It is shown that the gravity above a box filled with gas at ultra-low pressure can be reduced when an electromagnetic field is applied through the gas. The gravity decrease is proportional to the intensity of the electromagnetic field, and inversely proportional to the mass density of the gas. From the technical point of view, there are several applications for this discovery; possibly it will change the paradigms of *energy* generation, *transportation* and *telecommunications*.

Key words: Gravity, Ultrahigh Vacuum, Gravity Control, Gravitational Shielding.

I. INTRODUCTION

It will be shown that the local gravity acceleration can be controlled by means of a device called Gravity Control Cell (GCC) which basically is a box filled with gas at ultra-low pressure where an *electromagnetic field* is applied through the gas. The gravity decrease is proportional to the intensity of the electromagnetic field, and inversely proportional to the mass density of the gas.

With a GCC it is possible to convert the gravitational energy into rotational mechanical energy by means of the *Gravitational Motor*. In addition, a new concept of spacecraft (the *Gravitational Spacecraft*) and aerospace flight is presented here based on the possibility of gravity control. We will also see that the gravity control will be very important to *Telecommunication*.

II. THEORY

It was shown that the *gravitational* mass m_g is correlated to *inertial* mass m_i by means of the following expression [1]:

$$m_g = m_i - 2 \left[\sqrt{1 + \left(\frac{\Delta p}{m_i c}\right)^2} - 1 \right] m_i.$$
 (1)

where Δp is the *momentum* variation on the particle.

In general, the *momentum* variation Δp is expressed by $\Delta p = F\Delta t$ where *F* is the applied force during a time interval Δt . Note that there is no restriction concerning the *nature* of the force *F*, i.e., it can be mechanical, electromagnetic, etc.

For example, we can look on the *momentum* variation Δp as due to absorption or emission of *electromagnetic energy* by the particle.

In the case of radiation, Δp can be obtained as follows: It is known that the radiation pressure, dP, upon an area dA = dxdy of a volume dV = dxdydz of a particle (the incident radiation normal to the surface dA)is equal to the energy dU absorbed per unit volume (dU/dV).i.e.,

$$dP = \frac{dU}{dV} = \frac{dU}{dxdydz} = \frac{dU}{dAdz}$$
(2)

Substitution of dz = vdt (*v* is the speed of radiation) into the equation above gives

$$dP = \frac{dU}{dV} = \frac{(dU/dAdt)}{v} = \frac{dD}{v}$$
(3)

Since dPdA = dF we can write:

$$dFdt = \frac{dU}{v} \tag{4}$$

However we know that dF = dp/dt, then

$$dp = \frac{dU}{v}$$
(5)

From this equation it follows that

$$\Delta p = \frac{U}{v} \left(\frac{c}{c}\right) = \frac{U}{c} n_r$$

Substitution into Eq. (1) yields

$$m_g = \left\{ 1 - 2 \left[\sqrt{1 + \left(\frac{U}{m_i c^2} n_r\right)^2} - 1 \right] \right\} m_i \qquad (6)$$

Where U, is the electromagnetic energy absorbed by the particle; n_r is the index of refraction.

The Eq. (6) can be rewritten in the following form

$$m_g = \left\{ 1 - 2 \left[\sqrt{1 + \left(\frac{W}{\rho c^2} n_r\right)^2} - 1 \right] \right\} m_i \qquad (7)$$

where W = U/V is the density of electromagnetic energy and $\rho = m_i/V$ is the density of inertial mass.

In classical electrodynamics the density of energy in an *electromagnetic* field has the following expression

$$W = \frac{1}{2}\varepsilon_r\varepsilon_0 E^2 + \frac{1}{2}\mu_r\mu_0 H^2$$

Since $E/H = \mu c$ then we can write that

$$W = \mu_r \mu_0 H^2 = \mu H^2$$

Thus, we can rewrite the Eq. (7) as follows

$$m_g = \left\{ 1 - 2 \left[\sqrt{1 + \left(\frac{\mu H^2}{\rho c^2} n_r\right)^2} - 1 \right] \right\} m_i \qquad (8)$$

The Electrodynamics tells us that v will be given by

$$v = \frac{dz}{dt} = \frac{\omega}{\kappa_r} = \frac{c}{\sqrt{\frac{\varepsilon_r \mu_r}{2} \left(\sqrt{1 + \left(\frac{\sigma}{\omega\varepsilon}\right)^2} + 1\right)}}$$

Where k_{r} is the real part of the propagation vector \vec{k} ; $k=\left|\vec{k}\right|=k_{r}+ik_{i}$; ε , are the electromagnetic μ and $\sigma_{\rm H}$ characteristics of the medium in which the incident (or emitted) radiation is propagating $(\varepsilon = \varepsilon_r \varepsilon_0)$ where ε_r is the relative dielectric permittivity and $\varepsilon_0 = 8.854 \times 10^{-12} F/m$; $\mu = \mu_r \mu_0$ where μ_r is the relative magnetic permeability and $\mu_0 = 4\pi \times 10^{-7} H / m$; σ is the electrical conductivity). For an atom inside a body, the incident (or emitted) radiation on this atom will be propagating inside the body, and consequently,

 $\sigma = \sigma_{body}, \ \mathcal{E} = \mathcal{E}_{body}, \ \mu = \mu_{body}.$ It is then evident that the *index* of *refraction* $n_r = c/v$ will be given by

$$n_r = \frac{c}{v} = \sqrt{\frac{\varepsilon_r \mu_r}{2} \left(\sqrt{1 + (\sigma/\omega\varepsilon)^2} + 1 \right)} \qquad (9)$$

Now consider a box filled with *Air* at $1 \times 10^{-11} torr$ and 300K as shown in Figure 1 (a). Under these circumstances, the mass density of the *air* inside the box is $\rho \cong 5 \times 10^{-15} kg.m^{-3}$.

