B_1, B_2} T_{\phi_2}^{B_1, B_2}.$$

*Proof.* (i) If we take representations of the form (4) with  $(S_1, \nu_1)$  and  $(S_2, \nu_2)$  for  $\phi_1$  and  $\phi_2$  and put  $(S, \nu) = (S_1, \nu_1) \sqcup (S_2, \nu_2)$  for  $\phi_1 + \phi_2$  with evident definition of  $\alpha_1, \alpha_2, \dots$ , then the equality (9) follows from Definition 4.1. Here  $\sqcup$  denotes the disjoint sum of measure spaces.

(ii) If

$$\phi_j(\lambda_1, \lambda_2) = \int_{S_1} \alpha_j(\lambda_1, \sigma_1) \beta_j(\lambda_2, \sigma_1) d\nu_j(\sigma_1), \quad j = 1, 2,$$

set

$$\phi(\lambda_1, \lambda_2) = \int_S \alpha(\lambda_1, \sigma) \beta(\lambda_2, \sigma) d\nu(\sigma),$$

where

$$(S, \nu) = (S_1, \nu_1) \times (S_2, \nu_2)$$

and

$$\alpha(\lambda, \sigma) = \alpha_1(\lambda, \sigma_1) \alpha_2(\lambda, \sigma_2), \quad \beta(\lambda, \sigma) = \beta_1(\lambda, \sigma_1) \beta_2(\lambda, \sigma_2).$$

Consequently,

$$\begin{aligned} T_{\phi_1}^{B_1, B_2} \left( T_{\phi_2}^{B_1, B_2}(V) \right) &= \int_{S_1} \alpha_1(B_1, \sigma_1) T_{\phi_2}^{B_1, B_2}(V) \beta_1(B_2, \sigma_1) d\nu_1(\sigma_1) \\ &= \int_{S_1} \alpha_1(B_1, \sigma_1) \left( \int_{S_2} \alpha_2(B_1, \sigma_2) V \beta_2(B_2, \sigma_2) d\nu_2(\sigma_2) \right) \beta_1(B_2, \sigma_1) d\nu_1(\sigma_1). \end{aligned}$$

Now, Lemma 3.7 and Fubini's theorem (Lemma 3.8) imply

$$\begin{aligned} T_{\phi_1}^{B_1, B_2} \left( T_{\phi_2}^{B_1, B_2}(V) \right) &= \int_{S_1 \times S_2} \alpha_1(B_1, \sigma_1) \alpha_2(B_1, \sigma_2) V \\ &\quad \times \beta_2(B_2, \sigma_2) \beta_1(B_2, \sigma_1) d(\nu_1 \times \nu_2)(\sigma_1, \sigma_2) = T_{\phi_1 \phi_2}^{B_1, B_2}(V). \end{aligned}$$

□

## 5. HIGHER ORDER FRÉCHET DIFFERENTIABILITY

We note that, by Stone's theorem [36, Theorem VIII.7] and joint continuity of multiplication of operators (from the unit ball) in the  $so$ -topology [6, Proposition 2.4.1] all operator-valued integrals occurring in this and subsequent sections are defined as in section 3.

**Lemma 5.1.** *If  $A$  is a self-adjoint (possibly unbounded) operator on a Hilbert space  $\mathcal{H}$  and if  $f$  is a function on  $\mathbb{R}$  such that  $f \in W_1(\mathbb{R})$ , then*

$$f(A) = (2\pi)^{-1/2} \int_{\mathbb{R}} e^{isA} m_f(ds).$$

The proof is a simple application of Fubini's theorem. See [6, Theorem 3.2.32]

**Lemma 5.2.** (*Duhamel's formula*). *If  $B$  is an unbounded self-adjoint operator on a Hilbert space  $\mathcal{H}$ , if  $V$  is a bounded self-adjoint operator on  $\mathcal{H}$  and if  $A = B + V$ , then*

$$(10) \quad e^{isA} - e^{isB} = \int_0^s e^{i(s-t)A} i(A - B) e^{itB} dt.$$

*Proof.* Let  $F(t) = e^{itA} e^{-itB}$ . Taking derivative of  $F(t)$  in the  $so$ -topology gives

$$F'(t) = iAe^{itA} e^{-itB} + e^{itA} (-iB) e^{-itB} = e^{itA} i(A - B) e^{-itB}.$$

So,

$$\int_0^s e^{itA} i(A - B) e^{-itB} dt = F(s) - F(0) = e^{isA} e^{-isB} - 1.$$

Multiplying the last equality by  $e^{isB}$  from the right gives (10).  $\square$

**Theorem 5.3.** *Let  $\mathcal{N}$  be a von Neumann algebra. Suppose that  $B = B^*$  is affiliated with  $\mathcal{N}$ , that  $V \in \mathcal{N}$  is self-adjoint and set  $A = B + V$ . If  $f \in W_1(\mathbb{R})$ , then*

$$f(A) - f(B) = T_{f[1]}^{A,B}(V).$$

*Proof.* It follows from Lemma 5.1 that

$$f(A) - f(B) = \frac{1}{\sqrt{2\pi}} \int_{\mathbb{R}} (e^{isA} - e^{isB}) m_f(ds).$$

