

# Weighted Sobolev spaces and embedding theorems

V. Gol'dshtein, A. Ukhlov<sup>1</sup>

ABSTRACT.

In the present paper we study embedding operators for weighted Sobolev spaces whose weights satisfy the well-known Muckenhoupt  $A_p$ -condition. Sufficient conditions for boundedness and compactness of the embedding operators are obtained for smooth domains and domains with boundary singularities. The proposed method is based on the concept of 'generalized' quasiconformal homeomorphisms (homeomorphisms with bounded mean distortion.) The choice of the homeomorphism type depends on the choice of the corresponding weighted Sobolev space. Such classes of homeomorphisms induce bounded composition operators for weighted Sobolev spaces. With the help of these homeomorphism classes the embedding problem for non-smooth domains is reduced to the corresponding classical embedding problem for smooth domains. Examples of domains with anisotropic Hölder singularities demonstrate sharpness of our machinery comparatively with known results.

## Introduction

Weighted Sobolev spaces are solution spaces of degenerate elliptic equations (see, for example [1]). Type of a weight depends on the equation type. Similar to the classical theory of Sobolev spaces, embedding theorems of weighted Sobolev spaces are suitable for the corresponding elliptic boundary problems, especially for existence and uniqueness of solutions. Embedding operators for weighted Sobolev spaces in smooth domains were studied by many authors (see, for example, [1–6]) with the help of the integral representations theory adopted to the weighted case. Weighted Sobolev spaces in non smooth domains were not studied before, except article [7] where some sufficient conditions for boundedness of the embedding operators were obtained. The main technical problem for the non-smooth case is an adequate description of an interplay between weights and boundary types (singularities). The adequate choice allows us to obtain sharp Sobolev type embeddings.

The relation between Jacobians of quasiconformal homeomorphisms and admissible weights for Sobolev and Poincare inequalities was studied in [8]. In the present article we introduce a new approach based on the concept of 'generalized' quasiconformal homeomorphisms (or homeomorphisms with bounded mean distortion in another terminology) that induce bounded composition operators of weighted Sobolev spaces. These homeomorphisms transform the original embedding operators on non smooth domains to the embedding operators on smooth domains with a corresponding weight change. This approach was suggested in [9] for classical Sobolev spaces on non smooth domains and can be briefly described with the help of the following diagram:

$$\begin{array}{ccc} W_p^1(D', w) & \xrightarrow{\varphi^*} & W_q^1(D) \\ \downarrow & & \downarrow \\ L_s(D', w) & \xleftarrow{(\varphi^{-1})^*} & L_r(D) \end{array}$$

---

Here the operator  $\varphi^* f = f \circ \varphi$  is a bounded composition operator of Sobolev spaces induced by a homeomorphism  $\varphi$  that maps smooth domain  $D \subset \mathbb{R}^n$  onto non smooth domain  $D' \subset \mathbb{R}^n$ . Suppose that its inverse homeomorphism  $\varphi^{-1}$  induces a bounded composition operator of corresponding Lebesgue spaces. If the Sobolev space  $W_q^1(D)$  permits a bounded (compact) embedding operator into  $L_r(D)$  then, using the corresponding compositions, we can construct the embedding operator of the weighted Sobolev space  $W_p^1(D', w)$  into  $L_s(D', w)$ . The same scheme was used in the article [10] for the study of the embedding operators of  $W_2^1$  into  $L_2$  on non smooth bounded domains. In article [11] the same approach was applied to embedding problems for domains of Carnot groups.

Let us shortly describe the content of the paper. In section 1 we give necessary definitions and prove density of smooth functions in weighted Sobolev spaces with weights satisfying the  $A_p$ -condition. Such weighted Sobolev spaces are Banach spaces. In section 2 we introduce classes of quasiisometrical homeomorphisms and prove sufficient conditions for the compactness of the embedding operators for the weighted Sobolev spaces in domains quasiisometrically equivalent to smooth ones. In section 3 we introduce classes of homeomorphisms with bounded mean distortion and study embedding operators for weighted Sobolev spaces defined on images of smooth domains. We apply these abstract results to domains with anisotropic Hölder type singularities. The obtained estimates are sharper than the known result [7].

In section 5 we apply embedding theorems for weighted Sobolev spaces to degenerated elliptic boundary problems.

## 1. Weighted spaces

In this paper we study weighted Lebesgue and Sobolev spaces defined in the domains of  $n$ -dimensional Euclidean space  $\mathbb{R}^n$ ,  $n \geq 2$ .

Let  $D$  be an open subset of  $\mathbb{R}^n$ ,  $n \geq 2$ , and  $w : \mathbb{R}^n \rightarrow [0, \infty)$  be a locally summable nonnegative function, i.e., a weight. Define a weighted Lebesgue space  $L_p(D, w)$ ,  $1 \leq p < \infty$ , as a Banach space of locally summable functions  $f : D \rightarrow \mathbb{R}$  equipped with the following norm:

$$\|f\|_{L_p(D, w)} = \left( \int_D |f|^p(x) w(x) dx \right)^{1/p}, \quad 1 \leq p < \infty.$$

Define a weighted Sobolev space  $W_p^m(D, w)$ ,  $1 \leq m < \infty$ ,  $1 \leq p < \infty$ , as a normed space of locally summable,  $m$  times weakly differentiable functions  $f : D \rightarrow \mathbb{R}$  equipped with the following norm:

$$\|f\|_{W_p^m(D, w)} = \left( \int_D |f|^p(x) w(x) dx \right)^{1/p} + \sum_{|\alpha|=m} \left( \int_D |D^\alpha f|^p(x) w(x) dx \right)^{1/p},$$

$\alpha := (\alpha_1, \alpha_2, \dots, \alpha_n)$  is a multiindex,  $\alpha_i = 0, 1, \dots$ ,  $|\alpha| = \alpha_1 + \alpha_2 + \dots + \alpha_n$  and  $D^\alpha f$  is the weak derivative of order  $\alpha$  of the function  $f$ :

$$\int_D f D^\alpha \eta dx = (-1)^{|\alpha|} \int_D (D^\alpha f) \eta dx, \quad \forall \eta \in C_0^\infty(D).$$

As usual  $C_0^\infty(D)$  is the space of infinitely smooth functions with a compact support.

By technical reasons we will need also a seminormed space  $L_p^m(D)$  of locally summable,  $m$  times weakly differentiable functions  $f : D \rightarrow \mathbb{R}$  equipped with the following seminorm:

$$\|f\|_{L_p^1(D, w)} = \sum_{|\alpha|=m} \left( \int_D |D^\alpha f|^p(x) w(x) dx \right)^{1/p}.$$

Without additional restrictions the space  $W_p^m(D, w)$  is not necessarily a Banach space (see, for example [1]).

Let us assume additionally that weight  $w : \mathbb{R}^n \rightarrow [0, \infty)$  satisfies the well-known  $A_p$ -condition:

$$\sup_{B \subset \mathbb{R}^n} \left( \frac{1}{|B|} \int_B w \right) \left( \frac{1}{|B|} \int_B w^{1/(1-p)} \right)^{p-1} < +\infty,$$

where  $1 < p < \infty$ , and  $|B|$  is Lebesgue measure of ball  $B$ .

**Theorem 1.** Let  $D \subset \mathbb{R}^n$  be an open set and a weight  $w$  satisfies to the  $A_p$ -condition. Then  $W_p^m(D, w)$ ,  $1 \leq m < \infty$ ,  $1 < p < \infty$ , is a Banach space. Smooth functions of the class  $W_p^m(D, w)$  are dense in  $W_p^m(D, w)$ .

Let us give some remarks before the proof.

Suppose that nonnegative function  $\omega : \mathbb{R}^n \rightarrow [0, \infty)$  belongs to  $C^\infty(\mathbb{R}^n)$ ,  $\text{supp } \omega \subset \overline{B(0, 1)}$  and

$$\int_{\mathbb{R}^n} \omega dx = 1.$$

Denote by

$$A_r f(x) = \frac{1}{r^n} \int_{\mathbb{R}^n} \omega\left(\frac{x-z}{r}\right) f(z) dz$$

a mollifier function of  $f$  with a mollification kernel  $\omega$ .

Let  $D_\delta = \{x \in D : \text{dist}(x, \partial D) > \delta\}$  for  $\delta > 0$ . The proof of the theorem is based on the following lemma (see, for example [12]):

**Lemma 1.** Let  $D \subset \mathbb{R}^n$  be an open set and a function  $f \in L_{1,\text{loc}}(D)$  has a weak derivative  $D^\alpha f$  on  $D$ . Then for every  $0 < r < \delta$

$$D^\alpha(A_r f) = A_r(D^\alpha f) \quad \text{on } D_\delta.$$

**PROOF.** For the reader convenience we reproduce here a version of the proof. Note, that for every  $x \in D_\delta$ ,

$$(A_r f)(x) = \int_{B(0,1)} f(x - rz) \omega(z) dz, \quad 0 < r < \delta.$$

By definition of the weak derivative  $D_x^\alpha(f(x - rz)) = (D_x^\alpha f)(x - rz)$  on  $D_\delta$ .