If the frequency of the *magnetic* field, *H*, through the *air* is f = 60Hz then $\omega \varepsilon = 2\pi f \varepsilon \cong 3 \times 10^{-9} S / m$. Assuming that the electric conductivity of the *air* inside the box, $\sigma_{(air)}$ is much less than $\omega \varepsilon$, i.e., $\sigma_{(air)} \ll \omega \varepsilon$ (The atmospheric air conductivity is of the order of $2-100 \times 10^{-15} S.m^{-1}$ [2,3]) then we can rewritten the Eq. (9) as follows

$$n_r \cong \sqrt{\varepsilon_r \mu_r} \cong 1 \tag{10}$$

Consequently from Eq. (8) we thus obtain

$$m_{g(air)} = \left\{ 1 - 2 \left[\sqrt{1 + 3 \times 10^6 B^4} - 1 \right] \right\} m_{i(air)}$$

It was shown [1] that there is an additional effect of *gravitational shielding* produced by the substance under these conditions. Above the substance the gravity acceleration g' is reduced at the same ratio $\chi = m_g / m_i$, i.e., $g' = \chi g$, (g is the gravity acceleration under the substance). Therefore, due to the gravitational shielding effect produced by the decreasing of $m_{g(air)}$, the gravity acceleration above the air inside the box will be given by

$$g' = \chi_{air} g = \frac{m_{g(air)}}{m_{i(air)}} g = \left\{ 1 - 2 \left[\sqrt{1 + 3 \times 10^{6} B^{4}} - 1 \right] \right\} g$$

Note that the gravity acceleration above the *air* becomes *negative* for $B > 2.54 \times 10^{-2} T$.

For B = 0.1T the gravity acceleration above the air becomes

 $g' \cong -31.7g$

Therefore the box filled with air at ultra-low pressure works such as a Gravity Control Cell (GCC). Note that below and above the air are the bottom and the top of the box. Therefore the choice of the material of the box is highly relevant. If the box is made of steel, for example, and the gravity acceleration below the box is g then at the bottom of the box, the gravity becomes $g' = \chi_{steel} g$; the air. in the gravity is $g'' = \chi_{air}g' = \chi_{air}\chi_{steel}g$. At the top of the box, $g''' = \chi_{steel} g'' = (\chi_{steel})^2 \chi_{air} g$. Thus, out of

the box (close to the top) the gravity acceleration becomes g'''. (See Fig. 1 (a)). However, for the steel at B < 300T and $f = 1 \times 10^{-6} Hz$, we have

$$\chi_{steel} = \frac{m_{g(steel)}}{m_{i(steel)}} = \left\{ 1 - 2 \left[\sqrt{1 + \frac{\sigma_{(steel)}B^4}{4\pi f \mu \rho_{(steel)}^2 c^2}} - 1 \right] \right\} \cong 1$$

Since $\rho_{steel} = 1.1 \times 10^6 S.m^{-1}$, $\mu_r = 300$ and $\rho_{(steel)} = 7800k.m^{-3}$.

Thus, due to $\chi_{steel} \cong 1$ it follows that

$$g''' \cong g'' = \chi_{air} g' \cong \chi_{air} g$$

. If instead of one GCC we have three GCC, all with steel box (Fig. 1(b)), then the gravity acceleration above the second GCC, g_2 will be given by

$$g_2 \cong \chi_{air} g_1 \cong \chi_{air} \chi_{air} g$$

and the gravity acceleration above the *third* GCC, g_3 will be expressed by

$$g_3 \cong \chi_{air} g'' \cong \chi_{air}^3 g$$

III. CONSEQUENCES

These results point to the possibility to convert gravitational energy mechanical into rotational energy. Consider for example the system presented in Fig. 2 . Basically it is a motor with massive iron rotor and a box filled with gas at ultra-low pressure (Gravity Control Cell-GCC) as shown in Fig.2. The GCC is placed below the rotor in order to become negative the acceleration of gravity inside half of the rotor $(g' = (\chi_{steel})^2 \chi_{air} g \cong \chi_{air} g = -ng).$ Obviously this causes a torque T = (-F' + F)r and the rotor spins with angular velocity ω . The average power, P, of the motor is given by

$$P = T\omega = \left[\left(-F' + F \right) r \right] \omega \tag{11}$$

where

$$F' = \frac{1}{2}m_g g' \qquad F = \frac{1}{2}m_g g$$

and $m_g \cong m_i$ (mass of the rotor). Thus, Eq. (11) gives

$$P = (n+1)\frac{m_i g \,\omega \, r}{2} \tag{12}$$

On the other hand, we have that

$$-g' + g = \omega^2 r \tag{13}$$

Therefore the angular speed of the rotor is given by

$$\omega = \sqrt{\frac{(n+1)g}{r}} \tag{14}$$

By substituting (14) into (12) we obtain the expression of the average power of the *gravitational motor*, i.e.,

$$P = \frac{1}{2}m_i\sqrt{(n+1)^3 g^3 r}$$
(15)

Now consider an electric generator coupling to the gravitational motor in order to produce electric energy. Since $\omega = 2\pi f$ then for f = 60Hz we have $\omega = 120 \pi rad \cdot s^{-1} = 3600 rpm$.