Hence, by Lemma 5.2,

$$(11) \quad f(A) - f(B) = \frac{i}{\sqrt{2\pi}} \int_{\mathbb{R}} m_f(ds) \int_0^s e^{i(s-t)A} V e^{itB} dt.$$

Since  $f \in W_1(\mathbb{R})$ , by Lemma 2.1 and Fubini's theorem (Lemma 3.8), the repeated integral can be replaced by a double integral, so that

$$(12) \quad f(A) - f(B) = \frac{i}{\sqrt{2\pi}} \iint_{\Pi} e^{i(s-t)A} V e^{itB} m_f(ds) dt \\ = \iint_{\Pi} e^{i(s-t)A} V e^{itB} d\nu_f(\sigma).$$

It now follows from Lemma 4.5 that  $f(A) - f(B) = T_{f[1]}^{A,B}(V)$ .  $\square$

**Remark 5.4.** *The preceding formula is due to Birman-Solomyak [5]. It is similar to [30, Corollary 7.2], which applies to a wider class of functions but is restricted to bounded operators in a semifinite von Neumann algebra  $\mathcal{N}$ .*

Let  $X$  be a topological vector space,  $\mathcal{E}$  be a normed space embedded in  $X$ . Let  $x \in X$  and  $f: x + \mathcal{E} \rightarrow f(x) + \mathcal{E}$ . The function  $f$  is called affinely Fréchet

differentiable at  $x$  along  $\mathcal{E}$  if there exists a (necessarily unique) bounded operator  $L: \mathcal{E} \rightarrow \mathcal{E}$  such that

$$f(x+h) - f(x) = L(h) + r(x,h),$$

where  $\|r(x,h)\|_{\mathcal{E}} = o(\|h\|_{\mathcal{E}})$ . We write  $L = D_{\mathcal{E}}f(x)$ .

**Theorem 5.5.** *Let  $\mathcal{N}$  be a von Neumann algebra, acting in a Hilbert space  $\mathcal{H}$ . Let  $B = B^*$  be affiliated with  $\mathcal{N}$  and let  $V \in \mathcal{E}_{sa}$ , where  $\mathcal{E}$  is an invariant operator ideal over  $\mathcal{N}$  with property (F). If  $f \in W_2(\mathbb{R})$ , then the function  $f: B' \in B + \mathcal{E}_{sa} \mapsto f(B') \in f(B) + \mathcal{E}_{sa}$  is affinely Fréchet differentiable along  $\mathcal{E}_{sa}$  and  $D_{\mathcal{E}}f(B) = T_{f^{[1]}}^{B,B}$ . The function  $X \mapsto D_{\mathcal{E}}f(B+X)$  is continuous in the norm of  $\mathcal{E}$  and satisfies the estimate*

$$(13) \quad \|D_{\mathcal{E}}f(B+X)(V) - D_{\mathcal{E}}f(B)(V)\|_{\mathcal{E}} \leq \|m_{f''}\| \|V\|_{\mathcal{E}} \|X\|_{\mathcal{E}}, \quad X, V \in \mathcal{E}.$$

*Proof.* By (12) we have, following [42],

$$(14) \quad \begin{aligned} f(B+V) - f(B) &= \iint_{\Pi} e^{i(s-t)(B+V)} V e^{itB} d\nu_f(s,t) \\ &= \iint_{\Pi} e^{i(s-t)B} V e^{itB} d\nu_f(s,t) + \iint_{\Pi} (e^{i(s-t)(B+V)} - e^{i(s-t)B}) V e^{itB} d\nu_f(s,t) \\ &= (I) + (II). \end{aligned}$$

(I) is equal to  $T_{f^{[1]}}^{B,B}(V)$  and represents a continuous linear operator on  $\mathcal{E}$  (see Lemmas 4.5 and 4.6), so that it will be a Fréchet derivative of  $f: B + \mathcal{E} \rightarrow f(B) + \mathcal{E}$  provided it is shown that the second term is  $o(\|V\|_{\mathcal{E}})$ . Applying Duhamel's formula (10) yields

$$(15) \quad (II) = \iint_{\Pi} \left( \int_0^{s-t} e^{i(s-t-u)(B+V)} iV e^{iuB} du \right) V e^{itB} d\nu_f(s,t).$$

Since  $f \in W_2(\mathbb{R})$ , Lemmas 2.4, 4.3 and 4.5 enable us to rewrite (15) as

$$(II) = \iiint_{\Pi^{(2)}} e^{i(s-t)(B+V)} V e^{i(t-u)B} V e^{iuB} d\nu_f^{(2)}(s,t,u),$$

where  $(\Pi^{(2)}, \nu_f^{(2)})$  is the finite measure space defined in Lemma 2.1. The  $\mathcal{E}$ -norm of the last expression is estimated by  $\left| \nu_f^{(2)} \right| \|V\| \|V\|_{\mathcal{E}} \leq \left| \nu_f^{(2)} \right| \|V\|_{\mathcal{E}}^2$ . So, the function  $f: B + \mathcal{E} \rightarrow f(B) + \mathcal{E}$  is Fréchet differentiable and  $D_{\mathcal{E}}f(B) = T_{f^{[1]}}^{B,B}$ .