Suppose  $(x, z) \in D_\delta \times B(0, 1)$ . Define  $F(x, z) = f(x - rz) \omega(z)$  and  $G(x, z) = (D_x^\alpha f)(x - rz) \omega(z)$ . Then for each compact  $K \subset D_\delta$  the functions  $F, G$  belong to  $L_1(K \times B(0, 1))$ .

Moreover, by Fubini's theorem and the definition of the mollification kernel we get

$$\begin{aligned}
\int_K \left( \int_{B(0,1)} |f(x-rz)\omega(z)| dz \right) dx &= \int_K \left( \frac{1}{r^n} \int_{B(x,r)} |f(y)\omega\left(\frac{x-y}{r}\right)| dy \right) dx \\
&= \int_{K^r} \left( \frac{1}{r^n} \int_K |f(y)\omega\left(\frac{x-y}{r}\right)| dx \right) dy \leq \int_{K^r} |f(y)| \left( \frac{1}{r^n} \int_K \omega\left(\frac{x-y}{r}\right) dx \right) dy \\
&\leq \int_{K^r} |f(y)| \left( \frac{1}{r^n} \int_{\mathbb{R}^n} \omega\left(\frac{x-y}{r}\right) dx \right) dy = \int_{K^r} |f(y)| dy = \|f\|_{L_1(K^r)}.
\end{aligned}$$

Here  $K^r$  is the  $r$ -neighborhood of  $K$ ,  $\overline{K^r} \subset D$ . Of course, the same estimate is correct for  $G$ .

Using the Fubini's theorem we have

$$\begin{aligned}
\int_{D_\delta} \left( \int_{B(0,1)} D_x^\alpha f(x-rz)\omega(z) dz \right) \eta(x) dx &= \int_{B(0,1)} \left( \int_{D_\delta} (D_x^\alpha f(x-rz)\omega(z)) \eta(x) dx \right) dz \\
&= (-1)^{|\alpha|} \int_{B(0,1)} \left( \int_{D_\delta} f(x-rz)\omega(z) (D^\alpha \eta(x)) dx \right) dz \\
&= (-1)^{|\alpha|} \int_{D_\delta} \left( \int_{B(0,1)} f(x-rz)\omega(z) dz \right) D^\alpha \eta(x) dx
\end{aligned}$$

for every function  $\eta \in C_0^\infty(D_\delta)$ .

Hence for every  $x \in D_\delta$

$$\begin{aligned}
D^\alpha((A_r f)(x)) &= D^\alpha \left( \int_{B(0,1)} f(x-rz)\omega(z) dz \right) \\
&= \int_{B(0,1)} D_x^\alpha f(x-rz)\omega(z) dz = (A_r(D^\alpha f))(x).
\end{aligned}$$

**PROOF OF THEOREM 1.** Fix  $\delta > 0$ . Since the weight  $w$  satisfies the  $A_p$ -condition, Hardy-Littlewood maximal operator

$$Mf(x) = \sup_{\delta > r > 0} \frac{1}{r^n} \int_{B(x,r)} f(z) dz$$

is bounded in  $L_p(D_\delta, w)$  [13]. Hence

$$\begin{aligned} \|A_r f - f\|_{L_p(D_\delta, w)} &= \left( \int_{D_\delta} \left| \int_{B(0,1)} f(x - rz) \omega(z) dz - f(x) \right|^p w(x) dx \right)^{\frac{1}{p}} \\ &= \left( \int_{D_\delta} \left| \int_{B(0,1)} (f(x - rz) - f(x)) \omega(z) dz \right|^p w(x) dx \right)^{\frac{1}{p}} \\ &\leq \|M\| \max_{x \in B(0,1)} \omega(x) \left( \int_{D_\delta} |f(x - rz) - f(x)|^p w(x) dx \right)^{\frac{1}{p}}. \end{aligned}$$

Here  $\|M\|$  is the norm of the maximal operator in the space  $L_p(D_\delta, w)$ .

From the last inequality follows, that for continuous functions  $f$

$$A_r f \rightarrow f \quad \text{in } L_p(D_\delta, w).$$

Using an approximation of an arbitrary function  $f \in L_p(D_\delta, w)$  by continuous functions (see, for example, [14]) the convergence can be obtained for  $f \in L_p(D_\delta, w)$  also.

By Lemma 1

$$A_r f \rightarrow f \quad \text{in } W_p^m(D_\delta, w)$$

for an arbitrary function  $f \in W_p^m(D, w)$ . Therefore smooth functions are dense in  $W_p^m(D_\delta, w)$ .

Density of smooth functions of class  $W_p^m(D, w)$  in  $W_p^m(D, w)$  will be proved using the scheme proposed in [15].

Choose a sequence of open sets  $D_j \Subset D_{j+1} \Subset D$ ,  $j \geq 1$  compactly embedded one into another, such that  $\cup_j D_j = D$ . Let  $\Psi$  be a partition of unity on  $D$ , subordinate to the covering  $D_{j+1} \setminus \overline{D}_{j-1}$ . Let  $\psi_j$  denote the (finite) sum of those  $\psi \in \Psi$  for which  $\text{supp } \psi \subset D_{j+1} \setminus \overline{D}_{j-1}$ . Thus  $\psi_j \in C_0^\infty(D_{j+1} \setminus \overline{D}_{j-1})$  and  $\sum_j \psi_j \equiv 1$  in  $D$ .

Fix  $\varepsilon > 0$  and for each  $j = 1, 2, \dots$  choose  $\varphi_j \in C_0^\infty(D_{j+1} \setminus \overline{D}_{j-1})$  such that

$$\|\varphi_j - \psi_j f\|_{W_p^m(D, w)} \leq \varepsilon 2^{-j}.$$

Then  $\varphi = \sum_j \varphi_j \in C^\infty(D)$ , and

$$\begin{aligned} \|\varphi - f\|_{W_p^m(D, w)} &= \left\| \sum_j \varphi_j - \sum_j \psi_j f \right\|_{W_p^m(D, w)} \\ &\leq \sum_j \|\varphi_j - \psi_j f\|_{W_p^m(D, w)} < \varepsilon. \end{aligned}$$

Therefore, the weighted space  $W_p^m(D, w)$  is a Banach space and smooth functions of the class  $W_p^m(D, w)$  are dense in this space.

Denote by  $w(A) = \int_A w(x) dx$  the weighted measure (the measure associated with the weight  $w$ ) of a measurable set  $A \subset \mathbb{R}^n$ . By [13] the Muckenhoupt  $A_p$ -condition leads to the doubling condition for the weighted measure i.e.,  $\mu(B(x, 2r)) \leq C \alpha \mu(B(x, r))$  for all  $x \in \mathbb{R}^n$  and  $r > 0$ .

**Definition 1.** We call a bounded subdomain  $D$  of Euclidean space  $\mathbb{R}^n$  an embedding domain, if for any function  $f \in L_q^1(D)$ ,  $1 \leq q < n$ , the Sobolev-Poincare type inequality

$$\inf_{c \in \mathbb{R}} \|f - c\|_{L_r(D)} \leq M \|f\|_{L_q^1(D)}$$

holds for any  $r \leq nq/(n - q)$ . Here a constant  $M$  depends on  $q$  and  $r$  only.

Remind that for any embedding domain and for any  $r < nq/(n - q)$  the corresponding embedding operator  $W_q^1(D) \hookrightarrow L_r(D)$  is compact.

Lipschitz bounded domains  $D \subset \mathbb{R}^n$  represent examples of embedding domains. Let us remind also that Sobolev type embeddings for smooth domains have been studied thoroughly and a discussion about the different aspects of the embedding problem can be found, for example, in [16].