Therefore for $\omega = 120\pi rad.s^{-1}$ and n = 788 ($B \cong 0.22T$) the Eq. (15) tell us that we must have

$$r = \frac{(n+1)g}{\omega^2} = 0.0545m$$

Since r = R/3 and $m_i = \rho \pi R^2 h$ where ρ , R and h are respectively the mass density, the radius and the height of the rotor then for h = 0.5m and $\rho = 7800 Kg.m^{-3}$ (iron) we obtain

$$m_i = 327.05 kg$$

Then Eq. (16) gives

$$P \cong 2.19 \times 10^5 \text{ watts} \cong 219 \text{ KW} \cong 294HP \qquad (16)$$

This shows that the *gravitational motor* can be used to yield electric energy at large scale.

The possibility of gravity control leads to a new concept of spacecraft which is presented in Fig.3. Due to the *Meissner effect*, the magnetic field *B* is expelled from the *superconducting shell*. The Eq. (8) shows that a magnetic field, *B*, through the *aluminum shell* of

the spacecraft reduces its gravitational mass according to the following expression:

$$m_{g(Al)} = \left\{ 1 - 2 \left[\sqrt{1 + \left(\frac{B^2}{\mu c^2 \rho_{(Al)}} n_r \right)^2} - 1 \right] \right\} m_{i(Al)} \quad (17)$$

If the frequency of the magnetic field is $f = 10^{-4} Hz$ then we have that $\sigma_{(AI)} >> \omega \epsilon$ the electric since conductivity of the aluminum is $\sigma_{(Al)} = 3.82 \times 10^7 S.m^{-1}$. In this case, the Eq. (9) tell us that

$$n_r = \sqrt{\frac{\mu c^2 \sigma_{(Al)}}{4\pi f}} \tag{18}$$

Substitution of (18) into (17) yields

$$m_{g(Al)} = \left\{ 1 - 2 \left[\sqrt{1 + \frac{\sigma_{(Al)} B^4}{4\pi f \mu \rho_{(Al)}^2 c^2}} - 1 \right] \right\} m_{i(Al)} \quad (19)$$

Since the mass density of the Aluminum is $\rho_{(Al)} = 2700 kg \cdot m^{-3}$ then the Eq. (19) can be rewritten in the following form:

$$\chi_{Al} = \frac{m_{g(Al)}}{m_{i(Al)}} = \left\{ 1 - 2 \left[\sqrt{1 + 3.68 \times 10^{-8} B^4} - 1 \right] \right\}$$
(20)

In practice it is possible to adjust *B* in order to become, for example, $\chi_{Al} \cong 10^{-9}$. This occurs to $B \cong 76.3T$. (Novel superconducting magnets are able to produce up to 14.7T [4,5]).

Then the gravity acceleration in any direction *inside* the spacecraft, g'_l , will be reduced and given by

$$g'_{l} = \frac{m_{g(Al)}}{m_{i(Al)}} g_{l} = \chi_{Al} g_{l} \cong -10^{-9} g_{l} \quad l = 1, 2, ..., n$$

Where g_l is the *external* gravity in the direction *l*. We thus conclude that the gravity acceleration inside the spacecraft becomes negligible if $g_l << 10^9 m. s^{-2}$.

This means that the aluminum shell, under these conditions, works like a gravity shielding.

Consequently, the gravitational forces between anyone point inside the spacecraft with gravitational mass, m_{gj} , and another external to the spacecraft (gravitational mass m_{gk}) are given by

$$\vec{F}_j = -\vec{F}_k = -G \frac{m_{gj}m_{gk}}{r_{ik}^2} \hat{\mu}$$

where $m_{gk} \cong m_{ik}$ and $m_{gj} = \chi_{Al} m_{ij}$. Therefore we can rewrite equation above in the following form

$$ec{F}_j = -ec{F}_k = -\chi_{Al}G rac{m_{ij}m_{ik}}{r_{ik}^2}\hat{\mu}$$

Note that when B = 0 the initial gravitational forces are

$$\vec{F}_j = -\vec{F}_k = -G \frac{m_{ij}m_{ik}}{r_{jk}^2}\hat{\mu}$$

Thus, if $\chi_{Al} \cong -10^{-9}$ then the initial gravitational forces are reduced from 10^{9} times and become repulsives.

According to the new expression for the *inertial forces* [1], $\vec{F} = m_g \vec{a}$, we see that these forces have origin in the *gravitational interaction* between a particle and the others of the Universe, just as *Mach's principle* predicts. Hence mentioned expression incorporates the Mach's principle into Gravitation Theory, and furthermore reveals that the inertial effects upon a body can be strongly reduced by means of the decreasing of its gravitational mass.

Consequently, we conclude that if the gravitational forces upon the spacecraft are reduced from 10^9 times then also the *inertial forces* upon the spacecraft will be reduced from 10^9 times when $\chi_{Al} \cong -10^{-9}$. Under these conditions, the inertial effects on the crew would be strongly decreased. Obviously this leads to a new concept of aerospace flight.