The norm continuity of this derivative and the estimate (13) follow by a similar argument using Duhamel's formula (10).  $\square$

**Remark 5.6.** It follows, in particular, from the preceding theorem via Lemma 4.6 that the operator  $T_{f^{[1]}}^{B,B} \Big|_{\mathcal{E}}$  is a bounded linear operator on  $\mathcal{E}$ .

**Theorem 5.7.** Let  $\mathcal{N}$  be a von Neumann algebra on a Hilbert space  $\mathcal{H}$ , let  $B = B^*$  be affiliated with  $\mathcal{N}$  and let  $V_1, \dots, V_n \in \mathcal{E}_{sa}$ . If  $f \in W_{n+1}(\mathbb{R})$ , then the function  $f: B' \in B + \mathcal{E}_{sa} \mapsto f(B') \in f(B) + \mathcal{E}_{sa}$  is  $n$ -times affinely Fréchet differentiable along  $\mathcal{E}_{sa}$  and

$$(16) \quad D_{\mathcal{E}}^n f(B)(V_1, \dots, V_n) = \sum_{\sigma \in P_n} T_{f^{[n]}}^{B, \dots, B}(V_{\sigma(1)}, \dots, V_{\sigma(n)}) \in \mathcal{E},$$

where  $P_n$  is the standard permutation group.

*Proof.* If  $n = 1$  then this theorem is exactly Theorem 5.5. Set  $\tilde{B} = B + V_{n+1}$ . By induction we have

$$\begin{aligned} & D^n f(\tilde{B}; V_1, \dots, V_n) - D^n f(B; V_1, \dots, V_n) \\ &= \sum_{\sigma \in P_n} \left( T_{f^{[n]}}^{\tilde{B}, \tilde{B}, \dots, \tilde{B}}(V_{\sigma(1)}, \dots, V_{\sigma(n)}) - T_{f^{[n]}}^{B, B, \dots, B}(V_{\sigma(1)}, \dots, V_{\sigma(n)}) \right). \end{aligned}$$

A single term of this sum is

$$\begin{aligned} & T_{f^{[n]}}^{\tilde{B}, \tilde{B}, \dots, \tilde{B}}(V_{\sigma(1)}, \dots, V_{\sigma(n)}) - T_{f^{[n]}}^{B, B, \dots, B}(V_{\sigma(1)}, \dots, V_{\sigma(n)}) \\ &= \sum_{j=0}^n \left( T_{f^{[n]}}^{\tilde{B}, \dots, \tilde{B}, B, \dots, B}^{(j)}(V_{\sigma(1)}, \dots, V_{\sigma(n)}) - T_{f^{[n]}}^{\tilde{B}, \dots, \tilde{B}, \tilde{B}, \dots, B}^{(j)}(V_{\sigma(1)}, \dots, V_{\sigma(n)}) \right). \end{aligned}$$

Now, the  $j$ -th summand is (Lemma 4.5)

$$\begin{aligned} & T_{f^{[n]}}^{\tilde{B}, \dots, \tilde{B}, B, \dots, B}^{(j)}(V_{\sigma(1)}, \dots, V_{\sigma(n)}) - T_{f^{[n]}}^{\tilde{B}, \dots, \tilde{B}, \tilde{B}, \dots, B}^{(j)}(V_{\sigma(1)}, \dots, V_{\sigma(n)}) \\ &= \int_{\Pi^{(n)}} e^{i(s_0 - s_1)\tilde{B}} V_{\sigma(1)} \dots V_{\sigma(j)} e^{i(s_j - s_{j+1})\tilde{B}} V_{\sigma(j+1)} e^{i(s_{j+1} - s_{j+2})B} V_{\sigma(j+2)} \\ & \quad \dots V_{\sigma(n)} e^{is_n B} d\nu_f^{(n)}(s_0, \dots, s_n) \\ & - \int_{\Pi^{(n)}} e^{i(s_0 - s_1)\tilde{B}} V_{\sigma(1)} \dots V_{\sigma(j-1)} e^{i(s_{j-1} - s_j)\tilde{B}} V_{\sigma(j)} e^{i(s_j - s_{j+1})B} V_{\sigma(j+1)} \\ & \quad \dots V_{\sigma(n)} e^{is_n B} d\nu_f^{(n)}(s_0, \dots, s_n) \\ &= \int_{\Pi^{(n)}} e^{i(s_0 - s_1)\tilde{B}} V_{\sigma(1)} \dots V_{\sigma(j)} \left( e^{i(s_j - s_{j+1})\tilde{B}} - e^{i(s_j - s_{j+1})B} \right) V_{\sigma(j+1)} \\ & \quad \dots V_{\sigma(n)} e^{is_n B} d\nu_f^{(n)}(s_0, \dots, s_n). \end{aligned}$$