## 2. Quasiisometrical mappings and Sobolev embeddings

Let  $D$  and  $D'$  be domains in Euclidean space  $\mathbb{R}^n$ ,  $n \geq 2$ . A homeomorphism  $\varphi : D \rightarrow D'$  is called  $Q$ -quasiisometrical, if there exists a constant  $0 < Q < +\infty$ , such that

$$\frac{1}{Q} \leq \underline{\varphi}'(x) \leq \overline{\varphi}'(x) \leq Q$$

for all points  $x \in D$ . Here

$$\underline{\varphi}'(x) = \liminf_{z \rightarrow x} \frac{|\varphi(x) - \varphi(z)|}{|x - z|} \quad \text{and} \quad \overline{\varphi}'(x) = \limsup_{z \rightarrow x} \frac{|\varphi(x) - \varphi(z)|}{|x - z|}.$$

It is well known that any  $Q$ -quasiisometrical homeomorphism is locally bi-Lipschitz, weakly differentiable and differentiable almost everywhere in  $D$ . Hence its Jacobi matrix  $D\varphi = \left(\frac{\partial \varphi_i}{\partial x_j}\right)$ ,  $i, j = 1, \dots, n$  and its Jacobian  $J(x, \varphi) = \det\left(\frac{\partial \varphi_i}{\partial x_j}\right)$  are well defined almost everywhere in  $D$ . By definition of a  $Q$ -quasiisometrical homeomorphism

$$Q^{-n} \leq |J(x, \varphi)| \leq Q^n$$

almost everywhere.

Let us remind also, that a quasiisometrical homeomorphism has Luzin  $N$ -property: the image of a set of measure zero is a set of measure zero.

Therefore, for any  $Q$ -quasiisometrical homeomorphism  $\varphi$  the change of variable formula in the Lebesgue integral

$$\int_{\varphi(E)} f(y) dy = \int_E f \circ \varphi(x) |J(x, \varphi)| dx$$

holds for any nonnegative measurable function  $f$  and any measurable set  $E \subset D$  [17].

Suppose weight  $w$  satisfies the  $A_p$ -condition and a homeomorphism  $\varphi : \mathbb{R}^n \rightarrow \mathbb{R}^n$  is  $Q$ -quasiisometrical. Combining the change of variable formula and the two side estimate for  $|J(x, \varphi)|$  we can conclude that the weight  $w \circ \varphi$  also satisfies the  $A_p$ -condition.

**Theorem 2.** Let  $\varphi : D \rightarrow D'$  be a  $Q$ -quasiisometrical homeomorphism. Then a composition operator  $\varphi^* f = f \circ \varphi$  is an isomorphism of the Sobolev spaces  $W_p^1(D, w)$  and  $W_p^1(D', w')$ ,  $1 < p < \infty$ , where  $w = w' \circ \varphi$ .

PROOF. Choose an arbitrary function  $f \in W_p^1(D', w')$ . By [14]  $f$  belongs to the space  $W_{1,\text{loc}}^1(D')$  and by [17] the composition  $f \circ \varphi \in W_{1,\text{loc}}^1(D)$ . Hence

$$\begin{aligned} \|\varphi^* f \mid W_p^1(D, w)\| &= \left( \int_D |f \circ \varphi|^p(w' \circ \varphi)(x) \, dx \right)^{\frac{1}{p}} + \left( \int_D |\nabla(f \circ \varphi)|^p(w' \circ \varphi)(x) \, dx \right)^{\frac{1}{p}} \\ &\leq \left( \int_D |f \circ \varphi|^p(w' \circ \varphi)(x) |J(x, \varphi)| \frac{1}{|J(x, \varphi)|} \, dx \right)^{\frac{1}{p}} \\ &\quad + \left( \int_D |\nabla f|^p(\varphi(x)) (w' \circ \varphi)(x) |J(x, \varphi)| \frac{|\overline{\varphi}'(x)|^p}{|J(x, \varphi)|} \, dx \right)^{\frac{1}{p}}. \end{aligned}$$

Since  $\varphi$  is a  $Q$ -quasiisometrical homeomorphism the following estimates are correct:

$$\frac{1}{|J(x, \varphi)|} \leq Q^n \quad \text{for almost all } x \in D$$

and

$$|\overline{\varphi}'(x)| \leq Q \quad \text{for almost all } x \in D.$$

Hence

$$\begin{aligned} \|\varphi^* f \mid W_p^1(D, w)\| &\leq Q^{\frac{n}{p}} \left( \int_D |f \circ \varphi|^p(w' \circ \varphi)(x) |J(x, \varphi)| \, dx \right)^{\frac{1}{p}} \\ &\quad + Q^{\frac{n}{p}+1} \left( \int_D |\nabla f|^p(\varphi(x)) w' \circ \varphi(x) |J(x, \varphi)| \, dx \right)^{\frac{1}{p}}. \end{aligned}$$

Using the change of variable formula we finally get the following inequality

$$\begin{aligned} \|\varphi^* f \mid W_p^1(D, w)\| &\leq Q^{\frac{n}{p}} \left( \int_{D'} |f|^p w'(y) \, dy \right)^{\frac{1}{p}} + Q^{\frac{n}{p}+1} \left( \int_{D'} |\nabla f|^p(y) w'(y) \, dy \right)^{\frac{1}{p}} \\ &\leq Q^{\frac{n}{p}} (Q + 1) \|f \mid W_p^1(D', w')\|. \end{aligned}$$

Since the inverse homeomorphism  $\varphi^{-1}$  is also a  $Q$ -quasiisometrical one, the inverse inequality

$$\|(\varphi^{-1})^* g \mid W_p^1(D', w')\| \leq Q^{\frac{n}{p}} (Q + 1) \|g \mid W_p^1(D, w)\|, \quad g \in W_p^1(D, w).$$

is also correct.

**Corollary 1.** Let  $D$  and  $D'$  be domains in the Euclidean space  $\mathbb{R}^n$ . Suppose there exists a  $Q$ -quasiisometrical homeomorphism  $\varphi : D \rightarrow D'$ . Then the embedding operator

$$i : W_p^1(D, w) \hookrightarrow L_r(D, w)$$

is bounded (compact) if and only if the embedding operator

$$i' : W_p^1(D', w') \hookrightarrow L_r(D', w')$$

is bounded (compact).

PROOF. Suppose the embedding operator

$$i : W_p^1(D, w) \hookrightarrow L_r(D, w)$$

is bounded (compact). Since  $\varphi^{-1}$  is a  $Q$ -quasiisometrical homeomorphism, then a composition operator  $(\varphi^{-1})^* = g \circ \varphi^{-1} : L_r(D, w) \hookrightarrow L_r(D', w')$  is bounded as one can see by a simple calculation:

$$\begin{aligned} \|(\varphi^{-1})^* g \mid L_r(D', w')\| &= \left( \int_{D'} |g \circ \varphi^{-1}|^r(y) w'(y) dy \right)^{\frac{1}{r}} = \left( \int_D |g|^r(x) w' \circ \varphi(x) |J(x, \varphi)| dx \right)^{\frac{1}{r}} \\ &\leq Q^{\frac{n}{r}} \left( \int_D |g|^r(x) w(x) dx \right)^{\frac{1}{r}} = Q^{\frac{n}{r}} \|g \mid L_r(D, w)\|. \end{aligned}$$

Therefore, the embedding operator  $i' : W_p^1(D', w') \hookrightarrow L_r(D', w')$  is bounded (compact) as a composition of bounded operators  $\varphi^*$ ,  $(\varphi^{-1})^*$  and bounded (compact) embedding operator  $W_p^1(D, w) \hookrightarrow L_r(D, w)$ .

The proof in the inverse direction is the same.

By Corollary 1 an image  $D' = \varphi(D)$  of an embedding domain  $D$  under a quasiisometrical homeomorphism  $\varphi$  is an embedding domain also. In the paper [10] the various examples of embedding domains of such type were discussed.

The next theorem demonstrates simple conditions for compactness of the embedding operators of weighted Sobolev spaces.

**Theorem 3.** Let  $D' \subset \mathbb{R}^n$  be a quasiisometrical image of an embedding domain  $D$ ,  $1 \leq s \leq r < nq/(n - q)$ ,  $q \leq p$ ,  $1 < p < \infty$ , and

$$K(w) = \max \left\{ \|w^{-\frac{1}{p}} \mid L_{\frac{pq}{p-q}}(D')\|, \|w^{\frac{1}{s}} \mid L_{\frac{rs}{r-s}}(D')\| \right\} < +\infty.$$

Then the embedding operator

$$i : W_p^1(D', w) \hookrightarrow L_s(D', w)$$

is a compact operator.

For  $r = nq/(n - q)$  the embedding operator  $i$  is bounded only.