Inside the spacecraft the gravitational forces between the

dielectric with gravitational mass, M_g and the man (gravitational mass, m_g), when B = 0 are

$$\vec{F}_m = -\vec{F}_M = -G\frac{M_g m_g}{r^2}\hat{\mu}$$
(21)

or

$$\vec{F}_m = -G \frac{M_g}{r^2} m_g \hat{\mu} = -m_g g_M \hat{\mu}$$
(22)

$$\vec{F}_M = +G \frac{m_g}{r^2} M_g \hat{\mu} = +M_g g_m \hat{\mu}$$
(23)

If the superconducting box under M_g (Fig. 3) is filled with *air* at ultra-low pressure (10⁻¹¹torr, 300K for example) then, when $B \neq 0$, the gravitational mass of the *air* will be reduced according to (8). Consequently, we have

$$g'_{M} = (\chi_{steel})^{2} \chi_{air} g_{M} \cong \chi_{air} g_{M} \qquad (24)$$

$$g'_{m} = (\chi_{steel})^{2} \chi_{air} g_{m} \cong \chi_{air} g_{m}$$
(25)

Then the forces \vec{F}_m and \vec{F}_M become

$$\vec{F}_m = -m_g \left(\chi_{air} g_M \right) \hat{\mu} \tag{26}$$

$$\vec{F}_M = +M_g \left(\chi_{air} g_m \right) \hat{\mu}$$
 (27)

Therefore if $\chi_{air} = -n$ we will have

$$\vec{F}_m = +nm_g g_M \hat{\mu} \tag{28}$$

$$\vec{F}_M = -nM_g g_m \hat{\mu} \tag{29}$$

Thus, \vec{F}_m and \vec{F}_M become *repulsive*. Consequently, the man inside the spacecraft is subjected to a gravity acceleration given by

$$\vec{a}_{man} = ng_M \hat{\mu} = -\chi_{air} G \frac{M_g}{r^2} \hat{\mu}$$
(30)

Inside the GCC we have,

$$\chi_{air} = \frac{m_{g(air)}}{m_{i(air)}} = \left\{ 1 - 2 \left[\sqrt{1 + \frac{\sigma_{(air)}B^4}{4\pi f \mu \rho_{(air)}^2 c^2}} - 1 \right] \right\}$$
(31)

By ionizing the air inside the GCC (Fig.3), for example, by means of a *radioactive* material, it is possible to increase the *air conductivity* inside the GCC up to $\sigma_{(air)} \cong 10^6 S.m^{-1}$. Then for

 $f = 10 \ Hz$; $\rho_{(air)} = 5 \times 10^{-15} kg.m^{-3}$ (Air at 1×10⁻¹¹ torr, 300K) and we obtain

$$\chi_{air} = \left\{ 2 \left[\sqrt{1 + 2.8 \times 10^{21} B^4} - 1 \right] - 1 \right\}$$
(32)

For $B = B_{GCC} = 0.1T$ (note that, due to the *Meissner effect*, the magnetic field B_{GCC} stay confined inside the *superconducting box*) the Eq. (32) yields

$$\chi_{air} \cong -10^9$$

Since there is no magnetic field through the *dielectric* presented in Fig.3 then, $M_g \cong M_i$. Therefore if $M_g \cong M_i = 100 Kg$ and $r = r_0 \cong 1m$ the gravity acceleration upon the man, according to Eq. (30), is

$$a_{man} \cong 10 m.s^{-1}$$

Consequently it is easy to see that this system is ideal to yield artificial gravity inside the spacecraft in the case of *interstellar travel*, when the gravity acceleration out of the spacecraft - due to the Universe - becomes negligible.

The vertical displacement of the spacecraft can be produced by means of *Gravitational Thrusters*. A schematic diagram of a Gravitational Thruster is shown in Fig.4. The Gravitational Thrusters can also provide the *horizontal* displacement of the spacecraft.

The concept of Gravitational Thruster results from the theory of the *Gravity Control Battery*, showed in Fig. 1 (b). Note that the number of GCC increases the thrust of the thruster. For example, if the thruster has *three* GCCs then the gravity acceleration upon the gas sprayed inside the thruster will be *repulsive* in respect to M_g (See Fig. 4) and given by

$$a_{gas} = (\chi_{air})^3 (\chi_{steel})^4 g \cong -(\chi_{air})^3 G \frac{M_g}{r_0^2}$$

Thus, if inside the GCCs, $\chi_{air} \cong -10^9$ (See Eq. 31 and 32) then the equation above gives

$$a_{gas} \cong +10^{27} G \frac{M_i}{r_0^2}$$

For $M_i \cong 10 kg$, $r_0 \cong 1m$ and $m_{gas} \cong 10^{-12} kg$ the thrust is

$$F = m_{gas} a_{gas} \cong 10^5 N$$

Thus, the Gravitational Thrusters are able to produce strong thrusts.

It is important to note that if F is force produced by a thruster then the spacecraft acquires acceleration $a_{spacecraft}$ given by [1]

$$a_{spacecraft} = \frac{F}{M_{g(spacecraft)}} = \frac{F}{\chi_{Al}M_{i(inside)} + m_{i(Al)}}$$

Therefore if $\chi_{Al} \cong 10^{-9}$; $M_{i(inside)} = 10^4 Kg$ and $m_{i(Al)} = 100 Kg$ (inertial mass of the aluminum shell) then it will be necessary F = 10kN to produce

$$a_{spacecraft} = 100 m \cdot s^{-2}$$

Let us now calculate the gravitational forces between two very close *thin* layers of the *air* around the spacecraft. (See Fig. 5).