By Duhamel's formula (Lemma 5.2), we have

$$\begin{aligned} & T_{f^{[n]}}^{\tilde{B}, \dots, \tilde{B}, B, \dots, B}^{(j)}(V_{\sigma(1)}, \dots, V_{\sigma(n)}) - T_{f^{[n]}}^{\tilde{B}, \dots, \tilde{B}, \tilde{B}, \dots, B}^{(j)}(V_{\sigma(1)}, \dots, V_{\sigma(n)}) \\ &= \int_{\Pi^{(n)}} e^{i(s_0 - s_1)\tilde{B}} V_{\sigma(1)} \dots V_{\sigma(j)} \left( \int_0^{s_j - s_{j+1}} e^{iu\tilde{B}} i V_{n+1} e^{i(s_j - s_{j+1} - u)B} du \right) \\ & \quad V_{\sigma(j+1)} \dots V_{\sigma(n)} e^{is_n B} d\nu_f^{(n)}(s_0, \dots, s_n). \end{aligned}$$

Applying Fubini's theorem (Lemma 3.8) we get

$$\begin{aligned} (17) \quad & T_{f^{[n]}}^{\tilde{B}, \dots, \tilde{B}, B, \dots, B}^{(j)} - T_{f^{[n]}}^{\tilde{B}, \dots, \tilde{B}, \tilde{B}, \dots, B}^{(j)} \\ &= i \int_{\Pi^{(n)}} \int_0^{s_j - s_{j+1}} e^{i(s_0 - s_1)\tilde{B}} V_{\sigma(1)} \dots V_{\sigma(j)} e^{iu\tilde{B}} V_{n+1} e^{i(s_j - s_{j+1} - u)B} V_{\sigma(j+1)} \\ & \quad \dots V_{\sigma(n)} e^{is_n B} du d\nu_f^{(n)}(s_0, \dots, s_n). \end{aligned}$$

Hence, it follows from formula (17), Lemma 2.4 and the fact that multiple operator integral is well-defined (Lemma 4.3) that

$$\begin{aligned} & T_{f^{[n]}}^{\tilde{B}, \dots, \tilde{B}, B, \dots, B}^{(j)}(V_{\sigma(1)}, \dots, V_{\sigma(n)}) - T_{f^{[n]}}^{\tilde{B}, \dots, \tilde{B}, \tilde{B}, \dots, B}^{(j)}(V_{\sigma(1)}, \dots, V_{\sigma(n)}) \\ &= T_{f^{[n+1]}}^{\tilde{B}, \dots, \tilde{B}, B, \dots, B}^{(j)}(V_{\sigma(1)}, \dots, V_{\sigma(j)}, V_{n+1}, V_{\sigma(j+1)}, \dots, V_{\sigma(n)}). \end{aligned}$$

Since the multiple operator integral on the right hand side minus the same multiple operator integral with the last  $\tilde{B}$  replaced by  $B$  has the order of  $o((\max \|V_j\|)^{n+2})$  by Duhamel's formula, we see that the theorem is proved.

That the value of the derivative (16) belongs to  $\mathcal{E}$  follows from Lemma 4.6.  $\square$

The argument of the last proof and Lemma 4.5 implies

**Corollary 5.8.** *Let  $\mathcal{N}$  be a von Neumann algebra on a Hilbert space  $\mathcal{H}$ . If  $B = B^*$  is affiliated with  $\mathcal{N}$ , if  $V \in \mathcal{E}_{sa}$  and if  $f \in W_{n+1}(\mathbb{R})$ , then*

$$\begin{aligned} (18) \quad f(B + V) - f(B) &= T_{f^{[1]}}^{B, B}(V) + T_{f^{[2]}}^{B, B, B}(V, V) + \\ & \quad \dots + T_{f^{[n]}}^{B, \dots, B}(V, \dots, V) + O(\|V\|_{\mathcal{E}}^{n+1}). \end{aligned}$$

*Proof.* This corollary is a consequence of Theorem 5.7 and Taylor's formula [38, Theorem 1.43].  $\square$

## 6. SPECTRAL SHIFT AND SPECTRAL AVERAGING

The aim of this section is to prove a semifinite extension of a formula for spectral averaging due to Birman-Solomyak [4].

We first recall the following extension of the spectral shift formula of M. G. Krein from [2, Theorem 3.1].