PROOF. By conditions of the theorem there exists a  $Q$ -quasiisometrical homeomorphism  $\varphi : D \rightarrow D'$  of the embedding domain  $D$  onto the domain  $D'$ . For any function  $u \in W_p^1(D', w)$  the composition  $u \circ \varphi$  is weakly differentiable in the domain  $D$ , and the

following estimate is correct

$$\begin{aligned} \|u \circ \varphi | W_q^1(D)\| &= \left( \int_D |u \circ \varphi|^q dx \right)^{\frac{1}{q}} + \left( \int_D |\nabla(u \circ \varphi)|^q dx \right)^{\frac{1}{q}} \\ &\leq \left( \int_D |u \circ \varphi|^q (|J(x, \varphi)|w(\varphi(x)))^{\frac{q}{p}} \frac{1}{(|J(x, \varphi)|w(\varphi(x)))^{\frac{q}{p}}} dx \right)^{\frac{1}{q}} \\ &\quad + \left( \int_D |\nabla u|^q |\bar{\varphi}'(x)|^q (|J(x, \varphi)|w(\varphi(x)))^{\frac{q}{p}} \frac{1}{(|J(x, \varphi)|w(\varphi(x)))^{\frac{q}{p}}} dx \right)^{\frac{1}{q}}. \end{aligned}$$

By the Hölder inequality

$$\begin{aligned} \|u \circ \varphi | W_q^1(D)\| &\leq \\ &\leq \left( \int_D \left( \frac{1}{|J(x, \varphi)|w(\varphi(x))} \right)^{\frac{q}{p-q}} dx \right)^{\frac{p-q}{pq}} \left( \int_D |u|^p(\varphi(x))w(\varphi(x))|J(x, \varphi)| dx \right)^{\frac{1}{p}} \\ &\quad + \left( \int_D \left( \frac{|\bar{\varphi}'(x)|^p}{|J(x, \varphi)|w(\varphi(x))} \right)^{\frac{q}{p-q}} dx \right)^{\frac{p-q}{pq}} \left( \int_D |\nabla u|^p(\varphi(x))w(\varphi(x))|J(x, \varphi)| dx \right)^{\frac{1}{p}}. \end{aligned}$$

Since  $\varphi$  is a  $Q$ -quasiisometrical homeomorphism, then by the change of variable formula for the Lebesgue integral we obtain

$$\begin{aligned} \|u \circ \varphi | W_q^1(D)\| &\leq Q^{\frac{n}{q}} \left( \int_{D'} w(y)^{\frac{q}{q-p}} dy \right)^{\frac{p-q}{pq}} \left( \int_{D'} |u|^p w(y) dy \right)^{\frac{1}{p}} \\ &\quad + Q^{\frac{p-q+n}{q}} \left( \int_{D'} w(y)^{\frac{q}{q-p}} dy \right)^{\frac{p-q}{pq}} \left( \int_{D'} |\nabla u|^p w(y) dy \right)^{\frac{1}{p}} \\ &\leq Q^{\frac{n}{q}} K(w) \|u | L_p(D', w)\| + Q^{\frac{p-q+n}{q}} K(w) \|\nabla u | L_p(D'w)\|. \end{aligned}$$

By the previous inequality the composition operator

$$\varphi^* : W_p^1(D', w) \rightarrow W_q^1(D), \quad 1 \leq q \leq p < +\infty,$$

is bounded.

Let us prove boundedness of the composition operator  $(\varphi^{-1})^* : L_r(D) \rightarrow L_s(D', w)$ . By the theorem's conditions the quantity  $\|w^{\frac{1}{s}} | L_{\frac{rs}{r-s}}(D')\|$  is finite. Hence by [18] the composition operator

$$(\varphi^{-1})^* : L_r(D) \rightarrow L_s(D', w), \quad 1 \leq s \leq r < +\infty,$$

is bounded.

Because  $D$  is an embedding domain the embedding operator  $i : W_q^1(D) \hookrightarrow L_r(D)$  is compact for any  $r < nq/(n - q)$  and bounded for  $r = nq/(n - q)$ . Therefore the embedding operator  $i' : W_p^1(D', w) \hookrightarrow L_s(D', w)$  is compact (bounded) as a composition

of bounded operators  $\varphi^*$ ,  $(\varphi^{-1})^*$  and the compact (bounded) embedding operator  $i$  for any  $r < nq/(n - q)$  ( $r = nq/(n - q)$ ).

In a similar way we can prove

**Theorem 4.** Let  $D' \subset \mathbb{R}^n$  be a quasiisometrical image of an embedding domain  $D$ ,  $1 \leq s \leq r < nq/(n - q)$ ,  $q \leq p$ ,  $1 < p < \infty$ , and

$$K(w) = \|w^{\frac{1}{s}} | L_{\frac{rs}{r-s}}(D')\| < +\infty.$$

Then the embedding operator

$$i : W_p^1(D') \hookrightarrow L_s(D', w)$$

is compact.

For  $r = nq/(n - q)$  the embedding operator  $i$  is bounded only.

The next lemma allows us to construct various examples of the embedding domains.

**Lemma 2.** Let  $D_1$  and  $D_2$  be such domains that embedding operators

$$i : W_p^1(D_1, w) \hookrightarrow L_s(D_1, v),$$

$$i : W_p^1(D_2, w) \hookrightarrow L_s(D_2, v)$$

are compact. Then the embedding operator

$$i : W_p^1(D_1 \cup D_2, w) \hookrightarrow L_s(D_1 \cup D_2, v)$$

is also compact.

**PROOF.** We prove this lemma by the scheme suggested in [10]. Choose a sequence of functions  $\{f_n\} \subset W_p^1(D_1 \cup D_2, w)$  such that  $\|f_n | W_p^1(D_1 \cup D_2, w)\| \leq 1$  for all  $n$ . Let  $g_n = f_n|_{D_1}$  and  $h_n = f_n|_{D_2}$ . Then  $g_n \in W_p^1(D_1)$ ,  $h_n \in W_p^1(D_2)$ ,  $\|f_n | W_p^1(D_1)\| \leq 1$ ,  $\|h_n | W_p^1(D_2)\| \leq 1$ .

Because the embedding operator  $i : W_p^1(D_1, w) \hookrightarrow L_s(D_1, v)$  is compact, we can choose a subsequence  $\{g_{n_k}\}$  of the sequence  $\{g_n\}$  which converges in  $L_s(D_1, v)$  to a function  $g_0 \in L_s(D_1, v)$ . Because the second embedding operator  $i : W_p^1(D_2, w) \hookrightarrow L_s(D_2, v)$  is also compact we can choose a subsequence  $\{h_{n_{k_m}}\}$  of the sequence  $\{h_{n_k}\}$  which converges in  $L_s(D_2, v)$  to a function  $h_0 \in L_s(D_2, v)$ . It is evident that  $g_0 = h_0$   $v$ -almost everywhere in  $D_1 \cap D_2$  and the function  $f_0 = g_0$  on  $D_1$  and  $f_0 = h_0$  on  $D_2$  belongs to  $L_s(D_1 \cup D_2, v)$ .

Hence

$$\|f_{n_{k_m}} - f_0 | L_s(D_1 \cup D_2, v)\| \leq \|g_{n_{k_m}} - g_0 | L_s(D_1, v)\| + \|h_{n_{k_m}} - h_0 | L_s(D_2, v)\|.$$

Therefore  $\|f_{n_{k_m}} - f_0 | L_s(D_1 \cup D_2, v)\| \longrightarrow 0$  for  $m \longrightarrow \infty$ .

### 3. Embedding operators for general domains

Let  $D$  and  $D'$  be domains in Euclidean space  $\mathbb{R}^n$ ,  $n \geq 2$ . Remember that a homeomorphism  $\varphi : D \rightarrow D'$  belongs to Sobolev class  $W_{1,\text{loc}}^1(D)$  if its coordinate functions belong to

$W_{1,\text{loc}}^1(D)$ . Denote by  $D\varphi$  the weak differential of  $\varphi$ . The norm  $|D\varphi(x)|$  is the standard norm of the linear operator defined by  $D\varphi(x)$ .

Call a homeomorphism  $\varphi : D \rightarrow D'$   $w$ -weighted  $(p, q)$ -quasiconformal, if  $\varphi$  belongs to the Sobolev space  $W_{1,\text{loc}}^1(D)$ ,  $|D\varphi| = 0$  almost everywhere on the set  $Z = \{x : |J(x, \varphi)|w(\varphi(x)) = 0\}$  and the following inequality

$$K_{p,q}(D, w) = \left[ \int_D \left( \frac{|D\varphi(x)|^p}{|J(x, \varphi)|w(\varphi(x))} \right)^{\frac{q}{p-q}} dx \right]^{\frac{p-q}{pq}} < \infty$$

is correct.

For  $w \equiv 1$  we call a 1-weighted  $(p, q)$ -quasiconformal homeomorphism a  $(p, q)$ -quasiconformal one.

The following result was proved in [19] for a more general class of mappings. For readers convenience we reproduce here a simple version of the proof adopted to homeomorphisms.