The gravitational force dF_{12} that dm_{g1} exerts upon dm_{g2} , and the gravitational force dF_{21} that dm_{g2} exerts upon dm_{g1} are given by

$$d\vec{F}_{12} = d\vec{F}_{21} = -G \frac{dm_{g2}dm_{g1}}{r^2} \hat{\mu}$$
(33)

Thus, the gravitational forces between the *air layer* 1, gravitational mass m_{g1} , and the *air layer* 2, gravitational mass m_{g2} , around the spacecraft are

$$\vec{F}_{12} = -\vec{F}_{21} = -\frac{G}{r^2} \int_0^{m_{g_1}} \int_0^{m_{g_2}} dm_{g_1} dm_{g_2} \hat{\mu} =$$
$$= -G \frac{m_{g_1} m_{g_2}}{r^2} \hat{\mu} = -\chi_{air} \chi_{air} G \frac{m_{i1} m_{i2}}{r^2} \hat{\mu} \qquad (34)$$

At 100km altitude the air pressure is $5.69 \times 10^{-3} torr$ and $\rho_{(air)} = 5.998 \times 10^{-6} kg.m^{-3}$ [6]. By ionizing the air surround the spacecraft, for example, by means of an oscillating electric field, E_{osc} , starting from the surface of the spacecraft (See Fig. 5) it is possible to increase the *air* conductivity near the spacecraft up to $\sigma_{(air)} \cong 10^{6} S.m^{-1}$. Since f = 1Hz and, in this case $\sigma_{(air)} \gg \omega \varepsilon$, then, according to Eq. (9), $n_r = \sqrt{\mu \sigma_{(air)} c^2/4\pi f}$. From Eq.(8) we thus obtain

$$\chi_{air} = \frac{m_{g(air)}}{m_{i(air)}} = \left\{ 1 - 2 \left[\sqrt{1 + \frac{\sigma_{(air)}B^4}{4\pi f \mu_0 \rho_{(air)}^2 c^2}} - 1 \right] \right\}$$
(35)

Then for B = 763T the Eq. (35) gives

$$\chi_{air} = \left\{ 1 - 2 \left[\sqrt{1 + \sim 10^4 B^4} - 1 \right] \right\} \cong -10^8$$
 (36)

By substitution of $\chi_{air} \cong -10^8$ into Eq., (34) we get

$$\vec{F}_{12} = -\vec{F}_{21} = -10^{16} G \frac{m_{i1} m_{i2}}{r^2} \hat{\mu}$$
(37)

If $m_{i1} \cong m_{i2} = \rho_{air} V_1 \cong \rho_{air} V_2 \cong 10^{-8} kg$, and $r = 10^{-3} m$ we obtain

$$\vec{F}_{12} = -\vec{F}_{21} \cong -10^{-4} N \tag{38}$$

These forces are much more intense than the *inter-atomic forces* (the forces which maintain joined atoms, and molecules that make the solids and liquids) whose intensities, according to the Coulomb's law, is of the order of $1-1000 \times 10^{-8}$ N.

Consequently, the air around the spacecraft will be strongly compressed

upon their surface, making an "*air shell*" that will accompany the spacecraft during its displacement and will protect the *aluminum shell* of the direct attrition with the Earth's atmosphere.

In this way, during the flight, the attrition would occur just between the "air shell" and the atmospheric air around her. Thus, the spacecraft would stay free of the thermal effects that would be produced by the direct attrition of the aluminum shell with the Earth's atmosphere.

Another interesting effect produced by the magnetic field *B* of the spacecraft is the possibility of to lift a body from the surface of the Earth to the spacecraft as shown in Fig. 6. By ionizing the air surround the spacecraft, by means of an oscillating electric field, E_{osc} , the *air conductivity* near the spacecraft can reach, for example, $\sigma_{(air)} \cong 10^6 S.m^{-1}$. Then for f = 1Hz; B = 40.8T and $\rho_{(air)} \cong 1.2kg.m^{-3}$ (300K and 1 atm) the Eq. (35) yields

$$\chi_{air} = \left\{ 1 - 2 \left[\sqrt{1 + 4.9 \times 10^{-7} B^4} - 1 \right] \right\} \cong -0.1$$

Thus, the weight of the body becomes

 $P_{body} = m_{g(body)}g = \chi_{air}m_{i(body)}g = m_{i(body)}g'$ Consequently, the body will be lifted on the direction of the spacecraft with acceleration

$$g' = \chi_{air} g \cong +0.98 m.s^{-1}$$

Let us now consider an important aspect of the flight dynamics of a Gravitational Spacecraft.

Before starting the flight, the gravitational mass of the spacecraft, M_g , must be strongly reduced, by means of a gravity control system, in order to produce – with a weak thrust \vec{F} , a strong acceleration, \vec{a} , given by [1]

$$\vec{a} = \frac{\vec{F}}{M_g}$$

In this way, the spacecraft could be strongly accelerated and quickly to reach very high speeds near speed of light. If the gravity control system of the spacecraft is *suddenly* turned off, the *gravitational mass* of the spacecraft becomes immediately equal to its *inertial mass*, M_i , $(M'_g = M_i)$ and the velocity \vec{V} becomes equal to $\vec{V'}$. According to the *Momentum* Conservation Principle, we have that

$$M_{g}V = M'_{g}V'$$

Supposing that the spacecraft was traveling in space with speed $V \approx c$, and that its gravitational mass it was $M_g = 1Kg$ and $M_i = 10^4 Kg$ then the velocity of the spacecraft is reduced to

$$V' = \frac{M_g}{M'_g} V = \frac{M_g}{M_i} V \approx 10^{-4} c$$

Initially, when the velocity of the spacecraft is \vec{V} , its kinetic energy is $E_k = (M_g - m_g)c^2$. Where $M_g = m_g/\sqrt{1 - V^2/c^2}$. At the instant in which the gravity control system of the spacecraft is turned off, the kinetic energy becomes $E'_k = (M'_g - m'_g)c^2$. Where $M'_g = m'_g/\sqrt{1 - {V'}^2/c^2}$.