**Theorem 6.1.** *If  $B = B^*$  is affiliated with  $\mathcal{N}$  and  $V = V^* \in \mathcal{L}^1(\mathcal{N}, \tau)$ , then there exists a unique function  $\xi = \xi_{B+V, B}(\cdot) \in L^1(\mathbb{R})$  such that*

$$\|\xi\|_1 \leq \|V\|_1, \quad \int_{-\infty}^{\infty} \xi(\lambda) d\lambda = \tau(V),$$

$$-\tau(\text{supp}(V_-)) \leq \xi(\lambda) \leq \tau(\text{supp}(V_+)) \quad \text{for a.e. } \lambda \in \mathbb{R}$$

and for any function  $f \in C^1(\mathbb{R})$ , whose derivative  $f'$  admits the representation

$$f'(\lambda) = \int_{-\infty}^{\infty} e^{-i\lambda t} dm(t), \quad \lambda \in \mathbb{R}$$

for some finite (complex) Borel measure on  $\mathbb{R}$ , the operator  $f(B+V) - f(B)$  is  $\tau$ -trace class and

$$\tau(f(B+V) - f(B)) = \int_{-\infty}^{\infty} f'(\lambda)\xi(\lambda) d\lambda.$$

The function  $\xi_{B+V, B}(\cdot)$  is called the *Krein spectral shift function* for the pair  $(B+V, B)$ .

**Lemma 6.2.** *If  $(\mathcal{N}, \tau)$  is a semifinite von Neumann algebra, if  $B = B^*$  is affiliated with  $\mathcal{N}$  and  $V \in \mathcal{L}^1(\mathcal{N}, \tau)$ , then the function  $\gamma(\lambda, r) = \tau(VE_\lambda^{B_r})$  is measurable, where  $B_r := B + rV$ ,  $r \in [0, 1]$ .*

*Proof.* Let  $\phi_{\lambda, \varepsilon}$  be a smooth approximation of  $\chi_{(-\infty, \lambda]}$ . We note that  $\phi_{\lambda, \varepsilon}(B) = \phi_{0, \varepsilon}(B - \lambda)$ , and that the unbounded-operator valued function  $(\lambda, r) \in \mathbb{R}^2 \mapsto B_r - \lambda$  is resolvent uniformly continuous [36, VIII.7]. It follows from [36, Theorem VIII.20(b)] that the function  $(\lambda, r) \mapsto \phi_{\lambda, \varepsilon}(B_r)$  is *so*-continuous, so that Lemma 2.5 implies that the function  $(\lambda, r) \mapsto \tau(V\phi_{\lambda, \varepsilon}(B_r))$  is continuous. Now, since  $\phi_{\lambda, \varepsilon} \rightarrow \chi_{(-\infty, \lambda]}$  pointwise as  $\varepsilon \rightarrow 0$ , the operator  $\phi_{\lambda, \varepsilon}(B_r) \rightarrow \chi_{(-\infty, \lambda]}(B_r)$  in *so*-topology. Hence, again by Lemma 2.5, the function  $\tau(V\chi_{(-\infty, \lambda]}(B_r))$  is measurable.  $\square$

**Theorem 6.3.** *Let  $(\mathcal{N}, \tau)$  be a semifinite von Neumann algebra on a Hilbert space  $\mathcal{H}$  with a faithful normal semifinite trace  $\tau$ . Let  $B = B^*$  be affiliated with  $\mathcal{N}$  and let  $V = V^* \in \mathcal{L}^1(\mathcal{N}, \tau)$ . If  $f \in W_2(\mathbb{R})$ , then  $f(B+V) - f(B) \in \mathcal{L}^1(\mathcal{N}, \tau)$  and*

$$\tau(f(B+V) - f(B)) = \int_{\mathbb{R}} f'(\lambda) d\Xi(\lambda),$$

where the measure  $\Xi$  is given by

$$\Xi(a, b) = \int_0^1 \tau(VE_{(a, b)}^{B_r}) dr, \quad a, b \in \mathbb{R}.$$

Here  $B_r := B + rV$ ,  $r \in [0, 1]$  and  $dE_\lambda^{B_r}$  is the spectral measure of  $B_r$ .

Due to Lemma 6.2 the measure  $\Xi$  is well-defined.

*Proof.* If  $\phi(\lambda, \mu) = \alpha(\lambda)\beta(\mu)$ , where  $\alpha, \beta$  are continuous bounded functions on  $\mathbb{R}$ , then by the definition of the multiple operator integral

$$T_\phi^{B,B}(V) = \alpha(B)V\beta(B).$$

Hence,

$$\tau\left(T_\phi^{B,B}(V)\right) = \tau(\alpha(B)V\beta(B)) = \tau(\alpha(B)\beta(B)V).$$

Since the function  $\alpha(\cdot)\beta(\cdot)$  is bounded, the simple spectral approximations to the bounded operator  $\alpha(B)\beta(B)$  converge uniformly and so, after multiplying by  $V$ , converge in norm of  $\mathcal{L}^1(\mathcal{N}, \tau)$ . This implies that

$$\tau(\alpha(B)\beta(B)V) = \tau\left(\int_{\mathbb{R}} \alpha(\lambda)\beta(\lambda) dE_\lambda^B V\right) = \int_{\mathbb{R}} \alpha(\lambda)\beta(\lambda)\tau(dE_\lambda^B V).$$