**Proposition 1.** Let  $D$  and  $D'$  be domains in Euclidean space  $\mathbb{R}^n$ ,  $n \geq 2$  and  $\varphi : D \rightarrow D'$  be a  $w$ -weighted  $(p, q)$ -quasiconformal homeomorphism. Then a composition operator

$$\varphi^* : L_p^1(D', w) \rightarrow L_q^1(D), \quad 1 \leq q \leq p < +\infty,$$

is bounded.

PROOF. Let  $f \in L_p^1(D', w)$  be a smooth function. Then  $f \circ \varphi \in L_{1,\text{loc}}^1(D)$  and the following inequalities

$$\begin{aligned} \|\varphi^* f \mid L_q^1(D)\| &= \left( \int_D |\nabla(f \circ \varphi)|^q dx \right)^{\frac{1}{q}} \leq \left( \int_D |D\varphi|^q |\nabla f|^q dx \right)^{\frac{1}{q}} \\ &\leq \left( \int_D |D\varphi|^q \frac{1}{|J(x, \varphi)|^{\frac{q}{p}} w(\varphi(x))^{\frac{q}{p}}} |\nabla f|^q |J(x, \varphi)|^{\frac{q}{p}} w(\varphi(x))^{\frac{q}{p}} dx \right)^{\frac{1}{q}} \end{aligned}$$

are correct.

Using Hölder inequality and the change of variable formula for Lebesgue integral, we obtain

$$\begin{aligned} \|\varphi^* f \mid L_q^1(D)\| &\leq \left[ \int_D \left( \frac{|D\varphi(x)|^p}{|J(x, \varphi)|w(\varphi(x))} \right)^{\frac{q}{p-q}} dx \right]^{\frac{p-q}{pq}} \left( \int_D |\nabla f|^p |J(x, \varphi)|w(\varphi(x)) dx \right)^{\frac{1}{p}} \\ &= K_{p,q}(D, w) \|f \mid L_p^1(D', w)\|. \end{aligned}$$

The fulfillment of the last inequality for an arbitrary function  $f \in L_p^1(D', w)$  can be proved by an approximation of  $f$  by smooth functions [19].

The next theorem gives sufficient condition for boundedness (compactness) embedding operators in non-smooth domains.

**Theorem 5.** Let a domain  $D \subset \mathbb{R}^n$  be an embedding domain and there exists a  $w$ -weighted  $(p, q)$ -quasiconformal homeomorphism  $\varphi : D \rightarrow D'$  of domain  $D$  onto bounded domain  $D'$ .

If for some  $p \leq s \leq r < \infty$  the following inequality is correct

$$\int_D \left( |J(x, \varphi)| w(\varphi(x)) \right)^{\frac{r}{r-s}} dx < +\infty,$$

then an embedding operator

$$i : W_p^1(D', w) \hookrightarrow L_s(D', w)$$

is bounded, if  $s \leq r \leq nq/(n-q)$ , and is compact if  $s \leq r < nq/(n-q)$ .

PROOF. Because

$$\int_D \left( |J(x, \varphi)| w(\varphi(x)) \right)^{\frac{r}{r-s}} < +\infty,$$

the composition operator  $(\varphi^{-1})^* : L_r(D) \rightarrow L_s(D', w)$  is bounded, i.e. the following inequality

$$\|(\varphi^{-1})^* v \mid L_s(D', w)\| \leq A_{r,s}(D, w) \|v \mid L_r(D)\|$$

is correct. Here  $A_{r,s}(D, w)$  is a positive constant.

Because domain  $D$  is an embedding domain and the composition operators

$$(\varphi^{-1})^* : L_r(D) \rightarrow L_s(D', w), \quad \varphi^* : L_p^1(D', w) \rightarrow L_q^1(D)$$

are bounded, the following inequalities

$$\begin{aligned} \inf_{c \in \mathbb{R}} \|u - c \mid L_s(D', w)\| &\leq A_{r,s}(D, w) \inf_{c \in \mathbb{R}} \|v - c \mid L_r(D)\| \\ &\leq A_{r,s}(D, w) M \|v \mid L_q^1(D)\| \leq A_{r,s}(D, w) K_{p,q}(D, w) M \|u \mid L_p^1(D', w)\| \end{aligned}$$

hold. Here  $M$  and  $K_{p,q}(D, w)$  are positive constants.

The Hölder inequality implies the following estimate

$$\begin{aligned} |c| = w(D')^{-\frac{1}{p}} \|c \mid L_p(D', w)\| &\leq w(D')^{-\frac{1}{p}} (\|u \mid L_p(D', w)\| + \|u - c \mid L_p(D', w)\|) \\ &\leq w(D')^{-\frac{1}{p}} \|u \mid L_p(D', w)\| + w(D')^{-\frac{1}{s}} \|u - c \mid L_s(D', w)\|. \end{aligned}$$

Because  $q \leq r$  we have

$$\begin{aligned} \|v \mid L_q(D)\| &\leq \|c \mid L_q(D)\| + \|v - c \mid L_q(D)\| \leq |c| |D|^{\frac{1}{q}} + |D|^{\frac{r-q}{r}} \|v - c \mid L_r(D)\| \\ &\leq \left( w(D')^{-\frac{1}{p}} \|u \mid L_p(D', w)\| + w(D')^{-\frac{1}{s}} \|u - c \mid L_s(D', w)\| \right) |D|^{\frac{1}{q}} + |D|^{\frac{r-q}{r}} \|v - c \mid L_r(D)\|. \end{aligned}$$

From previous inequalities we obtain finally

$$\begin{aligned} \|v \mid L_q(D)\| &\leq |D|^{\frac{1}{q}} w(D')^{-\frac{1}{p}} \|u \mid L_p(D')\| \\ &\quad + A_{r,s}(D, w) K_{p,q}(D, w) M |D|^{\frac{1}{q}} w(D')^{-\frac{1}{p}} \|u \mid L_p^1(D', w)\| \\ &\quad + K_{p,q}(D, w) M |D|^{\frac{r-q}{r}} \|u \mid L_p^1(D', w)\|. \end{aligned}$$

Therefore the composition operator

$$\varphi^* : W_p^1(D', w) \rightarrow W_q^1(D)$$

is also bounded.

Finally we can conclude that the embedding operator  $i : W_p^1(D', w) \hookrightarrow L_s(D', w)$  is bounded as the composition of bounded operators  $\varphi^*$ ,  $(\varphi^{-1})^*$  and the embedding operator  $W_q^1(D) \hookrightarrow L_r(D)$  in the case  $r \leq nq/(n - q)$ . The embedding operator  $i : W_p^1(D', w) \hookrightarrow L_s(D', w)$  is compact as the composition of bounded operators  $\varphi^*$ ,  $(\varphi^{-1})^*$  and compact the embedding operator  $W_q^1(D) \hookrightarrow L_r(D)$ , in the case  $r < nq/(n - q)$ .

Let us apply these general results to domains with anisotropic Hölder singularities described in [9].

Let  $g_i(\tau) = \tau^{\gamma_i}$ ,  $\gamma_i \geq 1$ ,  $0 \leq \tau \leq 1$ . For the function  $G = \prod_{i=1}^{n-1} g_i$  denote by

$$\gamma = \frac{\log G(\tau)}{\log \tau} + 1.$$

It is evident that  $\gamma \geq n$ . Let us consider the domain

$$H_g = \{x \in \mathbb{R}^n : 0 < x_n < 1, 0 < x_i < g_i(x_n), i = 1, 2, \dots, n - 1\}.$$

In the case  $g_1 = g_2 = \dots = g_{n-1}$  we will say that domain  $H_g$  is a domain with  $\sigma$ -Hölder singularity,  $\sigma = (\gamma - 1)/(n - 1)$ . For  $g_1(\tau) = g_2(\tau) = \dots = g_{n-1}(\tau) = \tau$  we will use notation  $H_1$  instead of  $H_g$ . The domain  $H_1$  is quasiisometrically homeomorphic to the standard unit ball. Hence by Theorem 3 domain  $H_1$  is an embedding domain.

If the weight is polynomial i.e.  $w(x) := |x|^\alpha$  then the  $A_p$ -condition is correct only if  $-n < \alpha < n(p - 1)$ .

**Theorem 6.** Let  $-n < \alpha < n(p - 1)$  and  $1 < p < \alpha + \gamma$ , then the embedding operator

$$W_p^1(H_g, |x|^\alpha) \hookrightarrow L_s(H_g, |x|^\alpha)$$

is compact for any  $1 \leq s < \frac{(\alpha + \gamma)p}{\alpha + \gamma - p}$ .