We can rewritten the expressions of E_k and E'_k in the following form

$$E_{k} = \left(M_{g}V - m_{g}V\right)\frac{c^{2}}{V}$$
$$E_{k}' = \left(M_{g}'V' - m_{g}'V'\right)\frac{c^{2}}{V'}$$

Substitution of $M_g V = M'_g V' = p$, $m_g V = p \sqrt{1 - V^2/c^2}$ and $m'_g V' = p \sqrt{1 - V'^2/c^2}$ into the equations of E_k and E'_k gives

$$E_{k} = \left(1 - \sqrt{1 - V^{2}/c^{2}}\right) \frac{pc^{2}}{V}$$
$$E_{k}' = \left(1 - \sqrt{1 - V'^{2}/c^{2}}\right) \frac{pc^{2}}{V'}$$

Since $V \approx c$ then follows that

$$E_k \approx pc$$

On the other hand, since $V' \ll c$ we get

$$E'_{k} = \left(1 - \sqrt{1 - {V'}^{2}/c^{2}}\right) \frac{pc^{2}}{V'} = \\ \cong \left(1 - \frac{1}{1 + \frac{{V'}^{2}}{2c^{2}} + \dots}\right) \frac{pc^{2}}{V'} \cong \left(\frac{V'}{2c}\right) pc$$

Therefore we conclude that $E_k >> E'_k$. Consequently, when the gravity control system of the spacecraft is turned off, occurs an *abrupt* decrease in the kinetic energy of the spacecraft, ΔE_k , given by

$$\Delta E_k = E_k - E'_k \approx pc \approx M_g c^2 \approx 10^{17} J$$

By comparing the energy ΔE_k with the *inertial energy* of the spacecraft, $E_i = M_i c^2$, we conclude that

$$\Delta E_k \approx \frac{M_g}{M_i} E_i \approx 10^{-4} M_i c^2$$

The energy ΔE_k (several *megatons*) must be released in very short time interval. It is approximately the same amount of energy that would be released in the case of collision of the spacecraft[†]. However, the situation is very different of a collision (M_g just becomes suddenly equal to M_i), and possibly the energy ΔE_k is converted into a *High Power Electromagnetic Pulse*.

Obviously this electromagnetic pulse (EMP) will induce heavy currents in all electronic equipment that mainly contains semiconducting and conducting materials. This produces immense heat that melts the circuitry inside. As such, while not being directly responsible for the loss of lives, these EMP are capable of disabling electric/electronic systems. Therefore, we possibly have a new type of electromagnetic bomb. An electromagnetic bomb or E-bomb is a well-known weapon designed to disable electric/electronic systems on a wide

[†] In this case, the collision of the spacecraft would release $\approx 10^{17}$ J (several megatons) and it would be similar to a powerful *kinetic weapon*.

scale with an intense electromagnetic pulse.

Based on the theory of the GCC it is also possible to build a *Gravitational Press* of *ultra-high* pressure as shown in Fig.7.

The chamber 1 and 2 are GCCs with air at 1×10^{-4} torr, 300K $(\sigma_{(air)} \approx 10^{6} S.m^{-1}; \rho_{(air)} = 5 \times 10^{-8} kg.m^{-3})$. Thus, for f = 10Hz and B = 0.107T we have

$$\chi_{air} = \left\{ 1 - 2 \left[\sqrt{1 + \frac{\sigma_{(air)}B^4}{4\pi \mu_0 \rho_{(air)}^2 c^2}} - 1 \right] \right\} \cong -118$$

The gravity acceleration above the air of the chamber 1 is

$$\vec{g}_1 = \chi_{stell} \chi_{air} g \hat{\mu} \cong +1.15 \times 10^3 \hat{\mu}$$
(39)

Since, in this case, $\chi_{steel} \cong 1$; $\hat{\mu}$ is an *unitary vector* in the opposite direction of \vec{g} .

Above the air of the chamber 2 the gravity acceleration becomes

$$\vec{g}_2 = (\chi_{stell})^2 (\chi_{air})^2 g \hat{\mu} \cong -1.4 \times 10^5 \hat{\mu}$$
 (40)

Therefore the *resultant* force \vec{R} acting on m_2 , m_1 and m is

$$\vec{R} = \vec{F}_2 + \vec{F}_1 + \vec{F} = m_2 \vec{g}_2 + m_1 \vec{g}_1 + m\vec{g} =$$

= -1.4×10⁵ m_2 $\hat{\mu}$ + 1.15×10³ m_1 $\hat{\mu}$ - 9.81m $\hat{\mu}$ =
 \approx -1.4×10⁵ m_2 $\hat{\mu}$ (41)

where

$$m_2 = \rho_{steel} V_{disk\,2} = \rho_{steel} \left(\frac{\pi}{4} \phi_{inn}^2 H \right) \qquad (42)$$