Hence, for functions of the form  $\phi(\lambda, \mu) = \alpha(\lambda)\beta(\mu)$ , it follows that

$$(19) \quad \tau\left(T_\phi^{B,B}(V)\right) = \int_{\mathbb{R}} \phi(\lambda, \lambda)\tau(dE_\lambda^B V).$$

Let  $(S, \Sigma, \nu)$  be a finite (complex) measure space, let  $\alpha(\cdot, \cdot), \beta(\cdot, \cdot)$  be bounded continuous functions on  $\mathbb{R} \times S$  and suppose that

$$\phi(\lambda, \mu) = \int_S \alpha(\lambda, \sigma)\beta(\lambda, \sigma) d\nu(\sigma) \quad \text{for all } (\lambda, \mu) \in \mathbb{R}^2$$

is a representation of  $\phi$  given by (4). Let  $\phi_\sigma(\lambda, \mu) := \alpha(\lambda, \sigma)\beta(\mu, \sigma)$ . It then follows from the definition of the multiple operator integral that  $T_\phi^{B,B}(V) = \int_S T_{\phi_\sigma}^{B,B}(V) d\nu(\sigma)$  and hence by Corollary 4.8

$$\tau\left(T_\phi^{B,B}(V)\right) = \int_S \tau\left(T_{\phi_\sigma}^{B,B}(V)\right) d\nu(\sigma).$$

It follows from (19) that

$$(20) \quad \begin{aligned} \tau\left(T_\phi^{B,B}(V)\right) &= \int_S \int_{\mathbb{R}} \phi_\sigma(\lambda, \lambda)\tau(dE_\lambda^B V) d\nu(\sigma) \\ &= \int_{\mathbb{R}} \int_S \phi_\sigma(\lambda, \lambda) d\nu(\sigma)\tau(dE_\lambda^B V) \\ &= \int_{\mathbb{R}} \phi(\lambda, \lambda)\tau(dE_\lambda^B V). \end{aligned}$$

The interchange of integrals in the second equality is justified by Lemma 2.6 and Fubini's theorem. Further, since  $f \in W_2(\mathbb{R})$ , it follows from Theorem 5.5 applied to  $\mathcal{E} = \mathcal{L}^1(\mathcal{N}, \tau)$  that the Fréchet derivative  $D_{\mathcal{L}^1} f(B_r) = T_{f^{[1]}}^{B_r, B_r}$  exists for all  $r \in [0, 1]$ . By the continuity of the Fréchet derivative given by

the estimate (13) and the Newton-Leibnitz formula for the Fréchet derivative (see e.g. [38, Theorem 1.43]) it follows that

$$\int_0^1 T_{f^{[1]}}^{B_r, B_r}(V) dr = \int_0^1 D_{\mathcal{L}^1} f(B_r)(V) dr = f(B + V) - f(B).$$

By Corollary 4.8 and taking traces it follows that

$$(21) \quad \int_0^1 \tau \left( T_{f^{[1]}}^{B_r, B_r}(V) \right) dr = \tau(f(B + V) - f(B)).$$

Since  $f^{[1]}$  is continuous,  $f^{[1]}(\lambda, \lambda) = f'(\lambda)$ , so that (21) and (20) imply

$$\begin{aligned} \tau(f(B + V) - f(B)) &= \int_0^1 \int_{\mathbb{R}} f^{[1]}(\lambda, \lambda) \tau(dE_{\lambda}^{B_r} V) dr \\ &= \int_0^1 \int_{\mathbb{R}} f'(\lambda) \tau(dE_{\lambda}^{B_r} V) dr \\ &= \int_{\mathbb{R}} f'(\lambda) \int_0^1 \tau(dE_{\lambda}^{B_r} V) dr, \end{aligned}$$

the interchange of the integrals in the last equality being justified by Fubini's theorem [24, VI.2] via Lemma 2.6 and the fact that  $f'$  is a bounded function.  $\square$

The next corollary in the case that  $\mathcal{N} = \mathcal{B}(\mathcal{H})$  and  $\tau = \text{Tr}$  was established in [4].

**Corollary 6.4.** *The measure  $\Xi$  is absolutely continuous and the following equality holds*

$$d\Xi(\lambda) = \xi(\lambda) d\lambda,$$

where  $\xi(t)$  is the spectral shift function for the pair  $(B + V, B)$ .