PROOF. For any  $0 < a < 1$  we define a homeomorphism  $\varphi_a : H_1 \rightarrow H_g$ ,  $a > 0$ , by the expression

$$\varphi_a(x) = \left( \frac{x_1}{x_n} g_1^a(x_n), \dots, \frac{x_{n-1}}{x_n} g_{n-1}^a(x_n), x_n^a \right).$$

During the proof we will choose a number  $a$  and a corresponding homeomorphism in such a way that the conditions of Theorem 5 will be fulfilled. By simple calculation

$$\frac{\partial(\varphi_a)_i}{\partial x_i} = \frac{g_i^a(x_n)}{x_n}, \quad \frac{\partial(\varphi_a)_i}{\partial x_n} = \frac{-x_i g_i^a(x_n)}{x_n^2} + \frac{a x_i g_i^{a-1}(x_n)}{x_n} g_i'(x_n) \quad \text{and} \quad \frac{\partial(\varphi_a)_n}{\partial x_n} = a x_n^{a-1}$$

for any  $i = 1, \dots, n - 1$ .

Hence  $J(x, \varphi_a(x)) = a x_n^{a-n} G^a(x_n)$ . By definition functions  $g_i$ ,  $i = 1, 2, \dots, n - 1$  are Lipschitz functions. Therefore there exists a constant  $M < +\infty$  such that

$$g_i(x_n) \leq M x_n \quad \text{and} \quad g_i'(x_n) \leq M$$

for any  $x_n \in [0, 1]$  and  $i = 1, 2, \dots, n-1$ . Using estimates for derivatives and the inequalities  $x_i \leq x_n$  that are correct for all  $x \in H_1$  we obtain the following estimate  $|D\varphi_a(x)| \leq c_1 x_n^{a-1}$ . By the same way we obtain also the two-sided estimate:

$$c_2 x_n^{\alpha a} \leq |\varphi_a(x)|^\alpha \leq c_3 x_n^{\alpha a}.$$

Now we can check for which  $q$  the homeomorphism  $\varphi_a : H_1 \rightarrow H_g$  is a  $w$ -weighted  $(p, q)$ -quasiconformal homeomorphism:

$$\begin{aligned} I_a &= K_{p,q}(H_1, w)^{\frac{pq}{p-q}} = \int_{H_1} \left( \frac{|D\varphi_a(x)|^p}{|J(x, \varphi_a)|w(\varphi_a(x))} \right)^{\frac{q}{p-q}} dx \\ &\leq C \int_0^1 \int_0^{x_n} \dots \int_0^{x_n} \left( \frac{x_n^{p(a-1)}}{x_n^{a-n} G^a(x_n) x_n^{\alpha a}} \right)^{\frac{q}{p-q}} dx_1 \dots dx_{n-1} dx_n \\ &= C \int_0^1 x_n^{(p(a-1)-a(\alpha+1)+n)\frac{q}{p-q}+n-1} G^{-a\frac{q}{p-q}}(x_n) dx_n. \end{aligned}$$

Hence the quantity  $I_a$  is finite if

$$(p(a-1) - a(\alpha+1) + n)\frac{q}{p-q} + n - a(\gamma-1)\frac{q}{p-q} > 0$$

or

$$q < np / (a(\alpha + \gamma) + p - ap).$$

Hence, the homeomorphism  $\varphi_a$  is a  $w$ -weighted  $(p, q)$ -quasiconformal homeomorphism.

Let us check the conditions of Theorem 5. First we have to estimate the degree of integrability for Jacobian  $J_a$  of the homeomorphism  $\varphi_a$ :

$$\begin{aligned} J_a &= \int_{H_1} \left( |J(x, \varphi)|w(\varphi(x)) \right)^{\frac{r}{r-s}} dx \\ &\leq C \int_0^1 \int_0^{x_n} \dots \int_0^{x_n} x_n^{(a(\alpha+1)-n)\frac{r}{r-s}} G^{a\frac{r}{r-s}}(x_n) dx_1 \dots dx_{n-1} dx_n \\ &\leq C \int_0^1 x_n^{(a(\alpha+1)-n)\frac{r}{r-s}+n-1+a\frac{r}{r-s}(\gamma-1)} dx_n. \end{aligned}$$

The integral  $J_a$  converges, if

$$(a(\alpha+1) - n)\frac{r}{r-s} + n + a\frac{r}{r-s}(\gamma-1) > 0,$$

or

$$s < \frac{a(\alpha + \gamma)}{n} r.$$

Hence, the conditions of Theorem 5 are fulfilled if

$$s < \frac{a(\alpha + \gamma)}{n}r, \quad r < \frac{nq}{n - q} \quad \text{and} \quad q < \frac{np}{a(\alpha + \gamma) + p - ap}.$$

Therefore

$$s < \frac{a(\alpha + \gamma)}{n} \frac{nq}{n - q} < \frac{np}{a(\alpha + \gamma - p)} \frac{a(\alpha + \gamma)}{n} = \frac{p(\alpha + \gamma)}{\alpha + \gamma - p}.$$

Theorem 6 is proved.

**Remark 1.** The conclusion of Theorem 6 are fulfilled for functions  $g_i : [0, 1] \rightarrow \mathbb{R}$ ,  $i = 1, 2, \dots, n - 1$  such that

$$C_1\tau^{\gamma_i} \leq g_i(\tau) \leq C_2\tau^{\gamma_i}$$

for some constants  $C_1$  and  $C_2$ .

From theorem 6 immediately follows.

**Corollary 2.** Let  $D \subset \mathbb{R}^n$  be a domain with  $\sigma$ -Hölder singularity. Then the embedding operator

$$W_p^1(D, |x|^\alpha) \hookrightarrow L_s(D, |x|^\alpha)$$

is compact for

$$s \leq \frac{(\sigma(n - 1) + 1 + \alpha)p}{\sigma(n - 1) + \alpha - (p - 1)}.$$

(Here  $s \geq 0$ , since  $p < \alpha + \gamma$ ,  $\sigma = (\gamma - 1)/(n - 1)$ .)

Let us compare this result with the known ones. From the main result of [7] it follows that for an arbitrary domain  $D$  with  $\sigma$ -Hölder singularity the embedding operator

$$W_p^1(D, |x|^\alpha) \hookrightarrow L_{\tilde{s}}(D, |x|^\alpha)$$

is bounded, while

$$\tilde{s} \leq \frac{(n + \alpha)p}{\sigma(\alpha + n - 1) - (p - 1)}.$$

Then  $s > \tilde{s}$  while  $\sigma > 1$ , and  $s = \tilde{s}$  while  $\sigma = 1$ . Hence our estimate is sharper.

The next results deal with embeddings of classical Sobolev spaces into weighted Lebesgue spaces.

**Theorem 7.** Let  $D \subset \mathbb{R}^n$  be an embedding domain and there exists a  $(p, q)$ -quasiconformal homeomorphism  $\varphi$  of  $D$  onto bounded domain  $D'$ .

If

$$\int_D \left( |J(x, \varphi)| w(\varphi(x)) \right)^{\frac{r}{r-s}} < +\infty,$$

for a pair of numbers  $p \leq s < r < \infty$  then an embedding operator

$$i : W_p^1(D') \hookrightarrow L_s(D', w)$$

is compact for  $r < nq/(n - q)$  and is bounded for  $r = nq/(n - q)$ .

PROOF. Because  $D$  is an embedding domain  $(p, q)$ -quasiconformal homeomorphism  $\varphi$  induces the bounded composition operator

$$\varphi^* : W_p^1(D') \rightarrow W_q^1(D)$$

(see [18]).

Because  $\int_D \left( |J(x, \varphi)| w(\varphi(x)) \right)^{\frac{r}{r-s}} < +\infty$  the composition operator for Lebesgue spaces

$$\|(\varphi^{-1})^* v \mid L_s(D', w)\| \leq A_{r,s}(D, w) \|v \mid L_r(D)\|$$

is bounded also.

Finally we can conclude that

1) If  $r \leq nq/(n - q)$  then the embedding operator  $i : W_p^1(D') \hookrightarrow L_s(D', w)$  is bounded as a composition of bounded operators  $\varphi^*$ ,  $(\varphi^{-1})^*$  and the bounded embedding operator  $W_q^1(D) \hookrightarrow L_r(D)$  ;

2) If  $r < nq/(n - q)$  then the embedding operator  $i : W_p^1(D') \hookrightarrow L_s(D', w)$  is compact as a composition of bounded operators  $\varphi^*$ ,  $(\varphi^{-1})^*$  and the compact embedding operator  $W_q^1(D) \hookrightarrow L_r(D)$ .

Apply the previous result to anisotropic Hölder domains.

**Theorem 8.** Let  $1 < p < \gamma$  and  $1 \leq s < \frac{(\alpha+\gamma)p}{\gamma-p}$ , then the embedding operator

$$W_p^1(H_g) \hookrightarrow L_s(H_g, |x|^\alpha)$$

is compact.