Thus, for $\rho_{steel} \cong 10^4 kg.m^{-3}$ we can write that

$$F_2 \cong 10^9 \phi_{inn}^2 H$$

For the steel $\tau \approx 10^5 kg.cm^{-2} = 10^9 kg.m^{-2}$ consequently we must have $F_2/S_{\tau} < 10^9 kg.m^{-2}$, ($S_{\tau} = \pi \phi_{inn}H$ see Fig.7). This means that

$$\frac{10^9 \phi_{inn}^2 H}{\pi \phi_{inn} H} < 10^9 kg.m^{-2}$$

Then we conclude that

$$\phi_{inn} < 3.1m$$

For $\phi_{inn} = 2m$ and H = 1m the Eq. (42) gives

$$m_2 \cong 3 \times 10^4 \, kg$$

Therefore from the Eq. (41) we obtain $R \cong 10^{10} N$

Consequently, in the area $S = 10^{-4} m^2$ of the Gravitational Press, the pressure is

$$p = \frac{R}{S} \cong 10^{14} \, N \, \text{m}^{-2}$$

This enormous pressure is much greater than the pressure in the center of the Earth $(3.617 \times 10^{11} N.m^{-2})$ [7]. It is near of the gas pressure in the center of the sun $(2 \times 10^{16} N.m^{-2})$. Under the action of such intensities new states of matter are created and astrophysical phenomena may be simulated in the lab for the first time, e.g. supernova explosions. Controlled thermonuclear fusion by inertial confinement, fast nuclear ignition for energy gain, novel collective acceleration schemes of particles and the numerous variants of material processing constitute examples of progressive applications of such Press Gravitational of ultra-high pressure.

The GCCs can also be applied on generation and detection of *Gravitational Radiation*.

Consider a cylindrical GCC (GCC antenna) as shown in Fig.8 (a). The *gravitational mass* of the *air* inside the GCC is

$$m_{g(air)} = \left\{ 1 - 2 \left[\sqrt{1 + \frac{\sigma_{(air)}B^4}{4\pi f \mu \rho_{(air)}^2 c^2}} - 1 \right] \right\} m_{i(air)} \quad (43)$$

By varying *B* one can varies $m_{g(air)}$ and consequently to vary the gravitational field generated by $m_{g(air)}$, producing then gravitational radiation. Then a GCC can work like a *Gravitational Antenna*.

Apparently, Newton's theory of gravity had no gravitational waves

because, if a gravitational field changed in some way, that change took place instantaneously everywhere in space, and one can think that there is not a wave in this case. However, we have already seen that the gravitational interaction can be repulsive, besides attractive. Thus, as with electromagnetic interaction, the gravitational interaction must be produced by the exchange of "virtual" guanta of spin 1 and mass null, i.e., the gravitational "virtual" guanta (graviphoton) must have spin 1 and not 2. Consequently, the fact of a change in gravitational field а reach instantaneously everywhere in space occurs simply due to the speed of the graviphoton to be infinite. It is known that there is no speed limit for "virtual" contrary, photons. the On the electromagnetic ("virtual" quanta photons) could not communicate the electromagnetic interaction an infinite distance.

Thus, there are two types of gravitational radiation: the real and virtual. which is constituted of gravitational graviphotons; the real waves are ripples in the space-time generated by gravitational field changes. According to Einstein's theory of gravity the velocity of propagation of these waves is equal to the speed of light (c).

Unlike the electromagnetic waves the real gravitational waves have low interaction with matter and consequently scattering. Therefore low real gravitational waves are suitable as a of transmitting information. means However, when the distance between transmitter and receiver is too large. for example of the order of magnitude of several light-years, the transmission of information by means of gravitational waves becomes impracticable due to the long time necessary to receive the information. On the other hand, there is no delay during the transmissions by means of *virtual* gravitational radiation. In addition the scattering of this radiation is null. Therefore the *virtual* gravitational radiation is very suitable as a means of transmitting information at any distances including astronomical distances.

As concerns detection of the virtual gravitational radiation from GCC antenna, there are many options. Due to Resonance Principle a similar GCC antenna (receiver) tuned at the same frequency can absorb energy from an incident virtual gravitational radiation (See Fig.8 (b)). Consequently, the gravitational mass of the air inside the GCC receiver will vary such as the gravitational mass of the air inside the GCC transmitter. This will induce a magnetic field similar to the magnetic field the GCC of transmitter and therefore the current through the coil inside the GCC receiver will have the same characteristics of the current through the coil inside the GCC transmitter. However, the volume and pressure of the air inside the two GCCs must be exactly the same; also the type and the quantity of atoms in the air inside the two GCCs must be exactly the same. Thus, the GCC antennas are simple but they are not easy to build.

Note that a GCC antenna radiates *graviphotons* and *gravitational waves* simultaneously (Fig. 8 (a)). Thus, it is not only a gravitational antenna: it is a *Quantum Gravitational Antenna* because it can also emit and detect gravitational "virtual" *quanta* (graviphotons), which, in turn, can transmit information *instantaneously* from any distance in the Universe *without* scattering.