*Proof.* From Theorem 6.1 and Theorem 6.3, it follows that

$$\int_{\mathbb{R}} f'(\lambda) d\Xi(\lambda) = \int_{\mathbb{R}} f'(\lambda) \xi(\lambda) d\lambda$$

for all  $f \in C_c^\infty(\mathbb{R})$ . Consequently, the measures  $d\Xi(\lambda)$  and  $\xi(\lambda) d\lambda$  have the same derivative in the sense of generalized functions. By [22, Ch. I.2.6] there exists a constant  $c$  such that

$$d\Xi(\lambda) - \xi(\lambda) d\lambda = c \cdot d\lambda.$$

Since the measures  $d\Xi(\lambda)$  and  $\xi(\lambda) d\lambda$  are finite, it follows immediately, that  $c = 0$ .  $\square$

## 7. SPECTRAL SHIFT AND SPECTRAL FLOW

The second named author and J. Phillips have established various analytic formulae for spectral flow along a path of self-adjoint unbounded Breuer-Fredholm operators affiliated with a semifinite von Neumann algebra. For special choices of path suggested by the theory of the Krein spectral shift function, one may study a spectral flow function on the real line:  $\mu \mapsto \text{sf}(\mu, D_0, D_1)$ ,  $\mu \in \mathbb{R}$ , where  $D_1$  and  $D_0$  differ by a  $\tau$ -trace class operator and the function measures spectral flow from  $D_0 - \mu$  to  $D_1 - \mu$ . We now show that, under these circumstances, the spectral flow function actually coincides with the Krein spectral shift function.

Let us first recall preliminary material about spectral flow. For more details see [34, 35, 9]. In these papers the notion of type II spectral flow is introduced and an analytic approach is developed starting from ideas of Getzler [23]. The new approach of these papers allows the study of spectral flow between certain unbounded Breuer-Fredholm operators affiliated with a general semifinite von Neumann algebra [9]. We summarize the main features.

Let  $\mathcal{N}$  be a semifinite von Neumann algebra with a faithful normal semifinite trace  $\tau$  and  $P, Q \in \mathcal{N}$  be two infinite projections. Let  $\ker_Q T := \ker T \cap Q(\mathcal{H})$ . An operator  $T \in P\mathcal{N}Q$  is said to be  $(P, Q)$   $\tau$ -Fredholm if the subspaces  $\ker_Q T$  and  $\ker_P T^*$  are  $\tau$ -finite and there exists a projection  $P_1 \in \mathcal{N}$  such that  $P_1 \leq P$ ,  $\tau(P - P_1) < \infty$  and  $P_1(\mathcal{H}) \subset T(\mathcal{H})$ . In this case  $(P, Q)$ -index of the operator  $T$  is defined to be a number

$$\tau\text{-ind}_{P-Q}(T) := \tau[\ker_Q T] - \tau[\ker_P T^*].$$

Here  $[\mathcal{K}]$  denotes the projection onto the subspace  $\mathcal{K} \subseteq \mathcal{H}$ . If  $P = Q = 1$  we call  $T$  just  $\tau$ -Fredholm. For details see [7, 8, 33].

Now, let  $F: t \in [a, b] \mapsto F_t \in \mathcal{N}$  be a norm continuous path of  $\tau$ -Fredholm operators and  $P_t = \frac{1}{2}(1 + \text{sign}(F_t))$ . If a partition  $t_0 = a < t_1 < \dots < t_n = b$  of the segment  $[a, b]$  is sufficiently small, then the operators  $P_{j-1}P_j: P_j\mathcal{H} \rightarrow P_{j-1}\mathcal{H}$ ,  $P_{j-1}P_j \in P_{j-1}\mathcal{N}P_j$ , are  $(P_{j-1}, P_j)$   $\tau$ -Fredholm for  $j = 1, \dots, n$  ( $P_j := P_{t_j}$ ), so that the number

$$\text{sf}(\{F_t\}) := \sum_{j=1}^n \tau\text{-ind}_{P_{j-1}-P_j}(P_{j-1}P_j)$$

is well-defined and does not depend on the partition  $\{t_j, j = 1, \dots, n\}$ . Further, if two paths  $\{F_t\}$  and  $\{G_t\}$  with the same ends points are norm homotopic, then  $\text{sf}(\{F_t\}) = \text{sf}(\{G_t\})$ , so that the spectral flow  $\text{sf}(F_0, F_1)$  depends only on the endpoints.

We recall the definition of a semifinite spectral triple (see e.g. [10]).

**Definition 7.1.** *A semifinite spectral triple  $(\mathcal{A}, \mathcal{N}, D)$  is given by a Hilbert space  $\mathcal{H}$ , a  $*$ -algebra  $\mathcal{A} \subset \mathcal{N}$  where  $\mathcal{N}$  is a semifinite von Neumann algebra*

acting on  $\mathcal{H}$ , and a densely defined unbounded self-adjoint operator  $D$  affiliated to  $\mathcal{N}$  such that

- 1)  $[D, a]$  is densely defined and extends to a bounded operator for all  $a \in \mathcal{A}$ ;
- 2)  $(\lambda - D)^{-1} \in \mathcal{K}(\mathcal{N}, \tau)$  for all  $\lambda \notin \mathbb{R}$ , where  $\mathcal{K}(\mathcal{N}, \tau)$  is the set of all  $\tau$ -compact operators.

A spectral triple  $(\mathcal{A}, \mathcal{N}, D)$  is said to be  $\theta$ -summable if for all  $t > 0$  the operator  $e^{-tD^2}$  is  $\tau$ -trace class.