PROOF. Similar to the proof of Theorem 6 for any  $0 < a < 1$  we define a homeomorphism  $\varphi_a : H_1 \rightarrow H_g$ ,  $a > 0$  by the expression

$$\varphi_a(x) = \left( \frac{x_1}{x_n} g_1^a(x_n), \dots, \frac{x_{n-1}}{x_n} g_{n-1}^a(x_n), x_n^a \right).$$

During the proof we will choice a number  $a$  and the corresponding homeomorphism in such a way that the conditions of Theorem 7 will be fulfilled.

By simple calculation we have

$$\frac{\partial(\varphi_a)_i}{\partial x_i} = \frac{g_i^a(x_n)}{x_n}, \quad \frac{\partial(\varphi_a)_i}{\partial x_n} = \frac{-x_i g_i^a(x_n)}{x_n^2} + \frac{a x_i g_i^{a-1}(x_n)}{x_n} g_i'(x_n) \quad \text{and} \quad \frac{\partial(\varphi_a)_n}{\partial x_n} = a x_n^{a-1}$$

for any  $i = 1, \dots, n - 1$ .

Hence  $J(x, \varphi_a(x)) = a x_n^{a-n} G^a(x_n)$ . By definition functions  $g_i$ ,  $i = 1, 2, \dots, n - 1$  are Lipschitz. So there exists a constant  $M < +\infty$  such that

$$g_i(x_n) \leq M x_n \quad \text{and} \quad g_i'(x_n) \leq M$$

for any  $x_n \in [0, 1]$  and  $i = 1, 2, \dots, n - 1$ . Using estimates for derivatives and the inequalities  $x_i \leq x_n$  that are correct for all  $x \in H_1$  we obtain the following estimate  $|D\varphi_a(x)| \leq c_1 x_n^{a-1}$ . In the same way we obtain also the two-sided estimate

$$c_2 x_n^{\alpha a} \leq |\varphi_a(x)|^\alpha \leq c_3 x_n^{\alpha a}.$$

Now we can check for which  $q$  the homeomorphism  $\varphi_a : H_1 \rightarrow H_g$  is a  $(p, q)$ -quasiconformal homeomorphism. Let us start from the following estimate

$$\begin{aligned}
I_a &= K_{p,q}(H_1)^{\frac{pq}{p-q}} = \int_{H_1} \left( \frac{|D\varphi_a(x)|^p}{|J(x, \varphi_a)|} \right)^{\frac{q}{p-q}} dx \\
&\leq C \int_0^1 \int_0^{x_n} \dots \int_0^{x_n} \left( \frac{x_n^{p(a-1)}}{x_n^{a-n} G^a(x_n)} \right)^{\frac{q}{p-q}} dx_1 \dots dx_{n-1} dx_n \\
&= C \int_0^1 x_n^{(p(a-1)-a+n)\frac{q}{p-q} + n-1} G^{-a\frac{q}{p-q}}(x_n) dx_n.
\end{aligned}$$

Hence, the quantity  $I_a$  is finite if

$$(p(a-1) - a + n) \frac{q}{p-q} + n - a(\gamma-1) \frac{q}{p-q} > 0$$

or

$$q < np / (a\gamma + p - ap).$$

Hence, the homeomorphism  $\varphi_a$  is a  $(p, q)$ -quasiconformal homeomorphism.

Let us check the conditions of Theorem 5. First we have to estimate the degree of integrability for Jacobian  $J_a$  of the homeomorphism  $\varphi_a$ :

$$\begin{aligned}
J_a &= \int_{H_1} \left( |J(x, \varphi)| w(\varphi(x)) \right)^{\frac{r}{r-s}} dx \\
&\leq C \int_0^1 \int_0^{x_n} \dots \int_0^{x_n} x_n^{(a(\alpha+1)-n)\frac{r}{r-s}} G^{a\frac{r}{r-s}}(x_n) dx_1 \dots dx_{n-1} dx_n \\
&\leq C \int_0^1 x_n^{(a(\alpha+1)-n)\frac{r}{r-s} + n-1 + a\frac{r}{r-s}(\gamma-1)} dx_n.
\end{aligned}$$

The integral  $J_a$  converges, if

$$(a(\alpha+1) - n) \frac{r}{r-s} + n + a \frac{r}{r-s} (\gamma-1) > 0,$$

or

$$s < \frac{a(\alpha+\gamma)}{n} r.$$

Hence, the conditions of Theorem 5 are fulfilled if

$$s < \frac{a(\alpha+\gamma)}{n} r, \quad r < \frac{nq}{n-q} \quad \text{and} \quad q < \frac{np}{a\gamma + p - ap}.$$

Therefore

$$s < \frac{a(\alpha+\gamma)}{n} \frac{nq}{n-q} < \frac{np}{a(\gamma-p)} \frac{a(\alpha+\gamma)}{n} = \frac{p(\alpha+\gamma)}{\gamma-p}.$$

#### 4. Sobolev embeddings for spaces with high derivatives

This section is devoted to embedding theorems for weighted Sobolev spaces with high derivatives.

If for some  $m$  and  $p$  an embedding theorem for classical Sobolev spaces  $W_p^m$  is correct then, using a standard procedure, it is possible to obtain the corresponding embedding theorem for  $m_1 \geq m$  and  $p_1 \geq p$  also (see, for example [9]). Here we adopt the scheme of [9] to the case of weighted Sobolev spaces. The next lemma is the main technical result of this section.

**Lemma 3.** Let  $D$  be a domain in  $\mathbb{R}^n$ . Suppose that for some  $p_0 \geq 1$  and  $q_0 \geq 1$  the embedding operator

$$W_{p_0}^1(D, w) \hookrightarrow L_{q_0}(D, w)$$

is bounded. Let  $p \geq p_0$  and  $\frac{1}{p} > \frac{1}{p_0} - \frac{1}{q_0}$ . If  $q$  is such that

$$\frac{1}{p} - \frac{1}{q} = \frac{1}{p_0} - \frac{1}{q_0}$$

then the embedding operator

$$W_p^1(D, w) \hookrightarrow L_q(D, w)$$

is bounded also.

PROOF. Let a function  $u$  belongs to the space  $W_p^1(D, w) \cap C_0^\infty(D)$ . Using boundedness of the embedding operator

$$W_{p_0}^1(D, w) \hookrightarrow L_{q_0}(D, w)$$

we obtain the following estimate

$$\begin{aligned} \left( \int_D |u|^q w(x) dx \right)^{\frac{1}{q_0}} &= \left( \int_D (|u|^{\frac{q}{q_0}})^{q_0} w(x) dx \right)^{\frac{1}{q_0}} \\ &\leq C \left( \left( \int_D |\nabla(u^{\frac{q}{q_0}})|^{p_0} w(x) dx \right)^{\frac{1}{p_0}} + \left( \int_D (|u|^{\frac{q}{q_0}})^{p_0} w(x) dx \right)^{\frac{1}{p_0}} \right) \\ &\leq C \left( \left( \int_D |u|^{p_0 \frac{q-q_0}{q_0}} |\nabla u|^{p_0} w(x) dx \right)^{\frac{1}{p_0}} + \left( \int_D |u|^{p_0 \frac{q-q_0}{q_0}} |u|^{p_0} w(x) dx \right)^{\frac{1}{p_0}} \right). \end{aligned}$$

Applying Hölder inequality we get

$$\begin{aligned} \left( \int_D |u|^q w(x) dx \right)^{\frac{1}{q_0}} &\leq C \left( \left( \int_D |\nabla u|^p w(x) dx \right)^{\frac{1}{p}} \cdot \left( \int_D |u|^{pp_0 \frac{q-q_0}{q_0(p-p_0)}} w(x) dx \right)^{\frac{p-p_0}{pp_0}} \right. \\ &\quad \left. + \left( \int_D |u|^p w(x) dx \right)^{\frac{1}{p}} \cdot \left( \int_D |u|^{pp_0 \frac{q-q_0}{q_0(p-p_0)}} w(x) dx \right)^{\frac{p-p_0}{pp_0}} \right). \end{aligned}$$

Because  $q = pp_0 \frac{q-q_0}{q_0(p-p_0)}$  we obtain finally

$$\begin{aligned} & \left( \int_D |u|^q w(x) dx \right)^{\frac{1}{q_0}} \\ & \leq C \left( \left( \int_D |\nabla u|^p w(x) dx \right)^{\frac{1}{p}} + \left( \int_D |u|^p w(x) dx \right)^{\frac{1}{p}} \right) \cdot \left( \int_D |u|^q w(x) dx \right)^{\frac{p-p_0}{pp_0}}. \end{aligned}$$

Since  $\frac{1}{q_0} - \frac{p-p_0}{pp_0} = \frac{1}{q}$  then

$$\|u\|_{L_q(D, w)} \leq C \|u\|_{W_p^1(D, w)}.$$

Lemma is proved.