Due to the difficulty to build two similar GCC antennas and, considering that the electric current in the receiver antenna can be detectable even if the gravitational mass of the nuclei of the antennas are not *strongly* reduced, then we propose to replace the gas at the nuclei of the antennas by a thin *dielectric lamina*. The dielectric lamina with exactly 10^8 atoms (10^3 atoms × 10^3 atoms × 10^2 atoms) is placed between the plates (electrodes) as shown in Fig. 9. When the virtual gravitational radiation strikes upon the dielectric lamina, its gravitational mass varies similarly to the gravitational mass of the dielectric lamina of the transmitter antenna. inducing an electromagnetic field (E, B)similar to the transmitter antenna. Thus, the electric current in the receiver antenna will have the same characteristics of the current in the transmitter antenna. In this way, it is then possible to build two similar antennas whose nuclei have the same volumes and the same types and quantities of atoms.

Note that the Quantum Gravitational Antennas can also be used to transmit *electric power*. It is easy to see that the Transmitter and Receiver (Fig. 9(a)) can work with strong voltages and electric currents. This means that strong electric power can be transmitted among Quantum Gravitational Antennas. This obviously solves the problem of *wireless* electric power transmission.

The existence of *imaginary masses* has been predicted in a previous work [1]. Here we will propose a method and a device using GCCs for obtaining *images* of *imaginary bodies*.

It was shown that the *inertial* imaginary mass associated to an *electron* is given by

$$m_{ie(ima)} = \frac{2}{\sqrt{3}} \left(\frac{hf}{c^2}\right) i = \frac{2}{\sqrt{3}} m_{ie(real)} i$$

Assuming that the correlation between the gravitational mass and the inertial mass (Eq.6) is the same for both imaginary and real masses then follows that the *gravitational* imaginary mass associated to an *electron* can be written in the following form:

$$m_{ge(ima)} = \left\{ 1 - 2 \left[\sqrt{1 + \left(\frac{U}{m_i c^2} n_r\right)^2} - 1 \right] \right\} m_{ie(ima)}$$

Thus, the gravitational *imaginary* mass *associated to matter* can be *reduced*, made *negative* and *increased*, just as the gravitational *real* mass.

It was shown that also *photons* have imaginary mass. Therefore, the imaginary mass can be associated or *not* to the matter.

In a general way, the gravitational forces between two gravitational imaginary masses are then given by

$$\vec{F} = -\vec{F} = -G\frac{(iM_g)(im_g)}{r^2}\hat{\mu} = +G\frac{M_gm_g}{r^2}\hat{\mu}$$

Note that these forces are *real* and *repulsive*.

Now consider а gravitational imaginary mass, $m_{g(ima)} = im_{g}$, not with associated matter (like the gravitational imaginary mass associated to the photons) and another gravitational imaginary mass $M_{g(ima)} = iM_{g}$ associated to a material body.

Any material body has an imaginary mass associated to it, due to the existence of imaginary masses associated to the electrons. We will choose a *quartz crystal* (for the material body with gravitational imaginary mass $M_{g(ima)} = iM_{g}$) because quartz crystals are widely used to detect forces (piezoelectric effect).

By using GCCs as shown in Fig. 10(b) and Fig.10(c), we can increase the gravitational acceleration, \vec{a} , produced by the imaginary mass im_g upon the crystals. Then it becomes

$$a = -\chi_{air}^3 G \frac{m_g}{r^2}$$

As we have seen, the value of χ_{air} can be increased up to $\chi_{air} \cong -10^9$ (See Ea.32). Note that in this case, the gravitational forces become attractive. In not small, addition, if m_{g} is the gravitational forces between the imaginary body of mass im, and the crystals can become sufficiently intense to be easily detectable.

Due to the piezoelectric effect, the gravitational force acting on the crystal will produce a voltage proportional to its intensity. Then consider a board with hundreds micro-crystals behind a set of GCCs, as shown in Fig.10(c). By amplifying the voltages generated in each micro-crystal and sending to an appropriated data acquisition system, it will be thus possible to obtain an image of the imaginary body of mass $m_{g(ima)}$ placed in front of the board.

In order to decrease strongly the gravitational effects produced by bodies placed behind the imaginary body of mass im_g , one can put five GCCs making a *Gravitational Shielding* as shown in Fig.10(c). If the GCCs are filled with air at 300K and $1 \times 10^{-11} torr$. Then $\rho_{air} \cong 5 \times 10^{15} kgm^{-3}$ and $\sigma_{air} \cong 1 \times 10^{14} Sm^{-1}$. Thus, for f = 60Hz and $B \cong 0.7T$ the Eq. (8) gives

$$\chi_{air} = \frac{m_{g(air)}}{m_{i(air)}} = \left\{ 1 - 2 \left[\sqrt{1 + 5B^4} - 1 \right] \right\} \cong -10^{-2}$$

For $\chi_{air} \cong 10^{-2}$ the gravitational shielding presented in Fig.10(c) will reduce any value of g to $\chi_{air}^5 g \cong 10^{-10} g$. This will be sufficiently to reduce strongly the gravitational effects proceeding from both sides of the gravitational shielding.

IV.CONCLUSION

The process described here is clearly the better way in order to control the gravity. This is because the Gravity Control Cell in this case is very easy to be built, the cost is low and it works at ambient temperature. The Gravity Control is the starting point for the generation of and detection of Virtual Gravitational Radiation (Quantum Gravitational Transceiver) also for the construction of the Gravitational Motor and the Gravitational Spacecraft which includes the system for generation of artificial gravity presented in Fig.3 and the Gravitational Thruster (Fig.4). While the Gravitational Transceiver leads to a new concept in Telecommunication, the Gravitational Motor changes the paradigm of energy conversion and the

Gravitational Spacecraft points to a new concept in *aerospace flight*.