Let  $(\mathcal{A}, \mathcal{N}, D)$  be a  $\theta$ -summable semifinite spectral triple, let  $V \in \mathcal{L}^1(\mathcal{N}, \tau)$  and let

$$D_r = D + rV, \quad r \in [0, 1].$$

The Carey-Phillips formula [9] for spectral flow between  $D_0 = D$  and  $D_1 = D + V$  is given by

$$\begin{aligned} \text{sf}(D_0, D_1) &= \sqrt{\frac{\varepsilon}{\pi}} \int_0^1 \tau \left( V e^{-\varepsilon D_r^2} \right) dr + \frac{1}{2} (\eta_\varepsilon(D_1) - \eta_\varepsilon(D_0)) \\ &\quad + \frac{1}{2} \tau ([\ker(D_1)] - [\ker(D_0)]), \end{aligned}$$

where the  $\eta_\varepsilon$ -invariant of an unbounded self-adjoint operator  $D$ , such that  $e^{-tD^2}$  is  $\tau$ -trace class for all  $t > 0$ , is defined as [9, Definition 8.1]

$$\eta_\varepsilon(D) := \frac{1}{\sqrt{\pi}} \int_\varepsilon^\infty \tau \left( D e^{-tD^2} \right) t^{-1/2} dt.$$

Spectral flow may be interpreted as the ‘net amount’ of spectrum crossing zero while moving from  $D_0$  to  $D_1$ . So, it is natural to define the function  $\text{sf}(\lambda; D_0, D_1) := \text{sf}(D_0 - \lambda, D_1 - \lambda)$  as spectral flow at a point  $\lambda$ .

It follows from the Carey-Phillips formula that

$$\begin{aligned} (22) \quad \text{sf}(\mu; D_0, D_1) &= \sqrt{\frac{\varepsilon}{\pi}} \int_0^1 \tau \left( V e^{-\varepsilon(D_r - \mu)^2} \right) dr + \frac{1}{2} (\eta_\varepsilon(D_1 - \mu) - \eta_\varepsilon(D_0 - \mu)) \\ &\quad + \frac{1}{2} \tau ([\ker(D_1 - \mu)] - [\ker(D_0 - \mu)]), \quad \mu \in \mathbb{R}. \end{aligned}$$

The following theorem establishes a connection between the spectral shift function for the pair  $(D_0 + V, D_0)$  and the spectral flow function  $\text{sf}(\cdot, D_0, D_0 + V)$ .

**Theorem 7.2.** *If  $V \in \mathcal{N}$  belongs to the  $\tau$ -trace class, then*

$$\text{sf}(\mu; D_0, D_1) = \xi_{D_1, D_0}(\mu) + \frac{1}{2} \tau ([\ker(D_1 - \mu)] - [\ker(D_0 - \mu)])$$

for almost all  $\mu \in \mathbb{R}$ .

*Proof.* The spectral theorem and Lemma 2.5 implies

$$\begin{aligned} \sqrt{\frac{\varepsilon}{\pi}} \tau \left( V e^{-\varepsilon(D_r - \mu)^2} \right) &= \sqrt{\frac{\varepsilon}{\pi}} \tau \left( V \int_{\mathbb{R}} e^{-\varepsilon(\lambda - \mu)^2} dE_{\lambda}^{D_r} \right) \\ &= \int_{\mathbb{R}} j_{\varepsilon}(\lambda - \mu) \tau \left( V dE_{\lambda}^{D_r} \right), \end{aligned}$$

where  $j_{\varepsilon}(x) = \sqrt{\frac{\varepsilon}{\pi}} e^{-\varepsilon x^2}$ ,  $x \in \mathbb{R}$ . By Corollary 6.4 and using the fact that the system  $\{j_{\varepsilon}\}$  is an approximate identity, we obtain that

$$\begin{aligned} \int_0^1 \int_{\mathbb{R}} j_{\varepsilon}(\lambda - \mu) \tau \left( V dE_{\lambda}^{D_r} \right) dr &= \int_{\mathbb{R}} j_{\varepsilon}(\lambda - \mu) \frac{d}{d\lambda} \int_0^1 \tau \left( V E_{\lambda}^{D_r} \right) dr d\lambda \\ &= j_{\varepsilon} * \xi_{D_1, D_0}(\mu) \xrightarrow{L^1} \xi_{D_1, D_0}(\mu) \quad \text{when } \varepsilon \rightarrow \infty. \end{aligned}$$

The convergence in the last line can be justified by [37, Chapter 3, section 5.6].

Since  $\eta_{\varepsilon}(D_j - \mu) \rightarrow 0$ ,  $j = 0, 1$ , when  $\varepsilon \rightarrow \infty$ , it follows from the Carey-Phillips formula (22) that

$$\text{sf}(\mu; D_0, D_1) = \xi_{D_1, D_0}(\mu) + \frac{1}{2} \tau \left( [\ker(D_1 - \mu)] - [\ker(D_0 - \mu)] \right), \quad \mu \in \mathbb{R}.$$