Denote

$$q_{m,D}^*(p) = \sup\{q \in \mathbb{R}^+ : \text{the operator } W_p^m(D, w) \hookrightarrow L_q(D, w) \text{ is bounded}\}.$$

The following statements can be obtained directly from Lemma 3.

**Corollary 3.** If  $D$  is a bounded domain in  $\mathbb{R}^n$ ,  $p \geq p_0$ , then

$$q_{1,D}^*(p) \geq \frac{pp_0 q_{1,D}^*(p_0)}{p_0 q_{1,D}^*(p_0) - p(q_{1,D}^*(p_0) - p_0)}.$$

**Corollary 4.** If  $D$  is a bounded domain in  $\mathbb{R}^n$ ,  $p \geq p_0$  and  $m > 1$ , then

$$q_{m,D}^*(p) \geq \frac{pp_0 q_{1,D}^*(p_0)}{p_0 q_{1,D}^*(p_0) - mp(q_{1,D}^*(p_0) - p_0)}.$$

PROOF. This corollary follows from the previous corollary by induction with respect to  $m$ .

Combining Theorem 5 and Corollary 4 we obtain finally.

**Theorem 9.** Let domain  $D \subset \mathbb{R}^n$  be an embedding domain and there exist  $w$ -weighted  $(p, q)$ -quasiconformal homeomorphism  $\varphi : D \rightarrow D'$  of domain  $D$  onto bounded domain  $D'$ .

If for some  $s \leq r \leq nq/(n-q)$  the following inequality is correct

$$\int_D \left( |J(x, \varphi)| w(\varphi(x)) \right)^{\frac{r}{r-s}} < +\infty,$$

then an embedding operator

$$i : W_p^m(D', w) \hookrightarrow L_{s^*}(D', w)$$

is bounded, if

$$s^* \geq \frac{ps}{s - m(s-p)}.$$

## 5. Solvability of degenerate elliptic equations

In this section we apply an embedding theorem for Hilbert Sobolev spaces  $W_2^1$  to a degenerate elliptic boundary problem.

**Theorem 10.** Let  $D' \subset \mathbb{R}^n$  be a quasiisometrical image of an embedding domain  $D$  and

$$\int_{D'} w(y)^{-\frac{n}{2}} dy < +\infty.$$

Then an embedding operator

$$i' : W_2^1(D', w) \hookrightarrow L_2(D')$$

is bounded.

**PROOF.** By conditions of the theorem there exists a  $Q$ -quasiisometrical homeomorphism  $\varphi : D \rightarrow D'$  of the embedding domain  $D$  onto  $D'$ . For any function  $u \in W_2^1(D', w)$  the composition  $u \circ \varphi$  is weakly differentiable in domain  $D$ , and the following estimates are correct for any  $1 \leq q \leq 2$ .

$$\begin{aligned} \|u \circ \varphi | W_q^1(D)\| &= \left( \int_D |u \circ \varphi|^q dx \right)^{\frac{1}{q}} + \left( \int_D |\nabla(u \circ \varphi)|^q dx \right)^{\frac{1}{q}} \\ &\leq \left( \int_D |u \circ \varphi|^q (|J(x, \varphi)|w(\varphi(x)))^{\frac{q}{2}} \frac{1}{(|J(x, \varphi)|w(\varphi(x)))^{\frac{q}{2}}} dx \right)^{\frac{1}{q}} \\ &\quad + \left( \int_D |\nabla u|^q |\bar{\varphi}'(x)|^q (|J(x, \varphi)|w(\varphi(x)))^{\frac{q}{2}} \frac{1}{(|J(x, \varphi)|w(\varphi(x)))^{\frac{q}{2}}} dx \right)^{\frac{1}{q}}. \end{aligned}$$

By the Hölder inequality we have

$$\begin{aligned} \|u \circ \varphi | W_q^1(D)\| &\leq \\ &\leq \left( \int_D \left( \frac{1}{|J(x, \varphi)|w(\varphi(x))} \right)^{\frac{q}{2-q}} dx \right)^{\frac{2-q}{2q}} \left( \int_D |u|^2(\varphi(x))w(\varphi(x))|J(x, \varphi)| dx \right)^{\frac{1}{2}} \\ &\quad + \left( \int_D \left( \frac{|\bar{\varphi}'(x)|^2}{|J(x, \varphi)|w(\varphi(x))} \right)^{\frac{q}{2-q}} dx \right)^{\frac{2-q}{2q}} \left( \int_D |\nabla u|^2(\varphi(x))w(\varphi(x))|J(x, \varphi)| dx \right)^{\frac{1}{2}}. \end{aligned}$$

Since  $\varphi$  is the  $Q$ -quasiisometrical homeomorphism, then by the change of variable formula in the Lebesgue integral, we obtain

$$\begin{aligned} \|u \circ \varphi | W_q^1(D)\| &\leq Q^{\frac{n}{q}} \left( \int_{D'} w(y)^{\frac{q}{q-2}} dy \right)^{\frac{2-q}{2q}} \left( \int_{D'} |u|^2 w(y) dy \right)^{\frac{1}{2}} \\ &\quad + Q^{\frac{2-q+n}{q}} \left( \int_{D'} w(y)^{\frac{q}{q-2}} dy \right)^{\frac{2-q}{2q}} \left( \int_{D'} |\nabla u|^2 w(y) dy \right)^{\frac{1}{2}} \\ &= Q^{\frac{n}{q}} K(w) \|u | L_2(D', w)\| + Q^{\frac{2-q+n}{q}} K(w) \|\nabla u | L_2(D'w)\|. \end{aligned}$$

By the previous inequality the composition operator

$$\varphi^* : W_2^1(D', w) \rightarrow W_q^1(D), \quad 1 \leq q \leq 2,$$

is bounded.

Since  $D$  is an embedding domain there exists the bounded embedding operator

$$i : W_q^1(D) \hookrightarrow L_{\frac{nq}{n-q}}(D).$$

Now we choose a number  $q$  such that  $\frac{nq}{n-q} = 2$  (i.e.  $q = \frac{2n}{n+2}$ ).

Since  $\varphi$  is the  $Q$ -quasiisometrical homeomorphism, the following composition operator acting on Lebesgue spaces

$$(\varphi^{-1})^* : L_2(D) \rightarrow L_2(D'),$$

is bounded also [18].

Therefore the embedding operator  $i' : W_2^1(D', w) \hookrightarrow L_2(D')$  is bounded as a composition of bounded operators  $\varphi^*$ ,  $(\varphi^{-1})^*$  and the bounded embedding operator  $i$ .

Define an inner product in the weighted space  $W_2^1(D, w)$  as:

$$\langle u, v \rangle = \int_D \nabla u \cdot \nabla v w(x) dx,$$

for any  $u, v \in W_2^1(D, w)$ .

Consider Dirichlet problem for the degenerate elliptic equation:

$$\operatorname{div}(w(x)\nabla u) = f, \tag{1}$$

$$u|_{\partial D} = 0. \tag{2}$$

in a bounded domain  $D$  for the weight  $w \in C^1(D)$ .

**Theorem 11.** Let  $f \in L_2(D)$  and  $\int_D w(y)^{-\frac{n}{2}} dx < +\infty$ . Then there exists the unique weak solution  $u \in \overset{\circ}{W}_2^1(D, w)$  of the problem (1, 2).

**PROOF.** The function  $f \in L_2(D)$  induces a linear functional  $F : L_2(D) \rightarrow R$  by the standard rule

$$F(\phi) = \int_D f(x)\phi(x) dx.$$

By Theorem 10 there exists bounded embedding operator  $i : \overset{\circ}{W}_2^1(D, w) \hookrightarrow L_2(D)$ .

Therefore

$$\begin{aligned} |F(\phi)| &\leq \|f \cdot \phi\|_{L_1(D)} \\ &\leq \|f\|_{L_2(D)} \cdot \|\phi\|_{L_2(D)} \leq C \|f\|_{L_2(D)} \cdot \|\phi\|_{\overset{\circ}{W}_2^1(D, w)}. \end{aligned}$$

Hence,  $F$  is a bounded linear functional in Hilbert space  $\overset{\circ}{W}_2^1(D, w)$ . By Riesz representation theorem [20] there exists the unique function  $u \in \overset{\circ}{W}_2^1(D, w)$  such that

$$F(\phi) = \langle u, \phi \rangle = \int_D \nabla u \cdot \nabla \phi w(x) dx,$$

or

$$\int_D \nabla u \cdot \nabla \phi w(x) dx = \int_D f(x) \phi(x) dx.$$

Therefore  $u$  is the unique weak solution of the problem (1, 2).
